Bromo methylene phthalide v vol 1 p 580

Isomeride of methylene phthalide v METHYLENE PHTHALYL

Polymeride of methylene phthalide

$C_{18}H_{12}O_4$ [216°] Obtained by allowing a solution of acetophenone carboxylic acid (1 pt) in H_2SO_4 (2 pts) to stand in the cold, and then ppg with water (Roser, *B* 17, 2620, Gabriel, *B* 17, 2666, cf ACETOPHENONE *o* CARBOXYLIC ACID, reaction 2) Plates Insol water and cold alkalis, sl sol alcohol, v sol HOAc

Oxym $C_{18}H_{12}NO_4$ [180°] Obtained by heating the substance with alcoholic hydroxylamine hydrochloride at 160° Crystalline granules (from dilute HOAc)

METHYLENE-DI-PHTHALIMIDE

$CH_2(N \begin{matrix} \diagup CO \\ \diagdown CO \end{matrix} C_6H_4)_2$ [226°] Formed by heating potassium phthalimide (2 mols) with methylene iodide (1 mol) at 175° (Neumann, *B* 23, 1002) Light brown crystals (from HOAc), insol dilute alkalis Yields phthalic acid on heating with $HClAq$

TRIMETHYLENE-DI-PHTHALIMIDE

$C_{18}H_{12}N_2O_4$ i.e. C_6H_4O , N , CH , CH , CH_2 , N , C_6H_4O , [198°] Formed by the action of tri methylene bromide on potassium phthalimide (Gabriel, *B* 21, 2669) White needles, m sol hot HOAc, sl sol ether, CS_2 , chloroform, and cold alcohol, v sl sol water and petroleum ether Converted by heating with KOH into tri methylene di phthalamic acid $C_{18}H_{12}(NHCOC_6H_4CO_2H)_2$ De composed by heating with HCl at 180° into phthalic acid and tri methylene diamine

METHYLENE-PHTHALYL C_6H_4O , i.e.

$C_6H_4 \begin{matrix} \diagup CO \\ \diagdown CO \end{matrix} CH_2$? [219°] Fine yellow needles

Formed, together with *o* tribenzoylene benzene, by heating phthalic anhydride with malonic ether and sodium acetate (Gabriel, *B* 14, 925)

METHYLENE-DI-PIPERIDINE

$CH_2(NC_4H_8)_2$ (230°) Formed by distilling piperidine with trimethylene oxide (formic par aldehyde) (Ehrenberg, *J pr* [2] 36, 126) Liquid, with pepper like smell Is decomposed by dilute acids into its constituents CS_2 forms an addition product $B''CS_2$, [58°], sol alcohol and ether, insol water

METHYLENE-TETRA-PROPYL-DIAMINE

$CH_2(NPr)_2$ (220°) Formed by distilling di-propylamine with trimethylene oxide (formic paraldehyde) (Ehrenberg, *J pr* [2] 36, 122) Liquid, sl sol water, v sol alcohol, ether, and chloroform

METHYLENE DI-PROPYL OXIDE v Di-propyl ether of FORMIC ORTHALDEHYDE

TRI-METHYLENE SELENO-UREA v SELENIUM COMPOUNDS, ORGANIC

METHYLENE SULPHIDE v. THIOFORMIC ALDEHYDE.

Tri methylene tetrasulphide $C_3H_2S_4$, i.e.

$CH_2 \begin{matrix} \diagup S CH_2 S \\ \diagdown S CH_2 S \end{matrix}$ [84°] Formed by the action of H_2S on formic aldehyde (Baumann, *B* 23, 1869) Colourless needles, insol water, m sol alcohol and ether, v e sol $CHCl_3$ and benzene

METHYLENE SULPHOCYANIDE $C_3H_2S_2N_2$, i.e. $CH_2(SCy)_2$, [102°] Formed by digesting potassium sulphocyanide (2 mols) with methylene iodide (1 mol) in alcoholic solution for 2 or 3 hours on the water bath, ppg with water, and recrystallising from alcohol (Lermontoff, *B* 7, 1282) Crystals, v sol alcohol and ether, m sol hot, nearly insol cold, water Oxidised by conc HNO_3 to methane disulphonic acid

TRI-METHYLENE-TRISULPHONE

$C_3H_2S_3O_6$, i.e. $CH_2 \begin{matrix} \diagup SO_2 CH_2 \\ \diagdown SO_2 CH_2 \end{matrix} SO_2$ Formed by oxidising thioformic paraldehyde (trithio form aldehyde) with $KMnO_4$ (E Baumann a R Camps, *B* 23, 69) Crystalline powder, insol water, dilute acids, alcohol, ether, chloroform, and glacial acetic acid, v sol cold caustic soda, ammonia (by warming), and sodic carbonate Expels CO from $Na CO_3$ on warming Conc HNO_3 and H_2SO_4 have no action even on warming Its solution in H_2SO_4 is ppd by water unaltered It partially sublims The six hydrogen atoms can be displaced by alkyl groups The hexamethyl derivative

is identical with the product obtained by B Jaffé, E Baumann, and Fromm (*B* 22, 2598, 2609) by oxidising trithio acetone

TRIMETHYLENE-DI-SULPHONIC ACID so called v PROPANE DI SULPHONIC ACID

METHYLENE TRI-THIO-CARBONATE

$CH_2 \begin{matrix} \diagup S \\ \diagdown S \end{matrix} CS$ Separates on gently heating $CS(SNa)_2$ with methylene iodide in alcoholic solution (Husemann, *A* 126, 292) Amorphous yellowish white powder, insol water Converted by fuming nitric acid into methane di sulphonic acid

TRIMETHYLENE THIO UREA $C_3H_4N_2S$ i.e.

$CH \begin{matrix} \diagup CH_2 NH \\ \diagdown CH_2 NH \end{matrix} CS$ [198°] Formed, together with ammonium sulphocyanide, by heating the sulphocyanide of trimethylene diamine $C_3H_4(NH_2)_2(HNCS)$, (Lellmann a Wurthner, *A* 228, 232) White needles (from chloroform mixed with light petroleum) Sol water, alcohol, $CHCl_3$, and benzene, m sol aqueous NaOH, insol light petroleum Forms a sparingly soluble compound with $HgCl_2$

Trimethylene-ψ thio-urea

$CH_2 \begin{matrix} \diagup CH_2 S \\ \diagdown CH_2 NH \end{matrix} C NH$ Formed by evaporating a solution of γ bromo propyl aminohydrobromide and potassium sulphocyanide to dryness at 100° (Gabriel a Lauer, *B* 23, 94) Liquid, v sol water forming an alkaline solution, from which it can be extracted by benzene -B'HBr [136°] -B'C₆H₅(NO₂)OH [128°] Long needles

TRIMETHYLENE-UREA $C_3H_4N_3O$ i.e.

$CH_2 \begin{matrix} \diagup CH_2 NH \\ \diagdown CH_2 NH \end{matrix} CO$ *Oxy-pyrimidine tetrahy dride* [260°] Formed by heating trimethylene diamine (1 mol) with carbonic ether (1 mol) for 6 hours at 180° (Fischer a Koch, *A* 232, 224).

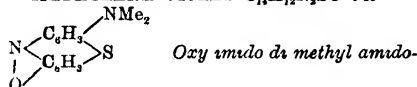

White needles, ν sol water, sl sol alcohol and ether. Its solution is neutral, and is not pptd by HNO_3 or oxalic acid. By chromic acid mixture it is oxidised to a compound $\text{C}_6\text{H}_4\text{N}_2\text{O}_2$ crystallising in plates [275°]

Trimethylene ψ -urea $\text{CH}_2\langle\text{CH}_2\text{O}\rangle\text{C NH}$

or $\text{CH}_2\langle\text{CH}_2\text{O}\rangle\text{C NH}_2$. Formed by evaporating a solution of equivalent quantities of potassium cyanate and γ -bromo propyl aminehydrobromide (Gabriel & Lauer, *B* 23, 95). Thick liquid, ν sol water— $\text{B}'\text{C}_6\text{H}_5(\text{NO}_2)_2\text{OH}$ [200°]. Long yellow needles.

Trimethylene-di-urea $\text{C}_6\text{H}_4\text{N}_2\text{O}_2$ ν e $\text{CH}_2(\text{CH}_2\text{NH CO NH}_2)_2$ [182°]. Formed by warming a dilute aqueous solution of trimethylene diamine hydrochloride with silver cyanate (F & K). White needles, ν sol water, sl sol alcohol, insol ether.

METHYLENE VIOLET $\text{C}_{11}\text{H}_{12}\text{N}_2\text{SO}$ ν e.

diphenylene sulphide. Oxy dimethylamido thio diphenylamide. Formed by boiling a solution of methylene blue (base). Formed also by oxidising a mixture of di methyl di amido phenyl, mercaptan, and phenol (Bernthsen, *A* 230, 171, 251, 96). Needles, ν sl sol water, sl sol alcohol, ether acetone, chloroform, benzene, ligroin, and cumene, with a reddish brown fluorescence, ν sol aniline, without fluorescence— $\text{B}'\text{HCl}$ ν sl sol cold dilute HClAq .

METHYLENITAN ν vol n p 571

DI METHYL ENNYLENE DIKETONE

$\text{C}_{11}\text{H}_{16}\text{O}_2$ ν e $\text{CH}(\text{CH}_3\text{CHEt CO CH}_3)_2$. *Di acetyl di ethyl n pentane* (208° at 110 mm). Formed from its dicarboxylic ether by treatment with alcoholic potash (Kipping & Perkin, jun, *C J* 57, 33). Colourless oil, with slight aromatic odour, ν sl sol water, miscible with alcohol and ether. It dissolves without change in conc H_2SO_4 , forming a yellowish brown solution. It does not combine with NaHSO_3 .

Orim $\text{CH}(\text{CH}_3\text{CHEt CMe NOH})_2$ [111°]. Obtained by heating the ketone with an alcoholic solution of hydroxylamine, evaporating, adding water, and extracting with ether. Minute colourless crystals (from benzene ligroin), ν sol alcohol, ether, HOAc , benzene, and aqueous alkalis.

DI-METHYL ENNYLENE DIKETONE DI-CARBOXYLIC ETHER

$\text{CH}_2(\text{CH}_2\text{Cet}(\text{CO CH}_3)_2\text{CO}_2\text{Et})_2$ ν e *Di acetyl ac di ethyl pmetic ether* [45°]. Obtained, together with compounds of low boiling point, when sodium ethyl acetoacetic ether is heated with an alcoholic solution of trimethylene bromide on a water bath (Kipping & Perkin, jun, *C J* 57, 81). Very slender needles (from ether alcohol), ν sol ether and alcohol, ν e sol benzene, light petroleum, xylene, and chloroform, insol cold water. Gives no colour with FeCl_3 . Readily decomposed by warm alcoholic potash.

METHYL ENNYL KETONE $\text{CH}_2\text{CO C}_6\text{H}_5$, [16°] (224°) SG 17.5 8295. The chief constituent of oil of rue, obtained by distilling *Ruta*

graveolens with steam (Greville Williams, *T* 1858 [1] 99, Hallwachs, *A* 113, 109, Harbordt, *A* 123, 293, Giesecke, *Z* [2] 6, 429, cf Gerhardt *C R* 26, 225, 361, Cahours, *C R* 26, 262). Occurs in the essential oil obtained from lime leaves (*citrus Limetta*) (F Watts, *C J* 49, 316). Formed also by distilling a mixture of calcium acetate and calcium decanoate (Gorup Besanez & Grimm, *A* 157, 275, B 3, 518), and by boiling octyl acetoacetic ether with alcoholic potash (Guthzeit, *A* 204, 4). It is oxidised by chromic acid mixture to acetic and ennoic acids. Sodium amalgam reduces it, in alcoholic solution, to *sec* hendecyl alcohol (229°), SG 12 826. It combines with NH_3 . With alkali bisulphites it forms compounds such as $\text{C}_6\text{H}_5\text{CMe}(\text{OH})\text{SO}_2\text{NH}_2\text{aq}$, which crystallises in pearly plates. PCl_5 converts the ketone into $\text{C}_{11}\text{H}_{22}\text{Cl}_2$, which is resolved by distillation into HCl and $\text{C}_{11}\text{H}_{22}\text{Cl}$ (222°).

Orim $\text{C}_6\text{H}_5\text{CMe NOH}$ [42°]. Minute prisms (from alcohol), ν sol ether (Spiegler, *M* 5, 242, B 17, 1575).

METHYL ENNYL KETONE CARBOXYLIC

ACID $\text{CH}_2\text{CO CHEt CH}_2\text{CH}_2\text{CH}_2\text{CHEt CO}_2\text{H}$ ν e *Acetyl-ac di ethyl-caproic acid* (254° at 90 mm). Formed, together with di methyl ennylene diketone and acetic acid, by boiling di ethyl ennylene diketone dicarboxylic acid with alcoholic potash (Kipping & Perkin, *C J* 57, 36). Thick oil, miscible with alcohol, ether, and benzene— AgA' . Amorphous pp, m sol hot water.

Orim $\text{CH}_2\text{C}(\text{NOH})\text{C}_6\text{H}_5\text{CO}_2\text{H}$ [103°]. Minute plates (from benzene ligroin), ν sol alcohol and benzene, sl sol ligroin, sol alkalis and conc HClAq .

TETRAMETHYLENYL-CARBINYL-AMINE

$\text{C}_6\text{H}_{11}\text{N}$ ν e $\text{CH}_2\langle\text{CH}_2\text{CH}_2\text{NH}\rangle_2$ 'Tetra methylenylamine' (83°). Formed from the nitrile of tetramethylene carboxylic acid $\text{CH}_2\langle\text{CH}_2\text{CH}_2\text{CN}\rangle_2$ by reduction in alcoholic solution with sodium (Freund & Gudeman, *B* 21, 2692). Oil, with alkaline reaction, which absorbs CO_2 from the air— $\text{B}'\text{HCl}$ [236°]. Crystallises from alcohol ether, ν sol water and alcohol, insol ether— $\text{B}'_2\text{H}_4\text{PtCl}_4$. Crystalline.

TETRAMETHYLENYLCARBINYL-THIO-UREA $\text{C}_6\text{H}_{11}\text{N}_2\text{S}$ ν e

$\text{CH}_2\langle\text{CH}_2\text{CH}_2\text{NH CS NH}_2\rangle_2$ [68°]. Prepared by the action of ammonium sulphocyanide upon the hydrochloride of tetramethylenyl-carbinyllamine (Freund, *B* 21, 2697). Slender needles (from water or alcohol).

TETRAMETHYLENYLCARBINYL UREA

$\text{C}_6\text{H}_{11}\text{N}_2\text{O}$ ν e $\text{CH}_2\langle\text{CH}_2\text{CH}_2\text{NH CO NH}_2\rangle_2$ [116°]. Obtained by evaporating a solution of tetramethylenylcarbinyllaminehydrochloride with potassium cyanate (Freund, *B* 21, 2697). Needles, sl alcohol, ν sol hot, m sol cold water.

DI-TETRAMETHYLENYL KETONE $\text{C}_6\text{H}_4\text{O}$ ν e $\text{CH}_2\langle\text{CH}_2\text{CH}_2\text{CO CH}_2\text{CH}_2\text{CO}\rangle_2$ (205°)

A product of the distillation of calcium tetramethylene carboxylate with lime (Colman & Perkin, jun, *C J* 61, 235). Oil, smelling of

KOH on the water bath White plates, sol boiling water, v sl sol cold water, v e sol alcohol and ether Forms the salts —(B'MeCl crystallising in rhombohedra, v e sol water — B'Me₂PtCl₂ — Picrate [112°] crystallising in needles, m sol boiling water and alcohol

METHYL DI-ETHYL AMINE C₅H₁₁N 2 e MeNkt, Formed by distilling its methyl chloride, or by distilling triethylamine methyl hydroxide NEt₃Me(OH) (V Meyer a Lecco, A 180, 184, Lossen, A 181, 379) — B'H.PtCl₂. Monoclinic crystals (Hjortdahl, J 1892, 476)

Methyl chloride C₂H₅Cl + Me₂NEt₂Cl Di methyl di ethyl ammonium chloride Obtained from the crystalline iodide Me₂NEt₂I, which is formed by heating dimethylamine with EtI or diethylamine with MeI (Petersen, A 91, 122, V Meyer a Lecco, A 180, 177) — (Me₂NEt₂Cl)₂PtCl₂, yellowish dimetric prisms, m sol water, sl sol alcohol and ether S 1 025 at 15° — (Me₂NEt₂Cl)₂HgCl₂, trimetric crystals (Topsoe, J 1893, 620) — Me₂NEt₂ClHgCl₂ — Me₂NEt₂Cl₂HgCl₂, trimetric crystals — Me₂NEt₂ClAuCl₂, dimetric crystals

Methyl picrate [287°] Needles (Lossen, A 181, 374)

Ethyl hydroxide v Tri ETHYLAMINE methyl hydroxide, vol 11 p 476

Di methyl ethyl amine NMe₂Et (41°) A product of the action of heat on trimethylamine ethylchloride (Collie a Schryver, C J 57, 770) Formed also by distilling NMe₂Et OH

METHYL TRI ETHYL AMMONIUM COMPOUNDS v *Methyl hydroxide* of Tri ETHYL-AMINE

Di methyl di ethyl ammonium compounds v *Methyl chloride* of METHYL DI ETHYL AMINE

Tri methyl-ethyl ammonium compounds v *Ethyl chloride* of Tri METHYL AMINE

METHYL ETHYL ISOAMYL-AMINE

C₅H₁₁N 2 e MeNEtC₅H₁₁ (135°) Formed, together with ethylene, by the dry distillation of methyl di ethyl isoamyl ammonium hydroxide MeNEt₂(C₅H₁₁)(OH), which is obtained by the action of moist Ag₂O on the product of the

union of MeI with di ethyl isoamyl amine (Hofmann, C J 4, 317) Fragrant liquid, sl sol water — B'H₂PtCl₂, orange yellow needles, v sol water

METHYL ETHYL-AMYL-PHENYL-AMMONIUM HYDROXIDE v *Methyl hydroxide* of ETHYL ISOAMYL ANILINE, vol 11 p 476

METHYL-ETHYL-ANILINE C₆H₅N 2 e C₆H₅NMeEt (201° uncor)

Formation — 1 By methylation of ethyl aniline (Hofmann, A 74, 152) — 2 By ethylation of methyl aniline (Claus a Howitz, B 17, 1325) — 3 From di ethyl aniline methyl iodide

Properties — Crystalline, forming extremely soluble salts The hydrochloride melts at 114° (Claus a Hirzel, B 19, 2785)

Methyl iodide B'MeI [125°], identical with di methyl aniline methyl iodide (Claus a Rautenberg, B 14, 620, Hjortdahl, J 1882, 510) Triclinic crystals, v sol water and alcohol De composed by boiling with conc KOHAq, yielding dimethylaniline — B'HCl [114°], very hygroscopic crystals — (B'MeI)₂ZnI₂, monoclinic crystals — (B'Me)₂H₂Fe₂Cy₁₂2aq (Fischer, A 190, 187)

Ethyl iodide B'EtI [102°], identical with di ethyl aniline methyl iodide, by treatment with KOH it gives methyl ethyl aniline

Propyl iodide C₃H₇NMeEtPrI *Methyl propyl aniline ethyl iodide*, ethyl propyl aniline methyl iodide Thick syrup, v sol water Formed by the combination of methyl ethyl aniline with propyl iodide, of ethyl propyl aniline with methyl iodide, or methyl propyl aniline with ethyl iodide By boiling with aqueous KOH the propyl group is split off and methyl-ethyl aniline regenerated (Claus a Hirzel, B 19, 2785)

Reference — Bromo METHYL ETHYL ANILINE **METHYL ETHYL ARSINE** v ARSENIC COMPOUNDS, ORGANIC

DIMETHYL ETHYL AZONIUM CHLORIDE

C₅H₁₁N₂Cl 2 e Me₂NEtClNH₂ Crystalline compound E sol water Prepared by the combination of ethyl chloride with dimethyl hydrazine On reduction with zinc dust and acetic acid it gives dimethyl ethylamine, NH₂, and HCl (Renouf, B 13, 2172) — (C₅H₁₁N₂Cl)₂PtCl₂, crystalline

METHYL ETHYL BENZENE v ETHYL-TOLUENE

Di methyl-ethyl-benzene v ETHYL-XYLENE Laurene C₁₁H₁₆ (LauroI) (188°) S G, 12 887 According to Armstrong a Miller (B 16, 2258) this liquid is di methyl ethyl benzene C₆H₅Me₂Et [1 2 4] It is one of the products of the action of ZnCl₂ on camphor (Fittig, A 145, 149) It yields di methyl benzoic acid on oxidation Montgolfer (A Ch [5] 14, 91) described laurene as C₁₁H₁₆ (195°) Reuter (B 16, 627) described two laurenes (a) laurene (190°) yielding C₆H₅Me₂CO₂H [1 4 2] on oxidation by dilute HNO₃, and (b) laurene (185°) yielding on oxidation C₆H₅Me₂CO₂H [1 3 4] and forming a sulphonic acid whose Ba salt is more soluble than that of (a) laurene According to Uhlhorn (B 23, 2346) laurene contains (1,2,4)- and (1,4,2)-di-methyl ethyl-benzenes

o **METHYL-ETHYL BENZENE HEXAHYDRIDE** C₆H₁₀ 2 e CH₂ < CH₂CHMe > CH₂Et

Methyl-ethyl hexamethylene (151°) Formed by boiling $\text{CH}_2 < \begin{smallmatrix} \text{CH}_2 \text{CHMe} \\ \text{CH}_2 \text{CH}_2 \end{smallmatrix} > \text{CH CH(OH) CH}_2$ with fuming HIAq , diluting with water, extracting with ether, and heating the resulting oily $\text{CH}_2 < \begin{smallmatrix} \text{CH}_2 \text{CHMe} \\ \text{CH}_2 \text{CH}_2 \end{smallmatrix} > \text{CH CHI CH}_2$, (179° at 110 mm) with excess of HIAq (S G 1 96) and amorphous phosphorus for 8 hours at 235° Kipping a Perkin, jun, C J 57, 26) Mobile oil with odour of paraffin, miscible with alcohol and ether

METHYL ETHYL-BENZENE (8) **SULPHONIC ACID** $\text{C}_6\text{H}_4\text{MeEt SO}_3\text{H}$ [1 2 47] Formed by sulphonating *o*-ethyl-toluene (Claus a Pieszek, B 19, 3087) Crystalline — NaA' aq plates, *v* sol water, insol alcohol — KA' aq plates, *v* sol water — CaA' , 2aq plates grouped in nodules, *v* e sol water — BaA' , 3aq plates, *v* e sol water — PbA' , 8aq plates, *v* e sol water — CuA' aq blue plates, *v* e sol water

TETRA-METHYL-ETHYLENE-DI-PHENYL-DIPHOSPHONIUM BROMIDE *v* **Ethylene-bromide of PHENYL DI METHYL PHOSPHINE**

DI METHYL-ETHYLENE DI PHENYL-DIPYRROLE DICARBOXYLIC ETHER

$\text{C}_6\text{H}_4(\text{C}_2\text{NHMePh CO}_2\text{Et})_2$, [197°] Formed from acetophenone acetoacetic ether and ethylene acetides (Paal a Schneider, B 19, 3156) Scales (containing 4aq) Yields on hydrolysis the corresponding acid [181°]

METHYL-ETHYLENE-PYRIDINE TETRA HYDRIDE $\text{C}_4\text{H}_8\text{N}_4$ *vs* $\text{C}_4\text{H}_8\text{NMe}(\text{C}_2\text{H}_5)_2$ **Tropidine** (162°) S G 2 9665 Formed by heat in atropine or tropine with fuming HClAq and HOAc at 180°, or by heating tropine with H_2SO_4 (Ladenburg, A 217, 117) Liquid, smelling like conine, *v* e sol cold, sl sol hot, water, *v* e sol alcohol and ether Alkaline in reaction Its hydrobromide is decomposed by bromine at 175° yielding di bromo methyl pyridine and ethylene — $\text{B}'\text{H}_2\text{PtCl}_4$, — $\text{B}'\text{HAuCl}_4$, — $\text{B}'\text{HI}$, [98°] Brown prisms — $\text{B}'\text{C}_2\text{H}_5(\text{NO}_2)_2\text{OH}$ yellow needles (from boiling water)

Methyl tropide B'Mel Cubes Decomposed on distillation with KOH yielding tropine $\text{C}_7\text{H}_{10}\text{O}$, an oil $\text{C}_7\text{H}_8\text{O}$ (?) (202°–207°), dimethylamine and methyl tropine With moist Ag_2O it

gives a syrupy base which yields the salts
 $(B'MeCl)_2PtCl_2 - B'MeBr - B'MeC_6H_4(NO_2)_2O$

TETRA METHYL, ETHYLENE DI PYR-
ROL $C_{14}H_{20}N_2$ *re*

tained by adding ethylene diamine (1 mol) to a solution of acetylonyl acetone (2 mols) in an equal weight of absolute alcohol. White pearly plates. Sublimable. Volatile with steam. V sol alcohol, ether, benzene, and petroleum spirit, insol water. Colours a chip of pine wood. Carmine red. Gives a purple red colouration with phenanthraquinone and H_2SO_4 . (Paal & Schneider. *B* 19. 3157).

DI METHYL ETHYLENE DISULPHIDE
 $C_2H_4S_2$ *vs* $C_2H_4(SMe)_2$ *Di methyl ether of di thio glycol* (183°) Formed from ethylene bromide and $NaSMe$ (Ewerlof, *B* 4, 716)

DI METHYL ETHYLENE DISULPHONE *v*
Di methyl ether of ETHANE DISULPHINIC ACID
METHYL ETHYLENE \downarrow THIO UREA

Methyl amido
thiazole dihydride [90°] Formed, together
with a crystalline compound $C_6H_{11}N_2O_2$ [70°],
by the action of methyl thiocarbamide on bromo
ethylamine (Gabriel, *B* 22, 1148) Needles, v e
sol water, v sol ordinary solvents Strongly
alkaline Oxidised by bromine water to an acid
(γ -NHMe CO NH, CH $_2$ CO, SO $_2$ H), which is de
composed by fuming HClAq at 155° into CO,
methylamine, and taurine —Picrate [226°]
needles —Aurochloride needles —Platino-
chloride needles

Methyl ethylene ψ thiourea

Formed by heating ethylene ϕ thio urea with methyl iodide (Gabriel). Oil. When it is oxidised by bromine water it yields methyl taurine $\text{NHMeCH}_2\text{CHSO}_3\text{H}$. Salts— B^+H^- [160°]. Colourless crystals, sol water and alcohol. Pirarate [200°–203°]—The aurochloride and platinochloride form long needles, sol boiling water.

METHYL ETHYL ETHER v METHYL ETHYL
OXIDE

METHYL-ETHYL-ETHYLENE u AMYLENE

METHYL-ETHYL-GLYOXAL 2 METHYL

ETHYL DIKFTONE

METHYL-ETHYL-GLYOXALINE $C_6H_{10}N_2 \cdot 0$

ethyl ethylamine (213°) SG 15 98 Formed by the action of ethyl bromide on methyl glyoxaline (glyoxal ethylamine) (Radziszewski, *B* 16, 489) Formed also from diethyl oxamide NHEt CO CO NHEt by treatment with PCl₅ and heating the hydro iodide (10 g) of the resulting 'chloroethylethylamine' C₄H₁₁ClN, with HIAq (7 g of SG 19) and amorphous phosphorus (1 g) for 6 hours at 140°. The product is dissolved in water, rendered alkaline, and extracted with chloroform (Wallach, *A* 214, 298) Colourless and liquid, with narcotic smell. Sol. water and

alcohol AgNO₃ gives a crystalline pp, HgCl₂, a white pp The zinc double chloride forms crystals melting at [160°] Burns with a blue flame It is a strong base and ppts metallic oxides from their salts Its zinc double salt distilled with lime yields pyrrole, ammonia, HCl, ethylene, and methyl glyoxaline (para oxal methylene) (Wallach, *A* 214, 305) It acts physiologically like atropine (Schulz, *B* 13, 2353) When heated in a sealed tube with dilute H₂SO₄ at 240° it yields ethylamine KMnO₄ yields oxalic acid, NH₃, and acetic acid When passed through a red hot tube it yields HCl and methyl glyoxaline (para oxal methyl ene) H₂O₂ oxidises it to ethyl oxamide (Radzi szewski, *B* 17, 1290)

Salts — $\text{B}'\text{HCl}$ deliquescent crystals — $\text{B}'_2\text{H}_2\text{PtCl}_6$ — $\text{B}'_2\text{H}_2\text{ZnCl}_4$ [160°] — $\text{B}'_2\text{AgNO}_3$.
Methyl iodide $\text{C}_5\text{H}_{10}\text{N}_2\text{MeI}$ Crystals, ν e sol water and alcohol. Not decomposed by aqueous NaOH — $\text{C}_5\text{H}_{10}\text{N}_2\text{MeI}_3$

Benzyl chloride $C_6H_5CH_2Cl$

Methyl - ethyl - glyoxaline $C_6H_{10}N_2$ 2 e

methylo iodide B'MeI of this body is formed by the action of MeI on para ethyl glyoxaline (Radziszewsky, *B* 16, 490)

ketole [191*] Formed by heating methyl
indole (methyl ketole), paraldehyde, and $ZnCl_2$
on the water-bath (Fischer, *A* 242, 376).
Colourless prisms, ν sol alcohol, ether, and
acetone

DIMETHYL ETHYLIDENE DIKETONE
(CH₃CO)₂CHMe (165°) Formed from sodium
methylene dimethyl diketone and MeI (Combes,
C R 105, 868)

METHYL ETHYL INDAZINE $C_{10}H_{12}N_2$ *ts*
 C_6H_5 $\begin{array}{c} \text{CMe} \\ \diagup \quad \diagdown \\ \text{N} \quad \text{NEt} \end{array}$ Formed by heating methyl-
 indazine with EtI at 100° (Fischer & Tafel, *A*
 227, 303) Liquid, m sol water, v e sol alco-
 hol and ether, volatile with steam—B'HCl
 needles

Methyl ethyl-iso indazine $\text{C}_4\text{H}_7\text{N}_2$ $\begin{smallmatrix} \text{CMe} \\ \text{NEt} \end{smallmatrix} \text{N}$
Ethyl-quinazole [80°] (235°) Formed by
 heating its carboxylic acid at 160°-190° (Fischer
 & Kuzel, *A* 221, 285, *B* 16, 655) Formed

also by reducing the nitrosamine of ethyl amido acetophenone, dissolved in dilute acetic acid, with zinc dust, adding NaOH, and distilling with steam. The oily distillate is dissolved in dilute H_2SO_4 , mixed with $NaNO_2$, and extracted with ether (Fischer & Tafel, *A* 227, 303). Plates, sl sol water, v sol alcohol and ether. Volatile with steam, giving off a pungent odour. Not affected by nitrous acid or by Ag_2O . Does not reduce Fehling's solution. Forms crystalline pps with $AgNO_3$ and $HgCl_2$, which may be recrystallised from hot water in slender needles. Its salts are extremely soluble in water. — $B'H_2SO_4$ long needles — $B'H_2PtCl_6$ sparingly soluble orange prisms — Picrate yellow needles

Methyl-iodide $B'MeI$ [192°]

METHYL-ETHYL-ISO INDAZINE **CARB-**

Formed by treating the nitrosamine of ethyl-o-amido cinnamic acid with zinc dust and acetic acid (Fischer & Kuzel, *A* 221, 285). Colourless plates [131°] (from water) or groups of smaller plates [126°] (from chloroform ligroin). Sl sol water, v sol alcohol, ether, and chloroform. Combines with alkalis and with acids. Does not reduce boiling alkaline solutions of silver or copper. With bromine in HOAc it forms a bromo derivative [173°] and a di bromo-derivative [196°].

METHYL-ETHYL-INDOLE $C_{11}H_{13}N$ $\frac{1}{2}$ aq

$C_6H_5\left\langle\begin{array}{c} CH \\ \backslash \\ NH \end{array}\right\rangle CMe$ (292° i V) Formed by heating the phenyl hydrazide of methyl propyl ketone with $ZnCl_2$ at 180° (E Fischer, *B* 19, 1565, *A* 236, 132). Yellowish oil, v sl sol water, v sol alcohol and ether. Its picrate crystallises from hot benzene in dark red needles. With $NaNO_2$ and HOAc it yields a nitrosamine

Methyl-ethyl-indole $C_6H_5\left\langle\begin{array}{c} CH \\ \backslash \\ NH \end{array}\right\rangle CMe$

Ethyl-methyl ketole (288° i V) Formed, together with a base boiling at 256°, by heating methyl indole (methyl ketole) with EtI and alcohol at 100° (E Fischer & Steche, *B* 20, 2199). Oil, insol dilute acids. Colours pine-wood red — Picrate [146°] Slender dark-red needles (from benzene)

Methyl-ethyl-indole $C_6H_5Me\left\langle\begin{array}{c} CH \\ \backslash \\ NH \end{array}\right\rangle CH$

Ethyl p tolindole (254°) Formed by heating its carboxylic acid for some time at 205° (Hegel, *A* 232, 218). Oil, volatile with steam. Resinified by conc H_2SO_4 . Colours pine wood moistened with HCl red. Fuming HNO_3 gives a red colour and a pp

Di-methyl-ethyl-indole $C_{12}H_{15}N$ $\frac{1}{2}$ aq

$C_6H_5\left\langle\begin{array}{c} CMe \\ \backslash \\ NH \end{array}\right\rangle CMe$ (281°) Formed by heating bromo levulic (bromo acetyl propionic) acid with ethyl aniline (Wolff, *B* 21, 3563). Yellowish oil, v sol ether, alcohol, and benzene, sl sol water — Picrate $B'C_6H_5(NO_2)_2OH$ [105°] Red needles, m sol benzene

METHYL-ETHYL-INDOLE CARBOXYLIC

ACID $C_6H_5\left\langle\begin{array}{c} CH \\ \backslash \\ NH \end{array}\right\rangle\begin{array}{c} CH_2 \\ \backslash \\ CO_2H \end{array}$ [202°] Formed from the p tolyl-ethyl-hydrazide of pyruvic acid by warming with dilute (10 p.c.)

$HClAq$, or with phosphoric acid (Hegel, *A* 232, 218). V sol alkalis, ether, and benzene, insol ligroin. With $NaOCl$ it yields a chloro derivative, which is converted by boiling water into methyl ethyl ψ -isatin

PENTA-METHYL-ETHYL IODIDE v **HEPTIL**

IODIDE

METHYL-ETHYL-ISATIN v **ISATIN**

METHYL-ETHYL-KETOLE v **METHYL**

ETHYL INDOLE

METHYL-ETHYL KETONE C_6H_5O $\frac{1}{2}$ aq $CH_3COCH_2CH_3$, *Methyl acetone* Mol w 72 (81°) (F & D), (78° at 740 mm) (Schramm, *B* 16, 1581) S G $\frac{1}{2}$ 8125 (F & D), $\frac{2}{3}$ 8045 (S).

Formation — 1 By the action of $ZnEt_2$ on acetyl chloride, or of $ZnMe_2$ on propionyl chloride (Freund, *A* 118, 3, Popoff, *A* 145, 289) — 2 By boiling methyl acetoacetic ether with potash (Frankland & Duppa, *A* 138, 336), or dilute H_2SO_4 (Böcking, *A* 204, 17) — 3 Among the products of the distillation of crude calcium acetate (Fittig, *A* 110, 18) — 4 By distilling a mixture of calcium acetate and calcium propionate (Schramm, *B* 16, 1581) — 5 By the oxidation of *sec* butyl alcohol (Kanonnikoff & Saytzeff, *A* 175, 377) — 6 By the action of H_2SO_4 on crotonylene (Lwoff & Almédingen, *Bl* [2] 37, 493)

Properties — Colourless liquid, smelling like acetone, miscible with water and alcohol. With hydrogen sodium sulphite it forms the compound $MeCEt(OH)SO_3Na$ $\frac{1}{2}$ aq (Fittig)

Reactions — 1 Sodium converts it into homologues of mesityl oxide, of phorone, and of pinacone (Lawrenovitch, *B* 8, 767). Sodium, added to its solution in benzene, forms an oil $C_{12}H_{22}O$, smelling like camphor — 2 *Chromic acid* in HOAc oxidises it to acetic acid — 3 PCl_5 yields di chloro-butane $CH_3CH_2CCl_2CH_3$. On treating this body with alcoholic potash at 170° there is formed $CH_3CH_2CCH_3$, which ultimately changes into the isomeric $CH_3CCH_2CH_3$, which yields hexa methyl benzene on condensation with H_2SO_4 (Favorsky, *Bl* [2] 43, 112) — 4 On warming with *pyrrol*, MeOH, and a little hydrochloric acid, there is formed a butylidene pyrrole

$Et\left\langle\begin{array}{c} C=CH \\ \backslash \\ C-NHCH \end{array}\right\rangle\begin{array}{c} C=CH \\ \backslash \\ C-NHCH \end{array}CMe$ This body, when crystallised as $C_{16}H_{22}N$ $\frac{1}{2}$ aq, melts at 80°, but when anhydrous it melts at 142°. With alcoholic $AgNO_3$ it yields slender needles of $B'AgNO_3$ (Dennstedt & Zimmermann, *B* 20, 2454)

Oxim $CH_3CH_2\left\langle\begin{array}{c} CH \\ \backslash \\ C-NH \end{array}\right\rangle$ (153° cor) S G

$\frac{1}{2}$ 9195 Formed by the action of an aqueous solution of hydroxylamine on methyl ethyl ketone (Janny, *B* 15, 2779). Colourless liquid, soluble in ten volumes of water, miscible with alcohol and ether. Concentrated NaOHAq forms a crystalline Na salt

Reference — **HEXA-BROMO-METHYL-ETHYL KETONE**

Methyl ethyl diketone $CH_3COCOCH_2CH_3$, *Diketopentane Acetyl propionyl* (108°) S 7 at 15° Formed by the action of amyl nitrite on its mono-oxim (nitroso-di-ethyl ketone) (Manasse,

B 21, 2177) Formed also from ethyl acetoacetic ether by saponifying with dilute (3 p c) alkali, treating the product with NaNO_2 and H_2SO_4 , removing alcohol by distillation, adding dilute H_2SO_4 (15 p c) and distilling with steam (Von Pechmann, *B 21*, 1411, 2140) Dark yellow liquid, smelling like quinone, v sol ordinary solvents Forms an unstable compound with alcohol Reacts with aniline, forming a compound crystallising in needles and melting at 137° Aqueous NaOH converts it into a 'quinogen,' and finally into a quinone $[112^\circ]$, which may be reduced to a hydroquinone $[220^\circ]$, and yields a phenyl hydrazide $[225^\circ]$

(a) Oxim $\text{CH}_3\text{C}(\text{NOH})\text{CO}\text{C}_2\text{H}_5$ *Isonitroso di ethyl ketone* $[59^\circ-62^\circ]$ Formed by the action of amyl nitrite and NaOEt upon di ethyl ketone (Claisen a Manasse, *B 22*, 528) Colourless plates

(b) Oxim $\text{CH}_3\text{CO}\text{C}(\text{NOH})\text{C}_2\text{H}_5$ *Isonitroso-methyl propyl ketone* $[55^\circ]$ ($183^\circ-187^\circ$ cor) Formed by the action of KNO_2 and H_2SO_4 on ethyl acetoacetic ether (V Meyer a Zublin, *B 11*, 323, 695) Crystals, v sol alcohol and ether in sol cold water Dissolves readily in alkalis, forming a yellow solution

Di oxim $\text{CH}_3\text{C}(\text{NOH})\text{C}(\text{NOH})\text{C}_2\text{H}_5$ $[170^\circ]$ Formed by the action of hydroxylamine on the mono oxim (Sohramm, *B 16*, 180, 2187) Small white needles May be sublimed $-\text{C}_3\text{H}_7\text{N}_2\text{O}$ Na white pp

Di acetyl derivative of the *di oxim* $\text{CH}_3\text{C}(\text{NOAc})\text{C}(\text{NOAc})\text{C}_2\text{H}_5$ Prisms, v sol alcohol and ether, sl sol hot water

(a) Oxim (b) phenyl hydrazide $\text{CH}_3\text{C}(\text{NOH})\text{C}(\text{N HPh})\text{C}_2\text{H}_5$ $[128^\circ]$ Formed from the (a) oxim by treatment with phenylhydrazine (Otte a Pechmann, *B 22*, 2119) Crystallises from benzene and ligroin

(b) Oxim (a) phenyl hydrazide $\text{CH}_3\text{C}(\text{N HPh})\text{C}(\text{NOH})\text{C}_2\text{H}_5$ $[131^\circ]$ Formed from the (b) oxim and phenyl hydrazine (Otte a Pechmann, *B 22*, 2118) Crystallises from benzene and ligroin

(a) Phenyl hydrazide $\text{CH}_3\text{C}(\text{N HPh})\text{CO}\text{C}_2\text{H}_5$ $[103^\circ]$ Formed by the action of phenyl hydrazine on the diketone (Otte a Pechmann, *B 22*, 2115)

(b) Phenyl hydrazide $\text{CH}_3\text{CO}\text{C}(\text{N HPh})\text{C}_2\text{H}_5$ $[117^\circ]$ Formed by saponifying ethyl acetoacetic ether by allowing it to stand with aqueous KOH , then adding di azobenzene chloride, and ppg by sodium acetate solution (Japp a Klingemann, *C J* 53, 519, *B 21*, 550, *A 247*, 220) Yellow radiating needles or prisms (from benzene)

Di phenyl hydrazide $\text{CH}_3\text{C}(\text{N HPh})\text{C}(\text{N HPh})\text{C}_2\text{H}_5$ $[162^\circ]$ (J), $[166^\circ-169^\circ]$ (C a M) Formed by the action of phenyl hydrazine on the diketone, on the (b) phenyl hydrazide, or on the (a) oxim (Von Pechmann, *B 21*, 1414, Japp, *A 247*, 221, Claisen a Manasse, *B 22*, 528) Yellow needles (from benzene), sol cold conc H_2SO_4 , forming a brown solution

METHYL-DI ETHYL-PHOSPHINE $\text{C}_4\text{H}_{13}\text{P}$ *v* Et_2PMe (111°) Formed by heating tri ethyl phosphine methylo chloride Et_3PMeCl at 300° (Collie, *C J* 53, 719) Combines with sulphur and with oxygen Forms red crystals with CS_2

Methylo-chloride v Ethylo chloride of Di methyl ethyl phosphine

Ethylo iodide v TRI ETHYL PHOSPHINE

TRIETHYL IODIDE
Di methyl ethyl phosphine Me_2PEt (84°) Formed by heating Me_2PEtHCl (the product of the distillation of its ethylo chloride) with aqueous NaOH (Collie, *C J* 53, 720)

Methylo chloride v Ethylo chloride of TRI METHYL PHOSPHINE

Ethylo chloride $\text{Me}_2\text{PEt}_2\text{Cl}$ Formed from $\text{Me}_2\text{PEt}_2\text{I}$, the product of the union of Et_2PMe and MeI Split up by heat into ethylene and Me_2PEtHCl (Collie)

METHYL - TRI - ETHYL - PHOSPHONIUM CHLORIDE *v* *Methylo iodide of TRI-ETHYL-PHOSPHINE*

(179°) SG 2 929 (Richard, *Bl* [2] 32, 488), 10 929 (Weidel a Pick, *M* 5, 659) SV 157 9 (Ramsay) A base found, together with many others, among the products of the dry distillation of bones (Anderson, *P M* [4] 9, 145, 214, *A* 94, 360), of bituminous shale (Greville Williams, *C J* 7, 97) and of peat (Church a Owen, *P M* [4] 20, 110) It occurs in coal tar Colourless oil, with unpleasant odour Fumes with HCl *V* sl sol water, separating again when warmed, *v* sol alcohol, ether, and oils Ppts ferric, aluminium, chromium, and mercurous oxides from their salts, but not manganese and nickel oxides Its salts are deliquescent and gummy KMnO_4 oxidises it to pyridine dicarboxylic (lutidmic) acid [219°], which is converted by heat into pyridine carboxylic acid [302°] — $\text{B}'_2\text{H}_2\text{PtCl}_4$ Orange yellow flakes

Ethylo-iodide $\text{B}'\text{EtI}$ Oil — ($\text{B}'\text{EtCl}_3$) PtCl_4 Sparingly soluble crystalline pp (Anderson, *P M* [4] 9, 221)

'*a*'-*Collidine* $\text{C}_8\text{H}_{11}\text{N}$ (179°-183°) This base, according to Oechsner de Coninck (*A Ch* [5] 27, 468), accompanies (*B*) collidine in the

product of the distillation of cinchonine with KOH. It is perhaps identical with (a) collidine.

When 'a' collidine is heated with *ethylene chlorhydrin* and a little water for a few hours at 100° combination takes place. After removing uncombined collidine and chlorhydrin by shaking with ether, the residue is evaporated *in vacuo*. PtCl₄ forms with the product an orange yellow pp of $\{C_8H_{11}N(C_2H_4OH)Cl\}_2PtCl_4$. Boiling water removes HCl, forming oxethyl- α collidine chloro platinite $\{C_8H_{11}N(C_2H_4OH)Cl\}_2PtCl_4$. This forms brilliant scales (from alcohol). Oxethyl- α collidine forms a gold salt, B'AuCl₄, crystallising in thin golden needles (Wurtz, *Pr* 33, 450, *C R* 95, 263, *Bl* [2] 39, 536).

Methyl-ethyl pyridine $N \begin{smallmatrix} \text{CH CEt} \\ \text{CH CH} \end{smallmatrix} > \text{CMe}$

(*B*) *Collidine* (196°) SG $\frac{2}{966}$ VD 4 25 (calc 4 19). Obtained by distilling cinchonine or brucine with KOH (Oechsner de Coninck, *C R* 91, 296, *A Ch* [5] 27, 469, *Bl* [2] 37, 457, 42, 100, *R T C* 1, 132, *Cf* Greville Williams, *Tr E* 21, Part 2, *A Ch* [3] 45, 488). Colourless, mobile, highly refractive liquid, rapidly turning yellow on exposure to air. Sl sol water, sol alcohol and ether. When left in contact with moist air it takes up water (1 mol) but does not form a well defined hydrate. Potassium permanganate oxidises it to homo nicotinic acid $N \begin{smallmatrix} \text{CH C(CO}_2\text{H)} \\ \text{CH CH} \end{smallmatrix} > \text{CMe}$, cinchomeronic acid $N \begin{smallmatrix} \text{CH C(CO}_2\text{H)} \\ \text{CH CH} \end{smallmatrix} > \text{C CO}_2\text{H}$, and formic acid. It is very poisonous, a sub cutaneous injection of 1 g paralysing the nerve centres. HI reduces it to the hydride $C_8H_{11}N$, and, at 250°, forms a brown oil $C_8H_{11}NI_4$. Sodium in alcohol reduces it to the hexahydride $C_8H_{11}N$ (175°-180°).

Salts - B'HCl. White deliquescent tables - B'H PtCl₄. S 21 at 60° (Richard, *Bl* [2] 32, 488). Orange red powder, converted by boiling water into B' PtCl₄, a yellow crystalline powder - B'HAuCl₄ - B' HCl $\frac{1}{3}$ AuCl₃ - B' H₂HgCl₂. Minute white needles, sl sol water, insol alcohol.

Methyl-ethyl pyridine $N \begin{smallmatrix} \text{CMe CH} \\ \text{CH CEt} \end{smallmatrix} > \text{CH}$

Aldehyde collidine (176°) SG $\frac{2}{9389}$ (D). Occurrence - As acetate in fusel oil (Kramer a Pinner, *B* 3, 77).

Formation - 1 By heating ethyldene chloride with alcoholic or aqueous ammonia for 12 hours at 160° (Kramer, *Z* [2] 6, 568, *B* 3, 202, Durkopt, *B* 18, 920). Ethyldene bromide may be used instead of the chloride, the temperature employed being then 125°-140° (Tavildaroff, *A* 176, 12) - 2 By heating an alcoholic solution of aldehyde ammonia at 120° (Baeyer a Ador, *A* 155, 297). 'Para' collidine, picoline, and lutidine are also formed in this reaction (Vohl, *J* 1870, 807) - 3 By distilling aldol ammonia (aldehyde) (Wurtz, *Bl* [2] 31, 433) - 4 By heating glycol with ammonium chloride for 8 hours at 185°, the yield being from 15 to 20 p.c. of the theoretical quantity (Hofmann, *B* 17, 1905) - 5 By heating ethylene chloride with ethylamine at 190° (Hofmann, *B* 17, 1907) - 6 By heating paraldehyde with acetamide and P₂O₅ at 160° (Hesekiel, *B* 18, 3091) - 7 By heating aldehyde-ammonia with paraldehyde at 220° (Ladenburg a Durkopt, *A* 247, 42).

Properties - Oil, with aromatic odour, insol water and dilute acids, v sol alcohol and ether. Fumes with HCl. Oxidised by KMnO₄ to methylpyridine carboxylic acid $N \begin{smallmatrix} \text{CMe CH} \\ \text{CH C(CO}_2\text{H)} \end{smallmatrix} > \text{CH}$

and isocinchomeronic acid $N \begin{smallmatrix} \text{C(CO}_2\text{H)} \text{CH} \\ \text{CH C(CO}_2\text{H)} \end{smallmatrix} > \text{CH}$ (Durkopt a Schlaugk, *B* 21, 294, *cf* Wischnegradsky, *B* 12, 1506). Bromine forms an oily compound. Fuming HIAq and amorphous phosphorus at 140° yield brownish blue prisms of $C_8H_{11}NI_4$ or $C_8H_{11}NI_4$ (Ladenburg, *B* 14, 232). Sodium, acting on its alcoholic solution, forms a hexahydride. Heated for some days at 100° with glycolic chlorhydrin and a little water it forms oxethyl aldehyde, of which the platinochloride, $\{C_8H_{11}N(C_2H_4OH)Cl\}_2PtCl_4$, forms orange crystals (from dilute alcohol). It may be decomposed by H₂S, the hydrochloride produced would not crystallise, but it is converted by Ag₂O into a caustic base (Wurtz, *Pr* 33, 448).

Salts - B'₂H₂PtCl₄ [180°] Very unstable trimetric crystals - B'HAuCl₄ [72°] Yellow needles, v sol water (Hesekiel, *cf* Herzog, *M* 2, 404) - B'C₆H₅(NO₂)₂OH [157°] Greenish-yellow four sided tables.

Ethylo iodide B'EtI. Trimetric tables, v sol water and alcohol. Yields (B'EtCl)₂PtCl₄, crystallising in needles or prisms.

Methyl ethyl pyridine $N \begin{smallmatrix} \text{CMe CH} \\ \text{CH CEt} \end{smallmatrix} > \text{CH}$

(161°) SG $\frac{2}{9361}$. Formed by heating (a)-methyl pyridine (a picoline) with EtI at 280°-300° (Ladenburg a Schultz, *A* 247, 46, *B* 20, 2720). Liquid, almost insol water, but takes up water from the air. Very volatile with steam. Oxidised by KMnO₄ to pyridine dicarboxylic acid $N \begin{smallmatrix} \text{C(CO}_2\text{H)} \text{CH} \\ \text{C(CO}_2\text{H)} \text{CH} \end{smallmatrix} > \text{CH}$ [226°]. Sodium reduces it, in alcoholic solution, to a hexahydride.

Salts - B'₂H₂PtCl₄ [174°] Triclinic tables, sl sol cold, v sol hot, water, insol alcohol - B'HAuCl₄ [110°] Yellow needles, sl sol water, v sol ether alcohol.

Methyl ethyl pyridine $N \begin{smallmatrix} \text{CMe CH} \\ \text{CH CH} \end{smallmatrix} > \text{CEt}$

(173°) SG $\frac{2}{9353}$, $\frac{20}{9218}$. Formed by heating (a) methyl pyridine with EtI at 280°-300°, and separated from the preceding by fractional distillation (Schultz, *B* 20, 2720, Ladenburg, *A* 247, 46). Colourless hygroscopic liquid, with unpleasant odour, sl sol water. Oxidised by KMnO₄ to pyridine dicarboxylic acid $N \begin{smallmatrix} \text{C(CO}_2\text{H)} \text{CH} \\ \text{CH} \end{smallmatrix} > \text{C CO}_2\text{H}$. Sodium, added to its alcoholic solution, reduces it to the corresponding hexahydride.

Salts - B'₂H₂PtCl₄ [190°] Reddish yellow plates, sl sol cold, v sol hot, water, insol alcohol - B'HAuCl₄ [90°] Yellow needles, sl sol cold, m sol hot, water, v sol alcohol - The phosphomolybdate and bismuthiodide are amorphous, the cadmium iodide and periodide are only.

Paracollidine $C_8H_{11}N$ (220°-230°) Formed, together with the collidine boiling at 176°, by heating aldehyde ammonia (Baeyer a Ador, *A* 155, 307). Liquid, with pungent aromatic odour. Its salts crystallise with difficulty. Its ethyloiodide is syrupy. The platinochloride is amorphous.

Isomeride of collidine—Obtained by the putrefaction at 40° of pancreas (200 g) mixed with gelatin (600 g) and water (10,000 g) After 5 days the liquid is distilled, first with H_2SO_4 , and afterwards with baryta. The alkaline distillate is neutralised by HCl , evaporated to dryness, and extracted with alcohol. The hydrochloride of the base crystallises from alcohol in trimetric needles. The free base is got by adding NaOH to the hydrochloride and shaking with ether (Nencki, *J pr* [2] 26, 49). —($\text{B}'\text{HCl}$), PtCl_4 . Flat needles. Gives off an odour of xylene when distilled. The base is not identical with collidine (from NH_3 and ethyldene chloride), for it differs in odour, in the crystalline form of the platinum chloride, and in being more soluble in water.

Isomeride of collidine $\text{C}_6\text{H}_7\text{N}$ (202°) SG 2 987. Occurs in the flesh of putrid cuttle fish (Oechsner de Connick, *C R* 106, 858, 1604). Mobile liquid, v sol water, alcohol, and ether. Absorbs moisture from the air, becoming brown. — $\text{B}'\text{HCl}$. Deliquescent radiating masses. — $\text{B}'\text{H}_2\text{PtCl}_6$. Deep yellow crystals, almost insol in cold water. Decomposed by hot water, with formation of $\text{B}'_2\text{PtCl}_6$, a pale brown powder. — $\text{B}'\text{H}_2\text{HgCl}_4$. Small white needles. — $\text{B}'\text{H}_2\text{Hg}_2\text{Cl}_6$. Long yellowish needles.

Methyl iodide $\text{B}'\text{MeI}$. Slender needles.

Isomeride of collidine v TRI METHYL PYRIDINE

Di-methyl-ethyl pyridine $\text{C}_6\text{H}_7\text{N}$ *Parvoline* (199° cor) (D & G) SG 2 9419, 2 9289 (D & S).

Formation—1 By heating propionic aldehyde ammonia (Waage, *M* 4, 718). —2 By heating methyl-ethyl acrolein ammonia (Hoppe, *M* 9, 643). —3 By heating propionic aldehyde with acetamide and P_2O_5 (Hesekiel, *B* 18, 3097). —4 By heating propionic aldehyde ammonia with paraldehyde in sealed tubes for 10 hours at 210° (Durkopf & Schlaug, *B* 21, 832). —5 By heating propionic aldehyde ammonia (4 g) with propionic aldehyde (6.5 g) for 6 hours at 210° (Durkopf & Gottsch, *B* 23, 685).

Properties—Colourless oil, not turned brown by light and air, with faint and not unpleasant smell. M sol cold water, sl sol hot water, v sol alcohol and ether. KMnO_4 oxidises it to methyl pyridine dicarboxylic acid [225°] and pyridine tricarboxylic acid [318°].

Salts— $\text{B}'\text{H}_2\text{PtCl}_6$ [189°]. Large monoclinic crystals, sl sol cold water. — $\text{B}'\text{HAuCl}_4$ [82°]. Glittering lemon yellow spangles, sl sol cold water. Not hygroscopic. — $\text{B}'\text{HHg}_2\text{Cl}_6$ [119°]. Long pointed needles, almost insol in cold water. — $\text{B}'\text{C}_6\text{H}_5(\text{NO}_2)_2\text{OH}$ [152°]. Yellow plates.

Di-methyl ethyl pyridine $\text{C}_6\text{H}_7\text{N}$ (217°). Formed, together with the preceding, by heating propionic aldehyde ammonia with propionic aldehyde at 200° (Durkopf & Gottsch, *B* 23, 692). Colourless liquid, not affected by air and light. Has a faint odour of nicotine. V sol alcohol and ether, sl sol water. Yields a di-methyl pyridine carboxylic acid on oxidation.

Salts— $\text{B}'\text{H}_2\text{PtCl}_6$ [above 270°]. Yellowish-red needles, sl sol water. — $\text{B}'\text{HAuCl}_4$ [140°]. Slender lemon-yellow needles, sl sol. water containing HCl . — $\text{B}'\text{HHg}_2\text{Cl}_6$ [159°]. Long

glittering spangles or well formed monoclinic crystals, sl sol cold water.

Di methyl-ethyl pyridine $\text{C}_6\text{H}_7\text{N}$ e

$\text{N} \begin{smallmatrix} \text{CHMe} \\ \text{CH} \end{smallmatrix} \text{CH} \text{CEt}$ (187°) SG 14 916 S

1.8 at 0°. Obtained by the action of propionic aldehyde and ammonia on acetoacetic ether (Jaekle, *A* 246, 45). Formed also by heating to redness a mixture of potassium di-methyl ethyl pyridine dicarboxylate (1 mol) with lime (2 mols) (Engelmann, *A* 231, 44). Liquid, more soluble in cold than in hot water. Its solution has a very bitter taste. KMnO_4 oxidises it to methyl ethyl pyridine carboxylic acid and uvonic acid.

Salts— $\text{B}'\text{H}_2\text{PtCl}_6$ [211°]. Crystalline pp, v sol, hot water and alcohol. — $\text{B}'_2\text{H}_2\text{Cr}_2\text{O}_7$. Crystalline pp. —Picrate [120°]. Needles.

METHYL-ETHYL PYRIDINE DIHYDRIDE

$\text{C}_6\text{H}_7\text{N}$ (8) *Di-hydro collidine* (200°–205°). Formed by heating (8) collidine with HIAq and red phosphorus at 140° (Oechsner de Connick, *Bl* [2] 42, 116).

Methyl ethyl pyridine hexahydride $\text{C}_6\text{H}_7\text{N}$ (c 177°). Formed by adding sodium to an alcoholic solution of (8) collidine (Oechsner de Connick, *Bl* [2] 42, 116).

Methyl ethyl pyridine hexahydride $\text{C}_6\text{H}_7\text{N}$

e $\text{NH} \begin{smallmatrix} \text{CHMe} \\ \text{CH}_2 \end{smallmatrix} \text{CH} \text{CH}_2$ *Copellidine* (164°)

SG 2 8653, 2 8546. Formed from the collidine derived from aldehyde, by reduction in alcoholic solution with sodium (Durkopf, *B* 18, 920, Ladenburg, *A* 247, 90). Colourless alkaline liquid, sl sol water. Its physiological action resembles that of conine, but is weaker.

Salts— $\text{B}'\text{HCl}$ [171°]. Colourless needles, v sol water. — $\text{B}'\text{HBr}$ [165°]. Tufts of needles. — $\text{B}'\text{HAuCl}_4$ [104°]. Dimetric prisms, v sol hot water. — $\text{B}'\text{H}_2\text{PtCl}_6$ [147°]. Long yellow needles, v e sol water.

Acetyl derivative $\text{C}_6\text{H}_7\text{N} \cdot \text{Ac}$ (254°)

SG 2 9787, 2 966

Methyl ethyl pyridine hexahydride

$\text{NH} \begin{smallmatrix} \text{CHMe} \\ \text{CH}_2 \end{smallmatrix} \text{CH} \text{CH}_2$ (147°–151°) SG 2

8550, 2 8410. Formed by reducing the corresponding methyl-ethyl pyridine in alcoholic solution with sodium, the product being purified by means of its oily nitrosamine (Schultz, *B* 20, 2723, Ladenburg, *A* 247, 95). Colourless alkaline liquid, smelling strongly like ammonia and like piperidine, sl sol water.

Salts— $\text{B}'\text{HCl}$. Needles, v e sol water and alcohol. — $\text{B}'\text{HBr}$. Needles.

Methyl ethyl pyridine hexahydride

$\text{NH} \begin{smallmatrix} \text{CHMe} \\ \text{CH}_2 \end{smallmatrix} \text{CH} \text{CH}_2$ *Copellidine* (155°–

160°) SG 2 8515, 2 8389. Obtained by reducing the corresponding methyl ethyl pyridine in alcoholic solution with sodium, the product being purified by means of the nitrosamine (Ladenburg & Schultz, *B* 20, 2723, *A* 247, 96). Colourless, strongly alkaline liquid. — $\text{B}'\text{HCl}$ [c 218°]. White needles, v e sol water and alcohol.

Methyl ethyl-pyridine hexahydride

$\text{NMe} \begin{smallmatrix} \text{CH} \\ \text{CH}_2 \end{smallmatrix} \text{CH} \text{CH}_2$ (c 149°) SG 2

8495. Formed by the action of MeI on the corresponding ethyl-pyridine hexahydride dis-

solved in MeOH, the product being distilled with strong aqueous NaOH (Ladenburg, A 247, 71) Liquid, smelling like ν methylpyridine hexahydride, sl sol water Its hydrochloride crystallises in small needles

Di-methyl-ethyl pyridine hexahydride
 $C_8H_{11}N$ *Parpevoline* (177°) SG 2 8628, 2 8542, 2 8474 Formed at the same time as di methyl ethyl pyridine (109°), when propionic aldehyde ammonia and propionic aldehyde are heated together at 200° Formed also by reducing the same di methyl ethyl pyridine by adding sodium to its alcoholic solution (Dürkopf a Gottsch, B 23, 690) Very mobile colourless liquid, with penetrating odour like rotten hay, v sol ether and alcohol, sl sol water Strongly alkaline in reaction — $B'H_2Cl$, [120°–130°] White sparingly soluble needles (from hot water) — The hydrochloride and hydroiodide are hygroscopic Chlorides of gold and of platinum give no pp in dilute solution, and only pps in concentrated solutions Picric acid acts in like manner

Di methyl ethyl pyridine hexahydride

CEt $\langle \begin{smallmatrix} N \\ N \end{smallmatrix} \rangle \langle \begin{smallmatrix} CMe \\ CH \end{smallmatrix} \rangle CH$ (160°) Formed by reducing oxy methyl ethyl pyrimidine with zinc dust (Pinner, B 22, 1619) Prisms (Py 2 3) **METHYL ETHYL QUINOLINE**

$C_{12}H_{13}N$ ν e C_2H_5 $\langle \begin{smallmatrix} CH \\ N \end{smallmatrix} \rangle \begin{smallmatrix} CMe \\ CMe \end{smallmatrix}$ [56°] (268° at 710

mm) Formed by the action of propionic aldehyde and HCl upon aniline (Dabner a Miller, B 17, 1714) Large monoclinic prisms V sol alcohol, ether, and benzene, sl sol water On oxidation with CrO_3 and H_2SO_4 it yields (Py 2)-methyl quinoline (Py 3) carboxylic acid

Salts — $B'HCl$, $PtCl_4$, fine yellow needles. — Picrate $B'_2C_6H_4(NO_2)_4OH$ yellow crystals — $B'_2H_2Cr_2O_7$, small yellowish brown prisms

Methyl iodide B'MeI [196°], yellow needles, insol ether

(B 2) Methyl (Py 3) ethyl-quinoline

$C_8H_9(CH_3) \langle \begin{smallmatrix} CH \\ N \end{smallmatrix} \rangle \begin{smallmatrix} CMe \\ CMe \end{smallmatrix}$ *Ethyl toluquinoline*

[60°] (270° at 718 mm) Formed by heating its (Py 2) carboxylic acid (Harz, B 18, 3395) White needles V sol ether or petroleum-ether Yields on oxidation ethyl quinoline carboxylic acid (Daniel, B 23, 2267)

Salts — $B'HCl$ * small white concentric crystals — $B'HNO_3$ * fine white needles — $B'H_2SO_4$ * colourless crystals — $B'H_2Cl_2PtCl_4$ * fine orange needles, sol hot water, sparingly in cold — $B'_2C_6H_4(NO_2)_4OH$ [244°], very sparingly soluble yellow microscopic crystals

(B 4-Py 2) Di methyl-(Py 3)-ethyl quinol-

$C_8H_9(CH_3) \langle \begin{smallmatrix} CH \\ N \end{smallmatrix} \rangle \begin{smallmatrix} C(CH_3) \\ C(CH_3) \end{smallmatrix}$ [44°] (280° at

717 mm) Formed by the action of propionic aldehyde and HCl upon o-toluidine (Harz, B 18, 3400) Large colourless monoclinic crystals It is reduced by tin and HCl to a tetra hydride, which is a yellowish oil of boiling point 275° at 724 mm Yields methyl ethyl-quinoline (B 4)-carboxylic acid on oxidation

Salts — $B'HCl$ * easily soluble fine colour-

less needles — $B'HI^*$, very long colourless needles, ν sol. hot water, very sparingly in cold — $B'H_2Cl_2PtCl_4$, large plates — $B'C_6H_5(NO_2)_2OH$; [187°], nearly insoluble yellow needles

Methylo-iodide $B'MeI$ 2aq white needles
Gives $(B'MeCl)_2PtCl_4$, small glistening orange red needles

(*B* 1or3 *Py* 2) Di-methyl (*Py* 3) ethyl-quinoline $C_6H_5(CH_3)_2$ $\begin{matrix} \text{CH} \\ | \\ \text{C}(\text{CH}_3) \\ | \\ \text{N} \text{C}(\text{C}_6\text{H}_5) \end{matrix}$ [41°] (288°–

292° at 720 mm) Formed by the action of propionic aldehyde and HCl upon *m* toluidine (Harz, *B* 18, 3397) Colourless trimetric hexagonal plates It is reduced by tin and HCl to a tetrahydride, which is a colourless oil of boiling point 282°–285° at 720 mm

Salts — $B'HCl^*$ easily soluble colourless prisms — $B'HI^*$ long colourless needles, soluble in hot water, very sparingly soluble in cold — $B'H_2Cl_2PtCl_4$ 2aq orange plates or fine needles, sl sol cold water — $B'C_6H_5(NO_2)_2OH$ [220°], yellow needles, sol hot alcohol, nearly insol water

Methylo-iodide $B'MeI$ aq yellow needles, ν sol hot water, gives $(B'MeCl)_2PtCl_4$, small glistening orange red crystals

(*B* 2 *Py* 2) Di methyl (*Py* 3) ethyl quinoline $C_6H_5(CH_3)_2$ $\begin{matrix} \text{CH} \\ | \\ \text{C}(\text{CH}_3) \\ | \\ \text{N} \text{C}(\text{C}_6\text{H}_5) \end{matrix}$ [54°] (288° at

720 mm) Prepared by adding propionic aldehyde (60 g) to a cooled mixture of *p* toluidine (50 g) and strong HCl (90 g), finally heating for a short time on the water bath White trimetric crystals Sparingly volatile with steam ν sol alcohol, ether, and benzene, insol water It is reduced by tin and HCl to a tetrahydride (286°) It combines with bromine, forming a dibromide, which crystallises in yellow needles [91°] By CrO_3 and dilute H_2SO_4 it is oxidised to (*B* 2) methyl (*Py* 3) ethyl quinoline (*Py* 2) carboxylic acid

Salts — $B'HCl$ syrup, which slowly crystallises — $B'HBr$ easily soluble white silky needles — $B'HI$ long colourless needles, ν sol hot water, sparingly in cold — $B'H_2Cr_2O_7$, sparingly soluble red needles — $B'H_2Cl_2PtCl_4$ 2aq orange-red needles [208°] (Jungmann, *B* 23, 2273) — $B'C_6H_5(NO_2)_2OH$ [177°], small yellow needles

Methylo-iodide $B'MeI$ aq [218°], monoclinic yellow crystals

Methylo-chloride $B'MeCl$, colourless soluble needles — $(B'MeCl)_2PtCl_4$

Ethylo-iodide $B'EtI$ aq [114°], small yellow crystals — $(B'EtCl)_2PtCl_4$ aq glistening crystals (Harz, *B* 18, 3384)

References — AMDO, DI BROMO, NITRO, and OXY-METHYL ETHYL QUINOLINES

(*B* 2,4 *Py* 2)-Tri methyl (*Py* 3) ethyl-quinoline $C_6H_5(CH_3)_3$ $\begin{matrix} \text{CH} \\ | \\ \text{C}(\text{CH}_3) \\ | \\ \text{N} \text{C}(\text{C}_6\text{H}_5) \end{matrix}$ [62°] (291°)

Formed from (1,3,4) xylidine, propionic aldehyde and HCl (Waldbott, *B* 23, 2270) Triclinic tables (from alcohol), gives on oxidation (*B* 2, *Py* 3) di-methyl- (*Py* 3)-ethyl quinoline (*B* 4) carboxylic acid [183°] — $B'H_2PtCl_4$ — $B'HCl$ 3aq — $B'H_2SO_4$ Monoclinic crystals — $B'H_2Cr_2O_7$ — $B'INO$, Monoclinic crystals (from alcohol-

ether) — $B'C_6H_5(NO_2)_2OH$ [183°]. Yellow needles

Methylo-iodide $B'MeI$ Needles
(*Py* 2,4) Methyl ethyl-quinoline dihydride

C_6H_5 $\begin{matrix} \text{CH} \\ | \\ \text{C}(\text{CH}_3) \\ | \\ \text{N} \text{C}(\text{C}_6\text{H}_5) \end{matrix}$ (255°) Formed by heating methyl ethyl-indole with $MeOH$ and MeI for 15 hours at 120° (Fischer a Steche, *A* 242, 363) Oil, forming very soluble salts

Py (2,3) Methyl ethyl quinoline tetrahydride $C_{12}H_{17}N$ $\begin{matrix} \text{CH}_2 \\ | \\ \text{CH} \\ | \\ \text{NH} \text{CH} \text{Et} \end{matrix}$ (262° at 720

mm) Formed by reduction of (*Py* 2,3) methyl ethyl quinoline with tin and HCl (Doebner a Miller, *B* 17, 1716) Colourless liquid $FeCl_3$ gives a red colouration — $B'HCl$ sparingly soluble colourless concentric needles

(*Py* 3,4) - Methyl - ethyl - quinoline tetrahydride $C_{12}H_{17}N$ $\begin{matrix} \text{CH}_2 \\ | \\ \text{CH} \\ | \\ \text{NH} \text{CH} \text{Me} \end{matrix}$

(256°) Obtained by reducing (*Py* 3) methyl quinoline ethylo iodide with tin and hydrochloric acid (Moller, *A* 242, 321) Colourless liquid — $B'H_2PtCl_4$ Red granular crystals, decomposed by boiling water

Methylo-iodide $B'MeI$ [187°] Not acted on by KOH aq
(*Py* 2,3,4) Di-methyl-ethyl-quinoline di-

hydride $C_{12}H_{17}N$ $\begin{matrix} \text{CH} \\ | \\ \text{CH} \\ | \\ \text{NH} \text{CH} \text{Me} \end{matrix}$

(256° ν V) Formed by heating methyl ketole (methyl indole) with ethyl alcohol and ethyl iodide for 15 hours at 100° (E Fischer a Steche, *A* 242, 360, *B* 20, 2200) Oil The salts are ν sol water

Methylo-iodide $B'MeI$ [189°] Colourless crystals, sol water and alcohol

Di-methyl-ethyl-quinoline dihydride $C_{12}H_{17}N$ (255° ν V) at 750 mm Formed by heating methyl ethyl ketole (methyl ethyl indole) (1 pt) with MeI (2 pts) and $MeOH$ (1 pt) at 120° (F a S)

(*B* 4, *Py* 2) Di-methyl- (*Py* 3)-ethyl-quinoline tetrahydride $C_{12}H_{17}N$ $\begin{matrix} \text{CH}_2 \\ | \\ \text{CH} \\ | \\ \text{NH} \text{CH} \text{Et} \end{matrix}$ (275°)

at 724 mm Obtained by reducing the corresponding di methyl ethyl quinoline with tin and HCl (Harz, *B* 18, 3400) Yellowish oil, sparingly volatile with steam

(*B* 3? *Py* 2) Di-methyl- (*Py* 3)-ethyl-quinoline tetrahydride $C_{12}H_{17}N$ $\begin{matrix} \text{CH}_2 \\ | \\ \text{CH} \\ | \\ \text{NH} \text{CH} \text{Et} \end{matrix}$ (c 284°)

at 720 mm Obtained by reducing the corresponding di methyl ethyl quinoline with tin and HCl (Harz) Oil

(*B* 2, *Py* 2) Di-methyl- (*Py* 3)-ethyl-quinoline tetrahydride $C_{12}H_{17}N$ $\begin{matrix} \text{CH}_2 \\ | \\ \text{CH} \\ | \\ \text{NH} \text{CH} (\text{C}_6\text{H}_5) \end{matrix}$ (286°

at 720 mm) Formed by reduction of di methyl ethyl quinoline with tin and HCl (Harz, *B* 18, 3387) Colourless refractive fluid

Salts — $B'HCl$ colourless needles, sl sol cold water — $B'H_2Cl_2PtCl_4$ 2aq brown plates

Nitrosamine $C_{12}H_{17}N(NO)$ crystalline solid, sparingly volatile with steam

(B 2-Py 24). Tri-methyl-(Py 3)-ethyl-quinoline tetrahydride $C_8H_8(CH_3)_3$ $\begin{matrix} CH_2-CH(CH_3) \\ | \\ N(CH_3)_2CH(C_2H_5) \end{matrix}$

(275°-280° at 720 mm) Oil Formed by heating (B 2 Py 2) di methyl-(Py 3)-ethyl-quinoline tetrahydride with methyl iodide— $B_2H_5Cl, PtCl_2$ 2aq needles (Harz, B 18, 3388)

(B 24, Py 2) Tri methyl (Py 3) ethyl-quinoline tetrahydride C_8H_8N (288°) Formed by reducing the corresponding tri methyl ethyl-quinoline (Waldbohm, B 23, 2272) Oil— $B^*C_2H_5(NO_2)OH$ [146°]

(B 2). METHYL-(Py 3)-ETHYL-QUINOLINE CARBOXYLIC ACID

$C_8H_8(CH_3)_3$ $\begin{matrix} CH C(CO_2H) \\ | \\ N C(C_2H_5) \end{matrix}$ [143°] Formed by

oxidation of (B 2 Py 2) di methyl (Py 3) ethyl quinoline with CrO_3 and dilute H_2SO_4 (Harz, B 18, 3392, Daniel, B 23, 2266) Trichinic needles, prisms, or plates (containing aq) Sol water and alcohol Yields on distillation methyl ethyl quinoline [60°]

Salts— A^*Na 3aq easily soluble glistening crystals— A^*Ag granular powder— A^*Ba 1/2 aq soluble needles— A^*Cu microcrystalline blue pp

Ethyl ether EtA^*aq [170°-190°] Decomposed on fusion (Harz, B 18, 3394)

Methyl ethyl quinoline (B 4) carboxylic acid $CO_2H C_8H_8$ $\begin{matrix} CH CMe \\ | \\ N CEt \end{matrix}$ [216°] Formed by

oxidation of (B 4, Py 2) Di methyl (Py 3) ethyl quinoline (Miller & Daniel, B 23, 2266) Insol water sl sol cold alcohol Gives on distillation methyl ethyl quinoline [56°]— BaA^* 1/2 aq (B 2, Py 2) Di methyl (Py 3) ethyl quinoline (B 4) carboxylic acid $C_8H_8NO_2$ $\begin{matrix} CH CMe \\ | \\ N CEt \end{matrix}$ [183°] Formed by

oxidising (B 24, Py 2) tri methyl (Py 3) ethyl-quinoline by CrO_3 and H_2SO_4 (Jungmann, B 23, 2273) Needles (from alcohol), v e sol alcohol and water, sl sol benzene On dry distillation it gives CO_2 and (B 2, Py 2) di methyl (Py 3) ethyl quinoline (254°)

(B 2) METHYL-(Py 3)-ETHYL-QUINOLINE CARBOXYLIC ALDEHYDE C_8H_8NO $\begin{matrix} CH CCHO \\ | \\ N CEt \end{matrix}$ [57°] (above 300°)

Formed, in small quantity, in the preparation of the preceding acid (Harz, B 18, 3397) Large trimetric prisms (from ether), not very volatile with steam Reduces ammoniacal $AgNO_3$, Ag_2O oxidises it to the corresponding acid (Daniel, B 23, 2267)

(B 2 Py 2) DI METHYL (Py 3) ETHYL QUINOLINE SULPHONIC ACID $C_8H_8N(SO_3H)$ [above 290°] Formed by heating di methyl ethyl quinoline with fuming sulphuric acid (20 p.c. SO_3) (Harz, B 18, 3389) White silky scales or thick trimetric crystals Easily soluble in hot water, sparingly in cold, insol strong alcohol

Salts— A^*Ba aq easily soluble white needles— A^*H_2Pb 6aq easily soluble needles

METHYL-TRI ETHYL-RESORCIN

$OMeEt_3(OH)_2$ [144°] Obtained by heating with HCl its mono-ethyl derivative $C_6MeEt_2(OH)(OEt)$

which is formed, together with the di ethyl ether of orcin, by treating orcin with EtI and KOH (Herzig & Ziesel, M 11, 318) Needles, insol water, v sol ether Neutralises only 1 mol $NaOH$

Acetyl derivative $C_6MeEt_2(OAc)(OH)$ [c 73°] Monoclinic needles

METHYL TRI-ETHYL SILICATE $C_6H_8SiO_3$ $\begin{matrix} MeEt_3SiO_3 \end{matrix}$ (156°) SG 2 989 Formed from $MeO SiCl_3$ by the action of $EtOH$ (Friedel & Crafts, A Ch [4] 9, 32)

Di methyl di ethyl silicate $Me_2Et_2SiO_3$ (143°-146°) VD 6 18 (calc 6 23) SG 2 1 004 Formed from $MeOH$ and Et_2SiO_3 Formed also by the action of $EtOH$ on $(MeO)_2Si_2Cl_2$ Liquid

Tri methyl ethyl silicate Me_3EtSiO_3 (134°) SG 2 1 023 Formed from $(MeO)_3SiCl$ and $EtOH$

METHYL ETHYL STIBONIUM SALTS v AN TIMONY, vol 1 p 294

METHYL ETHYL SUCCINIC ACID

$C_6H_8O_4$ $\begin{matrix} CO_2H CHEt CHMe CO_2H \end{matrix}$ [168 5°] Formed by the action of H_2SO_4 on pentane tricarboxylic ether (Bischoff & Walden, B 22, 1817) It is accompanied by the isomeric 'meso' acid [88°] (Bischoff & Mintz, B 23, 647) The same acid [160°] appears to be formed in small quantities in the saponification of $CH_3CO Me(CO_2Et)CHEtCO_2Et$ with HCl (Young, C J 43, 180) White crystals

Di methyl ethyl succinic acid $C_6H_8O_4$ $\begin{matrix} CO_2H CHEt CMe CO_2H \end{matrix}$ Formed by the action of H_2SO_4 on the product of the action of a bromo isobutyric ether on sodium ethyl malonic ether (Bischoff & Mintz, B 23, 651) It occurs in two varieties, one melting at 63° the other at 105°

DI METHYL DI ETHYL-SULPHAMIDE

$C_6H_8N SO_2$ $\begin{matrix} NMe_2 \\ | \\ NEt_2 \end{matrix}$ (229°) Formed

by the action of di ethyl amine on di methyl amido sulphonic chloride, or of di methyl amine on di ethyl amido sulphonic chloride (Behrend, B 15, 1610, A 222, 125, 136) Volatile with steam Heavy oil Insol water, sol alcohol, ether, and benzene

METHYL ETHYL SULPHIDE C_6H_8S $\begin{matrix} MeSEt \end{matrix}$ (67° 1 V) SG 22 837 VD 2 61 (calc 2 63) Formed by distilling an alcoholic solution of $NaSEt$ with MeI (Kruger, J pr [2] 14, 193, Claesson, J pr [2] 15, 174, B 20, 8413) Occurs also among the products obtained by heating di thio phosphoric ether $Et_2PO_2S_2$ with $MeOH$ at 150° (Carus, A 119, 313, 120, 61) Liquid, with unpleasant odour Yields ethane sulphonic acid on oxidation with HNO_3 — $EtSMeHgCl$, laminae (C)— $(EtSMe)_2HgI_2$

Yellow crystalline powder
Methylo iodide $EtSMeI$ v DI METHYL-SULPHIDE ethylo-iodide
Ethylo iodide Et_2SMeI v Methylo compounds of DI ETHYL SULPHIDE, vol 11 p 516

METHYL-ETHYL SULPHONAMIDE v METHYL ETHYL-SULPHAMIDE

METHYL ETHYL SULPHONE $C_6H_8SO_2$ $\begin{matrix} MeEtSO_2 \end{matrix}$ [36°] Formed by oxidising $MeSEt$ with $KMnO_4$ (Beckmann, J pr [2] 17, 455)

Formed also by heating $C_2H_5SO_2CH_3$, SO_2 , CH_3CO_2H to 190° (Otto, B 21, 993) White needles (from ether) V sol water, alcohol, benzene, chloroform, and strong acids Sl sol CS_2 and ether Not affected by reducing agents

METHYL ETHYL SULPHONE CARBOXYLIC ACID $C_2H_5SO_3$ *see* Et $SO_3CH_2CO_2H$ *Ethylsulphono acetic acid* Obtained by saponifying its ether with cold conc KOH aq. Formed also by oxidising the barium salt of the ethyl derivative of thio glycolic acid with $KMnO_4$ (Claesson, *Bt* [2] 23, 447) Thick colourless syrup At 190° it splits up into CO_2 and methyl ethyl sulphone [36°] Bromine added to its aqueous solution gives a di bromo methyl ethyl sulphone Zinc and HCl reduce it to ethyl mercaptan

Salts — NaA' Pearly plates, v sl sol hot alcohol, v sol water — KA' Small tables (from alcohol) — BA'_2 Nodules — CUA'_2 2aq Broad tables

Ethyl ether EtA' Formed by the action of chloro acetic ether on sodium ethane sulphinate (Claesson, *J pr* [2] 15, 223, Otto, *B* 21, 993) Oil

METHYL ETHYL-THIAZOLE

$\begin{matrix} S & OEt \\ \diagup & \diagdown \\ CH & OMe \end{matrix} N$ (161° cor) Formed by the action of thiopropionamide on chloro acetone in alcoholic solution (Hubacher, *A* 259, 230) Liquid, smelling like pyridine, miscible with alcohol, insol hot water, sl sol cold water — $B'_2H_2PtCl_6$ [177°]

METHYL ETHYL DITHIOCARBONATE v

ETHYL THIOCARBONATES, vol II p 521

METHYL ETHYL THIO UREA $C_2H_5N_2S$ *see*

NHMe CS NHEt [54°] Formed by addition of methylamine to ethyl thio carbimide (Hofmann, *B* 1, 27, *Z* 1868, 655) Fine crystals, sol water, alcohol, and HCl aq

Methyl di ethyl-thio- ψ urea $C_2H_5N_2S$ *see*

NHETC(SMe)NEt Formed from di ethyl thio urea and MeI (Noah, *B* 23, 2196) Oil With alcoholic NH_3 at 100° it yields di ethyl guanidine and MeSH — $B'HI$ — $B'_2C_2H_4(NO_2)_2OH$ [116°] — $B'_2H_2PtCl_6$ laminae

METHYL-ETHYL TOLUQUINOLINE v Di

METHYL-ETHYL-QUINOLINE

METHYL ETHYL UREA $C_2H_5N_2O$ *see*

NHMe CO NHET [53°] (267°) (Wurtz, *Rép chim pure*, 4, 199) [92°–112°] (Schreiner) Formed from methylamine and cyanic ether (Wurtz) When methylamine acts on ethyl carbamic ether there is formed a methyl ethyl urea which melts at 105° and solidifies again at 101° When, on the other hand, ethylamine acts on methyl carbamic ether the methyl ethyl urea which is produced melts at 75° and solidifies again at 72° (Schreiner, *J pr* [2] 22, 360). After frequent meltings and solidifications, both these forms begin to melt at 92° and end at 112°

METHYL-EUGETIC ACID v Methyl deriva-

tive of EUGETIC ACID

ACID and the dimethyl derivative of CAFFEIC ACID, vol I p 659

METHYL-FLAVOLINIUM HYDRATE v

methyl hydrate of (Py 31) PHENYL METHYL-QUINOLINE (flavoline)

METHYL-FLUORESCIN v so-called 'fom-

fluorescein,' vol II p 568

METHYL FLUORIDE CH_3F VD 1 22

(calc 119) S 166 at 15° (D & P) Formed, together with Me_2O , by the action of KF on $KMeSO_4$ (Dumas & Péligot, *A* 15, 59) Formed also, in small quantity, together with NMe_3 , by

heating NMe_3F at 180° *in vacuo* (Lawson & Collie, *C J* 53, 628, 55, 110) Prepared by the action of MeI upon silver fluoride (Moissan & Meslans, *C R* 107, 1155) Gas, sl sol water, v sol alcohol and MeI Liquefied by a pressure of 30 atmospheres It burns with a blue flame, yielding HF Saponified with difficulty by heating in sealed tubes with water or dilute aqueous KOH at 120° In the presence of a little water it forms a crystalline hydrate, decomposing at 18.8° (Villard, *C R* 111, 184) Chlorine, acting upon it in sunlight, forms CH_2ClF , a gas which is decomposed by water, and is hardly inflammable

METHYL FORMAMIDE v Formamide in the article on FORMIC ACID

Di methyl formamidide $C_2H_5N_2$ *see*

NMe_2CHNH Form-imid di methyl amide

Formed by the action of an alcoholic solution of di methyl amine on the hydrochloride of formimido ether (Pinner, *B* 16, 1650) — $B'HI$ thick prisms, [169°], v sol water and alcohol

s Di methyl-formamidide $NHMeCHNMe$

Form methyl imid methyl amide Formed by the action of an alcoholic solution of methyl amine on the hydrochloride of formimido ether $NHCH OEt$ — $B'_2H_2Cl PtCl_6$ short red prisms, [172°] (Pinner, *B* 16, 358, 1648)

METHYL FORMANILIDE v FORMIC ACID

DI METHYL-FUMARIC ACID v DI METHYL

MALEIC ACID

METHYL-FURFURALDEHYDE C_5H_4O *see*

$C_5H_4MeOCHO$ Methyl furfural (187° i V) S 33 Appears to accompany furfuraldehyde in the product of the dry distillation of wood (Hill, *B* 22, 607) Formed also by distilling isodulcote with dilute H_2SO_4 (Maquenne, *C R* 109, 604) According to Bieler & Tollens (*A* 258, 110, *B* 22, 3062) fucosol or fucus aldehyde (*q v*) is a mixture of furfuraldehyde and methyl furfuraldehyde Combines with $NaHSO_3$ Aqueous ammonia converts it into crystalline methyl furfuralamide $N_2(C_5H_4O)_2$ [87°] Yields, on oxidation, methyl pyromucic acid $C_6H_4O_6$ [109°] Reduces Ag_2O Gives Schiff's reaction with isosamine and SO_2 Its phenyl hydrazide is liquid With resorcin and HCl it yields an orange yellow condensation product Pyrogallol and HCl form a crimson compound Paper moistened with aniline acetate is coloured yellow, and finally deep orange red by an aqueous solution of methyl furfuraldehyde

(aa) DI METHYL FURFURANE C_6H_4O *see*

Formation — 1 By dry distillation of pyrotritic or carbopyrotritic acid, the yield being 5–7 p c — 2 By distilling acetonyl acetone $CH_3COCH_2CH_2COCH_3$ with $ZnCl_2$, the yield being 25 p c (Dietrich, *B* 20, 1085) — 3 Occurs also in the product obtained by distilling sugar (1 pt) with lime (3 pts) (E Fischer & Laycock, *B* 22, 101)

Properties — Colourless mobile very volatile liquid of characteristic odour Insol water, miscible with other solvents Does not react with phenyl-hydrazine. By PCl_5 or $POCl_3$ it is resinified By heating with acidified water it is converted back into acetonyl-acetone

METHYL-FURFURANE CARBOXYLIC ACID**METHYL PYROMUCIC ACID**

Di methyl-furfurane carboxylic acid v PYRO-TRITARIC ACID

Di methyl furfurane dicarboxylic acid

$\text{C}_6\text{H}_4\text{O}_4$, 1:2 \parallel (Knorr, cf Fittig,

B 18, 3410) *Carbopyrotritaric acid* [230°] Formed by boiling diacetyl succinic ether for a long time with dilute H_2SO_4 (Harrow, C J 33, 425, A 201, 152) Formed also by the action of fuming HCl on acetonyl aceto acetic ether $\text{CH}_3\text{COCH}_2\text{CH}(\text{CO}_2\text{Et})\text{COCH}_3$ (Paal, B 17, 2765)

Properties — Needles (by sublimation), m sol hot water, v sol alcohol and ether, volatile with steam On heating above its melting point it is decomposed into CO and di methyl furfurane carboxylic acid (pyrotritaric acid) Potash fusion yields acetic and succinic acids

Salts — K.A" silky needles — BaA" — Ag A" white pp HAgA" slender white needles

Mono methyl ether MeHA" [129°] Formed by leaving a mixture of the di methyl ether (1 pt) and fuming HClAq (10 pts) to stand in the summer time (K a C) Slender needles — AgMeA" Ppd by adding ammoniacal AgNO_3 to a solution of MeHA"

Di methyl ether MeA" [64°] (258°) From Ag A" and MeI at 100° under pressure (Knorr a Cavallo, B 22, 155) Snow white crystals, v sol alcohol, ether, chloroform, and benzene, v sl sol water, dilute acids, and alkalis

Methyl ethyl ether MeEtA" (268°) From AgMeA" and EtI, or from AgEtA" and MeI (K a C) The identity of the ethers piepared in these two ways shows that the carboxyls are similarly situated in the molecule of di methyl furfurane di carboxylic acid MeEtA" exhibits blue fluorescence With HCl it yields H A", and the ethers MeA" and EtA"

Mono ethyl ether EtHA" [83°] Formed by heating di acetyl succinic ether at 200°, or by allowing it to stand with conc HClAq for some hours in the cold (Knorr, B 17, 2463) Formed also from AgHA" and EtI (Harrow) Flat glistening needles, v sol alcohol and ether, sl sol water May be distilled AgEtA" Bulky white pp (Knorr a Cavallo, B 22, 154)

Di ethyl ether EtA" (275°) at 735 mm Formed by dissolving di acetyl succinic ether in cold H_2SO_4 , or by heating it with conc phosphoric acid (Knorr) Formed also, together with pyrotritaric and iso carbo pyrotritaric ethers, by heating diacetyl succinic ether at 175° (Knorr, B 22, 158) Oil Does not react with hydroxylamine or with phenyl hydrazine Easily saponified by alcoholic potash

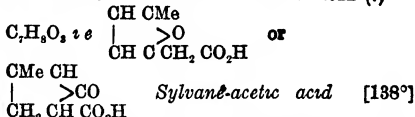

Di methyl-furfurane dicarboxylic acid v. METHRONIC ACID

METHYL FURFURINE

Formed by heating (5 g) methyl furfuramide (v METHYL FURFURALDEHYDE) with NaOH (2.5 g) dissolved in water (25 cc) at 100° (Bieler a Tollens, A 258, 123) Oil, which solidifies as an amorphous resin — B'HNO, lustrous crys-

als — B'H $_2$ SO $_4$ minute needles — B'H $_2$ PtCl $_4$, yellow crystalline pp

METHYL-FURFUROL v METHYL FURFUR-ALDEHYDE

METHYL-FURFURYL-ACETIC ACID (?)

Formed by heating its carboxylic acid (Polonowsky, A 246, 14) Prisms (from water), v e sol alcohol, m sol ether, almost insol cold water Somewhat volatile with steam It gives no colouration with FeCl_3 , and is dissolved without alteration by conc H_2SO_4 Nitric acid oxidises it, yielding acetic and oxalic acids — AgA' 3:4q. bulky white pp — BaA' 2:4aq transparent plates or spherical aggregates

Methyl-carboxy-furfuryl-acetic acid (?)

carboxyacetic acid [207°] Formed, together with methyl furfuryl-carbinyl methyl ketone carboxylic ether and a neutral substance $\text{C}_{12}\text{H}_{18}\text{O}_4$ [139°], by adding a conc solution of ZnCl_2 to a mixture of glyoxal and aceto acetic ether in the cold (Polonowsky, A 246, 1) Needles (from hot water), v sol alcohol — (NH $_4$)A' 3:4q minute needles — BaA' 2:4aq transparent needles — AgA' 1:4q

Mono methyl ether MeHA" [98°]: needles — AgMeA'

Di methyl ether MeA" Oil

Mono ethyl ether EtHA" [76°]

METHYL-FURFURYL-CARBINYL METHYL KETONE DI CARBOXYLIC ACID Ethyl

295°) One of the products formed by the condensation of aceto acetic ether (2 mol) with glyoxal (1 mol) in presence of aqueous ZnCl_2 (Polonowsky, A 246, 18) Light yellow oil, miscible with alcohol, ether, benzene, and chloroform Insol water and alkalis, resinsified by warming with conc H_2SO_4

DI METHYL - FURFURYL METHYL KETONE CARBOXYLIC ACID C₆H₁₀O₄ 1:2.

carboxylic acid [152°] Formed by heating at 225° in a sealed tube a mixture of β acetyl propionic acid (3 g) with Ac_2O (15 g), the product being freed from Ac_2O by distillation *in vacuo* and the residue extracted with water (Magnanim, B 21, 1523) Small needles (from hot water) — AgA' crystalline pp, sl sol water — BaA' 2:4q crystalline pp

DI - METHYL GENTISIC ALDEHYDE v. Di methyl derivative of Di oxy benzoic ALDEHYDE

METHYL GLUTACONIC ACID C₆H₈O₄ 1:2 $\text{CH}_2\text{CH}(\text{CO}_2\text{H})\text{CH}(\text{OH})\text{CO}_2\text{H}$ [187°] Formed by boiling methyl-dicarboxy-glutaconic ether (vol 1 p 706) with conc alcoholic potash (Conrad a Guthzeit, A 222, 259) Nodules (from water), v sol water, alcohol, and ether

α -METHYL GLUTARIC ACID $C_6H_{10}O_4$ *rac.*
 CO_2H $CHMe$ CH_2 CH_2 CO_2H *Butane dicarboxylic acid* Mol w 146 [77°] HF 238,200
 H C v 670,500 H C p 670,800 (Stohmann, Kleber & Langbein, *J pr* [2] 40, 214) Formed by saponifying with conc alcoholic KOH the product of the action of β iodo propionic ether on sodium methyl acetate ether (Wislizenus & Limpach, *A* 192, 133) Formed also by the action of HI and P on γ oxy α methyl glutaric acid (Krekeler, *B* 19, 3270), and on saccharonic acid CO_2H $CHMe(OH)$ $CH(OH)$ $CH(OH)$ CO_2H , a product of the decomposition of glucose (Kiliani, *A* 218, 369) Obtained by boiling γ cyano valeric acid (*q v*) with aqueous NaOH (Wislizenus, *A* 238, 101) Prisms, v sol water, alcohol, and ether The zinc salt is a viscid mass — Ag_2A''

β Methyl glutaric acid $C_6H_{10}O_4$ *rac*
 CH_3 $CH(CH_2CO_2H)_2$ *Ethylidene diacetic acid* [85°-86°] Formed from malonic acid, paraldehyde, and Ac_2O , by heating at 100° for several days On rectification the anhydride (282°-284°) is obtained (15 p c of weight of malonic acid). Boiling water changes it into the acid (Komnenos, *A* 218, 150) Colourless glass like prisms or tables (from CS_2 mixed with $CHCl_3$) V sol water, alcohol, or ether, m sol cold benzene or CS_2 , v sl sol CS_2 , or benzoline On distillation it splits up into H_2O and its anhydride On distilling its sodium salt with P_2S_5 , there is formed, as an oil, the homologue of thiophene $CH_2 \begin{smallmatrix} < CMe & CH \\ & CH & CH \end{smallmatrix} S$, boiling at 134° (Krekeler, *B* 19, 3270)

Salts — Ag_2A'' — CaA'' — PbA'' $\frac{1}{2}aq$ Trimetric needles $a b c = 6331$ 1 6072

Anhydride $C_6H_8O_3$ [46°] (282°-284°) V D 4.61 (calc 4.43) Mass of slender prisms (from CS_2) V sl sol cold water, neutral to litmus, on boiling it dissolves, becoming strongly acid, changing to the hydrated acid V sol alcohol, ether, benzene, chloroform, or glacial acetic acid, v sl sol petroleum

δ Di methyl glutaric acid $C_8H_{14}O_4$ *rac*
 CO_2H $CHMe$ CH_2 $CHMe$ CO_2H [114°] (*Z*), [c 90°] (*D*), [101°] (*B*), [106°] (*A* & *J*) Formed by treating a cyano-propionic ether with methylene iodide and alcoholic NaOEt, heating the mixture on the water bath, and saponifying the product with HCl (Zelinsky, *B* 22, 2823) Formed also by heating pentane tetracarboxylic acid either by itself, or in aqueous solution, or by heating its ether with H_2SO_4 (Dressel, *A* 256, 184) Obtained from sodium methyl malonic ether and methylene iodide (Bischoff, *B* 23, 1464, 1951) Crystals resembling those of di methyl-succinic acid, v sol water, alcohol, and ether Not volatile with steam According to Zelinsky the product obtained by his method really consisted of two isomeric modifications, melting at 102°-104° and 128° respectively A solution of the ammonium salt gives white pps with $AgNO_3$ and $HgCl_2$, and a brown pp with $FeCl_3$ — Ag_2A''

Anhydride $CH_2 \begin{smallmatrix} < CMe & CO \\ & CMe & CO \end{smallmatrix} O$ [93°]

Formed by boiling the acid for five minutes or by warming it with $AcCl$ (Auwers & Jackson, *B* 23, 1611) Rectangular prisms (from hot ligroin)

Tri methyl-glutaric acid $C_9H_{16}O_4$ *rac*
 CO_2H $CHMe$ CH_2 $CHMe$ CO_2H [97°] S 22 at

11° Formed, together with the isomeric tetramethyl-succinic acid, by the action of finely divided silver on a bromo isobutyric acid (Hell & Wittekind, *B* 7, 820, Auwers & V Meyer, *B* 23, 300) Flat plates (from hot water), sol cold water, m sol CS_2 and ligroin, v sol other solvents Can be distilled in small quantities Not volatile with steam When the acid (6 g) is mixed in the cold with dry red phosphorus (8 g) and bromine (16 g) the product is bromo trimethyl glutaric anhydride [114°]

Anhydride $CH_2 \begin{smallmatrix} < CMe & CO \\ & CMe & CO \end{smallmatrix} O$ [96°]

(262°) Formed by boiling the acid for some time, or by heating it with excess of Ac_2O Coarse flat satiny needles (from hot ligroin)

Ethyl ether Et_2A'' (230°) SG 2 1012

METHYL-GLYCERAMINE $C_6H_{11}NO_2$ *rac*
 $CH_2(OH)$ $CH(OH)$ CH_2NMeH Formed, together with the following body, by heating the (a) chlorhydrin of glycerin with aqueous NMe, in sealed tubes at 100° (Hanriot, *A Ch* [5] 17, 62, cf vol 11 p 623)

Tri-methyl-glyceramine chloride

$CH_2(OH)$ $CH(OH)$ CH_2NMe_3Cl Formed by heating glycerin chlorhydrin with trimethyl amine on the water bath for 12 hours (Hanriot, *C R* 86, 1335) — $C_6H_{11}ONMe_3Cl$ syrup — ($C_6H_{11}ONMe_3Cl$), $PtCl_4$, orange tables, sol water, insol alcohol, not decomposed by boiling the aqueous solution

DI-METHYL-GLYCERIC ACID *v Di oxy VALERIC ACID*

α METHYL-GLYCIDIC ACID $C_5H_8O_3$ *rac*

$O \begin{smallmatrix} < CH_2 \\ & CMe & CO_2H \end{smallmatrix}$ *Propylene oxide carboxylic*

acid Formed by decomposing chloro oxy iso butyric acid (the product of the union of $HOCl$ with methacrylic acid) with alcoholic potash (Mélkoff, *Bl* [2] 41, 311, 43, 115) Thick liquid, v sol water and ether

Reactions — 1 When heated with water for half an hour it forms di oxy butyric acid CH_2 $CH(OH)$ $CH(OH)$ CO_2H [100°] — 2 Heated with ammonia it forms oxy amido isobutyric acid — 3 Conc HCl combines, forming chloro oxy isobutyric acid [107°] — 4 HBr forms bromo oxy iso butyric acid [101°]

Salts — $KA' \frac{1}{2}aq$ glittering plates, sl sol cold alcohol — AgA' thin needles (from hot water)

Ethyl ether EtA' (164°) SG $\frac{1}{2}$ 10546 From AgA' and EtI (Mélkoff, *B* 21, 2053) Oil

β Methyl-glycidic acid $O \begin{smallmatrix} < CHMe \\ & CH & CO_2H \end{smallmatrix}$ [84°]

Formed by the action of alcoholic potash on chloro oxy butyric acid [63°] (the product of the union of $HOCl$ with crotonic acid) (Mélkoff, *Bl* [2] 43, 115) Trimetric crystals (from ether), v e sol water, m sol ether Volatile with steam

Reactions — 1 Combines with HCl forming chloro oxy butyric acid [86°] — 2 HBr yields bromo oxy butyric acid [90°] — 3 Ammonia forms oxy amido butyric acid — 4 When heated with water it slowly combines, forming di oxy-butyric acid [80°]

Salts — $KA' \frac{1}{2}aq$ powder, v sol water, sl sol cold alcohol — AgA' crystalline powder

Ethylether EtA' (174°) SG $\frac{1}{12}$ 1 0534 (Mélkoff a Zelnsky, B 21, 2052)

as Di-methyl-glycidic acid $C_3H_4O_2$ is

Formed by the action of alcoholic potash on chloro oxy valeric acid (the product of the union of HOCl on angelic acid) [45°] (Mélkoff, B 21, 47, 166, A 257, 118) Minute prisms, v sol water, alcohol, and ether Unites with HCl, forming chloro oxy valeric acid [75°] Water at 99° converts it into di oxy valeric acid [107°]

Salts—KA' $\frac{1}{2}$ aq prisms—AgA' thin scales

Ethylether EtA' (178°) SG $\frac{1}{12}$ 1 0250 From AgA' and F'I Oil

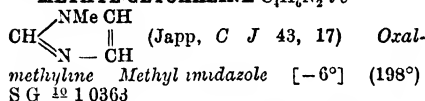

METHYL-GLYCOLLIC ACID v *Methyl derivative of GLYCOLLIC ACID*

DI-METHYL-GLYCOLURILE v *DI METHYL DIKETONE*

Tetra-methyl glycolurile v *GLYOXAL, Reaction 13*

METHYL-GLYOXAL v *PYRUVIC ALDEHYDE*
DI-METHYL-GLYOXAL v *DI METHYL DIKE*

METHYL-GLYOXALINE $C_4H_6N_2$ is

Formation—1 By the action of sodium amalgam on tri bromo methyl glyoxaline (g v) in alcoholic solution (Wyss, B 10, 1372)—2 By methylation of glyoxaline (Wallach, B 15, 644, A 214, 319)—3 From sulphhydro methyl glyox

aline $\text{HS} \begin{array}{c} \text{NMe CH} \\ \diagup \quad \diagdown \\ \text{N} - \text{CH} \end{array}$ by treatment with dilute nitric acid (Wohl a Marekwald, B 22, 1359)—4 By reducing chloro methyl glyoxaline with HIAq and P at 140° (Wallach, A 214, 310)

Properties—Liquid, sol water With aqueous HgCy₂, it gives a pp composed of slender needles [119°] Combines readily with MeI, forming a methylo iodide, whence B'Me₂PtCl₄ [206°] may be obtained

Salts—B'H PtCl₄ [191°] S 44 at 13° (W) 7.5 at 13° (W a M) Orange red prisms—B'H ZnCl₂ [128°–131°] Soluble crystals—B'HNO₃ Prisms—B'C₆H₅(NO₂), OH. [158°] Needles, sl sol alcohol and ether—B'HAuCl₄ [120°]

ethylene Para oxalmethylene [137°] (267°)

Formation—1 By saturating an aqueous solution of glyoxal (1 mol) and acetic aldehyde (1 mol) with ammonia (Radziszewsky, B 15, 2706, 16, 487)—2 By passing the preceding methyl glyoxaline [–6°] through a red hot tube (Wallach, B 16, 541)—3 By distilling the zinc salt of the preceding methyl glyoxaline or of chloro methyl ethyl glyoxaline with lime (Wallach, A 214, 296)

Properties—Long thin needles, v sol water, alcohol, and hot benzene, m sol cold benzene Decolourises bromine, forming C₂H₄Br₂ [258°] Yields oxamide on oxidation with H₂O₂ (Radzi-

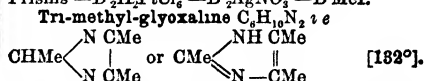

szewsky, B 17, 1290) Its solutions are ppd by tannin and by picric acid.

Salt—B'H₂PtCl₄ Trimetric needles
Di-methyl-glyoxaline $C_4H_6N_2$ is

SG $\frac{1}{12}$ 1 0051 Formed by the action of MeI on methyl-glyoxaline (Radziszewsky, B 16, 488). Liquid with narcotic odour, sol water, alcohol, and ether Its solution gives with CuSO₄ a blue pp, with AgNO₃ a crystalline pp, with HgCl₂ with tannin, and with phosphomolybdic acid white pps, and with picric acid a yellow pp All these pps are soluble in hot water—B'H₂PtCl₄ [138°]

Methylo iodide B'MeI Crystalline
Chloro di methyl - glyoxaline $C_4H_6ClN_2$ (213°) Formed by the action of PCl₅ on methyl-ethyl oxamide (Wallach, A 184, 71)—B'HCl Prisms—B'H₂PtCl₄—B'AgNO₃—B'MeI

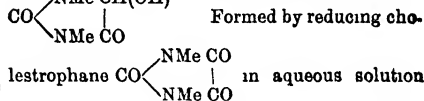

(271°) Formed by adding di methyl diketone CH₃COCOCH₃ to an ammoniacal solution of AgNO₃, and decomposing the resulting pp with dilute HCl (Fittig, A 249, 206) Formed also, with other bases, by heating di methyl diketone with conc NH₄Aq at 100° for an hour (Von Pechmann, B 21, 1411) Small white needles (from ether or ligron) Not affected by nitrous acid—B'HCl tufts of snow white needles

METHYL-GLYOXIM v *Oxim of PYRUVIC ALDEHYDE*

Di methyl glyoxim v *DI ACETYL and DI METHYL DIKETONE*

DI-METHYL-GLYOXYL-UREA $C_4H_8N_2O_3$ is

lestrophane $\begin{array}{c} \text{NMe CO} \\ \diagup \quad \diagdown \\ \text{CO} \quad \text{NMe CO} \end{array}$ in aqueous solution with zinc and H SO₄ (Andreassch, M 3, 436) Small needles, melting below 100° May be sublimed v e sol water and alcohol, insol ether Decomposed by boiling baryta water into CO₂, methylamine, and glyoxylic acid Readily re oxidised to cholestrophane

METHYL GUANACIL v *GUANIDINE, Reaction 11*

METHYL-GUANAMINE The name originally given by Nencki to *Acetoguanamine*, vol. II p 655

METHYL-DIGUANIDE $C_4H_6N_4$ Obtained, in combination with CuSO₄, by adding a 20 p c solution of methylamine to a mixture of di-cyan di amide C₂N₂(NH₂)₂, and copper sulphate, the crystalline (C₂H₅N₃)₂CuSO₄ 2 $\frac{1}{2}$ aq which separates is then decomposed by baryta (Reibenschuh, M 4, 388) Thick alkaline syrup, which absorbs CO₂ from the air

Salts—Colourless leaflets or prisms, v sol water—B'H₂SO₄ Prisms, obtained by decomposing B'₂CuSO₄ by H₂S—B'H₂SO₄ From B'H₂SO₄ and H₂SO₄ Crystalline powder v sl sol alcohol—Cu(C₂H₅N₃)₂ 3 $\frac{1}{2}$ aq Formed by shaking di cyan diamide with cupric oxide and methylamine Rose-red crystalline powder—

$B_2CuSO_4 \cdot 2\frac{1}{2}aq$ Pink needles — The chromate and picrate form yellow prisms

METHYL-GUANIDINE $C_2H_5N_3$, *re*
 $NH C(NH_2)(NHMe)$ *Methyl uramine*

Formation — 1 By boiling an aqueous solution of creatine with HgO or with PbO_2 and dilute H_2SO_4 (Dessaignes, *C R* 38, 839, 41, 1258, *A* 92, 407, 97, 340) — 2 By oxidising creatinin with $KMnO_4$ (Neubauer, *A* 119, 46) — 3 By heating cyanamide with methylamine hydrochloride in alcoholic solution at 100° (Erlenmeyer, *B* 3, 896) — 4 By the action of methyl cyanamide on NH_4Cl (Tavildaroff, *B* 5, 477)

Properties — Strongly alkaline, deliquescent, crystalline mass. Decomposed by KOH , giving off NH_3 and methylamine. When boiled with chloroacetic acid it yields glycolyl methylguanidine $C_4H_{11}N_3O_2$, which crystallises in tablets, *v* *e* sol water, and neutral in reaction, and forms the salts $C_4H_{11}NO_2 \cdot HCl$, and $C_4H_{11}N_3O_2 \cdot H_2PtCl_6$.

Salts — $B_2H_2PtCl_6$. Monoclinic crystals (Haushofer, *J* 1878, 351) *S* 143 at 19° — $B_2H_2AuCl_4$. Trimeric crystals, *v* sol ether, *m* sol water — $B_2H_2C_2O_4 \cdot 2aq$. Crystals, *v* sol water

Di-methyl-guanidine $C_3H_7N_3$, *re*
 $NH C(NH_2)(NMe)_2$ Formed by heating equimolecular quantities of cyanamide and dimethylamine hydrochloride at 110° (Tartaroff, *C R* 89, 608)

Salts — $B'HCl$. Trimeric crystals, *a b c* = 862 1 α (Haushofer, *Z K* 6, 130) — $B_2H_2PtCl_6$. Trichinic crystals, *a b c* = 941 1 678, $\alpha = 90^\circ 55'$, $\beta = 90^\circ 20'$, $\gamma = 90^\circ 4'$ — $B_2H_2AuCl_4$. Trimeric crystals (Haushofer, *J* 1882, 364)

s-Di-methyl-guanidine $NH C(NHMe)_2$. Formed by the action of methylamine on cyanogen iodide (Erlenmeyer, *B* 14, 1868)

Platinochloride $B_2H_2PtCl_6$. Trichinic crystals, *a b c* = 1212 1 1761, $\alpha = 90^\circ 22'$, $\beta = 110^\circ 20'$, $\gamma = 90^\circ 5'$

METHYL-GUANIDO-ACETIC ACID *v* **CREATINE**

(a) **METHYL-GUANIDO-BENZOIC ACID** $C_8H_{11}N_3O_2$, *re* $NH C(NH_2)NMe C_6H_4 CO_2H$

(a) *Benzcreatine*. Formed by methylation of benzglycocyamine (Griess, *B* 8, 324). Small acicular plates (containing $1\frac{1}{2}$ eq), *sl* sol hot water and alcohol. Decomposed by boiling baryta water into methyl amido benzoic acid and urea — $HA'HCl_{aq}$ plates, *m* sol water — $(HA')_2H_2PtCl_6 \cdot 2aq$

Anhydride *v* **BENZCREATININE**

(b) **Methyl-guanido-benzoic acid** $C_8H_{11}N_3O_2$, *re* $NH C(NHMe)NH C_6H_4 CO_2H$. Formed by the action of a cold concentrated solution of methylamine on the so called ethoxy carbumidamido benzoic acid (Griess, *B* 8, 325, vol 1 p 157). Plates, *sl* sol cold water and alcohol. Decomposed by baryta-water into *m* amido benzoic acid, CO_2 , and methylamine — $HA'HCl$ — $(HA')_2H_2PtCl_6 \cdot 2aq$

Anhydride *v* (b) **BENZCREATININE**

METHYL-GUANIDO-ETHANE SULPHONIC ACID $ON_2H_4Me(CH_2CH_2SO_3H)$ or probably $NH C(NHMe)NH CH_2CH_2SO_3H$. Formed by heating methyl amido ethane sulphonic acid (2 grms) and cyanamide (7 grms) with enough water to dissolve them, for 5 hours at 120° . Crystals of the new body are found in the tube (E. Dittrich, *J pr* [2] 18, 72). Transparent

monoclinic prisms. Crystallises with a molecule of water that goes off at 110° . *V* sol hot, *m* sol cold, water, *insol* alcohol and ether. Turns brown at 285° , giving off methylamine. Does not form salts.

METHYL-GUANIDO-VALERIC ACID *Anhydride* $C_6H_{11}N_3O_2$, *re*

$(CH_3)_2CH CH \langle \overset{NMe}{\underset{O}{C}} NH \rangle C NH$ *Isovaleric creatinine*. Formed by heating methyl-amido-isovaleric acid with cyanamide and ammonia (Duvillier, *Bl* [2] 39, 539). *Sol* alcohol

METHYL-HEMIPIC ACID *v* **Methyl ether of HEMIPIC ACID**

METHYL HENDECYL KETONE $C_{15}H_{32}O$, *re*. $CH_3 CO C_6H_{13}$, *Methyl undecyl ketone* [28°] (263°) *SG* (liquid) d_4^{25} 823. Formed by distilling a mixture of barium laurate and barium acetate (Krafft, *B* 12, 1667, 15, 1724). Yields acetic and hendecic acids on oxidation.

Isomeride $C_{15}H_{32}O$ (265° – 275°) *SG* d_4^{25} 887. One of the products of the action of CO on a mixture of $NaOAc$ and $NaOC_6H_{11}$ at 180° (Poetsch, *A* 218, 62). Liquid

METHYL HEPTADECYL KETONE $C_{17}H_{34}O$, *re*. $CH_3 CO C_6H_{13}$, [56°] (267° at 110 mm) *SG* (liquid) d_4^{25} 811. Prepared by distilling a mixture of barium stearate and barium acetate. On oxidation it gives margaric acid (Krafft, *B* 12, 1672, 15, 1724).

Methyl heptaacyl ketone $C_{15}H_{32}O$, *re*. $CH_3 CO CH(C_6H_{13})_2$. *Di octyl acetone* (325° – 330°). Formed by boiling di octyl acetoacetic ether with alcoholic potash (Guthzeit, *A* 204, 10). Liquid

METHYL HEPTINYL KETONE $C_{11}H_{20}O$, *re*. $CH_3 CO CH(C_6H_9)_2$. *Di allyl acetone* (175°). Formed by boiling di allyl acetoacetic ether with conc KOH_{aq} (Wolff, *A* 201, 48). *V* sol alcohol and ether

METHYL HEPTINYL OXIDE $C_9H_{16}O$, *re*. $CH_3 O CH(C_6H_9)_2$ (136°) *SG* d_4^{25} 8258. Formed from $NaOCH(C_6H_9)_2$ and MeI (Rabinin, *J pr* [2] 23, 270). Yields, on oxidation by cold $KMnO_4$, $CH_3 O CH(C_6H_9)_2$

METHYL HEPTYL KETONE $C_9H_{18}O$, *re*. $CH_3 CO CHPr_2$. *Di propyl acetone* (174°). Formed by heating di propyl acetoacetic ether with alcoholic potash (Burton, *Am* 3, 390). Liquid. Appears not to combine with $NaHSO_4$.

Methyl heptyl ketone $CH_3 CO C_6H_{13}$, (177°). Formed by the decomposition of *sec* hexyl acetoacetic ether by KOH (Lundahl, *B* 16, 789).

METHYL HEPTYL OXIDE $C_8H_{16}O$, *re*. $CH_3 O C_6H_{13}$, (161°) *SG* d_4^{25} 830 *VD* 42 (calc 45) *SV* 1946 (Lossen, *A* 254, 57). Formed by the action of MeI on $NaOC_6H_{13}$, derived from *canthol* (Wills, *C J* 6, 314). Mobile liquid, with strong odour, *insol* water, *v* sol alcohol and ether

METHYL-HESPERETIC ACID *v* **Dimethyl derivative of Caffeic acid**

METHYL-HEXADECYL-BENZENE *v* **HEXADECYL-TOLUENE**

Di-methyl-hexadecyl-benzene *v* **HEXADECYL-TYLENE**

Tri-methyl-hexadecyl-benzene *v* **HEXADECYL-MESITYLENE**

METHYL-HEXANE *v* **HEPTANE**

METHYL-HEXOSE $C_6H_{12}O_6$, *re*

$CH_2(OH)(CH_2OH)(CH_2OH)(CH_2OH)(CH_2OH)(CHO)CHO$

[181°] Formed by reducing the lactone of rhamnose carboxylic acid with sodium amalgam (Emil Fischer, *B* 23, 936) Crystallises from methyl alcohol Hydrogen cyanide yields $C_8H_{13}O_5N$, which on saponification forms methyl heptonic acid $C_8H_{15}O_6$, the lactone of which crystallises easily, and gives rise, on reduction, to methyl-heptose $CH_2(CH(OH)_2CHO$, of which the phenyl hydrazide is sl sol water

Phenyl-hydrazide V sol water

Oxazone [200° with decomposition]

METHYL HEXYL-CARBINOL *v* OCTYL ALCOHOL

DI METHYL HEXYLENE DIKETONE

$C_{16}H_{32}O_2$ *ie* $(CH_2CO)_2CH_2C_6H_{11}$ Iso amyl acetyl acetone (c 222°) Formed by heating $(CH_3CO)_2CHNa$ with isoamyl iodide at 180° (Combes, *A Ch* [6] 12, 249) Liquid Decomposed by caustic potash into acetic acid and $CH_3COCH_2C_6H_{11}$

Di methyl hexylene diketone $C_{16}H_{32}O_2$ *ie* $CH_3COCH_2CH_2CH_2CH_2CHMeCOCH_3$ a methyl *ae-di* acetyl pentane (232°-235°) Formed by decomposing its carboxylic ether with alcoholic potash (Kipping a Perkin, *C J* 55, 346) Colourless mobile oil Dissolves in a solution of $NaHSO_3$, and is reprecipitated by K_2CO_3

DI METHYL HEXYLENE DIKETONE

CARBOXYLIC ETHER $C_{16}H_{32}O_4$ *ie* $CH_3COCHMe(CO_2Et)CH_2CH_2CH_2CH_2COCH_3$ (255°-260°) Formed by the action of $NaOEt$ and $BrCH_2CH_2CH_2CH_2COCH_3$ on methyl acetoacetic ether (Kipping a Perkin, *C J* 55, 346) Colourless liquid, with faint odour, v sl sol water

METHYL-HEXYL-GLYOXALINE $C_{16}H_{32}N_2$

ie $C_6H_{13}CH \begin{matrix} \diagup NMech \\ | \\ \diagdown N=CH \end{matrix}$ (262°) SG 155 923

Formed by heating hexyl glyoxaline with a solution of MeI in methyl alcohol (Karez, *M* 8, 221) Colourless oil, insol water, sol alcohol and ether Gives the alkaloidal reactions — $B'H.PtCl_4$, yellow plates, sol water

Methyl iodide $B'MeI$ [124°] V sol alcohol and ether

METHYL *n* HEXYL KETONE $C_{16}H_{32}O$ *ie*

$CH_3COCH_2CH_2CH_2CH_2CH_2CH_2CO$ (172°) SG 29 8185 (Bruhl, *A* 203, 29), d_4^{20} 835 (C) SV 186 6 (R. Schiff, *A* 220, 103) $\mu_D = 1.4213$ R_{∞} 63 29 H C 1,209,510 (Lougumme, *Bl* [2] 41, 389)

Formation — 1 By distilling sodium ricinoleate with $NaOH$ (Lumprecht, *A* 93, 242, Bouas, *A* 97, 34) — 2 By distilling a mixture of calcium acetate and calcium *n* heptate (enanthe) (Stadeler, *J pr* 72, 246) — 3 From octoic aldehyde by treatment with PCl_5 , decomposing the resulting $C_8H_{17}CHCl_2$ by alcoholic KOH , and adding the octene C_8H_{16} , CCH so formed to cold H_2SO_4 , diluting and distilling with water (Béhal, *Bl* [2] 47, 39, *A Ch* [6] 15, 275) — 4 Together with ethyl amyl ketone by treating $C_8H_{17}CCH_2$ with H_2SO_4 and water successively (Béhal, *Bl* [2] 48, 704) — 5 'Oil of wine' contains a methyl hexyl ketone (164°), which yields hexoic and acetic acids on oxidation (Hartwig, Scholl, *J pr.* [2] 23, 449) — 6 By heating octyl alcohol with boric acid at 170°, and distilling *in vacuo* (Councler, *B* 11, 1108)

Properties — Colourless, mobile liquid, smelling like apples and tasting like camphor, sol alcohol and ether, insol water Combines with $NaHSO_3$, forming a compound sol alcohol, but decomposed by hot water Does not reduce ammoniacal $AgNO_3$ or Fehling's solution Chromic acid mixture oxidises it to acetic and hexoic acids (Béhal a Combes) Nitric acid oxidises it to heptonic acid (Petersen, *A* 118, 78) PCl_5 forms $C_8H_{17}Cl_2$ (190°-200°) (Dachauer, *A* 106, 271)

Combinations — $C_8H_{17}OKHSO_3$ $\frac{1}{2}$ aq — $C_8H_{17}ONH_2HSO_3$ V sol water (L)

Oxim $CH_3C(NO)H_2C_6H_{11}$ (214°) at 725 mm (*B* 21, 509, cf Béhal, *Bl* [2] 47, 163)

Methyl isohexyl ketone $CH_3COCH_2C_6H_{11}$ Isoamyl acetone (170°) Formed by the action of KOH upon di methyl hexylene diketone $(CH_3CO)_2CH_2C_6H_{11}$ (Combes, *A Ch* [6] 12, 249) Limpid liquid, with agreeable odour Combines with $NaHSO_3$

Methyl hexyl ketone (?) $MeCO C_6H_{13}$ (208°-210° cor) SG 15 843 Occurs in small quantity (40 g) among the products of the passage of CO over a mixture of sodic acetate (546 g) and sodic iso amylate (746 g) (Poetsch, *A* 218, 60)

Methyl hexyl diketone $C_8H_{17}O_2$ *ie* $CH_3COCH_2COCH_2CH_2Pr$ (165°) (Von Pechmann, *B* 21, 2140)

DI-METHYL-HEXYL-PYRIDINE $C_{15}H_{21}N$

ie $C_6H_5 \cdot C \begin{matrix} \diagup CHCMe \\ | \\ \diagdown CHCMe \end{matrix} N$ *n* Hexyl lutidine (250°) at 719 mm Obtained by distilling its dicarboxylic acid with lime (Jaekle, *A* 246, 41) Colourless liquid, with faint blue fluorescence — $B'H.PtCl_4$ [163°] Orange prisms — $B'AgNO_3$ [65°] White needles, sol hot water and alcohol

Hexahydrate $C_{15}H_{21}N \cdot 6H_2O$

$C_6H_5 \cdot CH \begin{matrix} \diagup CHMe \\ | \\ \diagdown CHNH \end{matrix}$ *Hexyl lupetidine*

(240°) at 715 mm Obtained by the action of sodium amalgam on an alcoholic solution of di methyl hexyl pyridine (J) Colourless oil, not exhibiting fluorescence Its dilute alcoholic solution gives a dark brown pp, with mercurous nitrate Its platinumchloride and dichromate could not be obtained in a crystalline state — $B'HCl$ long white prisms, v sl sol water

DI-METHYL-HEXYL-PYRIDINE DICARB-

OXYLIC ACID $C_{15}H_{21}NO_4$ *ie*

$C_6H_5 \cdot C \begin{matrix} \diagup C(CO_2H)CMe \\ | \\ \diagdown C(CO_2H)CMe \end{matrix} N$ *Hexyl lutidine dicarboxylic acid* The potassium salt is formed by saponifying its ether with boiling KOH aq (Jaekle, *A* 246, 40) The free acid has not been prepared — PbA'' $\frac{1}{2}$ aq

Di ethyl ether Et_2A'' Formed by oxidising its dihydride with nitrous acid Yellowish-brown oil, forming salts with mineral acids — $H_2A''H_2PtCl_4$ [141°] Orange plates

Dihydrate *Di ethyl ether*

$C_6H_5 \cdot CH \begin{matrix} \diagup C(CO_2Et)CMe \\ | \\ \diagdown C(CO_2Et)CMe \end{matrix} NH$ [54°] Formed by the condensation of heptonic aldehyde (enanthal) (1 mol) with acetoacetic ether (2 mols) and ammonia (1 mol) (J) Yellow prisms, crystallising with difficulty from a dilute alcoholic solution

DI-METHYL-HOMO-CAFFEIC ACID *v* *Di-methyl derivatives of* (4.3.1) **DI OXY-PHENYL-CROTONIC ACID**

METHYL-HOMO FERULIC ACID *v* *Di-methyl derivative of (431) Di-oxy phenyl-cro-tonic acid*

METHYL-HYDANTOIC ACID $C_4H_5N_2O_4$ *v* $NH_2 \cdot CO \cdot NMe \cdot CH_2 \cdot CO_2H$ *Methyl uramido acetic acid*

Formation—1 Occurs in the urine of a dog whose food is mixed with methyl amido acetic acid (Schultzen, *B* 5, 578)—2 By digesting an aqueous solution of sarcosine with potassium cyanate and ammonium sulphate for two days at 40° (Baumann a Hoppe Seyler, *B* 7, 35)—3 By boiling methyl amido acetic acid with urea and excess of baryta-water, or by digesting the same mixture for two days at 40° (*B* a *H*)—4 By the action of potassium cyanate and H_2SO_4 on methyl amido acetic acid (*E* Salkowsky, *B* 7, 116)

Properties—Transparent plates (from alcohol), m sol cold water and cold alcohol, v sol hot water and hot alcohol. Acid in reaction. When the concentrated aqueous solution is boiled it is partially converted into methyl-hydantoin, this dehydration is more rapidly effected by boiling with water and $PbCO_3$ or $BaCO_3$, only traces of the acid then passing into solution. When heated in a sealed tube with a saturated solution of baryta at 140° it yields NH_3 , methyl amido acetic acid, and CO_2 . Moist Ag_2O forms laminae of silver methyl hydantoin. Salts— BaA_2 Ppd by adding alcohol to its aqueous solution— CuA_2 . Amorphous.

Di methyl hydantoinic acid *v* **ACETONURAMIC ACID**

METHYL-HYDANTOIN $C_4H_5N_2O_4$ *v* $CO \begin{smallmatrix} \text{NMe} \cdot CH_2 \\ \text{NH} \cdot CO \end{smallmatrix}$ *Anhydride of methyl uramido acetic acid* Mol w 114 [182°] (*F* a *K*), [156°] (*E* Salkowsky, *B* 7, 119), [145°] (*N*)

Formation—1 By heating creatinin with baryta water at 100° in a sealed tube (Neubauer, *A* 137, 288)—2 By boiling methyl hydantoinic acid with water and $PbCO_3$ or $BaCO_3$ —3 By melting methyl-amido acetic acid with urea (Huppert, *B* 6, 1278)—4 By the action of cyanogen chloride on melted methyl amido-acetic acid (Traube, *B* 15, 2110)—5 By warming caffeic acid with baryta water (Fischer, *A* 215, 286)—6 By the reduction of methyl allantoin by HI (Hill, *B* 9, 1091)—7 By heating a mixture of hydantoin (3 pts), MeI (6 pts), methyl alcohol (16 pts), and KOH (2 pts), for three hours at 100°, and extracting the product with boiling alcohol (Franchimont a Klobbie, *R T C* 8, 289)

Properties—Short prisms, v sol boiling water, sl sol cold water, v sol alcohol, v sl sol ether. May be sublimed. It does not unite with baryta, but its hot solution dissolves Ag_2O , and the alkaline filtrate then deposits $C_4H_5AgN_2O_4$ as groups of thin laminae. The mercuric compound, obtained in like manner, forms nodular groups of minute needles, very soluble in water. Nitric acid (*S G* 15) converts methyl hydantoin into the nitramine

$CO \begin{smallmatrix} \text{NMe} \cdot CH_2 \\ \text{N}(NO_2) \cdot CO \end{smallmatrix}$ which crystallises from alcohol in scales [168°], v sl sol cold water, decomposed by boiling water

(a)-Methyl-hydantoin *v* **LACTYL-UREA.**

Di-methyl hydantoin $C_4H_5N_2O_4$ *v*

$CO \begin{smallmatrix} \text{NH} \cdot CMe_2 \\ \text{NH} \cdot CO \end{smallmatrix}$ [175°] Formed by slowly

adding HCl to commercial potassium cyanide (containing cyanate) covered by acetone. The liquid, after the action is completed, is left to evaporate, and the crystals which separate extracted with ether, and finally sublimed (Urech, *A* 164, 264). Large prisms, v sol water, alcohol, and ether. Slowly converted by boiling baryta water into acetouramic acid $NH_2 \cdot CO \cdot NH \cdot CMe_2 \cdot CO_2H$. By heating in a sealed tube with fuming hydrochloric acid at 160° it is resolved into CO_2 , ammonia, and a amido isobutyric acid $CMe_2(NH_2) \cdot CO_2H = C_4H_5AgN_2O_4$ crystalline powder, sl sol hot water— $C_4H_5N_2O_4 \cdot AgNO_3$ large prisms, v sol water

METHYL-HYDANTOIN CARBOXYLIC ACID $C_5H_5N_2O_5$ Formed by boiling caffeic acid with baryta water (*E* Fischer, *A* 215, 286). The free acid is decomposed into CO_2 and methyl-hydantoin when its aqueous solution is warmed

METHYL HYDRASTINE $C_7H_{11}NO_6$ *v* $CH_3O \cdot C \cdot C(OMe) \cdot C \cdot CO_2O \cdot CH \cdot C_6H_4(O_2CH_3) \cdot CH$
 $HC \cdot CH = C \cdot C = CH \cdot C \cdot C(C_6H_4NMe_2) \cdot CH$

[156°] Formed, together with hydrastine methylo hydroxide, by the action of alkalis on a solution of hydrastine methylo chloride. Prepared by adding potash to a hot aqueous solution of hydrastine methylo iodide until no further pptn takes place (Freund a Rosenberg, *B* 23, 406). Small yellow needles (from alcohol), almost insol water, sol chloroform, benzene, CS_2 , ether, and dilute alcohol. With sulphomolybdic acid (Froehde's reagent) it gives a violet colour, changing through blue to green. Forms sparingly soluble double salts with $SnCl_4$, zinc chloride, and $HgCl_2$. Ammonia converts it into the amide $C_{10}H_{15}N_2O_6$ [180°] which forms a crystalline hydrochloride $C_{10}H_{15}N_2O_6 \cdot HCl$ 2aq, and on boiling with dilute nitric acid yields hemipic acid (Freund a Heim, *B* 23, 2902). The formula of this amide may be written

$C_6H_2(OMe)_2CONH_2$

$CO \cdot CH_2 \cdot C_6H_2(O_2CH_3) \cdot CH_2 \cdot CH_2 \cdot NMe_2$

and it may also be got by heating hydrastine methylo iodide with alcoholic ammonia. The corresponding methylamide $C_{10}H_{15}N_2O_6$ [182°], ethylamide $C_{12}H_{19}N_2O_6$ [162°], allylamide $C_{12}H_{19}N_2O_6$ [158°], and amylamide $C_{14}H_{23}N_2O_6$ [171°] have been prepared

Salts— $B'HCl$ [241°] M sol hot water. Decomposed on fusion. A 1 p c solution is in active— $B'_2H_2PtCl_6$ sl sol water— $B'H \cdot SO_4$ [250°] Less soluble than the chloride— $B' \cdot HNO_3$ Decomposes at 250° V sl sol water

Methylo-iodide $C_{12}H_{19}NO_6 \cdot MeI$ Yellow needles, more soluble in water than in alcohol. Decomposes at 250° On warming with aqueous KOH it gives off trimethylamine

Methyl-hydrastimide $C_{12}H_{19}N_2O_6$ *v*

$C_6H_2(OMe)_2 \begin{smallmatrix} \text{CO} \cdot NH \\ \text{CO} \cdot NH \end{smallmatrix} \cdot C \cdot CH \cdot C_6H_2(O_2CH_3) \cdot CH_2 \cdot CH_2 \cdot NMe_2$ [192°] Formed by the action of dilute H_2SO_4 on the amide (Freund a Heim, *B* 23, 2899). Yellow needles, insol water, sl sol alcohol— $B'HCl$ [227°]— $B'HCl$ 2aq.— $B'_2H_2PtCl_6$ [205°].

— BH_2SO_4 , [218°] Yellow crystals (from alcohol) — $BHNO_3$ aq

Methylol-iodide $BMeI$ aq [245°]

Methyl hydrastine $C_{22}H_{27}NO_3$, [161°] Formed by warming hydrastine methyl-chloride with excess of KOH aq, or, better, by warming methyl-hydrastine with strong caustic potash (Freund a Rosenberg, *B* 23, 408) Colourless needles (containing aq) (from water), sl sol cold water, more sol hot water and alcohol Decomposed by long heating at 110° Very soluble in alkalis, but reprecipitated by CO_2 , insoluble in aqueous Na_2CO_3 It dissolves in aqueous NH_3 , but is precipitated on evaporation It also dissolves in HCl aq In a 5 p.c. hydrochloric acid solution it is inactive Tertiary base Coloured reddish brown by chlorine water and ammonia Iodine has no action Hot conc HBr aq reconverts it into methyl hydrastine Its salts are colourless — $BHCl$ aq [290°] Compact groups of crystals

Methyl hydrastinine *Methylol iodide* $C_{13}H_{19}NO$, I *re* CHO C_6H_5O , CH_3 , CH_2 , NMe , I [267°] Formed by heating hydrastinine with MeI (Freund, *B* 22, 2329) Pale yellow needles (from alcohol or water) $AgCl$ gives $C_{13}H_{19}NO_2Cl$ [213°], which forms white crystals (containing aq) — $(C_{13}H_{19}NO_2Cl)_2PtCl_2$, yellow crystalline pp

Oxime of the methylol iodide

$HO-N-CH(C_6H_5O)_2NMe$, I Yellowish needles, decomposed at 250° V sol alkalis and precipitated unchanged by acids Gives a dark reddish brown pp with platinum chloride

METHYL HYDRAZINE CN_2H_5 , *re* CH_3NH-NH (87° i.v.) at 745 mm Formed by treating methyl urea nitrate with $NaNO$, reducing the resulting nitroso methyl urea [124°] with zinc and dilute acetic acid, and decomposing the product with HCl (Brunner, *B* 21, 1810, *A* 253, 7) Mobile liquid with strong ammoniacal odour, soluble in water (heat being evolved), miscible with alcohol and ether Reduces Fehling's solution

Salts — BH_2SO_4 , [139.5°] White needles v sol water, sl sol alcohol — $BHCl$ v sol water and alcohol — $B_2C_6H_5(NO)_2O_2H$ [162°] Yellow needles, decomposed on fusion

Di benzoyl derivative $CH_3N_2HBz_2$, [c 143°] Colourless needles (from water), m sol hot water, v sol alcohol, sl sol ether Does not reduce Fehling's solution

Picryl derivative $CH_3N_2H_2C_6H_2(NO_2)_3$, [171°] Obtained from the hydrazine and picryl chloride (chloro tri nitro benzene) in diluted alcoholic solution Yellow plates, v sol alcohol and ether, m sol chloroform Decomposed on fusion

Oxalyl derivative $CH_3N_2H_2CO-CO-N_2H_2CH_3$, [221.5°] Formed by adding an aqueous solution of methyl hydrazine to oxalic ether White needles, v sol alcohol, m sol water, v sl sol ether Sublimes at about 160° in needles Reduces Fehling's solution Nitrous acid forms the nitrosamine $CH_3N_2H(NO)CO-CO-N_2H_2CH_3$, [147°]

Di methyl-hydrazine $C_2H_5N_2$, *re* NMe , NH_2 , (63°) at 720 mm SG Δ 801 VD ($H=1$) 30 Prepared by reducing di methyl nitrosamine $(CH_3)_2NNO$ with zinc dust and acetic acid (Fischer, *B* 9, 111, Renout, *B* 13, 2171) Formed also by reducing di methyl nitramine

$(CH_3)_2NNO$, (Franchimont, *R T C* 2, 123) Light volatile liquid with ammoniacal odour, v sol water, alcohol, and ether Its haloid salts volatilise without decomposition

Reactions — 1 CS_2 forms di methyl thiocarbazoic acid NMe , NH CS_2H — 2 *Phenyl thiocarbimide* (phenyl mustard oil) forms C_6H_5NH CS NH NMe — 3 *Oxalic ether* produces NMe , NH CO CO NH NMe — 4 *Alkyl iodides* unite, forming azonium iodides, such as NH , NMe , I — 5 $K_2S_2O_8$ forms NMe , NH SO_3K , which crystallises in white plates, v sol water It is split up by hot HCl aq into dimethyl hydrazine and H_2SO_4 — 6 HgO oxidises it, forming tetra methyl tetrazone NMe , N N NMe , a yellow oil (130°) which explodes when heated above its boiling point It forms a mirror with ammoniacal $AgNO_3$, even in the cold, and is decomposed by boiling dilute acids into formic aldehyde, NH_3 , Me , nitrogen, and $NHMe$ The tetrazone is a strong base — 7 *Nitrous acid* decomposes it into N_2O and dimethylamine — 8 *Acetophenone* at 100° forms NMe , N $CMepH$, a liquid (165° at 100 mm) It is split up again by acids into its generators (Reisenegger, *B* 16, 663)

Salts — $BHCl$ — BH_2Cl , hygroscopic crystals — $B_2H_2PtCl_6$, orange yellow prisms, v sol water, sl sol alcohol — $B_2H_2SO_4$, [105°] White needles — $B_2H_2CO_4$, colourless plates, v sol water and alcohol, sl sol ether

Ethyl chloride NH , NMe , $EtCl$ Crystallises with difficulty, v sol water The ethyl hydroxide is reduced by zinc dust and acetic acid to HCl , ammonia, and NMe , Et — $(NH_2NMeEtCl)_2PtCl_2$, Crystals

DI-METHYL-DI-HYDRO ANTHRACENE v **DI-METHYL ANTHRACENE DI-HYDRIDE**

METHYL-HYPOPHOSPHATE of calcium $MeCaH_2P_2O_5$, 6aq Needles

METHYLIA. A name formerly used for **METHYLAMINE**.

METHYL-IMESATIN Described as *Imide* of *Methyl-ismatin* under ISATIN

METHYL-INDAZOLE A name employed by Wohl and Marckwald (*B* 22, 1859) to denote the substance usually called **METHYL-GLYOXALINE**
METHYL-INDAZYL MERCAPTAN *v*
SULPHYDRO-METHYL GLYOXALINE

METHYL-IMIDO-DI-METHYL-THIAZOLE $S \langle \text{C(NMe)} \rangle \text{NMe}$ [96°] Formed by the action of chloro acetone on di methyl urea (Traumann, *A* 249, 49) White needles (from water), with strong alkaline reaction Is identical with di methyl amido methyl thiazole

METHYL-IMIDO DI (β) NAPHTHYL SULPHIDE $\text{NMe} \langle \text{C}_{10}\text{H}_7 \rangle \text{S}$ [285°] Formed by heating imido di naphthyl sulphide (10 g) with MeI (5 g) and MeOH (12 c c) for five hours at 150° Formed also by heating di-(β) naphthyl-methyl amine with sulphur (Kym, *B* 23, 2459) Lemon-yellow plates or needles Gives a blue colour with H_2SO_4 containing HNO_3

METHYL-IMIDO PHENYL NAPHTHYL SULPHIDE $\text{NMe} \langle \text{C}_6\text{H}_5 \rangle \text{S}$ [133°] Formed by heating $\text{NH} \langle \text{C}_{10}\text{H}_7 \rangle \text{S}$ with MeI and MeOH at 150° (Kym, *B* 23, 2466) Light greenish-yellow needles, sl sol hot spirit, v e sol hot benzene

METHYL IMIDO DI PHENYL SULPHIDE $\text{C}_6\text{H}_5\text{NS} \text{ v e } S \langle \text{C}_6\text{H}_5 \rangle \text{NMe}$ [99.3°] (c 363°) Formed by heating imido di phenyl sulphide (thiodiphenylamine) with MeI and MeOH in sealed tubes at 110° (Bernthsen, *A* 230, 88, *B* 16, 2899) Long white prisms (from alcohol), insol water, v sol ether, benzene, and hot HOAc Its alcoholic solution is coloured brown by FeCl_3 Nitric acid forms a yellow nitro derivative which, unlike that of imido di phenyl sulphide, is insol NaOHAq The nitro derivative may be reduced to an amido compound which gives a deep bluish green colour with FeCl_3

Isomeride $\text{C}_6\text{H}_5\text{NS} \text{ v e } S \langle \text{C}_6\text{H}_5 \rangle_2\text{NMe}$ or $\text{C}_6\text{H}_5\text{N} \langle \text{C}_6\text{H}_5 \rangle \text{S} (?)$ [79°] Formed by the action of SCl_2 dissolved in petroleum on di phenyl methyl amine NMePh_2 (Holzmann, *B* 21, 2065) Thin yellow scales (from hot benzene alcohol), insol water, sl sol hot alcohol and ether, v sol hot benzene On heating with copper it yields di phenyl methyl amine

METHYL IMIDO-DI PHENYL SULPHONE $\text{C}_6\text{H}_5\text{NSO}_2 \text{ v e } \text{NMe} \langle \text{C}_6\text{H}_5 \rangle \text{SO}_2$ [222°] Formed by the action of KMnO_4 on methyl-imido di phenyl sulphide suspended in water (Bernthsen, *A* 230, 91) Chains of white needles, often slightly reddish (from alcohol) or small compact prisms (from glacial acetic acid) V sl sol cold alcohol, glacial acetic acid or ether Insol acids or alkalis, not affected by boiling KOH or HCl Boiled with conc H_2SO_4 it forms a splendid blue liquid, turned pale violet-brown by pouring into water Its nitro-derivative after reduction gives no colour with FeCl_3

METHYL INDAZINE $\text{C}_6\text{H}_7\text{N}_2 \text{ v e}$

$\text{C}_6\text{H}_7 \langle \text{CMe} \rangle \text{NH}$. Quinazole. *Methyl indazole*.

[113°]. (281° v) at 736 mm V D 4.37 (calc 4.53) Formed by slowly adding NaNO_2 to a paste composed of *o* amido acetophenone and HClAq The resulting diazo compound is soluble in water, and the liquid is poured into a solution of Na_2SO_3 The product at first contains $\text{CH}_3\text{CO C}_6\text{H}_4\text{NH NHSO}_3\text{Na}$, but it gradually loses its reducing power, and deposits needles of

$\text{C}_6\text{H}_7 \langle \text{CMe} \rangle \text{N SO}_3\text{Na}$ When these needles are

heated with HClAq they yield methyl indazine and H_2SO_4 (Fischer a Tafel, *A* 227, 303) Methyl indazine is also formed, together with carbonic acid gas, when indazyl acetic acid

$\text{C}_6\text{H}_7 \langle \text{C CH}_2\text{CO}_2\text{H} \rangle \text{NH}$ is heated

Properties — Colourless needles (from water), m sol hot water, v sol alcohol, ether, and chloroform, almost insol conc NaOHAq May be sublimed Does not reduce Fehling's solution Gives crystalline compounds with metallic salts

Salts — B'HCl [177°] Needles, v sol water and alcohol — Sulphate needles — Picrate yellow crystalline powder — Platino chloride yellow needles

Nitrosamine $\text{C}_6\text{H}_7\text{N}_3\text{O}$ v e

$\text{C}_6\text{H}_7 \langle \text{CMe} \rangle \text{NNO}$ [60°] From B'HCl and

cold aqueous NaNO_2 Yellow needles, v sol alcohol, ether, and chloroform

Di methyl indazine $\text{C}_6\text{H}_9\text{N}_2 \text{ v e}$

$\text{C}_6\text{H}_7 \langle \text{CMe} \rangle \text{NMe}$ [80°] Formed by methylation of the preceding Colourless plates, v sol alcohol, ether, benzene, and hot water

Di methyl ψ indazine $\text{C}_6\text{H}_7 \langle \text{CMe} \rangle \text{NMe} \text{N}$ [36°]

Formed from methyl *o* amido acetophenone by conversion into the nitrosamine

$\text{CH}_3\text{CO C}_6\text{H}_4\text{NMeNO}$ and reducing this body with zinc and HOAc (Fischer a Tafel, *A* 227, 336) Yellow oil, solidifying on cooling as nearly colourless plates Very volatile with steam It forms crystalline compounds with metallic salts — The chloride forms colourless needles — The sulphate crystallises in needles, and the picrate in rectangular tables

METHYL INDAZINE ψ -SULPHONIC ACID

$\text{C}_6\text{H}_7\text{N}_2\text{SO}_3 \text{ v e } \text{C}_6\text{H}_7 \langle \text{CMe} \rangle \text{N SO}_3\text{H}$ The

sodium salt of this acid is formed as described under methyl indazine It is m sol cold water, but ppd on addition of NaOH or NaCl It does not reduce HgO or Fehling's solution Boiling conc HClAq splits it up into NaHSO_4 and methyl-indazine

METHYL INDAZOLE ψ METHYL INDAZINE.

DI-METHYL-INDIGO ψ INDIGO

METHYL-ISO-INDILEUCINE ψ INDIGO.

(In. 1) METHYL INDOLE C_8H_7N i.e.

$C_8H_7\langle\begin{smallmatrix} CMe \\ NH \end{smallmatrix}\rangle CH$ Scatole Skatole [95°]
(266° i V) V D (H=1) 65.2 (calc 65.5)

Occurrence—The chief volatile constituent of human faeces, but not present in that of dogs (Brieger, *J pr* [2] 17, 129, *B* 12, 1986) It occurs among the products of the putrefaction of albuminous substances (Brieger, Nencki, *J pr* [2] 17, 98, *H* 4, 371, *E* a *H* Salkowsky, *B* 12, 651)

Formation—1 By fusing egg albumen with KOH (Nencki)—2 By reducing indigo with tin and HCl, and distilling the product with zinc dust A mixture of indole and scatole is thus obtained, and these are combined with picric acid When the picrates are distilled with conc NaOHAq the indole is destroyed, and the scatole passes over, and may be crystallised from water The yield is 3 p.c. Scatole prepared in this way has no faecal odour (Baeyer, *B* 13, 2339)—3 By heating aniline zinc chloride with glycerine (Fischer a German, *B* 16, 710)—4 By adding nitro cummic acid (6 pts) to amido cummic acid (obtained by reducing 4 pts of the nitro acid), mixing with baryta (10 pts), drying, and distilling (Fileti, *G* 13, 358, 378)—5 The phenyl hydrazide of propionic acid is warmed with $ZnCl_2$, and the product distilled with steam (*E* Fischer, *A* 236, 138)—6 In small quantity in distilling strychnine with lime (Stoehr, *B* 20, 1108, Lobisch a Malfatti, *M* 9, 629)—7 By heating its carboxylic acid (Arnold, *A* 246, 835)

Preparation from pancreas—2,300 grms pancreas and 500 grms flesh are freed from fat, cut up and put into a loosely covered pot containing 8 litres of water The whole is left for 5 months at the ordinary temperature At the end of the fourth month the odour of scatole appears The liquid is acidified with acetic acid and distilled The distillate is acidified with HCl and picric acid is added Red needles of skatepicric acid, $C_8H_7N \cdot C_6H_4(NO_2)_3OH$, separate This is decomposed by ammonia, and the scatole is distilled over with steam and crystallised from water (Nencki, *J pr* [2] 20, 467)

Properties—Glittering plates of powerful faecal odour, sl sol water It differs from indole in giving no colour when its solutions are treated with chlorine water Its solution gives with fuming HNO_3 , an opalescence, with KNO_3 and acetic acid a white pp of the nitrosamine, with CrO_3 a red amorphous pp in concentrated solutions, and with $FeCl_3$ no colour (Brieger, *J pr* [2] 17, 130) It is not attacked by warm dilute HNO_3 It colours pine wood moistened with HCl red, this is best seen by dropping pine wood saturated with an alcoholic solution of scatole into cold conc HClAq (Fischer, *A* 236, 138)

Reactions—1 Potash-fusion yields the corresponding indole carboxylic acid (Ciamician a Magnanini, *B* 21, 673)—2 By passing CO over a mixture of sodium and scatole, heated at 240° there is formed indole (In-1)-carboxylic acid (C a M)—3 With chloroform and NaOEt it yields a chloro methyl-quinoline C_9H_7ClN —4 Benzonic aldehyde and $ZnCl_2$ form, slowly at 100°, $C_8H_7 \cdot CH(C_6H_5 \cdot N)$, which crystallises from alcohol [142°] (Fischer, *B* 19, 2989)—5 When adminis-

tered to animals it appears in the urine in the form of the chromogen of a red pigment and as methyl indyl sulphuric acid $C_8H_7N \cdot SO_3H$ (?) (Brieger, *H* 4, 414, Mester, *H* 12, 130)

Salts— B^+HCl Ppd in needles when ether is added to its alcoholic solution (Wenzing, *A* 239, 239) [168°] Insol ether, v sl sol water, v sol alcohol—Picrate $B^+C_6H_4(NO_2)_3OH$ Red needles

Acetyl derivative so called v METHYL-INDYL METHYL KETONE

Dihydride $C_8H_{11}N$ i.e.

$C_8H_7\langle\begin{smallmatrix} CHMe \\ NH \end{smallmatrix}\rangle CH_2$ (232° i V) at 744 mm

Formed by reducing an alcoholic solution of scatole with zinc dust and HCl (Wenzing, *A* 239, 242) Colourless oil, resembling quinoline and piperidine in odour V sol alcohol, ether, and ligroin Its alcoholic solution stains pine wood, moistened with HClAq, orange It reduces $AgNO_3$ and $FeCl_3$ on warming It yields a nitrosamine which may be reduced to an oily hydrazine With phenyl thiocarbimide it forms a compound melting at 125°— B^+HCl sol. alcohol and water, insol ether—Oxalate [126°], insol ether— $B^+H_2PtCl_6$, yellow needles, sl sol water, decomposed by hot water—Picrate [150°], yellow granular crystals (from benzene)

(In 2) Methyl-indole C_8H_7N i.e.

$C_8H_7\langle\begin{smallmatrix} CH \\ NH \end{smallmatrix}\rangle CMe$ Methyl ketole [60°] (272° i V) at 750 mm V D 4.75 (calc 4.54) (Treadwell, *B* 14, 1466)

Formation—1 By nitrating benzyl methyl ketone with fuming HNO_3 , reducing the resulting $[2]C_8H_7(NO_2)CH_2COCH_3$ with zinc dust and ammonia, and distilling with steam (Baeyer a Jackson, *B* 13, 187, 14, 879)—2 Obtained by heating the phenyl hydrazide of acetone $(CH_3)_2C=N \cdot NHC_6H_5$ (1 pt) with $ZnCl_2$ (5 pts) for half an hour at 100° and then for some minutes at 180° (*E* Fischer, *B* 19, 1564, *A* 236, 124)

Properties—Needles or plates (from ligroin), al. sol hot water, v sol alcohol and ether Smells like indole V sol cold HClAq, but decomposed on boiling with conc HClAq HNO_3 colours its solution yellow, and soon gives a yellow amorphous pp which does not give Liebermann's reaction Colours pine wood, moistened with HClAq, red

Reactions—1 $KMnO_4$ oxidises it to acetyl o amido benzoic acid—2 Potash fusion yields indole (In 2) carboxylic acid (Ciamician a Magnanini, *B* 21, 673)—3 By heating with sodium in a stream of CO_2 at 240° there is formed methyl indole carboxylic acid (Ciamician a Magnanini, *B* 21, 671)—4 Reduced by tin and HCl to a hydride, although sodium amalgam does not act upon it—5 With chloroform and NaOEt it yields chloro methyl quinoline [71°] Bromoform and NaOEt yield the corresponding bromo methyl quinoline (Magnanini, *G* 17, 246)—6 On heating with conc HClAq for 7 hours at 225° there is formed aniline and a liquid base C_9H_9N (250°) which smells like quinoline and forms the salts $B^+H_2PtCl_6$ and B^+HAuCl_4 (Magnanini, *B* 20, 2609)—7 Benzonic aldehyde at 100° forms $C_8H_7 \cdot CH(C_6H_5 \cdot N)$, which separates from acetone in colourless shining crystals

[247°], insol water, v. sl sol hot alcohol and ether. On boiling with FeCl_3 in HOAc it is converted into di-methyl rosindole (Fischer, *A* 242, 378, *B* 19, 2988) — 8 *Nitro-benzoic aldehyde* heated with (*In* 2) methyl indole on the water bath forms the corresponding $[\text{3.1}]\text{O}_2\text{C}_6\text{H}_4(\text{NO}_2)\text{CH}(\text{C}_6\text{H}_5)_2$, small crystals (from acetone), sl sol alcohol, ether, and HOAc . This body melts at 263° , and is reduced by zinc dust and ammonia to $\text{C}_6\text{H}_4(\text{NH}_2)\text{CH}(\text{C}_6\text{H}_5)_2$, a yellow crystallisable oil (Fischer, *A* 242, 375) — 9 By fusing with *phthalic anhydride* and a little ZnCl_2 , there is formed an acid $\text{C}_6\text{H}_4\text{NO}_2$, probably $\text{C}_6\text{H}_4\text{N CO C}_6\text{H}_4\text{CO}_2\text{H}$ which crystallises from alcohol in colourless prisms, insol water, l sol ether, v sol hot alcohol and HOAc (Fischer) — 10 On heating with *benzoyl chloride* and a little ZnCl_2 , the products are di-methyl-rosindole $\text{C}_6\text{H}_4\text{N}_2$ and benzoyl methyl indole. — 1 On heating with *zinc chloride* alone, a small quantity of quinoline is formed (Fischer a Steche, *B* 20, 819) — 12 *Diazo benzene chloride* and NaOAc form compact red crystals (from petroleum ether) of $\text{C}_6\text{H}_4\text{N N C} \begin{smallmatrix} \text{C}_6\text{H}_5 \\ \text{CMe} \end{smallmatrix} \text{NH}$, 116° , insol water, v sol alcohol, ether, and benzene, m sol petroleum ether. This body is split up again, by reduction, into aniline and amido methyl indole $\text{C}_6\text{H}_4 \begin{smallmatrix} \text{C}(\text{NH}_2) \\ \text{NH} \end{smallmatrix} \text{CMe}$

[113°] (Fischer, *A* 242, 384) — 13 When (*In* 2)-methyl indole (1 pt) is heated with MeI (2½ pts) and a little methyl alcohol at 100° for 15 hours, here is produced di-methyl quinoline dihydride (243°) (Fischer a Steche, *B* 20, 818, 2199)

Salts — B^+HI^- Formed by passing dry HI into a solution of the methyl indole in ether (Wagner, *A* 242, 388). Flocculent pp, very easily decomposed by water and by moist air — $\text{B}^+\text{H}_2\text{PtCl}_6$ 3aq yellow needles, decomposed by water

Acetyl derivative $\text{C}_6\text{H}_4 \begin{smallmatrix} \text{CH} \\ \text{NAc} \end{smallmatrix} \text{CMe}$ (200° – 210° at 40 mm) Formed in small quantity, together with methyl indyl methyl ketone (*q v*), by heating (*In* 2) methyl indole with Ac_2O and NaOAc . The product is extracted with chloroform, and the extract distilled *in vacuo* (Magnanini, *G* 18, 95). Pale yellow liquid. Decomposed by boiling aqueous KOH into KOAc and methyl indole. Yields indole carboxylic acid on fusion with potash. KMnO_4 oxidises it to acetyl o-amido benzoic acid (Ciamician a Marinum, *B* 21, 673)

(8) *Acetyl derivative v METHYL INDOL METHYL KETONE*

Benzoyl derivative $\text{C}_6\text{H}_4\text{NBz}$ [82°] Formed, together with di-methyl rosindole, by heating (*In* 2) methyl indole with BzCl and a little ZnCl_2 on the water bath (Fischer a Wagner, *B* 20, 817). Glittering plates (from alcohol), v sl sol hot water, m sol alcohol and ether

Dihydride $\text{C}_6\text{H}_4\text{N} \begin{smallmatrix} \text{CH}_2 \\ \text{NH} \end{smallmatrix} \text{CMe}$

Hydromethylketone (228° 1 V) at 742 mm Prepared by reduction of (*In* 2)-methyl indole with tin and HCl (Jackson, *B* 14, 883, Wenzig, *A* 239, 244). Colourless oil with powerful odour. Heavier than water. Strong base. With phenyl-thiocarbamide it forms a compound $\text{C}_6\text{H}_4\text{N}_2\text{S}$, which crystallises from ether in prisms

[101°] — $\text{B}^+\text{H}_2\text{PtCl}_6$, orange yellow needles, decomposed by water — Oxalate [130°], crystalline — Picrate [151°], crystalline

Acetyl derivative $\text{C}_6\text{H}_4\text{NAc}$ [56°] From the dihydride and Ac_2O . White needles, insol water, sol most other solvents

Nitrosamine $\text{C}_6\text{H}_4\text{N NO}$ [55°] Formed by adding NaNO_2 to a solution of the hydrochloride of (*In* 2) methyl indole dihydride (Jackson). Yellow crystals (from ligroin), v sol alcohol, ether, and boiling ligroin. On treatment with tin and HCl , methyl indole dihydride is regenerated. On reduction with zinc dust and HOAc it yields the hydrazine $\text{C}_6\text{H}_4\text{N NH}_2$, which crystallises from ligroin in prisms [41°], and yields a crystalline sulphate and hydrochloride

(*In* 3)-Methyl indole $\text{C}_6\text{H}_4 \begin{smallmatrix} \text{CH} \\ \text{NMe} \end{smallmatrix} \text{CH}$ (240° 1 V) at 720 mm SG η 1.0707. Obtained by long heating at about 205° from its carboxylic acid [212°], which is formed by the action of HCl on the phenyl methyl hydrazide of pyruvic acid (Fischer a Hess, *B* 17, 562). Formed also by heating ω chloro methyl o amido styrene $\text{C}_6\text{H}_4(\text{NHMe})\text{CH CHCl}$ with NaOEt at 135° (Lapp, *B* 17, 2510)

Properties — Yellowish liquid, nearly insol water, v sol alcohol, ether, and benzene. Volatile with steam. A chip of pine wood, dipped in HClAq , is coloured violet red by its vapour or solution. It dissolves in conc HClAq and is reprecipitated by addition of water. Fuming nitric acid added to (*In* 3) methyl indole suspended in water gives a deep red colour and finally a red pp

Reactions — 1 An alkaline solution of bromine (NaOBr) converts it into di-bromo methyl oxindole $\text{C}_6\text{H}_3\text{Br}_2\text{NO}$, which crystallises in transparent tables, melting at 204° . It is converted by heating with alcoholic potash into methyl isatin, which is ppd, after boiling off the alcohol, by adding HCl — 2 (*In* 3) methyl indole (2 mols) heated with benzoic aldehyde (1 mol) and ZnCl_2 for 2 hours on the water bath forms $\text{C}_6\text{H}_4\text{CH}(\text{C} \begin{smallmatrix} \text{C}_6\text{H}_5 \\ \text{CH} \end{smallmatrix} \text{NMe})_2$, which crystallises in colourless prisms [197°], insol water, sl sol alcohol and ether, v sol hot acetone and HOAc . It yields a red dye on heating with FeCl_3 in HOAc (Fischer, *A* 242, 377, *B* 19, 2988) — 3 On fusing equal weights of *phthalic anhydride* and (*In* 3) methyl indole with a little ZnCl_2 , at 100° there is formed $\text{C}_6\text{H}_4\text{C}_2\text{O}_2(\text{C}_6\text{H}_5\text{N})$, which crystallises from acetone in colourless prisms [300°]. It is insol water and alkalis, v sl sol ether and alcohol, but v sol hot acetone (Fischer, *A* 242, 382, *B* 19, 2989) — 4 Scarcely attacked by MeI at 100° , but at 120° it appears to yield a methyl quinoline dihydride (Fischer a Steche, *B* 20, 2199)

Picrate $\text{C}_6\text{H}_4\text{N} \begin{smallmatrix} \text{CH} \\ \text{NO}_2 \end{smallmatrix} \text{OH}$ [150°] Long dark red prisms or needles, v sol benzene, sl sol ether. Decomposed by alcohol

Chloro derivative v Di-chloro methyl-indole.

Dihydride $\text{C}_6\text{H}_4 \begin{smallmatrix} \text{CH}_2 \\ \text{NMe} \end{smallmatrix} \text{CH}_2$ (216° 1 V) at 728 mm Prepared by reducing (*In* 3) methyl indole with zinc dust and conc HClAq (Wenzig, *A* 239, 246). Liquid, sl sol water, v sol alcohol and ether, volatile with steam. Most of its salts dissolve in alcohol and water — $\text{B}^+\text{H}_2\text{PtCl}_6$:

yellow needles, decomposed by boiling water — Oxalate [105°] — Picrate [155°], yellow tabs (from benzene)

Tolindole [58 5°] Formed by heating at 240° its carboxylic acid, which is obtained from the *p* tolyl hydrazide of pyruvic ether (Raschen, *A* 239, 226) Needles (from water), m sol hot water, v sol alcohol, ether, benzene, and ligroin Volatile with steam Reacts like indole with pine wood and with nitrous acid — Picrate $\text{B}'\text{C}_6\text{H}_4(\text{NO}_2)_2\text{OH}$ [151°] Red needles (from water)

(In 1,2) Di methyl indole $\text{C}_{10}\text{H}_{11}\text{N}$ *z* *e*

$\text{C}_6\text{H}_5 \begin{array}{c} \text{CMe} \\ \diagup \quad \diagdown \\ \text{NH} \end{array} \text{CMe.}$ [108°] (285°; ∇) Formed by heating the phenyl hydrazide of methyl ethyl ketone with ZnCl_2 at 180° (E Fischer, *B* 19, 1565, *A* 236, 126) Formed also by heating bromo acetyl propionic acid $\text{CH}_3\text{COCHBrCH}_2\text{CO}_2\text{H}$ (1 pt) with aniline (3 pts) at 100° (Wolff, *B* 20, 427, 21, 123) Obtained likewise by heating

Properties — White plates (from dilute alcohol) Smells like indole V sl sol hot water, v e sol alcohol and ether, sl sol cold ligroin Dissolves in conc HClAq but is reprecipitated on dilution with water Does not colour pine wood

Reactions — 1 NaNO_2 added to its solution in HOAc forms a nitrosamine [63°], crystallising in yellow needles, v sl sol water, v sol alcohol By zinc dust and HCl it is reconverted into di methyl indole It exhibits Liebermann's reaction — 2 MeI in MeOH converts it into tri methyl quinoline dihydride

Picrate $\text{B}'\text{C}_6\text{H}_4(\text{NO}_2)_2\text{OH}$ [157°] Brown needles (from alcohol)

Dihydride $\text{C}_6\text{H}_5 \begin{array}{c} \text{CHMe} \\ \diagup \quad \diagdown \\ \text{NH} \end{array} \text{CHMe}$ (231°) at 750 mm Formed by reducing di methyl indole with zinc dust and HClAq (Steche, *A* 242, 371)

(In 2,3) Di methyl indole $\text{C}_{10}\text{H}_{11}\text{N}$ *z* *e*

$\text{C}_6\text{H}_5 \begin{array}{c} \text{CH} \\ \diagup \quad \diagdown \\ \text{NMe} \end{array} \text{CMe}$ [56°] Formed by heating the phenyl methyl hydrazide of acetone (1 pt) with zinc chloride (5 pts) for 3 hours at 130° (Fischer, *B* 19, 1565, Degen, *A* 236, 153) Formed also by heating its carboxylic acid

$\text{C}_6\text{H}_5 \begin{array}{c} \text{C}(\text{CO}_2\text{H}) \\ \diagup \quad \diagdown \\ \text{N}(\text{CH}_3) \end{array} \text{CMe}$ at 200° (D) White needles, v sol alcohol, ether, benzene, and ligroin, v sl sol water, v sol conc HClAq May be distilled without decomposition It gives the pine wood test very distinctly Nitrous acid forms a complicated product The picrate crystallises in dark red needles The hydride is v sol weak acids

(In 1,3) Di methyl indole $\text{C}_6\text{H}_5 \begin{array}{c} \text{CMe} \\ \diagup \quad \diagdown \\ \text{NMe} \end{array} \text{CH}$ (230°–255°) Formed by heating the phenyl-methyl hydrazide of *n* propionic aldehyde (1 pt) with ZnCl_2 (5 pts) at 135° (Degen, *A* 236, 163) Oil

(B 2-In-3) Di-methyl-indole $\text{C}_{10}\text{H}_{11}\text{N}$ *z* *e*

(242°–245°) Formed by heating its carboxylic acid at 225° (Hegel, *A* 232, 216) Liquid, volatile with steam, v sol. alcohol, ether, and benzene Dyes pine wood, moistened with HCl , red, fuming HNO_3 gives a red colour and, finally, a pp The picrate is crystalline

(B 2, In 2) Di methyl indole $\text{C}_{10}\text{H}_{11}\text{N}$ *z* *e*

[114°–117°] Formed by heating the *p*-tolyl-hydrazide of acetone with ZnCl_2 (Raschen, *A* 239, 227) May be distilled without decomposition Almost insol hot water, v sol hot alcohol, ether, and benzene — $\text{B}'\text{C}_6\text{H}_4(\text{NO}_2)_2(\text{OH})$ [155°] Dark red needles (from benzene)

(B 4, In 2) Di methyl indole $\text{C}_{10}\text{H}_{11}\text{N}$ *z* *e*

tained by the action of heat on its carboxylic acid, which is derived from the *o* tolyl methyl-hydrazide of pyruvic acid (Hegel, *A* 232, 220) Liquid, smelling like indole, volatile with steam Dyes pine wood, acidified by HCl , violet red. Behaves like indole towards nitrous acid

Di-methyl indole $\text{C}_{10}\text{H}_{11}\text{N}$ (275°) Formed by allowing a solution of the hydrochloride of (a) di methyl dipyrrole in dilute H_2SO_4 to stand for some time in the cold (Dennstedt, *B* 21, 3439) Liquid, volatile with steam — Picrate $\text{B}'\text{C}_6\text{H}_4(\text{NO}_2)_2\text{OH}$ [156°] Dark red silky needles (from benzene)

Di methyl indole $\text{C}_{10}\text{H}_{11}\text{N}$ (c 270°) Formed from (B) di methyl dipyrrole in the same way as the preceding isomeride (D) Liquid Smells like scatole — Picrate $\text{B}'\text{C}_6\text{H}_4(\text{NO}_2)_2\text{OH}$ [149°] Red silky needles

(In 1,2,3) Tri methyl indole $\text{C}_{11}\text{H}_{13}\text{N}$ *z* *e*

$\text{C}_6\text{H}_5 \begin{array}{c} \text{CMe} \\ \diagup \quad \diagdown \\ \text{NMe} \end{array} \text{CMe}$ (280°) Formed by heating di methyl indyl acetic acid for several hours at 210° (Degen, *A* 236, 160) Formed also by heating the phenyl methyl hydrazide of methyl ethyl ketone with ZnCl_2 at 180° (D) Yellow oil with characteristic odour Miscible with alcohol and ether Gives no colour to pine wood Picrate $\text{B}'\text{C}_6\text{H}_4(\text{NO}_2)_2\text{OH}$ [150°] Dark red needles (from hot benzene)

(B 4, In 1,2) Tri methyl indole $\text{C}_{11}\text{H}_{13}\text{N}$ *z* *e*

Formed by heating bromo acetyl propionic (bromo levulic) acid $\text{CH}_3\text{COCHBrCH}_2\text{CO}_2\text{H}$ with *o* toluidine (Wolff, *B* 21, 3362) White plates, v sol alcohol, chloroform, and petroleum ether, v sl sol water Volatile with steam — Picrate $\text{B}'\text{C}_6\text{H}_4(\text{NO}_2)_2\text{OH}$ [152°] Purple red scales

(B 2, In 1,2) Tri-methyl indole $\text{C}_{11}\text{H}_{13}\text{N}$ *z* *e*

Formed by warming β bromo acetyl propionic acid (1 pt) with *p* toluidine (3 pts), and finally heating the mixture to boiling (Wolff, *B* 21, 3361) Plates, v sol alcohol, chloroform, and petroleum ether, v sl sol water Does not give the pine wood reaction The solution in HOAc , mixed with FeCl_3 , becomes green on boiling, and

finally blue Picrate $B/C_6H_3(NO_2)_3OH$ [189°] Brownish-red needles, v sol benzene and alcohol

Nitrosamine $C_8H_7<\frac{CMe}{N(NO)}>CMe$ [73°] Golden-yellow needles, v e sol alcohol and HOAc, sl sol water

Tetra-methyl-indole $C_{12}H_{15}N$ (235°) Light-yellow oil, with characteristic odour (Dennstedt, B 22, 1924) Picrate $B/C_6H_3(NO_2)_3OH$ [100°] Shining red needles

METHYL-INDOLE ACETIC ACID v **METHYL-INDYL-ACETIC ACID**

(In 1)-**METHYL-INDOLE** (In 2)-**CARBOXYLIC ACID** $C_{10}H_9NO_2$ \pm e

$C_8H_7<\frac{CMe}{NH}>C CO_2H$ *Scatole* (β)-carboxylic acid [165°] Formed by saponifying with alcoholic potash its ether which is obtained by boiling with alcoholic hydrogen sulphate (10 p c), the phenyl hydrazide of ethyl glyoxylic ether $CH_3CH_2C(N,HPH)CO_2H$ (Wilschusen a Arnold, B 20, 3395, A 246, 335) Formed also by heating scatole with sodium in a current of CO_2 at 240° (Ciamician a Magnanini, G 13, 61, B 21, 672, 1927, *Rend Accad Linc* [4] 4, 740) Thin white needles (from boiling water), v sol alcohol and benzene, v sl sol water Its alcoholic solution is coloured deep red by $FeCl_3$. On heating above 165° it is split up into CO_2 and scatole [95°] — AgA' white powder, insol water

Ethyl ether EtA' [134°] Needles (from alcohol), insol water, v e sol benzene and ether

(In 1)-**Methyl-indole carboxylic acid** $C_{10}H_9NO_2$ *Scatole* (α) carboxylic acid [164°] (Possibly identical with the preceding acid) Occurs among the products of the putrefaction of serum albumen, and of muscular tissue (H a E Salkowsky, B 13, 191, 2217, H 8, 23, 9, 8) Small plates (from benzene) Decomposed on heating above its melting point into CO_2 and scatole v sl sol cold water, v sol alcohol and ether, m sol benzene $FeCl_3$ colours its dilute solution (containing HCl) violet on boiling Nitrous acid colours its dilute solution cherry red, and presently gives a pp Bleaching powder colours a dilute solution, acidified by HCl , purple, this reaction, and that with nitrous acid, are not exhibited by (In 1)-indole (In 2) carboxylic acid — AgA' Sparingly soluble pp

(In 2) **Methyl-indole** (In 1)-carboxylic acid $C_8H_7<\frac{C CO_2H}{NH}>CMe$

Methyl ketole carboxylic acid [172°] or [183°] Prepared by heating (In 2)-methyl indole (10 g) mixed with sodium (3 g) in a current of dry CO_2 first at 235° and finally at 315°, the unaltered methyl-indole is removed by steam distillation, and the acid re-crystallised from acetone (Ciamician a Magnanini, G 13, 60, B 21, 672, *Rend Accad Linc* [4] 4, 740) White crystalline powder, completely decomposed at its melting point into CO_2 and methyl indole (methyl ketole), this decomposition is partially effected by merely boiling the aqueous solution Sl sol water and benzene, v sol alcohol and acetone It gives white pps with lead and mercuric salts, and a

green pp with a cupric salt — AgA' white oryztalline pp

(In 3)-**Methyl-indole** (In 1) carboxylic acid $C_8H_7<\frac{C(CO_2H)}{N(CH_3)}>CH$ [212°] Obtained by

heating the phenyl methyl hydrazide of pyruvic acid (1 pt) with 10 p c aqueous HCl (15 pts) on the water bath (E Fischer a Hess, B 17, 559) White needles, v sol hot alcohol, ether, and benzene, sl sol hot water, nearly insol cold water Its solution in H_2SO_4 is red By prolonged heating at its melting point it is split up into CO_2 and (In 3)-methyl-indole Readily oxidised by $KMnO_4$. An alkaline solution of Br or Cl oxidises it to methyl- ψ isatin and CO_2

(B 4)-**Methyl-indole** (In 2) carboxylic acid $CH CH C CH > C CO_2H$ [171°] Formed by

saponifying with alcoholic potash its ethyl ether which is obtained by heating the o-tolyl hydrazide of pyruvic ether (1 pt) with $ZnCl_2$ (1 pt) at 220° (Raschen, A 239, 228) Needles (from water), v sol alcohol, ether, and HOAc

(B 2)-**Methyl-indole** (In 2) carboxylic acid $CMe CH C CH > C CO_2H$ [228°] Formed from

its ethyl ether which is obtained by heating the p-tolyl hydrazide of pyruvic ether with $ZnCl_2$ at 220° (Raschen, A 239, 228) Needles (from water), m sol hot water, v sol alcohol, ether, chloroform, and HOAc Decomposed on fusion into CO_2 and (B 2) methyl indole

Ethyl ether EtA' [160°] Colourless needles or plates

(In 2, 3) **Di-methyl-indole** (In 1)-carboxylic acid $C_{11}H_{11}NO_2$ \pm e $C_8H_7<\frac{C(CO_2H)}{NMe}>CMe$

[185°] Formed by saponifying its ether which is obtained by heating the phenyl methyl hydrazide of acetoacetic ether with $ZnCl_2$ (Fischer, B 19, 1569, Degen, A 236, 157) Six-sided plates, m sol hot alcohol and chloroform, sl sol water, ether, benzene, and ligroin Splits up at 200° into CO_2 and (In 2, 3) di-methyl indole The Na salt is insol conc $NaOHAq$ The Ag salt is insol NH_4Aq Colours pine wood

Ethyl ether EtA' [95°] Colourless needles (from alcohol-ligroin), v sol alcohol ether, benzene, and chloroform, sl sol ligroin

(B 4, In 3) **Di-methyl indole** (In 2)-carboxylic acid $C_{11}H_{11}NO_2$ \pm e

$CH CH C CH > C CO_2H$ [210°] Formed by

warming the o-tolyl methyl-hydrazide of pyruvic acid (1 pt) with phosphoric acid (20 pts of S G 1 17) on the water bath (Hegel, A 262, 220) Colourless needles (from benzene), v e sol alcohol Splits up on heating into CO_2 and the corresponding di-methyl indole When its alkaline solution is warmed with $NaOCl$ and the product heated with water there is formed di-methyl ψ isatin $C_8H_7Me<\frac{CO}{NMe}>CO$ [157°]

(B 2, In 3)-**Di-methyl-indole** (In 2) carboxylic acid $CMe CH C CH > C CO_2H$ [221°].

Formed by warming the p-tolyl methyl hydra-

sides of pyruvic acid (1 pt) with HCl (20 pts of 10 p.c.), the acid being pptd (Hegel, *A* 232, 216). Needles (from hot alcohol), sl sol ether, sol hot benzene, chloroform, and glacial HOAc, insol in groin. Forms the corresponding di-methyl-indole on heating. A neutral solution of its Na salt gives with NaOCl a yellow crystalline ppt [135°], which on boiling with water is changed to di-methyl-ψ isatin $C_8H_7Me \begin{smallmatrix} <CO \\ <NMe \end{smallmatrix} > CO$ crystals, crystallising in red needles [148°].

METHYL INDONAPHTHENE $C_{11}H_{10}$, *ψ* $C_8H_7 \begin{smallmatrix} <CMe \\ <CH_2 \end{smallmatrix} > CH$ Methyl-indene (206°)

(Roser), (201°) (Von Pechmann, *B* 16, 516). Formed by distilling methyl indonaphthene carboxylic acid with soda lime (Roser, *A* 247, 159). Transparent highly refractive liquid, smelling somewhat like naphthalene. Absorbs oxygen from the air, becoming gummy. On heating with conc HClAq it also becomes gummy, and H₂SO₄ has a like effect. By heating with HIAq at 180° it is converted into a solid body, fusible under water, v sol ether, sl sol alcohol.

Picric acid compound
 $C_8H_7C_6H_2(NO_2)_3OH$ [76°] Unstable orange powder (Von Miller, *B* 23, 1882).

METHYL INDONAPHTHENE CARBOXYLIC ACID $C_{11}H_{10}O_2$, *ψ* $C_8H_7 \begin{smallmatrix} <CMe \\ <CH_2 \end{smallmatrix} > CCO_2H$

'Dihydronaphthoic' acid [200°] Formed by gently warming benzyl aceto acetic ether (1 pt) with conc H₂SO₄ (7 pts), and pouring the product into water (Von Pechmann, *B* 16, 516, Roser, *B* 20, 1574, *A* 247, 158). White needles (from alcohol), almost insol water, m sol hot alcohol and ether. Crystallises from glacial acetic acid in prisms (containing HOAc). May be distilled with slight decomposition, but when boiled for a long time it splits up into CO₂ and methyl indonaphthene. On oxidation it yields phthalic acid.

Methyl ether *MeA' [78°] Small needles, v sol alcohol and ether.

Di-bromide $C_8H_7 \begin{smallmatrix} <CMeBr \\ <CH \end{smallmatrix} > CBr CO_2H$

[215°] Formed by exposing the acid to bromine-vapour. White crusts (from ether). On warming with HOAc it gives off HBr and leaves $C_8H_7 \begin{smallmatrix} <CMeBr \\ <CH \end{smallmatrix} > C CO_2H$ [245°], which forms a methyl ether melting at 100°.

Methyl ether $C_8H_7BrCO_2Me$. [157°] White needles, sl sol methyl alcohol.

METHYL INDONAPHTHENE DIHYDRIDE CARBOXYLIC ACID $C_{11}H_{12}O_2$, *ψ* $C_8H_9 \begin{smallmatrix} <CHMe \\ <CH_2 \end{smallmatrix} > CH CO_2H$ Methyl-hydrindonaphthene carboxylic acid [80°] (300°-310°)

Formed by the action of sodium amalgam on an alkaline solution of methyl indonaphthene carboxylic acid (Roser, *B* 20, 1574, *A* 247, 165). Small needles (from hot water), v sol alcohol and ether, scarcely volatile with steam. On continued heating above 310° it becomes viscid, but the crystalline acid is reproduced on treating this viscid mass with alkalis—AgA'—BaA', 2aq needles (from alcohol), v sol water.

METHYL INDONAPHTHOQUINONE

$C_{11}H_8O$, *ψ* $C_8H_7 \begin{smallmatrix} <CO \\ <CO \end{smallmatrix} > CHMe$. Methyl-di-keto-

hydrindene [85°] (c 150° at 18 mm) Formed by the action of sodium on a mixture of ethyl propionate and phthalate (Wishlencus a Kötze, *A* 252, 80). Blunt pyramids (from alcohol) or needles (from light petroleum), sol ether and hot water. The sodium derivative $C_{11}H_7NaO_2$ crystallises in small dark-red prisms.

Di-oxim $C_8H_7 \begin{smallmatrix} <C(OH) \\ <C(OH) \end{smallmatrix} > CHMe$ [117°].

Needles, sol alcohol, ether, alkalis, and HOAc.

Mono-phenyl-hydrazide

$C_8H_7 \begin{smallmatrix} <C(N_2HPh) \\ <CO \end{smallmatrix} > CHMe$ [164°] Crystals, v sol ether and benzene. Forms a green solution in HOAc.

Di-methyl-indonaphthoquinone $C_{11}H_8O_2$, *ψ* $C_8H_7 \begin{smallmatrix} <CO \\ <CO \end{smallmatrix} > CMe$ [108°] (c 250°) Formed

by heating methyl indonaphthoquinone with MeI and MeOH at 100° (W a K). V sol alcohol, ether, and benzene.

Phenyl hydrazide

$C_8H_7 \begin{smallmatrix} <C(N_2HPh) \\ <C(N_2HPh) \end{smallmatrix} > CMe_2$ [184°-187°] Slender yellowish prisms (from alcohol), sol ether and HOAc. FeCl₃ colours its solution in H₂SO₄ intensely dark green.

METHYL INDOPHENINE *ψ* **INDOPHENINE**
METHYL-INDYL ACETIC ACID $C_{11}H_{11}NO_2$, *ψ* $C_8H_9 \begin{smallmatrix} <C \\ <CH_2CO_2H \end{smallmatrix} > NH$ [195°-200°]

Formed by warming the phenyl hydrazide of acetyl propionic (levulic) acid with ZnCl₂ at 125° (E Fischer, *B* 19, 1565, *A* 236, 149). Colourless plates, sl sol hot water and chloroform, m sol ether, v sol hot alcohol, v e sol acetone and hot HOAc. Nitrous acid yields a nitrosamine. At 225° it is split up, slowly into CO₂ and di-methyl indole. Its picric acid compound crystallises in slender dark red needles.

Di-methyl-indyl-acetic acid $C_{12}H_{13}NO_2$, *ψ* $C_8H_9 \begin{smallmatrix} <C \\ <CH_2CO_2H \end{smallmatrix} > NH$

$C_8H_9 \begin{smallmatrix} <C \\ <NMeCMe \end{smallmatrix} >$ [188°] Formed by

saponification (by alcoholic KOH) of its ether, which is obtained by warming the phenyl methyl-hydrazide of acetyl propionic ether with ZnCl₂ (Fischer, *B* 19, 1568, Degen, *A* 236, 158). Colourless plates, sl sol water, ether, and benzene, v sol alcohol and chloroform. Its alkaline salts are v e sol water, but pptd on addition of caustic alkalis. At 210° it is split up into CO₂ and (In-1,2,3) tri-methyl-indole. Does not give the pine-wood reaction.

METHYL INDYL KETONE *ψ* (β) **Acetyl-INDOLE**

(In 1) **METHYL INDYL METHYL KETONE**

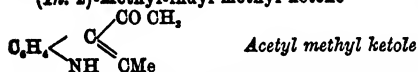

$C_{11}H_{11}NO$, *ψ* $C_8H_9 \begin{smallmatrix} <CMe \\ <NH \end{smallmatrix} > CCOCH_3$ Acetyl-scatole [148°] Formed by heating (In-1)-methyl indole (scatole) (1 g) with AcCl (10 g) and ZnCl₂ (½ g) (Magnanini, *G* 18, 99, *B* 21, 1938). Long needles (from dilute alcohol), insol cold water, v sol hot alcohol and acetone, m sol ether. Volatile with steam. Not affected by KOHAq, but conc HCl forms scatole. Hot conc H₂SO₄ gives a purple solution.

Picrate [156°] Yellow needles, sl sol cold, v sol hot, benzene.

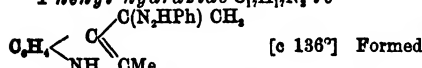

Small needles, decomposed by acids and alkalis, reproducing the ketone

(*In* 2)-Methyl-indyl methyl ketone

[196°]. Formed by heating (*In* 2) methyl indole (methyl ketole) (1 pt) with Ac_2O (5 pts) and NaOAc (1 pt) for six hours with inverted condenser (Jackson, *B* 14, 879, Fischer, *A* 242, 379). Colourless needles (from acetone), sl sol water, v sol alcohol and hot benzene. Dissolves in HClAq . Not decomposed by boiling NaOHAq , but boiling conc HClAq regenerates the ketone. KMnO_4 oxidises it to acetyl amido benzoic acid (Magnanini, *G* 18, 97).

Phenyl hydrazide $\text{C}_{11}\text{H}_9\text{N}_3$, s

by heating the ketone with phenyl hydrazine hydrochloride and NaOAc . Colourless plates, m sol hot benzene, v sl sol petroleum ether.

DI-METHYL INOSITE v DAMBONITE

METHYL-IODAMINE v METHYLAMINE

METHYL IODIDE CH_3I Iodo methane Mol

w 142 (42.8°) (Dobner, *A* 243, 23), (42.3°) (Perkin, *O* J 45, 459) S G 2 3346 (D), 2 2852, 2 2529 (P) S 008 at 15° (Bardy a Bordet, *A* Ch [5] 16, 569) CE (0°–10°) 00118 (D) S V 64.1 (Lossen, *A* 254, 69), 64.8 (Ramsay), M M 9 009 at 15° H F p (gas) +3420 H F v (gas) 2840 (Thomsen, *Th*). Obtained by distilling phosphorus (1 pt) with iodine (8 pts), dissolved in moist methyl alcohol (14 pts), or phosphorus (60 g) with iodine (1000 g) and methyl alcohol (500 g) (Dumas a Pélignot, *A* 15, 30, Pierre, *A* 56, 147, Landolt, *A* 84, 44, Hofmann, *C* J 13, 69). Prepared also from red phosphorus (10 pts), MeOH (35 pts), and I (100 pts) (Personne, *J* 1861, 607, Butlerow, *B* 6, 561), and from KI, MeOH , and gaseous HCl (De Vri, *J* 1857, 441). The distillate is washed with water and rectified over CaCl_2 and lead oxide. Colourless, slightly combustible liquid. Not attacked by gaseous HCl .

Reactions—1 Chlorine converts it into MeCl —2 When heated with zinc it forms I ZnMe . The moist copper zinc couple forms methane (Gladstone a Tribe, *C* J 26, 682)—3 When heated with alloys of K or Na with As or Sb it yields methides of arsenic or antimony—4 With Mg and Al it forms methides—5 When heated in a sealed tube with aqueous NH_3 it forms mono, di, and tri methylamine and NMe_3 —6 With EtOH at 125° it forms EtI and MeOEt (Busse a Kraut, *A* 177, 272)—7 Heated with water (15 pts) at 100° it is converted into methyl alcohol (Niederist, *A* 196, 350)—8 With H_2S and water it forms $\text{MeI}(\text{H}_2\text{S})$, 28aq (Forcrand, *A* Ch [5] 28, 21)—9 Sulphur at 160° to 190° forms SMe_2 and other products (Klinger, *B* 10, 1880).

Hydrate (MeI), aq [–4°] (F), [4.8°] (Villard, *C* R 111, 185). Formed by passing a current of moist air through the iodide (Forcrand, *C* R 90, 1491).

METHYL-iodoform v TRI IODO ETHANE

METHYL-ISATIC ACID v ISATIC ACID

METHYL-ISATIN v ISATIN

METHYL-ISATOIC ACID v ISATOIC ACID

METHYL-ISATOID v ISATOID

METHYL-ITACONIC ACID $\text{C}_6\text{H}_4\text{O}_4$, [166°].

A product of the distillation of methyl paraconic acid (Fränkel, *A* 255, 37). Formed also by heating a solution of methyl citraconic acid at 150° in sealed tubes. Prisms, sol water, insol chloroform. When distilled it partially carbonises, and is partially converted into the isomeric methyl citraconic acid. Nitric acid appears to convert it into methyl mesaconic acid [195°]. Sodium amalgam reduces it to ethyl succinic acid— $\text{BaA}''\frac{1}{2}\text{aq}$ — $\text{CaA}''\text{aq}$ — AgA'' .

METHYL-KETOLE v (*In* 2) METHYL

INDOLE

DI METHYL-KETONE is ACETONE

Di methyl di ketone $\text{C}_4\text{H}_8\text{O}_2$, s

$\text{CH}_3\text{COCOCH}_3$, Di acetyl (88°) S G 27 9734 S 25 at 15° Formed by heating its dicarboxylic acid (ketipic acid) either by itself or with dilute H_2SO_4 (Fittig, *B* 20, 3179, *A* 249, 200). Formed also from its mono oxim (nitroso methyl ethyl ketone) by successive treatment with NaHSO_3 and dilute acid $\text{CH}_3\text{CO Me NOH} + \text{H}_2\text{SO}_4 + \text{H}_2\text{O} = \text{CH}_3\text{CO COMe} + \text{NH}_4\text{SO}_4$ (Von Pechmann, *B* 20, 3162). Most easily prepared by saponifying methyl aceto acetic ether with dilute (3 p c) alkali, treating the product with NaNO_2 and H_2SO_4 , removing alcohol by distillation, adding dilute H_2SO_4 (20 vols of 15 p c), and distilling with steam (Von Pechmann, *B* 21, 1411). Yellow mobile liquid, smelling like acetone and quinone, miscible with alcohol and ether. Decomposed by alkalis or hot alkaline carbonates. Forms metallic derivatives of trimethyl glyoxaline with ammoniacal solutions of silver nitrate and of cuprous chloride. With alcohol it forms an unstable compound $\text{C}_4\text{H}_8\text{O}_2\cdot\text{HOEt}$, boiling at 75°. With water it forms a crystalline hydrate ($\text{C}_4\text{H}_8\text{O}_2$), 2aq, insol water, alcohol, and ether. Yields a very unstable compound with SO_2 . Combines with NaHSO_3 .

Reactions—1 With HCy it forms the nitrile of di oxy di methyl succinic acid—2 Bromine dissolved in CS_2 forms a di bromo derivative $\text{C}_4\text{H}_6\text{Br}_2\text{O}_2$ [117°]—3 Ammonia forms tri

4 When warmed with o tolylene diamine acetate it is converted into tri methyl quinoxaline $\text{C}_6\text{H}_3\text{Me}_3$, which crystallises from light petroleum in prisms [91°] (270°)—5 Aniline forms the anilide PhN Me Me NPh , which crystallises from alcohol in lustrous sulphur-yellow scales [133°], v sol ether, m sol alcohol, insol water—6 On adding dilute aqueous NaOH or Na_2CO_3 to an aqueous solution of the diketone until it becomes colourless, then at once acidifying with dilute H_2SO_4 , and extract-

ing with ether, the product is di methyl quino-
gen $\text{CH}_2\text{CO CMe CH CO CO CH}_2$, a yellowish
bitter syrup, which forms a phenyl-hydrazide
 $\text{C}_6\text{H}_5\text{N}(\text{N}_2\text{HPh})$, [205°], and is converted by excess
of alkali into *p*-xyloquinone—7 Heated with
an aqueous solution of *urea* it forms di methyl
glycolurate $\text{C}_6\text{H}_5\text{N}_2\text{O}_2$ (Franchi nont a Klobbie,
R T C 7, 251)—8 Reduced in alkaline solu-
tion to a product $(\text{CH}_2\text{CO CH(OH) CH}_2)_2$, which
instantly reduces Fehling's solution in the cold

Mono-oxim $\text{CH}_2\text{CO C(NOH) CH}_2$ *Iso*
nitroso methyl ethyl ketone [74°] (186°)
VD 351 (calc 349) Formed by treating
methyl aceto acetic ether (1 mol) with aqueous
KOH (3 mols), followed by nitrous acid (V
Meyer a Züblin, *B 11*, 322) Prisms (from
chloroform) or plates (from water), *v e* sol
alcohol, ether, and chloroform Decomposed
by heating with dilute HClAq at 140° into am-
monia and acetic acid Boiling conc HClAq
yields HOAc, hydroxylamine, and a little of the
dioxim (Schramm, *B 16*, 177) By boiling with
dilute H_2SO_4 it is split up into hydroxylamine
and the diketone (Von Pechmann, *B 20*, 3213)
Treatment with aqueous NaHSO_3 and dilute
 H_2SO_4 also forms di methyl diketone (Von Pech-
mann, *B 20*, 3162) Alkaline K_2FeCy_4 oxidises
it, even in the cold, to acetic and nitrous acids
(Gutknecht, *B 12*, 2290) On reduction by
 SnCl_2 and HCl , followed by removal of tin by
 H_2S and addition of alkali, tetra methyl pyrazine
is obtained But if the solution is allowed to stand
when acid another base is got (Braun, *B 22*,
559)

Methyl ether of the mono oxim
 $\text{CH}_2\text{CO C(OMe) CH}_2$ (125° cereasol) Colour-
less oil, lighter than water (Cereasole, *B 16*,
834)

Di oxim $\text{CH}_2\text{C(NOH) C(NOH) CH}_2$ *Me*
thyl ethyl acetoximic acid [234°] Formed
by the action of hydroxylamine on the mono
oxim (Schramm, *B 16*, 179, Auwers a V Meyer,
B 21, 3527) or on the diketone (Fittig, *A 249*,
204) Small colourless needles, insol water, *v*
sol alcohol and ether May be sublimed

Oxim phenyl hydrazide
 $\text{CH}_2\text{C(NOH) C(N}_2\text{HPh) CH}_2$ [158°] Formed
from the oxim and phenyl hydrazine (Von Pech-
mann a Wehsarg, *B 21*, 2997) Large crystals
(from alcohol) Its solution in H_2SO_4 is coloured
bluish violet by FeCl_3

Phenyl-hydrazide
 $\text{CH}_2\text{CO C(N}_2\text{HPh) CH}_2$ [138°] Formed by
running a solution of diazobenzene chloride
into one of methyl acetoacetic acid, the reaction
being completed by adding a solution of NaOAc
(Japp a Klingemann, *B 21*, 549, *A 247*, 218,
Von Pechmann, *B 21*, 1411) Yellow tables
(from benzene) Forms a yellow solution in
conc H_2SO_4

Di-phenyl di hydrazide
 $\text{CH}_2\text{C(N}_2\text{HPh) C(N}_2\text{HPh) CH}_2$ [243°] (Japp),
[239°] (Fittig) Formed by treating the mono
phenyl hydrazide with phenyl hydrazine (Japp,
A 247, 218), or by the action of phenyl-hydra-
zine on an ethereal solution of di methyl di
ketone (Fittig, *A 249*, 203, Von Pechmann,
B 20, 3164) Formed also by heating the
phenyl hydrazide of pyruvic acid (Japp a
Klingemann, *B 21*, 550) Yellowish needles,
almost insol water, alcohol, and ether, *sl* sol

chloroform, *m* sol acetone and hot benzene
Dissolves in cold conc H_2SO_4 forming a brown
solution, which after some time becomes dirty
wine red, appearing green in thin layers $\text{K}_2\text{Cr}_2\text{O}_7$
in HOAc oxidises it to the 'osotetrazone'
 $\text{CH}_2\text{C N NPh}$

$\text{CH}_2\text{C N NPh}$, which crystallises in matted red
needles [169°], insol water, sol chloroform and
benzene, *m* sol ether, *sl* sol acetone and alco-
hol, almost insol HOAc This 'osotetrazone'
is reduced to the original diphenyl dihydrazide
by warming with phenyl hydrazine HCl con-
verts the 'osotetrazone' into an 'osotriazone'
 $\text{CH}_2\text{C N}$

$\text{CH}_2\text{C N}$ > NPh, which is a very weak base,
[35°], (*c* 255°), insol water, sol alcohol and
ether (Von Pechmann, *B 21*, 2759)

DI METHYL DI-KETONE DICARBOXYLIC
 $\text{ACID C}_6\text{H}_5\text{O}_4$ *ie* $\text{CO}_2\text{H CH}_2\text{CO CO CH}_2\text{CO}_2\text{H}$ *Di-keto*
adipic acid Ketipic acid Ketipic acid Obtained by warm-
ing its ethyl ether with cold conc HClAq (Fittig
a Daumler, *B 20*, 203, *A 249*, 183) White
amorphous powder, insol or *v sl* sol cold water,
alcohol, chloroform, CS_2 , benzene, and petroleum
ether On heating alone or with dilute H_2SO_4 it
is converted into dimethyl diketone

Ethyl ether $\text{Et}_2\text{A}''$ [77°] Prepared by
warming oxalic ether with chloro-acetic ether
and amalgamated granulated zinc at 80° for
three days The mass is extracted with water
and the insoluble portion treated with dilute
 H_2SO_4 , and the solution so obtained extracted
with ether The ether is distilled off, and the
ketipic ether left recrystallised from alcohol
(Fittig a Daumler) Formed also by the action
of NaOEt and oxalic ether on acetic ether (Wis-
licenus, *B 20*, 589, *A 246*, 323) Colourless
plates or prisms, insol cold water, *v* sol ether
and chloroform, *m* sol hot alcohol, benzene,
and CS_2 Decomposed by boiling water FeCl_3
colours its alcoholic solution deep red

Reactions—1 Bromine added to a warm
solution of the ether in CS_2 forms
 $\text{CO}_2\text{Et CBr}_2\text{CO CO CBr}_2\text{CO}_2\text{Et}$ [119°], which is
converted by ammonia into oxamide and di
bromo acetamide [156°] Bromine added to a
solution of ketipic ether in cooled CS_2 forms
 $\text{CO}_2\text{Et CHBr CO CO CHBr CO}_2\text{H}$, which is de-
posited in colourless plates [70°]—2 Chlorine
passed into a boiling solution of the ether in
chloroform forms $\text{CO}_2\text{Et CCl}_2\text{CO CO CCl}_2\text{CO}_2\text{Et}$
[93°], which is also produced by chlorinating
di oxy quinone dicarboxylic ether (Böninger, *B*
22, 1285)—3 Phenyl hydrazine forms a phenyl
hydrazide

$\text{CO}_2\text{Et CH}_2\text{C(N}_2\text{HPh) C(N}_2\text{HPh) CH}_2\text{CO}_2\text{Et}$
crystallising from chloroform in light yellow
needles [160°-180°]

TRI METHYL PYRIDINE

DI-METHYL-MALEIC ACID $C_4H_4O_4$, &c.**CO₂H.COMe OMe.CO₂H.** *Pyrocinchoninic acid**Di-methyl-fumaric acid.* *Di-methyl-ethylene**di-carboxylic acid* *Butylene dicarboxylic acid*

Formation—1 Its anhydride is formed by the dry distillation of cinchoninic acid $C_4H_4O_4$ (Weidel & Schmidt, *B* 12, 1151; Weidel & Brix, *M* 8, 608)—2 The anhydride is formed by distilling the mother liquor from the preparation of terebic acid by oxidation of turpentine with HNO_3 (Roser, *B* 15, 1818)—3 By heating the lactone $CH_2.C(CO_2H).CH(CO_2H).CH_2.CO$ at 180°

(Rach, *A* 234, 39)—4 Together with di-chloro di-methyl succinic acid $CO_2H.CClMe.CClMe.CO_2H$ by the action of reduced silver upon di- α -chloro propionic acid (Otto & Beckurts, *B* 18, 825)—5 By the action of reduced silver upon di-chloro di methyl succinic acid (O & B)—6 The anhydride is formed by treating either 'anti' or 'para' di-methyl-succinic acid in the fused state with bromine (Bischoff & Voit, *B* 23, 646)

Properties—The free acid is unstable, on adding an acid to its salts the anhydride is at once pptd. The sodium salt gives a dark red colouration with $FeCl_3$, and crystalline pps with $Pb(NO_3)_2$ and $HgCl_2$.

Salts— Na_2A'' aq white crystalline solid— Na_2A'' l₂ aq— CaA'' small needles, less sol hot water than cold (Roser)— CaA'' aq small white plates (O & B)— BaA'' white glistening plates, more sol cold water than hot— Ag_2A'' sparingly soluble pp, decomposed on heating into Ag_2O and the anhydride

Methyl ether Me_2A'' Colourless oil

Ethyl ether Et_2A'' (240°) Oil Formed by treating the anhydride with alcohol and HCl

Anhydride $\begin{matrix} \text{CMe.CO} \\ \parallel \\ \text{CMe.CO} \end{matrix} O$ [96°] (223°)

VD 42 (calc 43) Formed as above. Crystallises in glistening white leaflets or trimetric tables (from water), $a, b, c = 626, 1152, 1$ or $201, 392, 1$ V sol alcohol, ether, and benzene, sl sol cold water. The aqueous solution is acid and has a sweet but burning taste. Volatile with steam. Readily sublimes. Not attacked by HNO_3 . Chromic acid mixture oxidises it to acetic acid and CO_2 . Reduced by sodium-amalgam to *s*-di-methyl-succinic acid [194°] and two isomeric acids [241°] and [120°], the last acid being methyl-ethyl-malonic acid (Otto & Rössing, *B* 20, 2736). Conc $HIAq$ at 220° , and zinc filings in water or ammonia also reduce it to *s*-di methyl succinic acid. The anhydride is not attacked by PCl_5 or $AcCl$. It is dissolved by aqueous alkalis, forming the sodium salt of the acid. Potash fusion yields oxalic acid. By heating with bromine and water at 100° there is formed di-bromo-acetic acid. When it is dissolved in benzene and shaken with phenyl-hydrazine in the cold the anhydride forms the compound $CH_2.C(COON_2H_5Ph).CMe.CO.ON_2H_5Ph$, which, when shaken with $HClAq$, regenerates the anhydride, but when heated at 115° yields CO_2 .

phenyl-hydrazine, and $\begin{matrix} \text{CMe.CO.NH} \\ \parallel \\ \text{CMe.CO.NH} \end{matrix}$ [129°], which crystallises from dilute alcohol in yellow monoclinic prisms, and yields di methyl maleic acid

when warmed with $KOHAq$ or $HClAq$ (Otto & Holst, *J pr* [2] 42, 67)

Chloride $\begin{matrix} \text{CMe.COCl} \\ \parallel \\ \text{CMe.COCl} \end{matrix}$ (220°–230°) Formed

by the action of PCl_5 on the anhydride (O & H). Yellow oil. When acted upon by the Na salt it yields the anhydride. NH_3 converts it into the imide. Phenyl-hydrazine forms the compound $\begin{matrix} \text{CMe.CO} \\ \parallel \\ \text{CMe.CO} \end{matrix} N.NHPh$ [187°] isomeric with the body melting at 129° (v *supra*)

Imide $\begin{matrix} \text{CMe.CO} \\ \parallel \\ \text{CMe.CO} \end{matrix} NH$ [118°] Formed by

heating the anhydride with alcoholic NH_3 . Triclinic plates, m sol hot water, v sol alcohol. May be sublimed— $B''_2H_2PtCl_4$.

Anilide $\begin{matrix} \text{CMe.CO} \\ \parallel \\ \text{CMe.CO} \end{matrix} NPh$ [96°] Formed

by heating the anhydride with aniline at 180° . Prisms (from alcohol)

METHYL-MALONIC ACID $C_4H_6O_4$, &c.

$CH_2.CH(CO_2H)_2$ *Iso succinic acid* Mol w 118 [130°] $H C v$ 365, 100 $H C p$ 364, 800 $H F$ 218, 200 (Stohmann, Kleber, & Langbein, *J pr* [2] 40, 207) $S H$ (0°–50°) 3372 (Hess *P* [2] 35, 410)

Formation—1 By decomposing a cyano propionic acid with potash (Wichelhaus, *Z* 1867, 247, Byk, *J pr* [2] 1, 19)—2 From sodium malonic ether and MeI (Zublin, *B* 12, 1112)

Preparation—By acting on potassium a bromo propionate with pure aqueous KCy , and saponifying the product by boiling with aqueous KOH (Cohn, *A* 251, 335)

Properties—Long prisms or tables (by sublimation). Decomposed on distillation into CO_2 and propionic acid. $FeCl_3$ gives no pp in neutral solutions. Fuming HNO_3 decomposes it into tri nitro ethane, CO_2 and acetic acid (Franchimont, *R T C* 5, 281). Electrolysis of a concentrated solution of its potassium salt yields hydrogen, CO_2 , and oxygen.

Salts— $NaHA''$ aq— Na_2A'' 2aq— KHA'' — K_2A'' aq— CaA'' aq— CaA'' aq Solubility Miczynsky (*M* 7, 269)— BaA'' 2aq— ZnA'' 3aq— PbA'' aq— Ag_2A'' heavy granular pp gradually becoming crystalline

Methyl ether Me_2A'' (179°) SG 18 1107. When treated with HNO_3 (SG 15) it gives a small quantity of $CH_3.C(NO_2)(CO_2Me)_2$.

Ethyl ether Et_2A'' (196.5° cor) (Krestownikoff, *B* 10, 409), (199°) (Perkin, *C J* 45, 510) SG $\frac{1}{2}$ 1021 (Conrad & Bischoff, *A* 24, 146), $\frac{1}{2}$ 10213, $\frac{1}{2}$ 10130 (P)

Di-amide $CH_2.CH(CO NH_2)_2$ [206°]. Formed, together with methyl carbonate, by treating the compound $CH_2.C(NO_2)(CO_2Me)_2$ (v *supra*) with ammonia (Franchimont, *R T. C.* 8, 286) V sl sol alcohol

Di-methyl-di-amide $CH_2.CH(CO NHMe)_2$ [154°] Formed by the action of methylamine on the ether (Franchimont, *R T C* 4, 204). Small needles (from benzene), v sol water and alcohol, sl sol ether and benzene. Fuming HNO_3 decomposes it, forming CO_2 and N_2O

Di-methyl-malonic acid $\text{CMe}_2(\text{CO}_2\text{H})_2$. *Isopyrotartaric acid* Mol w 132 [186°] H C 515,300 H F 230,700 (Stohmann, Kleber, a Langbein, *J pr* [2] 40, 208) S H (0°-50°) 310 (Hess, *P* [2] 35, 410)

Formation—1 By heating bromo isobutyric acid with KCy and decomposing the resulting nitrile with potash or HClAq (Markownikoff, *B* 6, 1440, *A* 182, 324)—2 By boiling di methyl-barbituric acid with potash (Conrad a Guthzeit, *B* 14, 1644)—3 From methyl malonic acid, NaOEt, and MeI (Thorne, *C J* 39, 543)—4 By oxidising β acetyl di a methyl propionic acid with nitric acid (3 pts of S G 14 and 1 pt water) (Anschutz, *A* 247, 105)

Properties—Transparent four sided monoclinic prisms, sl sol alcohol, v sol water and ether Sublimes in white needles, even at 100° Split up on melting into CO and isobutyric acid Not attacked by boiling dilute HNO_3 , and scarcely at all by boiling chromic acid mixture

Salts—*NaA" small efflorescent needles, sl sol water—*BaA" stellate groups of thin needles—*CaA" nodules, m sol cold water, deposited on warming its solution—*MgA" crystalline, v sol water—*PbA" aq insoluble pp, changing to shining scales on boiling—ZnA" aq S 68 at 24° Monoclinic pyramids (Thorne)—ZnA" 3aq S 94 (Markownikoff)—AgA" small needles, insol water

Ethyl ether EtA" (194.5°) (Thorne), (196.5° cor) (Peikin, *C J* 45, 511) S G $\frac{1}{2}$ 9965 (T), $\frac{1}{15}$ 10015, $\frac{2}{25}$ 9936 (P) M M 9 268 at 14.4°

Amide $(\text{CH}_3)_2\text{C}(\text{CO NH})_2$ [197°] From the ether and alcoholic NH_3 at 120° (Thorne)

Amic acid $\text{CO}_2\text{H CMe}_2\text{CO NH}$ [85°] A product of the oxidation of mesitylic acid

$\text{CMe} \begin{cases} \text{CH}_3 \text{ CMe CO}_2\text{H} \\ \text{CO NH} \end{cases}$ by KMnO_4 and H_2SO_4

(Hanner, *B* 15, 580) At 130° it decomposes, giving off CO_2 Boiling KOHAq forms NH_3 , and di methyl malonic acid The potassium salt KA' 2aq crystallises in prisms, v e sol water, m sol alcohol

Di methyl di-amide $\text{CMe}(\text{CO NHMe})_2$ [123°] Long needles (from benzene), v e sol water and alcohol, sl sol ether, m sol benzene (Franchimont, *R T C* 4, 206) Fuming HNO_3 attacks it, forming N_2O , methyl nitrate, and dimethylmalonic acid

Tetra methyl di amide $\text{CMe}_2(\text{CO NMe}_2)_2$ [80°] (276°) Long prisms (from ligroin), v e sol water, alcohol, and benzene Fuming HNO_3 forms di methyl malonic acid and di methyl nitramine

DIMETHYL-MALONYL-UREA v DI METHYL-BARBITURIC ACID

METHYL-MANDELIC ACID v Methyl derivative of MANDELIC ACID and OXY-TOLYL ACETIC ACID

Tetra methyl mandelic acid v OXY DURYL ACETIC ACID

METHYL-MELAMINE v Methyl cyanuramide in the article CYANIC ACIDS

METHYL MERCAPTAN CH_3S v CH_3SH Methyl sulphhydrate (5.8°) at 752 mm (Klason, *B* 20, 3407), (20°) (Gregory, *A* 15, 239), (21°) (Obermeyer, *B* 20, 2919) H F p 5,950 H F v 6,370 (Thomsen, *Th*) Occurs in human

excrement (Nencki, *M* 10, 863) Obtained by distilling KMeSO_4 with KHS Prepared by diluting with ice a cold mixture of MeOH (500 cc) and H_2SO_4 (750 cc), adding (2.75 kilos of) Na_2CO_3 10aq, and evaporating until most of the Na_2SO_4 has separated The mother liquor is mixed with a solution of potash (500 g) in water (1,000 cc) previously saturated with H_2S The mixture is distilled from a water bath, and the gases evolved are passed first through a concentrated aqueous solution of KOH (50 g) and then into a solution of KOH (350 g) in water (700 cc) A small quantity of lead acetate is added to the last solution to ppt H_2S , and the methyl mercaptan is then liberated by HCl, dried, and distilled The yield is fair (200 g of MeSH and 40 g of Me_2S) (Klason, *B* 20, 3407)

Properties—Thin, colourless, highly refractive liquid with very repulsive odour Yields a crystalline hydrate

Salts— $\text{Hg}(\text{SMe})_2$ [175°] Obtained by treating HgO with MeSH, or by passing the gas through an aqueous solution of HgCy_2 , V sl sol water— $\text{Pb}(\text{SMe})_2$ minutetables— $\text{Bi}(\text{SMe})_3$ minute yellow needles— AgSMe yellow crystalline pp

Reference—PER CHLORO METHYL MERCAPTAN **DI-METHYL-MESIDINE** $\text{C}_{11}\text{H}_{11}\text{N}$ v $\text{C}_6\text{H}_5\text{NMe}_2$ (214°) S G 908 Formed by methylation of mesidine (Hofmann, *B* 5, 718, Klobbie, *R T C* 6, 33) By treatment with H_2SO_4 and HNO_3 (S G 1.5) it is converted into $\text{C}_6\text{Me}_5(\text{NO})$, NMeNO [138°]— $\text{B}'_2\text{H}_2\text{PtCl}_4$

METHYL METHANE v ETHANE
Di methyl methane v PROPANE
Tri methyl methane v ISO BUTANE
Tetra methyl-methane v PENTANE

METHYL PENTAMETHENYL TRIHYDRIDE DICARBOXYLIC ACID $\text{C}_8\text{H}_{10}\text{O}_4$ v $\text{CO H CH} < \begin{matrix} \text{C}(\text{CH}_3) \\ \text{CH}_2\text{CH}_2 \end{matrix} > \text{CO}_2\text{H}$ [188°] Ob-

tained by saponifying its ether which is among the products resulting from the distillation of di methyl butylene diketone dicarboxylic (di acetyl adipic) ether with KOH (Perkin, jun, *C J* 57, 227, 233) Glistening needles or groups of plates, v sol hot water, alcohol, and acetone, sl sol cold light petroleum, benzene, CS_2 , and chloroform

Reactions—1 Its aqueous solution decolourises bromine in the cold and on evaporating to a syrup it gives off HBr—2 HBrAq in sealed tubes at 110° forms $\text{C}_8\text{H}_{11}\text{Br}$, a light brown oil, probably bromo methylpentamethylene—3 Sodium-amalgam has no action

Salts—*(NH_4)A" gelatinous— AgA'' : heavy white pp which darkens in daylight— AgHA'' slender needles, v sol hot water

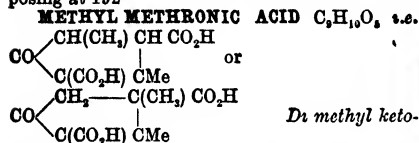

METHYL PENTAMETHENYLYL METHYL KETONE TRIHYDRIDE $\text{C}_8\text{H}_{10}\text{O}$ v

$\text{CH}_3 \begin{cases} \text{CH}_2\text{CMe} \\ \text{CH}_2\text{C CO CH}_3 \end{cases}$ Methyl dihydropentene

methyl ketone (191°) Formed by the action of boiling alcoholic potash on di-methyl butylene diketone dicarboxylic (di acetyl adipic) ether (Marshall a Perkin, jun, *C J* 57, 232, 244) Colourless mobile oil, smelling like peppermint Lighter than water V sol alcohol and ether Readily reacts with phenyl hydrazine. May be

reduced to the alcohol $C_6H_{13}O$, whence HI at 250° yields C_6H_{13} .

Oxim $C_6H_{12}(NOH)$ [85°] Formed by the action of hydroxylamine hydrochloride on the ketone dissolved in methyl alcohol. Thick colourless prisms, v sol alcohol, ether, acids, and alkalis. May be distilled with slight decomposition — $(C_6H_{13}NO)_2H_2PtCl_6$ tufts of orange crystals, v sol boiling alcohol, decomposing at 192° .

pentene dicarboxylic acid [198°] Formed by heating acetoacetic ether, sodium pyruvate, and Ac_2O at 140° , and saponifying the resulting ether with baryta or NaOH (Fittig, *A* 250, 195). White needles, v sol HOAc, ether, hot alcohol, and hot water, sl sol cold water, CS_2 , and benzene, almost insol petroleum ether. At 250° it is split up into CO_2 and methyl uvic acid $C_5H_{10}O_4$ [98°], which on prolonged boiling yields $\begin{array}{c} \text{CH}(\text{CH}_3) \text{CH}_2 \\ \text{CO} \begin{array}{l} \text{CH} = \text{CMe} \\ \text{CH} = \text{CMe} \end{array} \end{array}$ or $\begin{array}{c} \text{CH} \text{CH CH}_2 \\ \text{CO} \begin{array}{l} \text{CH} = \text{CMe} \\ \text{CH} = \text{CMe} \end{array} \end{array}$, an oil, boiling at 119° .

Salts — BaA' 2aq small needles, v e sol water — CaA' 3aq small prisms — AgA' silky nodules, sl sol water.

Mono-ethyl ether EtHA" Obtained by boiling the diethyl ether with alcoholic potash. Yellow syrup, sl sol water — Ba(EtA')₂ aq yellow gummy pp, v e sol water and alcohol — Ca(EtA')₂ 2aq needles, m sol water, v sol hot alcohol — AgEtA" flocculent pp, sl sol water, v sol alcohol and ether.

Di-ethyl ether EtA" (280° uncor) Heavy oil, miscible with alcohol and ether.

METHYL TETRAMETHYLENE C_6H_{10} *v.e.*
 $\text{CH}_2 \begin{array}{c} \text{CH}_2 \\ \text{CH}_2 \end{array} \text{CHMe}$ (c 40°) Formed by the action of sodium on α di bromo pentane dissolved in toluene (Colman & Perkin, *C J* 53, 201). Very volatile oil. Does not combine with conc HIAq.

METHYL PENTAMETHYLENE C_6H_{12} *v.e.*
 $\begin{array}{c} \text{CH}_2 \text{CH}_2 \\ \text{CH}_2 \text{CH}_2 \end{array} \text{CHMe}$? Formed by the action of finely divided sodium on α di bromo hexane dissolved in toluene (Perkin, *C J* 53, 214). Oil, not attacked by HI.

METHYL-PENTAMETHYLENE CARBOXYLIC ACID $C_6H_{12}O_4$ *v.e.*
 $\text{CH}_2 \begin{array}{c} \text{CH}_2 \text{CHMe} \\ \text{CH}_2 \text{CH}_2 \end{array}$ (220°) SG $\frac{1}{12}$ 1.0205,

$\frac{2}{3}$ 1.0174, $\frac{2}{3}$ 1.0144 MM 6.914 Formed by heating methyl pentamethylene dicarboxylic acid a little above its melting point (Colman & Perkin, jun, *C J* 53, 194). Colourless oil. Bromine at 110° attacks it with evolution of HBr — BaA' syrup — AgA' white amorphous pp.

Methyl-pentamethylene dicarboxylic acid
 $C_6H_{12}O_4$ *v.e.* $\text{CH}_2 \begin{array}{c} \text{CH}_2 \text{CHMe} \\ \text{CH}_2 \text{C}(\text{CO}_2\text{H})_2 \end{array}$ [175°] Obtained by boiling its ether with alcoholic potash

(C & P) Prisms (from ether), or plates (from water), v sol alcohol, ether, and hot water, m. sol cold water — AgA' white pp.

Ethyl ether EtA" (244°) Obtained from $\text{CH}_3\text{CHBrCH}_2\text{CH}_2\text{CH}_2\text{Br}$, malonic ether and NaOEt. Thick oil.

METHYL-HEXAMETHYLENE CARBOXYLIC ACID $C_6H_{14}O_4$ *v.e.*

$\text{CH}_2 \begin{array}{c} \text{CH}_2 \text{CHMe} \\ \text{CH}_2 \text{CH}_2 \end{array} \text{CH CO}_2\text{H}$ *o Toluic acid hexahydrate?* (236°) SG $\frac{1}{4}$ 1.0079, $\frac{1}{2}$ 1.0033, $\frac{2}{3}$ 9966 MM 7.975 Formed by decomposing the dicarboxylic acid by heat (Perkin, jun, *C J* 53, 208, 213). It is also one of the products of the electrolysis of methyl hexamethylene methyl ketone carboxylic ether by alcoholic potash. Colourless oil — AgA' white pp.

Methyl hexamethylene dicarboxylic acid
 $C_6H_{14}O_4$ *v.e.* $\text{CH}_2 \begin{array}{c} \text{CH}_2 \text{CHMe} \\ \text{CH}_2 \text{CH}_2 \end{array} \text{C}(\text{CO}_2\text{H})_2$ [147°].

Obtained by hydrolysing its ether with alcoholic potash (Perkin, *C J* 53, 207). Crystalline powder, v sol ether, alcohol, and hot water, sl sol cold water — AgA' white amorphous pp.

Ethyl ether EtA" (c 263°) Obtained from $\text{CH}_3\text{CHBrCH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{Br}$, malonic ether, and NaOEt (Perkin, jun, *C J* 53, 206). Thick oil, with unpleasant odour.

METHYL TETRAMETHYLENE KETONE *v.* **TETRAMETHYLENYL METHYL KETONE**

METHYL-TRI METHYLENE KETONE CARBOXYLIC ACID *v.* **TRI METHYLENYL METHYL KETONE CARBOXYLIC ACID**

METHYL PENTAMETHYLENE METHYL KETONE *v.* **METHYL PENTAMETHYLENYL METHYL KETONE**

TETRA-METHYL- ν -TRIMETHYLENE-DI-PYRROLE $C_{15}H_{22}N_2$ *v.e.*

$\text{HC CMe} \begin{array}{c} \text{N C}_2\text{H}_4 \text{N} \\ \text{CMe CH} \end{array} \text{CMe CH}$ [77°] Formed by heating acetonyl acetone (2 mols) and trimethylene diamine (1 mol) in conc alcoholic solution at 120° . Crystalline solid. Sol alcohol and ether, insol water (Paal & Schneider, *B* 19, 3157).

DI METHYL-TRI METHYLENE TRI SULPHONE $C_6H_4(\text{CH}_3)_2\text{S}_3O_6$ [330° - 340°] Two bodies of this formula are produced when 1 g tri methylene tri sulphone in 10 cc of 5 p.c. caustic soda is heated with an equal volume of methyl iodide. These two substances crystallise together in glittering needles. By further methylation the hexamethyl derivative is formed (E. Baumann & R. Camps, *B* 23, 72).

Tetra methyl di methylene disulphone
 $\text{CMe}_2 \begin{array}{c} \text{SO}_2 \\ \text{SO}_2 \end{array} \text{CMe}_2$ *Di isopropylidene di sulphone* [220° - 225°] Obtained from acetone (1 pt) by heating it with P_2S_5 (1 pt) at 125° for 7 hours, distilling with steam, and oxidising the resulting 'duplo'-thio acetone $\text{S}_2(\text{CMe}_2)_2$ with KMnO_4 (Autenrieth, *B* 20, 373). Slender white needles, v sol alcohol and ether, sl sol hot water. Not attacked by HNO_3 and H_2SO_4 , nor by boiling dilute aqueous KOH.

METHYL PENTAMETHYLENYL METHYL-CARBINOL $C_6H_{14}O$ *v.e.*
 $\text{CH}_2 \text{CHMe} \begin{array}{c} \text{CH CH}(\text{OH}) \text{CH}_2 \\ \text{CH}_2 \text{CH}_2 \end{array}$ (180°) Obtained by boiling its ether with alcoholic potash

tained by reducing the corresponding ketone in ethereal solution with sodium (Marshall a Perkin, jun, *C J* 57, 247) Colourless liquid, with strong odour of menthol, sl sol water, v sol alcohol and ether. On boiling with Ac_2O it yields a strongly refracting acetyl derivative with agreeable odour. Excess of solution of hydriodic acid (S G 196) forms a heavy oily iodide CH_2CHMe

$\text{CH}_2\text{CH}_2 \begin{matrix} \diagup \\ \text{CH} \end{matrix} \begin{matrix} \diagdown \\ \text{CH} \end{matrix} \text{CH}_2$ (155°–160° at 90 mm), which smells like *sec* hexyl iodide, and is slightly decomposed on distillation

METHYL-HEXAMETHYLENYL METHYL-CARBINOL $\text{C}_8\text{H}_{18}\text{O}$ *ze*

$\text{CH}_2 \begin{matrix} \diagup \\ \text{CH}_2\text{CHMe} \\ \diagdown \\ \text{CH}_2\text{CH}_2 \end{matrix} \begin{matrix} \diagup \\ \text{CH} \end{matrix} \begin{matrix} \diagdown \\ \text{CH} \end{matrix} \text{CH}(\text{OH})\text{CH}_3$ *Hexahydride of o tolyl methyl carbinol* (195°–200°) Formed by reducing tetrahydro tolyl methyl ketone in ethereal solution with sodium (Kipping a Perkin, jun, *C J* 57, 22) Thick, colourless liquid, smelling like menthol, sl sol water, miscible in alcohol and ether. When mixed with conc HIAq it dissolves with evolution of heat and separation of the corresponding iodide

METHYL-PENTAMETHYLENYL METHYL

KETONE $\text{C}_8\text{H}_{16}\text{O}$ *ze* $\text{CH}_2 \begin{matrix} \diagup \\ \text{CH}_2\text{CHMe} \\ \diagdown \\ \text{CH}_2\text{CH CO CH}_3 \end{matrix}$

(171°) S G $\frac{1}{4}$ 9222, $\frac{1}{10}$ 9174, $\frac{1}{15}$ 9136, $\frac{2}{35}$ 9070 M M 8019 Obtained as one of the products of the hydrolysis of its carboxylic ether by alcoholic potash (Colman a Perkin, *C J* 53, 198) Colourless oil, smelling of peppermint. Readily combines with phenyl hydrazine and with hydroxylamine. Dissolves with difficulty in a solution of NaHSO_3 .

Methyl-hexamethylenyl methyl ketone

$\text{CH}_2 \begin{matrix} \diagup \\ \text{CH}_2\text{CHMe} \\ \diagdown \\ \text{CH}_2\text{CH}_2 \end{matrix} \begin{matrix} \diagup \\ \text{CH} \end{matrix} \begin{matrix} \diagdown \\ \text{CH} \end{matrix} \text{CO CH}_3$ *o Tolyl methyl ketone hexahydride* (198°) Obtained as one of the products of the hydrolysis of its carboxylic ether by alcoholic potash (Perkin, *C J* 53, 213) Colourless oil, smelling, when in small quantities like new mown hay

METHYL TRIMETHYLENYL METHYL

KETONE CARBOXYLIC ACID $\text{C}_8\text{H}_{16}\text{O}_2$ *ze*

$\text{CHMe} \begin{matrix} \diagup \\ \text{C}(\text{CO}_2\text{H}) \end{matrix} \begin{matrix} \diagdown \\ \text{CO CH}_3 \end{matrix}$ *Propylene acetoacetic acid* Obtained by saponifying its ether, which is produced by treating acetoacetic ether with NaOEt and propylene bromide (Perkin, jun, *B* 17, 1443) Thick oil, splitting off CO_2 when heated—AgA' amorphous powder, sl sol water

Ethyl ether EtA' (210°–215°) at 720 mm

Methyl-pentamethylenyl methyl ketone

carboxylic ether $\text{CH}_2 \begin{matrix} \diagup \\ \text{CH}_2\text{CHMe} \\ \diagdown \\ \text{CH}_2\text{C}(\text{CO}_2\text{Et}) \end{matrix} \begin{matrix} \diagup \\ \text{CH} \end{matrix} \begin{matrix} \diagdown \\ \text{CH} \end{matrix} \text{CO CH}_3$

(238°) Obtained by the action of *ad* di bromo pentane on sodium acetoacetic ether (Colman a Perkin, jun, *C J* 53, 197) Thick, colourless oil. On hydrolysis with alcoholic potash it yields the corresponding ketone as well as the acid

Methyl-hexamethylenyl methyl ketone carboxylic ether

$\text{CH}_2 \begin{matrix} \diagup \\ \text{CH}_2\text{CHMe} \\ \diagdown \\ \text{CH}_2\text{CH}_2 \end{matrix} \begin{matrix} \diagup \\ \text{C}(\text{CO}_2\text{Et}) \end{matrix} \begin{matrix} \diagdown \\ \text{CO CH}_3 \end{matrix}$ *Hexa*

hydro-o tolyl methyl ketone carboxylic ether (257°) Formed by the action of di bromo-hexane $\text{CH}_3\text{CHBrCH}_2\text{CH}_2\text{CH}_2\text{CH}_3$ and NaOEt on acetoacetic ether (Perkin, *C J* 53, 212) Colourless oil with disagreeable odour. Yields on hydrolysis methyl hexamethylenyl methyl ketone as well as its carboxylic acid

METHYL-MORPHINE v CODEINE

(a) **METHYL-NAPHTHALENE** $\text{C}_{11}\text{H}_{10}$ *ze*

$\text{C}_6\text{H}_5 \begin{matrix} \diagup \\ \text{CMe CH} \\ \diagdown \\ \text{CH CH} \end{matrix}$ Mol w 142 (242° i V)

(S), (232°) (F a R) S G $\frac{1}{15}$ 1029 Occurs, together with (B) methyl naphthalene, in the fraction of coal-tar oil boiling between 200° and 300° (Schulze, *B* 17, 844)

Formation—1 By the action of sodium on a mixture of MeI and (a) bromo naphthalene (Fittig a Remsen, *A* 155, 114)—2 By distilling colophony, gum benzoin, or aldehyde resin with zinc-dust (Ciamician, *B* 11, 269, *M* 1, 193)—3 By distilling (a)-naphthyl acetic acid with lime (Boessneck, *B* 16, 1546)

Properties—Colourless liquid, not solid at -18° Boiling conc HNO_3 oxidises it to (a) naphthoic acid

Picric acid compound

$\text{C}_{11}\text{H}_9\text{C}_6\text{H}_3(\text{NO}_2)_3\text{OH}$ [117°] Long, slender orange needles (from alcohol)

(B) - **Methyl-naphthalene** C_{10}H (CH_3) *ze*

$\text{C}_6\text{H}_5 \begin{matrix} \diagup \\ \text{CH CMe} \\ \diagdown \\ \text{CH CH} \end{matrix}$ [33°] (242° i V) Occurs in

the fraction of coal tar oils boiling at 200°–300° The oil is shaken with NaOH and with H_2SO_4 to remove phenols and bases, and fractionally distilled. By cooling the fraction 239°–242° to 0° the (B) methyl naphthalene separates out, leaving the liquid (a) methyl naphthalene (Schulze, *B* 17, 842, 1203, Reingruber, *A* 206, 367) Could not be obtained from (B) bromo naphthalene MeI and Na (Brunel, *B* 17, 1179) White plates, insol water, sol alcohol, ether, and benzene, volatile with steam. Completely decomposed on oxidation. Yields, on chlorination at 245°, $\text{C}_{10}\text{H CH}_2\text{Cl}$ [47°]

Picric acid compound [115°], yellow needles

Di-methyl-naphthalene $\text{C}_{12}\text{H}_{12}$ + e $\text{C}_{10}\text{H}_8\text{Me}_2$ (110° at 6 mm), (c 265°) at 760 mm S G $\frac{1}{10}$ 10283, $\frac{1}{15}$ 10199 (C a C), $\frac{2}{20}$ 10176 (G), $\frac{1}{14}$ 10180 (Nasini, *G* 15, 84) R₂₀ 87 25 (N)

Formation—1 From di bromo naphthalene [81°], sodium, and MeI (Mono, *B* 13, 1517)—2 By heating santolin, or the dimethyl naphthol derived therefrom, to redness with zinc dust (Cannizzaro a Carnelutti, *G* 12, 410)—3 By heating dimethyl naphtholhydride with sulphide of phosphorus (Cannizzaro, *G* 13, 393)

Preparation—Di bromo-naphthalene dissolved in toluene is heated with MeI and sodium, the product is heated to 150° to remove MeI and toluene, and the residue extracted with ether. The extract is fractionally distilled, and the fraction 260°–270°, after rectification under 12 mm pressure, is heated with sodium at 100° to remove any unaltered di bromo naphthalene. The di methyl naphthalene is finally obtained pure by means of its compound with picric acid (Giovannozzi, *G* 12, 147)

Properties — Colourless, highly refractive oil, not solid at -18° . With bromine it appears to form $C_{12}H_8Br_2$ and $C_{12}H_7Br$.

Picric acid compound [139°] Orange needles, sol alcohol and ether

Hexahydride $C_{12}H_{18}$ SG 194 922 R_∞ 86 14 (Nasim & Bornheimer, G 15, 93) Formed by treating the di methyl naphthalene with HIAq and phosphorus (Zucco, G 15, 81)

Di-methyl-naphthalene $C_{12}H_{12}$ (265°) Occurs in coal tar (Emmert & Reingruber, A 211, 365) Not solid above -18°

Picric acid compound
 $C_{12}H_{12}C_6H_2(NO_2)_3OH$ [118°] Orange prisms

Trimethyl-naphthalene $C_{12}H_9$, i.e. $C_{10}H_7Me_2$ (275°) Obtained (according to Maschke, C C 1886, 824) by heating di methyl-(β) naphthylamine methylo iodide at 320° , and distilling the resinous product with steam

Picric acid compound [133°]

References — BROMO- and CHLORO METHYL-NAPHTHALENES

(α)-**METHYL-NAPHTHALENE SULPHONIC ACID** $C_{10}H_8MeSO_3H$ Obtained by sulphonating (α) methyl naphthalene (Fittig & Remsen, A 155, 115) — BaA_2 , sl sol water

(β)-**Methyl-naphthalene sulphonic acid** $C_{10}H_8MeSO_3H$ Obtained by sulphonating (β) methyl naphthalene (Reingruber, A 206, 377) Syrup — BaA_2 , amorphous mass

Di-methyl-naphthalene sulphonic acid $C_{12}H_8Me_2SO_3H$ Obtained by the action of H_2SO_4 at 120° on the di methyl naphthalene derived from di bromo naphthalene [81°] (Giovannozzi, G 12, 147) Deliquescent scales — KA_2aq iridescent laminae

Di-methyl-naphthalene sulphonic acid $C_{10}H_8Me_2SO_3H$ Obtained by heating the di-methyl naphthalene of coal tar with fuming H_2SO_4 (Emmert & Reingruber, A 211, 365) — BaA_2 , sl sol water

Di-methyl-naphthalene di-sulphonic acid $C_{10}H_6Me_2(SO_3H)_2$ Formed at the same time as the preceding, from which it differs in having an easily soluble barium salt (E & R)

METHYL-NAPHTHAQUINOLINE v **METHYL-NAPHTHOQUINOLINE**

(In 2) **METHYL (α)-NAPHTHINDOLE**

$C_{13}H_{11}N$ i.e. $C_{10}H_7\langle\begin{smallmatrix} CH \\ NH \end{smallmatrix}\rangle CMe$ [132°] Obtained by heating (1 pt of) the (α) naphthyl hydrazide of acetone with $ZnCl_2$ (2 pts) at 180° (Schlieper, A 239, 237) Slender needles (from water), v sol alcohol and ether Colours pine wood, acidified by HCl, bluish violet $FeCl_3$ imparts a cherry red colour to its solution in HOAc, and on adding water a pp is formed

Picrate [168°], dark red needles (from hot benzene)

(In 2) **Methyl-(β)-naphthindole**

$C_{10}H_7\langle\begin{smallmatrix} CH \\ NH \end{smallmatrix}\rangle CMe$ (314° – 320° at 223 mm) Prepared by heating the (β) naphthyl hydrazide of acetone with $ZnCl_2$ at 175° , dissolving the fused mass in water, and extracting with ether (Schlieper, A 236, 182) Liquid, v sl sol water, v sol alcohol, ether, and benzene Colours acidified pine-wood violet $NaNO_2$ added to the acetic acid solution gives a brown pp

Picrate [176°]; reddish brown needles (from hot benzene).

Dihydride $C_{12}H_{12}$, i.e. $C_{10}H_7\langle\begin{smallmatrix} CH \\ NH \end{smallmatrix}\rangle CHMe$.

(190° – 200° at 20 mm) Obtained by treating methyl (β) naphthindole with zinc dust and HClAq, until it ceases to give the pine wood reaction, then adding NaOH and extracting with ether Yellow oil, which in an ethereal solution exhibits blue fluorescence Forms soluble crystalline salts with mineral acids Reduces $AgNO_3$ on warming Gives an oily nitrosamine

(In 1, 2)-**Di-methyl (α) naphthindole** $C_{13}H_{13}N$ i.e. $C_{10}H_7\langle\begin{smallmatrix} NH \\ CMe \end{smallmatrix}\rangle CMe$ [150°] Formed by heat

ing bromo acetyl propionic (bromo levulic) acid $CH_2COCHBrCH_2CO_2H$ (2 pts) with (α) naphthylamine (7 pts) (Wolff, B 21, 3365) White granules or prisms (from alcohol), v sol ether and benzene, m sol cold alcohol and HOAc, insol water Its solution in conc HClAq is pptd by water $FeCl_3$ colours its solution in HOAc cherry red, whilst $K_2Cr_2O_7$ give a deep blue colour

(In 1, 2) **Di-methyl-(β)-naphthindole**

$C_{10}H_7\langle\begin{smallmatrix} CH \\ CH \end{smallmatrix}\rangle\begin{smallmatrix} C \\ C \\ NH \end{smallmatrix}\begin{smallmatrix} CMe \\ CMe \\ CMe \end{smallmatrix}$ or $C_{10}H_7\langle\begin{smallmatrix} C \\ CH \end{smallmatrix}\rangle\begin{smallmatrix} C \\ CH \\ NH \end{smallmatrix}\begin{smallmatrix} CMe \\ CMe \\ CMe \end{smallmatrix}$ [132°] (above

360°) Prepared by the action of bromo acetyl propionic acid on (β) naphthylamine (Wolff, B 21, 3363) Plates (from alcohol), v sol ether and benzene, m sol cold alcohol and HOAc, insol water $FeCl_3$ colours its solution in boiling HOAc green The concentrated alcoholic solution exhibits violet fluorescence

Picrate [175°], dark brown needles

(In 1, 2)-**Di-methyl-(β)-naphthindole**

$C_{10}H_7\langle\begin{smallmatrix} CMe \\ NH \end{smallmatrix}\rangle CMe$ [126°] Possibly identical with the preceding body Formed by heating (In 1, 2) methyl (β) naphthindyl acetic acid at 210° (E Fischer & Steche, A 242, 370) Six sided plates, insol water, v sol alcohol and HOAc $FeCl_3$ gives a blue colouration to its solution in HOAc Yields a crystalline nitrosamine Reacts with MeI forming di methyl (β)-naphtho quinoline dihydride

Picrate dark red crystals

Dihydride $C_{11}H_{13}N$ i.e.

$C_{10}H_7\langle\begin{smallmatrix} CHMe \\ NH \end{smallmatrix}\rangle CMe$ Obtained by reducing the di methyl (β) naphthindole with zinc-dust and HCl oil, turning red on oxidation Forms a crystalline platinumchloride, decomposed by boiling water

(In 1, 2)-**METHYL-(β) NAPHTHINDYL ACETIC ACID** $C_{11}H_{13}NO_2$, i.e.

$C_{10}H_7\langle\begin{smallmatrix} CMe \\ NH \end{smallmatrix}\rangle CCH_2CO_2H$ [210°] **Di methyl naphthindole α-carboxylic acid** Formed by heating the (β) naphthyl hydrazide of β acetyl-propionic ether with $ZnCl_2$ at 135° (Steche, A 242, 368) Small crystals containing $\frac{1}{2}C_6H_6O$ (from acetone), v sl sol water, benzene, and chloroform, v sol alcohol, ether, acetone, and HOAc Loses CO_2 on heating — AgA^+ white pp which yields a silver mirror on boiling with water

METHYL-NAPHTHOCUMARIN v **Anhydride of OXY-NAPHTHYL CROTONIC ACID**

METHYL-(α) NAPHTHOFURFURANE

[298°] Obtained by distilling its carboxylic acid alone or with KOH (Hantzsch a Pfeiffer, *B* 19, 1304) Very volatile with steam Reduces $AgNO_3$ on boiling Its solution in H_2SO_4 becomes green, and finally violet, on warming, on dilution with water it becomes green again

Methyl (β) naphthofurfurane

by distilling its carboxylic acid alone or with soda lime (H a P) Resembles the preceding isomeride

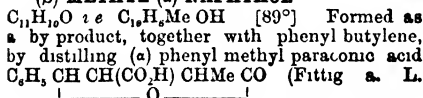

METHYL - (α) - NAPHTHOFURFURANE**CARBOXYLIC ACID $C_{11}H_{10}O_2$ i.e.**

the action of chloro aceto acetic ether on sodium (α) - naphthol there is formed $C_{11}H_9O \cdot CHAC \cdot CO_2Et$, and this ether is then mixed with H_2SO_4 , and the product poured into water The pnd ether is then saponified by alcoholic potash (Hantzsch a Pfeiffer, *B* 19, 1301) Needles (from HOAc), which may be sublimed, v sl sol alcohol and ether, almost insol water

Ethyl ether EtA' [108°] Flat needles (from alcohol), v sol ether and hot alcohol

Methyl-(β)-naphthofurfurane carboxylic acid

in the same manner as the preceding isomeride, which it greatly resembles, by using sodium (β) - naphthol (H a P) —NaA' 4aq blue fluorescent needles

(β) METHYL (α) NAPHTHOL

Liebmann, *A* 255, 263) Long slender elastic needles, v sl sol water $FeCl_3$ gives a white pp Bleaching powder produces a green pp which becomes yellow On distillation with zinc dust (β) methyl naphthalene is formed

(β)-Methyl-(α) naphthol $C_{11}H_9Me \cdot OH$ [92°] Formed by distilling (β)-phenyl methyl paracomic acid (Fittig a Liebmann, *A* 255, 272) Long elastic white needles (from boiling water), volatile with steam $FeCl_3$ gives a white pp which becomes yellow on standing Bleaching powder forms a green pp, quickly becoming yellow On distillation with zinc-dust it yields (β) methyl naphthalene

Di methyl naphthol $C_{12}H_{12}Me_2 \cdot OH$ [136°]

Obtained by heating santonic or isosantonous acid with $Ba(OH)_2$ above 360° The product is dissolved in water, and on passing CO_2 through the solution di-methyl naphthol is pnd together with $BaCO_3$, which is removed by $HClAq$ (Cannizzaro a Carnelutti, *G* 12, 406) Glistening needles (from alcohol), v sl sol water, sol alcohol and ether Begins to sublime at 100°

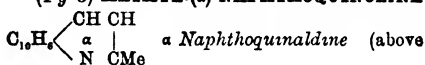

Chromic acid in HOAc oxidises it to $C_{12}H_{10}O_2$, crystallising in tables [105°], which may be reduced to di methyl naphthol by HI and phosphorus On heating to redness with zinc dust it yields di methyl naphthalene identical with that obtained from di bromo naphthalene [81°]

Methyl ether $C_{12}H_{11}OMe$ [68°] Prisms, sol alcohol and ether

Ethyl ether $C_{12}H_{11}OEt$ Viscid liquid

Acetyl derivative $C_{12}H_{11}OAc$ [78°]. Laminae

Dihydrate $C_{12}H_{11}O$ [113°] Obtained by saponification of its propionyl derivative, which is one of the products of the dry distillation of santonic acid Separated from accompanying di methyl naphthol by frequent crystallisation from light petroleum (Cannizzaro, *G* 13, 390) Glistening white needles, v sol ether and alcohol, insol water Volatile with steam P_2S_5 converts it into di methyl naphthalene

(Py 3) METHYL-(α) NAPHTHOQUINOLINE

$300^\circ)$ Heavy liquid Formed by heating (α) naphthylamine with paraldehyde and HCl Its salts have a blue fluorescence in dilute solution — $B'_2H_2Cl \cdot PtCl_2 \cdot 2aq$ concentric needles — $B'_2H_2Cr \cdot O$, yellow crystals (Doebner a Miller, *B* 17, 1711)

(Py 1) Methyl (β) naphthoquinoline $C_{11}H_{11}N$ 

with (β) naphtho acridine and a base $C_{12}H_{13}N$, by the action of a mixture of methylal, acetone, and HCl upon (β) naphthylamine (Reed, *J pr* [2] 35, 316) —Picrate $B'_2C_6H_4(NO_2)_3OH$

(Py 3) Methyl-(β)-naphthoquinoline

(above 300°) Formed by heating (β) naphthylamine with paraldehyde and HCl (Doebner a Miller, *B* 17, 1711, Seitz, *B* 22, 254) Large colourless needles V sol alcohol and ether, sl sol water With chloral it forms a crystalline compound $C_{11}H_9N \cdot CH_2 \cdot CH(OH) \cdot CCl_2$, [185°]

Salts — $B'_2H_2Cl \cdot PtCl_2 \cdot 2aq$ yellow, sparingly soluble needles — $B'_2H_2Cr \cdot O$ small yellow needles, sl sol hot water — $B'HCl \cdot 2aq$ slender needles, sl sol cold water — $B'HNO_3$ slender needles, becoming rose coloured in air — $B'_2H_2SO_4 \cdot 2aq$ very slender needles, v e sol hot water — $B'_2C_6H_4(NO_2)_3OH$ [221°] Minute needles, v sl sol boiling water, v sol HOAc

Methyl iodide $B'MeI$ [241°–247°]. Straw coloured needles, v sol boiling water, sl sol alcohol

(Py 3) Methyl-(β)-naphthoquinoline

the preceding isomeride Formed by heating (Py 1, 3) oxy methyl naphthoquinoline to redness with zinc-dust (Knorr, *B* 17, 544) Crystalline May be distilled Its acid solutions fluoresce blue when dilute, green when concentrated — $B'_2H_2PtCl_2$ sl sol hot dilute $HClAq$.

(Py 1, 3) **Di-methyl-(α)-naphthoquinoline**

$$\text{C}_{10}\text{H}_7 \begin{array}{c} \text{CMe CH} \\ \diagup \quad \diagdown \\ \text{N}=\text{CMe} \quad \text{CH CH CMe CH} \\ \diagdown \quad \diagup \\ \text{C N}=\text{CMe} \end{array} \text{ v. e. } \text{C}_6\text{H}_5$$

 [44°] (361°) Formed by heating at 100° a mixture of (α)-naphthylamine with ethylidene-acetone, derived from acetone and paraldehyde (Reed, *J pr* [2] 35, 312) Formed also by heating (α)-naphthylamine (1 mol) with acetyl-acetone (1 mol), and heating the product with H_2SO_4 at 100° (Combes, *C R* 106, 1536) Needles (from petroleum-ether), v e sol ether, insol 90 p c alcohol. Somewhat volatile with steam. Its solution in H_2SO_4 is coloured purple by $\text{K}_2\text{Cr}_2\text{O}_7$. The solutions of its salts fluoresce violet (C) The hydrated platinochloride is violet, after drying *in vacuo* it melts at 260° (C) — $\text{B}'\text{C}_6\text{H}_4(\text{NO}_2)_2\text{OH}$ [223°] Needles

(Py 1, 3)-Di methyl (β) naphthoquinoline

$$\text{C}_{10}\text{H}_7 \begin{array}{c} \text{CMe CH} \\ \diagup \quad \diagdown \\ \text{N}=\text{CMe} \quad \text{CH CH CMe CH} \\ \diagdown \quad \diagup \\ \text{C N}=\text{CMe} \end{array} \text{ v. e. } \text{C}_6\text{H}_5$$

$$\text{C}_6\text{H}_5 \begin{array}{c} \text{CMe CH} \\ \diagup \quad \diagdown \\ \text{N}=\text{CMe} \quad \text{CH CH CMe CH} \\ \diagdown \quad \diagup \\ \text{C N}=\text{CMe} \end{array} \text{ [127°] (above 300°)}$$

Formed from (β) naphthylamine hydrochloride by heating at 100° with ethylidene acetone, the product of the condensation of paraldehyde with acetone in presence of hydrochloric acid, as follows $\text{C}_{10}\text{H}_7\text{NH}_2 + \text{Me CO CH CHMe} = \text{C}_{10}\text{H}_7\text{N} + \text{H}_2\text{O} + \text{H}_2$ (Reed, *J pr* [2] 35, 299) Flat needles (from ether), v sl sol boiling water, hardly volatile with steam KMnO_4 oxidises it to (β) di methyl phenyl pyridine dicarboxylic acid. It does not yield a nitrosamine

Salts—Picrate $\text{B}'\text{C}_6\text{H}_4(\text{NO}_2)_2\text{OH}$ [215°] — $\text{B}'\text{H}_2\text{Cr}_2\text{O}_7$ [c 115°] — $\text{B}'\text{H}_2\text{PtCl}_6 \cdot 2\text{aq}$ — $\text{B}'\text{H}_2\text{SO}_4$ — $\text{B}'\text{HNO}_3$ [181°] — $\text{B}'\text{HBr}$ [207°] — $\text{B}'\text{HBr} \cdot 2\text{aq}$

Methyl iodide $\text{B}'\text{MeI}$ needles

Sulphonic acid $\text{C}_{10}\text{H}_7(\text{SO}_3\text{H})\text{N} \cdot \frac{1}{2}\text{aq}$ minute needles, insol water and alcohol

Disulphonic acid $\text{C}_{10}\text{H}_7(\text{SO}_3\text{H})_2\text{N} \cdot 4\frac{1}{2}\text{aq}$ needles, v e sol water and alcohol — $\text{CuH}_2\text{A} \cdot 5\text{aq}$ — $\text{BaA}'' \cdot 7\text{aq}$ Potash fusion produces $\text{C}_{10}\text{H}_{11}(\text{OH})(\text{SO}_3\text{H})\text{N}$

Di-methyl (β) naphthoquinoline $\text{C}_{10}\text{H}_7\text{N}$ [67°] (380°) Obtained by heating (β) naphthylamine with acetyl acetone and H_2SO_4 at 100° (Combes, *C R* 106, 1537) Its yellow sulphonic acid $\text{C}_{10}\text{H}_7\text{NSO}_3$ is also pptd on adding ammonia to the aqueous extract of the product. The base forms a greenish yellow platinochloride, decomposing at 220° without melting

DI-METHYL-(β)-NAPHTHOQUINOLINEDI-

HYDRIDE $\text{C}_{10}\text{H}_7\text{N} \cdot \text{v. e. } \text{C}_6\text{H}_5$

$$\begin{array}{c} \text{CMe CMe} \\ \diagup \quad \diagdown \\ \text{NH CH} \quad \text{CH CH} \\ \diagdown \quad \diagup \\ \text{C N}=\text{CMe} \end{array} \text{ [115°]}$$

Formed by heating (*In* 1, 2) di-methyl (β) naphthindole with MeI in sealed tubes for 15 hours at 100° (Fischer a Steche, *B* 20, 820, *A* 242, 364) Plates, v sl sol water, v sol ether, alcohol, and mineral acids, volatile with steam. With nitrous acid it yields a crystalline nitrosamine — $\text{B}'\text{HI}$ Needles (from water), sl sol water and alcohol —The platinochloride is sl sol water and alcohol

METHYL NAPHTHYLAMINE v NAPHTHYLAMINE

PYRIDINE CARBOXYLIC ACID

METHYL-NITRAMINE v METHYLAMINE

METHYL NITRATE $\text{CH}_3\text{NO}_2 \cdot \text{v. e. } \text{CH}_3\text{ONO}_2$
 Mol w 77 (65°) SG $\frac{1}{4}$ 1.2167, $\frac{3}{4}$ 1.2032
 M M 2 057 (Perkin, *C J* 55, 682) SV 69.3 (Lossen, *A* 254, 73) Obtained, together with methyl nitrite, by distilling wood spirit with NaNO_3 and H_2SO_4 (Dumas a Pélégot, *A Ch* [2] 58, 37) Prepared by distilling methyl alcohol (200 cc) with urea nitrate (40 g) and HNO_3 (150 cc of SG 1.31) free from nitrous acid. When two thirds have passed over, an additional quantity of MeOH (170 cc) and HNO_3 (110 cc) may be added and the distillation continued (Carey Lea, *Am S* [2] 33, 227) The process may also be conducted in a continuous manner (v LTHYL NITRATE)

Properties —Colourless liquid, exploding when struck or when its vapour is heated. With solid KOH it yields Me_2O (Berthelot, *A* 113, 80) When diluted with MeOH ($\frac{1}{2}$ vol) and treated with a current of gaseous NH_3 it gives methylamine nitrate and NMe_2NO , with only traces of di and tri methylamine. Aqueous ammonia forms NMeH_2 (13 pts), NMe_2NO (10 pts), and a small quantity (1 pt) of the bases NMe_2H and NMe_3 (Duvillier a Malbot, *A Ch* [6] 10, 284)

METHYL NITRITE $\text{CH}_3\text{NO}_2 \cdot \text{v. e. } \text{CH}_3\text{ONO}$
 Mol w 61 (−12°) SG (liquid) 1.991
 Produced by treating methyl alcohol with nitric acid and copper turnings or arsenious acid (Strecker, *C R* 39, 53, *A* 91, 82) The product is passed through a receiver at 0° and the gas after purification by passing through potash, a solution of ferrous sulphate, and dry CaCl_2 is condensed at −40°. It may also be prepared from methyl alcohol, NaNO_2 and H_2SO_4

Properties —Gas, smelling like nitrous ether. Burns with a green edged flame

METHYL NITRO-AMIDE v METHYLAMINE

METHYL-NITRO-ANILINE v NITRO

METHYL ANILINE

METHYL NITRO-BENZAMIDE v Amide of NITRO TOLUIC ACID

METHYL-NITROLIC ACID $\text{CHN O}_2 \cdot \text{v. e. } \text{CH}(\text{NO}_2)\text{NOH}$ or $\text{CH}_2(\text{NO}_2)(\text{NO})$ Mol w 90 [64°] Prepared by dissolving nitro methane (15 g) in water, adding a solution of KNO_2 (8 g), cooling to 0°, and adding a very dilute ice cold solution of H_2SO_4 (4 g) Caustic potash solution is added till the liquid turns red, and then more dilute H_2SO_4 . The liquid is then shaken with a little CaCO_3 and extracted with ether (Tscherniak, *B* 8, 114, *A* 180, 166) The result is very uncertain (V Meyer a Constam, *A* 214, 335)

Properties —Long needles (from ether). Decomposes slowly in the cold, rapidly at 64°, into formic acid, NO_2 , and nitrogen. By boiling dilute H_2SO_4 it is resolved into formic acid and N_2O . Sodium amalgam reduces it to methyl-azauric acid $\text{CH}(\text{NOH})\text{N N CH NOH}$ an amorphous powder which is violently gasified above 100°.

DI-METHYL OXIDE C_2H_6O *z* $(CH_3)_2O$ *Methyl ether* Mol w 46 (-24°) (Regnault, J 1863, 70) VD 1 617 S (gas) 37 at 18° HF p 49,640 (Thomsen), 56,800 (Berthelot, A Ch [5] 23, 185) HF v 48,190 (T) HC p 344,200 (B) Formed by heating $MeOH$ with H_2SO_4 (Dumas & Péligot, A 15, 12, Kane, A 19, 166) or with B_2O_3 (Ebelmen, A 57, 328) Formed also, together with NMe_4Cl and NMe_3HCl , by heating NH_4Cl with excess of $MeOH$ (Weith, B 8, 458) Prepared by heating $MeOH$ (13 pts) with H_2SO_4 (20 pts) at 140° The gas is passed through aqueous KOH to remove SO_2 , CO_2 , and $MeOH$, and then into conc H_2SO_4 , which absorbs 600 vols It is obtained by dropping the solution in H_2SO_4 into an equal volume of warm boiled water, and is dried by passing through tubes containing $CaCl_2$ (Erlenmeyer & Kriechbaumer, B 7, 699, cf Teller, Ar Ph [3] 10, 57)

Properties — Gas Combines with HCl forming $MeOHCl$ which boils at 2°

References — **CHLORO** and **DI IODO DI METHYL OXIDE**

METHYL - OXINDOLE C_8H_7NO *z*

$C_6H_5 < \begin{matrix} CH \\ NMe \end{matrix} > CO$ *Oxy methyl indole* [88°]

Obtained from methyl indole carboxylic acid by the action of $NaOBr$, the resulting di bromo methyl oxindole being suspended in alcohol and reduced by sodium amalgam (Colman, C J 55, 7, A 248, 120) White needles, sl sol cold water and light petroleum, *v* sol alcohol, ether, acetone and benzene Dissolves in hot alkalis without change Partially decomposes when heated much above its melting point Does not react with phenyl hydrazine Bromine water gives a crystalline pp Nitrous acid converts it into $C_6H_5 < \begin{matrix} C(OH) \\ NMe \end{matrix} > CO$, the oxim of methyl ψ isatin

Di-chloro methyl oxindole $C_8H_5 < \begin{matrix} CCl \\ NMe \end{matrix} > CO$.

[147°] Formed by adding a solution of sodium methyl indole carboxylate to a cold solution of $NaOCl$ (Colman) Colourless needles, *v* sol hot alcohol and acetone, *m* sol ether Not decomposed at 210°

Bromo methyl oxindole $C_8H_5 < \begin{matrix} CHBr \\ NMe \end{matrix} > CO$

[134°] Formed, together with methyl oxindole, by reducing di bromo methyl oxindole with sodium amalgam Lustrous white plates, *v* sl sol cold water, *v* sol hot alcohol Not decomposed by boiling aqueous KOH

Di-bromo methyl oxindole $C_8H_5 < \begin{matrix} CBr_2 \\ NMe \end{matrix} > CO$.

[204°] Formed by the action of $NaOBr$ on methyl indole carboxylic acid (Fischer, B 17, 564) Yellowish white tables, *v* sol alcohol, insol cold water Melts at 204° when quickly heated, but 180° when slowly heated Converted by boiling water into methyl ψ isatin Phenyl-

hydrazine gives the phenyl hydrazide of methyl- ψ -isatin

Di- methyl - oxindole $C_{10}H_7NO$ ν e
 $[5 \ 3 \ 1] C_6H_5(CH_2)_2 \begin{smallmatrix} CH \\ \diagup \quad \diagdown \\ NH \end{smallmatrix} > CO$ *Carbomesyl Anhydride of amido di methyl phenyl acetic acid* [282°] Prepared by reduction of (2 5 3 1) nitro di-methyl-phenyl acetic acid with tin and HCl (Wispeh, B 16, 1580) Sublimable White needles Sol hot alcohol and hot benzene sl sol hot water and cold alcohol and ether, insol cold water

Methyl di-oxindole $C_8H_7 \begin{smallmatrix} CH(OH) \\ \diagup \quad \diagdown \\ NMe \end{smallmatrix} > CO$

Di-oxy methyl indole [151°] Formed by reducing methyl ψ isatin with sodium amalgam or with zinc and HCl (Colman, C J 55, 8, A 248, 121) Needles or prisms (from benzene), m sol water, alcohol, and benzene Oxidising agents reconvert it into methyl- ψ isatin

METHYL PARACONIC ACID v **Anhydride of OXY METHYL SUCCINIC ACID**

TETRA METHYL-PARALEUCANILINE v **TETRA METHYL TRI AMIDO TRI PHENYL METHANE**

METHYL PENTADECYL KETONE $C_{15}H_{32}O$ \approx $CH_3CO C_{13}H_{27}$, [48°] (246°) at 110 mm, (320° uncor) at 760 mm SG (liquid) $\frac{25}{4}$ 814 Prepared by distilling a mixture of barium palmitate and barium acetate (Krafft, *B* 12, 1671) On oxidation it gives pentadecic acid

Methyl pentaecyl ketone $CH_3COCH(C_2H_5)_2$ **Di n heptyl acetone** (300°-304°) SG $\frac{47}{5}$ 826 Formed by boiling di heptyl acetoacetic ether with dilute aqueous KOH (Jourdain, *A* 200, 115) Oil, smelling of peppermint Forms a crystalline compound with $NaHSO_3$

METHYL PENTANE v **HEXANE**

DI-METHYL PENTENYLAMINE $C_8H_{17}N$ \approx $CH_3CHCH_2CHCH_2NMe$ This constitution is assigned by Merling to Ladenburg's di methyl piperidine, v **DI-METHYL PYRIDINE HEXAHYDRIDE**

Di methyl pentenylamine **Methylo hydroxide** $C_8H_{17}NMe_2OH$ Formed from amylene bromide and trimethylamine at 55° (Schmiedeberg a Harnack, *J* 1867, 805) — $(C_8H_{17}NMe_2Cl)_2PtCl_6$ aq Irregular laminae

(8) **METHYL PENTHIOPHENE** C_8H_8S \approx $S < \begin{array}{c} CHCMe \\ CHCH \end{array} > CH_3$ (134°) SG $\frac{18}{5}$ 9938

Formed by distilling sodium α methyl glutarate $CO_2NaCHMeCHCH_2CO_2Na$ (5 g) with P_2S_5 (10 g) at 180°-250° (Kreker, *B* 19, 3270) Colourless oil When successively mixed with a solution of isatin in $HOAc$ and conc H_2SO_4 it gives a dark green colour, and on adding water, a green pp Phenanthraquinone and H_2SO_4 (Laubenheimer's reagent) give a dark violet colour Phenyl glyoxylic acid yields a violet dye Alkaline $KMnO_4$ (3 pc) produces aceto and oxalic acid Nitric acid forms a nitro-derivative, and bromine a biomo-derivative

Methyl penthienyl methyl ketone $C_8H_{11}SO$ \approx $SC_2H_4MeCOCH_3$ (284°)

Oxim $SC_2H_4MeC(OH)CH_3$ [68°]

METHYL-PHENACYL-ANILIDE a **PHENYL-AMIDO PHENYL ETHYL KETONE**

METHYL - PHENACYL - BROMIDE

a Bromo phenyl ethyl ketone

METHYL-PHENANTHRIDINE ν **PHENYL-INDOLE****METHYL-PHENANTHROLINE** $C_{11}H_{10}N_2$ ν ϵ
CH N C CH CH C CH CH

CH CH C ——— C N CMe $^{\nu}$ [65°] (above 360°) Formed, together with an isomeride, when *m* amido (Py 3) methyl quinoline (100 g) is boiled with *o* nitro phenol (75 g), glycerin (320 g), and H_2SO_4 (270 g). The product is diluted with water and evaporated to remove *o* nitrophenol. The resinous mass that is ppd on adding NaOH is extracted with benzene, and the dark oily mixture of bases so obtained treated with HCl. The hydrochlorides are washed with alcohol, dissolved in water, decomposed by NH_3 , and the bases again extracted with benzene. From the crystalline mixture of bases left after evaporating the benzene, ether extracts methyl-phenanthroline only (Gerdeissen, B 22, 246).

Properties — White needles (containing 3 aq) Melts at 50° when hydrated, 65° when anhydrous. Sol boiling water, alcohol, and ether, ν sol cold benzene. On oxidation with $KMnO_4$ it yields phenanthroline carboxylic acid $C_{12}H_9N_2COH$ [209°], which decomposes at 210° into CO_2 and phenanthroline.

Salt — $B'HCl$ aq small snow white needles, sl sol cold, ν sol hot, water, *m* sol alcohol, insol ether — $B'H SO_4$ aq slender silky needles (from alcohol) — $B'H_2CrO_4$ red prisms (from hot water) — $B'H_2PtCl_6$ aq flesh coloured crystalline pp, insol hot water, sl sol alcohol — Picrate $B'C_6H_4(NO)_2OH$ [217°] Transparent yellow needles (from boiling alcohol).

Ethyl iodide $B'EtI$ 2aq [100°–110°] Glistening brown crystals. Yields the platinum chloride $B'EtClH.PtCl_6$ (?) which forms orange red crystals.

Isomeride $C_{11}H_{10}N_2$ ν ϵ 

CH CH C CH C CH CH CH [109°] Occurs in the

preparation of the preceding, from which it differs in being insol ether (G). Crystallises from alcohol in concentric groups of satiny needles (containing 1 aq). Melts at 82° when hydrated and 109° when anhydrous. The anhydrous base is a light white powder, ν sol warm benzene and hot dilute alcohol, insol cold ether, ν sl sol hot ether.

Methyl phenanthroline

CH CH C CH C CH CH CH [76°] Prepared

from *o* amido (Py 3) methyl quinoline, glycerin, *o* nitro phenol, and H_2SO_4 (Gerdeissen). Crystals (containing 2 aq). Melts at 58° when hydrated, and at 76° when anhydrous. ν e sol hot benzene, ν sol chloroform, *m* sol HOAc, sl sol ether and light petroleum. Decomposed on distillation.

Methyl-phenanthroline

CH CH C ——— C N CH [96°] (above

300°) Prepared by boiling *m*-tolylene diamine hydrochloride (40 g) with nitrobenzene (30 g), glycerin (100 g), and H_2SO_4 (100 g), and puri-

fied by means of the chromate (Skraup & Fischer, M 5, 523). Short prisms (containing 5 aq), more soluble in cold than in hot water, ν sol alcohol. Its solutions give a white crystalline pp with $AgNO_3$ and a blue crystalline pp with cupric acetate. Chromic acid mixture oxidises it to the corresponding phenanthroline carboxylic acid.

Salts — $B'HCl$ 4aq transparent needles — $B'H_2CrO_4$ red, sparingly soluble needles — $B'H_2PtCl_6$ 2aq yellow crystalline pp — Picrate [253°]

METHYL-PHENANTHROLINE TETRA-HYDRIDE

Formed by the action of acetic aldehyde or paraldehyde upon *m* phenylene diamine hydrochloride. The resulting base is ppd by ammonia, dissolved in aqueous HCl, and ppd by platinum chloride as $B'H_2PtCl_6$ (Schiff, A 253, 323).

METHYL PHENAZINE $C_{11}H_{10}N_2$ ν ϵ 

by heating tolylene *o* diamine with pyrocatechin in sealed tubes at 210° (Verz, B 19, 725). Formed also by eliminating the two NH_2 groups by means of the diazo reaction, from the oxidation product ($C_{12}H_{11}N_4$) of phenylene *p* diamine and tolylene *m* diamine (Berntsen & Schweitzer, B 19, 2604, A 236, 345). Needles (by sublimation) ν sl sol water and ligroin, ν sol alcohol and ether. Its solution in conc H_2SO_4 is blood red. It dissolves in conc HCl aq, but the base is ppd again on dilution — *Salts* — $B'H PtCl_6$ aq yellow laminae (from water) — $B'H_2PtCl_6$ 3aq (from dilute alcohol) — Picrate $B'C_6H_4(NO)_2OH$ [168°] Yellow nodules which blacken on fusion.

METHYL PHENTRIAZINE $C_8H_8N_4$ ν ϵ 

by the action of sodium amalgam on acetyl *o* nitro phenyl hydrazine in alcohol, the solution being kept acid with HOAc, and the temperature below 30° (Bischler, B 22, 2806). Crystals, partially decomposed on distillation. ν sol cold water, ν e sol alcohol, sl sol hot ligroin.

Bromo methyl phentriazine $C_8H_8BrN_4$ ν ϵ 

acetyl *p* bromo *o* nitro phenyl hydrazine by like treatment (Bischler & Brodsky, B 22, 2818). Golden plates, sl sol cold, ν sol hot, water.

(a) **METHYL - PHENTETRAZINE DIHY-**

Formed by the action of sodium nitrate on a very dilute hydrochloric acid solution of *o* amido-phenyl methyl hydrazine (Hempel, J pr [2] 41, 176). Colourless plates, ν sol ether and benzene, sl sol alcohol and petroleum ether. Sol hot conc NaOHAq. Conc HNO_3 at 80°–100° yields a product [127°] crystallising from alcohol in golden yellow prisms and needles.

TRI-METHYL PHENENYL TRIKETONE

$C_{15}H_{13}O_3$ *vs* $C_6H_5(COCH_3)_3$ [163°] *Tri acetyl-benzene* Formed by the action of NaOEt in ether on a mixture of acetone (1 mol) and allyl formate (1 mol) Sodium acetoacetic aldehyde slowly separates, and is then dissolved in ice cold water and neutralised by HOAc The free acetoacetic aldehyde changes to tri acetyl benzene and water (Claisen & Stylos, *B* 21, 1145) Small needles, sl sol water, alcohol, and ether, v sol HOAc Oxidised by HNO_3 to trimesic acid

METHYL - ($\alpha\beta$) - PHEN - NAPHTHAZINE

$C_{17}H_{13}N_3$ *vs* C_6H_5 $\begin{array}{c} \text{CH CH C N C CH CMc} \\ \text{CH CH C N C CH CH} \end{array}$ [142°] Formed by the action of (β)-naphthoquinone on tolylene diamine in HOAc (Hinsberg, *A* 237, 342)

Methyl-($\beta\beta$) phen-naphthazine

$C_{17}H_{13}N_3$ $\begin{array}{c} \text{CH C N C CH CMc} \\ \text{CH C N C CH CH} \end{array}$ [180°] Formed by oxidation of a mixture of (β) naphthol and tolylene *o*-diamine with alkaline K_2FeC_4 (Witt, *C N* 49, 404) Pale straw coloured needles, forming an intense red solution in H_2SO_4

METHYL PHENOL *v* CHLOROL**Di-methyl-phenol *v* XYLENOL**

Tri-methyl-phenol $C_9H_7Me_3OH$ [123 5] *Hemmellithenol Hemellithenol* [81°] Formed by fusing hemmellithene sulphonic acid with KOH (O Jacobson, *B* 19, 2518) Needles (from ether) Gives no pp with $FeCl_3$

Tetra-methyl-phenol $C_9H_5Me_4OH$ [123 4 5] [81°] (L), [87°] (T), (249° uncol) (L), (266°) (V) (T) Formed by the action of nitrous acid on the corresponding $C_9H_6Me_4NH$ [66°] (Limpach, *B* 21, 644), or by fusing *c* tetra-methyl-benzene sulphonic acid with potash (Töhl, *B* 21, 907) Long white needles (from very dilute alcohol), v e sol alcohol and ether, m sol petroleum ether Volatile with steam Bromine forms $C_{10}H_7BrOH$ [151°]

Acetyl derivative $C_{10}H_{13}OAc$ [57°]

Prisms

Tetra-methyl-phenol $C_9H(CH_3)_3OH$ [81°] Formed by the action of nitrous acid on tetra-methyl-phenyl amine [14°] (Hofmann, *B* 17, 1916) White crystals Yields a quinone on distillation with MnO_2 and H_2SO_4

Ethylether $C_9H(CH_3)_3OEt$ (236°), liquid Formed by the action of alcohol upon the sulphate of tetra-methyl-diazo benzene (Hofmann, *B* 17, 197)

Penta-methyl-phenol $C_9(CH_3)_5OH$ [125°] (267°) Formed by the action of nitrous acid upon penta-methyl-phenyl amine (Hofmann, *B* 18, 1826) Fine white needles Volatile with steam Soluble in alcohol Sparingly soluble in alkalis

Methyl ether $C_9(CH_3)_5OCH_3$ [64°], long needles

METHYL-DIPHENYL $C_{13}H_{11}$ *vs* $C_6H_5C_6H_5Me$ [3 1] *Phenyl-tolyl* (275°) SG 2 1031 Formed by the action of $MeCl$ upon melted diphenyl in presence of $AlCl_3$ (Adam, *Bl* [2] 47, 689, 49, 98, *A Ch* [6] 15, 239) Limpid colourless liquid, not solidified at -21° V e sol methyl alcohol and acetone Not attacked by $KMnO_4$, either in neutral or alkaline solution. Chromic acid oxidises it to diphenyl

m carboxylic acid [161°] Bromine at 150° forms $C_{12}H_9O_2Br$ which when treated with KOEt yields $C_{12}H_9CH_2OEt$ whence dry gaseous HI liberates phenyl benzyl alcohol

o Methyl-diphenyl $C_{13}H_{11}$ *vs* $C_6H_5C_6H_5Me$ [2 1] (259°) Appears to be formed by treating bromo benzene mixed with liquid bromo toluene with sodium (Barbier, *B* 7, 1548)

p Methyl-diphenyl $C_{13}H_{11}$ Me [4 1] (263°-267°) SG 2 1015 Formed by the action of sodium on an ethereal solution of bromo benzene and *p* bromo toluene (Carnelley, *C J* 29, 13) Formed also by passing a mixture of benzene and toluene through a red hot tube (Carnelley, *C J* 37, 701) Solidifies at -2° Dilute nitric acid oxidises it to diphenyl carboxylic acid. Chromic acid forms telephthalic acid

Di-methyl-diphenyl $C_{14}H_{12}$ *vs* $C_6H_5C_6H_5Me_2$ (284°-290°) SG 2 1025 Formed by the action of methyl chloride on diphenyl in presence of $AlCl_3$ (Adam) Colourless liquid, not solidified at -21° Oxidised by CrO_3 in HOAc yielding an infusible diphenyl dicarboxylic acid which cannot be sublimed

Other di-methyl-diphenyls are described as DIOLALS

DI - METHYL-PHENYLACETAMIDINE

$C_{16}H_{11}N$ *vs* $C_6H_5CH_2C(NHMe)(NMe)$ Formed by the action of alcoholic methylamine on the hydrochloride of phenylacetic imido ether $C_6H_5CH_2C(OEt)(NH)$ (Luckenbach, *B* 17, 1426) Crystalline solid, v sol alcohol - $BHCl$ six sided prisms - $B'H PtCl_4$ small glistening crystals, sol alcohol, sl sol water

u Di-methyl-phenylacetamide $C_6H_5CH_2C(NMe_2)(NH)$ Formed in the same manner as the preceding, using dimethylamine (L) - $B'H.H.PtCl_4$ small needles, sl sol water, m sol alcohol

DI-METHYL-PHENYL-ACETIC ACID

$[5\ 3\ 1]C_9H_7(CH_3)_2CH_2COH$ *Mesityl-acetic acid* [100°] (W), [97°] (Robmet, *Bl* [2] 40, 316) (273° at 735 mm) Formed by the saponification of the nitrile obtained by heating mesityl bromide with HCN (Wispek, *B* 16, 1578) Long white prisms Sol alcohol, ether, and hot water, v sl sol cold water

Salts - $A'K$ aq silky needles - $A'Ba$ 4aq transparent prisms - $A'Ca$ 3aq easily soluble thick needles - $A'Mg$ 5aq long silky needles - $A'Ag$ long thin needles

Tetra-methyl-phenyl-acetic acid $C_{11}H_9O_2$ *vs* $C_9HMe_4CH_2CO_2H$ [5 4 3 2 1] [125° uncol] Formed by reducing the corresponding tetra-methyl mandelic acid with HI (Claus & Fohlisch, *J pr* [2] 88, 234) Slender needles (from hot water), v sol alcohol, ether, and chloroform - $CaA'3aq$ silky needles

TRI-METHYL-PHENYL-AMIDO-CROTONIC ACID *v* ψ CUMYL AMIDO CROTONIC ACID

Tetra-methyl phenyl-amido-crotonic acid *Ethyl ether* $C_9HMe_4CH_2CO_2Et$ [101°] Obtained by the action of tetra-methyl phenyl amine (prepared from ψ -cumidine) on acetoacetic ether (Conrad & Limpach, *B* 21, 1655) Large white prisms (from alcohol and ether) At 280° - 285° it yields oxy tetra-methyl phenyl-di-methyl-pyridine carboxylic acid $C_9HMe_4N \begin{array}{c} \text{CMe} \\ \text{CMe} \end{array} \begin{array}{c} \text{C}(\text{CO}_2H) \\ \text{CO} \end{array}$ [145°]

METHYL-PHENYL AMINE *v* **TOLUIDINE** and **METHYL-ANILINE****Di-methyl-phenyl-amine** *v* **XYLIDINE** and **DI METHYL ANILINE****Tri-methyl-phenyl-amine** *v* **MESIDINE** and **ψ CUMIDINE**

Tetra methyl phenyl amine $C_6HMe_4(NH_2)$ [1 2 3 4 5] (66°) (260° uncor) Obtained by heating isocumidine hydrochloride with MeOH at 250° to 260° under pressure (Limpach, *B* 21, 641) Nacaceous leaflets (from water) May be sublimed The corresponding $C_6HMe_4(OH)$ melts at 81°

Formyl derivative [144°], silky needles (from water)

Acetyl derivative [170°], silky needles

Tetra methyl phenyl-amine $C_6HMe_4NH_2$ [1 2 3 5 6] *Isoduridine* [24°] (255°) Formed by heating the hydrochlorides of ψ cumidine or mesidine with MeOH at 300° (Hofmann, *B* 17, 1912, Noltung a Baumann, *B* 18, 1149, Limpach, *B* 21, 646) — $B'HCl$ — $B'H.PtCl_4$

Formyl derivative [183°], long silky needles

Acetyl derivative C_6HMe_4NHAc [215°]

Tetra methyl-phenyl amine $C_6HMe_4NH_2$ *Duridine* [14°] (253°) *SG* 21 978 A product of the action of MeOH on xylidine hydrochloride at a high temperature (Hofmann, *B* 17, 1913) — $B'HCl$ — $B'H.PtCl_4$

Penta methyl phenyl amine $C_6(CH_3)_5NH_2$ *Imido penta methyl ben ene* [152°] (278°) Prepared by heating dimethyl ψ cumidine with methyl iodide under pressure at 240°–20° (Hofmann, *B* 18, 1821) Large colourless needles *V* sol alcohol and ether, *insol* water On oxidation by acetic acid in conjunction with aniline it yields a homologue of rosaniline MeI at 100° forms $(MeNHMe)_6$, which is not further acted on by MeI even at 170°

Salts — $B'HCl$ long thin needles, easily soluble in hot water, *sl* sol cold — $B.H.Cl.PtCl_4$ sparingly soluble triumctic tablets — The acetate is very soluble the nitrate forms sparingly soluble needles, the sulphate and oxalate very sparingly soluble small scales

Acetyl derivative $C_6(CH_3)_5NHAc$ [213°], needles

METHYL DI PHENYL AMINE $C_6H_5NHCH_3$ *NPh Me Di phenyl methyl amine* (282°) (*G*) (292°) at 741 mm (Brühl, *A* 235, 21) *SG* 24 1 0476 Formed by methylation of diphenyl amine (Bardy, *Z* 1871, 649, Girard, *Bl* [2] 23, 2) Liquid Gives a violet colour with HNO_3 Fuming $HClAq$ at 150° resolves it into $MeCl$ and diphenylamine (Gnehm *B* 8, 1040) By passing through a red hot tube it is converted into diphenylamine, carbazole, benzonitrile, aniline, benzene, methane, hydrogen, nitrogen, and other products (Graebe, *A* 174, 181) Nitrous acid passed into its alcoholic solution yields $NMePh.C_6H_5.N_2.C_6H_5.NMePh$ Boiling nitric acid forms a compound which crystallises from alcohol in yellow prisms [234°]

Derivatives —Tri bromo and Bromo-DI NITRO, METHYL-DIPHENYLAMINE

METHYL-PHENYL-ANTHRACENE *v* **PHENYL-METHYL-ANTHRACENE****METHYL-PHENYL-CARBAMIC ACID** *v* **TOLYL CARBAMIC ACID****Di methyl phenyl carbamic acid** *v* **XYLYL-CARBAMIC ACID**

Tri methyl phenyl carbamic acid *Ethyl ether* $C_6H_3Me_3NH.CO.Et$ ψ *Cumyl-carbamic ether* [91 5°] Formed by the action of chloroformic ether $ClCO.Et$ on ψ cumidine (Frentzel, *C C* 1888, 1361) P_2O_5 converts it into the cyanate $C_6H_3Me_3NCO$ (221°), polymerised by PEt_3 or $KOAc$ into the cyanurate [234°]

Tri methyl phenyl carbamic acid *Ethyl ether* $C_6H_3Me_3NH.CO.Et$ *Mesityl-urethane* [62°] Formed from mesidine and $ClCO.Et$ (Eisenberg, *B* 15, 1016) Long colourless needles, volatile with steam, *sol* alcohol and ether

TETRA METHYL-PHENYL CARBAMINE $C_6H(CH_3)_4NC$ [51°] White crystals Formed by heating tetra methyl phenyl amine [14°] with chloroform and alcoholic KOH It is changed into the nitrile by distillation (Hofmann, *B* 17, 1914)

Penta-methyl phenyl carbamine $C_6(CH_3)_5NC$ [128°] Formed by heating penta-methyl phenyl amine with chloroform and alcoholic NaOH (Hofmann, *B* 18, 1824) Colourless crystals *V* sol alcohol At a few degrees above its melting point it is transformed into the nitrile with evolution of heat

METHYL TRI PHENYL CARBINOL CARBOXYLIC ACID *v* **DI PHENYL TOLYL CARBINOL-CARBOXYLIC ACID****METHYL PHENYLENE DIAMINE***v* **PHENYLENE METHYL DIAMINE****Di methyl phenylene diamine** *v* **PHENYLENE DI METHYL DIAMINE**

Tri methyl phenylene diamine $C_6H_3N_2$ *tc* $C_6HMe_3(NH_2)_2$ [1 2 4 3 5] (81°) Formed from nitro ψ cumidine by reduction (Mayer, *B* 20, 970) Long needles, *v* sol benzene $FeCl_3$ colours its solution deep red

Isomerides : **DI AMIDO MESITYLENE** and **DI-AMIDO ψ CUMYLENE**

Tetra-methyl phenylene diamine $C_6H_2N_2$ *tc* $C_6Me_4(NH_2)_2$ [1 2 4 3 5 6] *Prehnitylene-diamine* [140°] Formed by reducing $C_6Me_4(NH_2)_2(NO_2)_2$ with tin and HCl (Töhl, *B* 21, 906) Plates (from water), or needles (from alcohol), *v* sol alcohol, *sl* sol ether and ligroin — $B'H_2Cl_2Aq$ plates, *v* sol water, *v* sol conc $HClAq$ Coloured dark red by $FeCl_3$

Tetra-methyl phenylene diamine

$C_6Me_4(NH_2)_2$ [1 2 4 3 5 6] *Prehnitylene-diamine* [140°] Formed by reducing $C_6Me_4(NH_2)_2(NO_2)_2$ with tin and HCl (Töhl, *B* 21, 906) Plates (from water), or needles (from alcohol), *v* sol alcohol, *sl* sol ether and ligroin — $B'H_2Cl_2Aq$ plates, *v* sol water, *v* sol conc $HClAq$ Coloured dark red by $FeCl_3$

METHYL-DIPHENYLENE KETONE OXIDE *v* **PHENYLENE TOLYLENE KETONE OXIDE**

DI-METHYL PHENYLENE-DIVINYL DI-KETONE $C_6H_5CH=O_2$ *tc* $C_6H_5(CH=CH.CO.CH_3)_2$ [156°] Formed by the action of $NaOHAq$ on a mixture of acetone (10 pts) and terephthalaldehyde (1 pt) (Loew, *A* 231, 379) Needles, almost *insol* water, alcohol, and ether, *v* sol chloroform, *v* sol acetone With conc H_2SO_4 it yields a deep-red solution

METHYL-PHENYL-ETHYL-ALKINE *v* **METHYL-OXYETHYL ANILINE**

METHYL PHENYL-ETHYL KETONE v**BENZYL-ACETONE****METHYL PHENYL-GLYOXYLIC ACID v****TOLYL-GLYOXYLIC ACID****Di-methyl-phenyl glyoxylic acid v XYLIL-GLYOXYLIC ACID**

Tetra-methyl phenyl glyoxylic acid [6 5 3 2 1] $C_6H_5Me, CO CO_2H$ [124°] Formed by oxidising the ketone $C_6H_5Me, CO CH_3$ with cold aqueous $KMnO_4$ (Claus a Foecking, B 20, 8102) White scales, sl sol water, v sol alcohol and ether Reduced by sodium amalgam to tetra-methyl-mandelic acid $C_6H_5Me, CH(OH) CO_2H$ — KA' 5aq crystalline, v e sol water — CaA' 9aq nodules — BaA' 3aq nodules — AgA' white pp

Tetra-methyl phenyl glyoxylic acid [6 4 3 2 1] $C_6H_5Me, CO CO_2H$ Formed by oxidising the corresponding duryl methyl ketone with cold aqueous $KMnO_4$ (C a F) Yellow liquid, sl sol water, v sol alcohol and ether Solidifies when strongly cooled Sodium-amalgam reduces it in alcoholic solution to the corresponding tetra methyl mandelic acid — NaA' 5aq white crystalline crusts — BaA' 5aq nodules — CaA' 3aq granules — CuA' 5aq green crystals, v sol water — PbA' white pp, v sl sol water — AgA' white pp, insol water

Tetra-methyl-phenyl-glyoxylic acid $C_6H_5, O, \text{ etc } [5 4 3 2 1] C_6H_5Me, CO CO_2H$ Formed by oxidising the corresponding tetra methyl phenyl methyl ketone (Claus, J pr [2] 38, 232) Oil — BaA' 4aq needles — CaA' 4aq needles — CuA' 3aq

Penta-methyl-phenyl-glyoxylic acid $C_6H_5, O, \text{ etc } C_6Me, CO CO_2H$ [122°] Formed by the action of $AlCl_3$ on a mixture of penta methyl benzene and $ClCO CO_2Et$ (Jacobsen, B 22, 1218) Formed also by oxidising $C_6Me, CO CH_3$ with alkaline $KMnO_4$ Prisms, v sl sol cold water, v sol alcohol — NaA' 3aq plates, m sol cold water — BaA' 5aq nodules, v sl sol cold water — CuA' 5aq needles

HEXA METHYL DI-PHENYL GUANIDINE $C_6H_5, N, \text{ etc } HN C(NH C_6H_5Me)_2$ *Di mesityl guanidine* [218°] Formed by heating $SC(NH C_6H_5Me)_2$ with alcoholic NH_3 and lead oxide (Eisenberg, B 15, 1014) Minute prisms, sol. alcohol and ether, insol water

Hexa-methyl-tri-phenyl-guanidine $C_6H_5, N, \text{ etc } C_6H_5Me, N C(NH C_6H_5Me)_3$ [225°] Formed by heating hexa methyl di phenyl thio urea with alcoholic mesidine and lead oxide (E) Small crystals, sol alcohol, insol water

METHYL PHENYL-HYDRAZINE v PHENYL-METHYL-HYDRAZINE

Tri methyl-phenyl-hydrazine $C_6H_5, N, \text{ etc } [1 2 4 5] C_6H_5Me, NH NH_2$ ψ *Cumyl hydrazine* [120°] Formed by boiling its sodium sulphinate with water (Haller, B 18, 91) Needles (from ether), insol water and alkalis, v sol alcohol and ether With aceto acetic ether it yields oxy tetra methyl phenyl pyrazole

Sodium sulphinate $C_6H_5Me, NH NH SO_3Na$ Formed by warming diazo- ψ -cumene chloride with Na_2SO_3 and reducing the resulting $C_6H_5Me, N_2 SO_3Na$ with zinc-dust and $HOAc$ (Haller) White plates (containing 14aq), sl sol cold water and alcohol, v sol hot water

METHYL-PHENYL-DI-KETONE v. PHENYL-METHYL-DI-KETONE**TRI-METHYL-PHENYL MERCAPTAN**

$C_6H_5, S \text{ etc } C_6H_5Me, SH$ *Mesityl sulphhydrate. Thioresitol.* (229°) SG 10192 Formed by reducing mesitylene sulphochloride with zinc and H_2SO_4 (Holtmeyer, Z 1867, 686) Liquid, volatile with steam, v sol alcohol, ether, and benzene — $Hg(S C_6H_5Me)_2$ white silky needles

HEXA-METHYL-DI-PHENYL METHANE

$C_6H_5, \text{ etc } CH_2(C_6H_5Me)_2$ *Di-mesityl methane* [c 130°] Formed by the action of H_2SO_4 on a mixture of $CH_2(OAc)$, and mesitylene dissolved in $HOAc$ (Baeyer, B 5, 1098) Monoclinic prisms (from ether)

Methyl-tri-phenyl methane v Di PHENYL TOLYL METHANE

TETRA-METHYL-PHENYL-DI-METHYL AMINE $C_6H_5, N \text{ etc } C_6H_5Me, NMe_2$ (237°) Formed from tetra methyl phenyl amine [14°] by treatment with MeI and alcoholic soda (Hofmann, B 17, 1914) Colourless liquid — $B_2H_3PtCl_4$ crystalline

Penta-methyl-phenyl-methyl-amine $C_6H_5, N \text{ etc } C_6(CH_3), NHMe$ *Methyl-amido penta-methyl-benzene* [61°] Colourless scales Formed by heating penta methyl phenyl amine with methyl iodide — $B_2H_3Cl_2PtCl_4$ needles (Hofmann, B 18, 1824)

Penta methyl-phenyl-di methyl-amine $C_6(CH_3), NMe_2$ *Di-methyl-amido-penta-methyl-benzene* [54°] Colourless scales Formed by digesting penta methyl phenyl amine with methyl iodide in presence of an alkali Its methyl-iodide could not be obtained — $B_2H_3Cl_2PtCl_4$ needles (Hofmann, B 18, 1824)

TETRA-METHYL-PHENYL-METHYL-CARBINOL [6 4 3 2 1] $C_6H_5Me, CH(OH) CH_3$ *Duryl-methyl carbinol* (above 300°) Formed by reducing duryl methyl ketone with zinc and HCl (Claus a Foecking, B 20, 3099) Pale yellow liquid

Tetra methyl phenyl-methyl carbinol [6 5 3 2 1] $C_6H_5Me, CH(OH) CH_3$ [72°] Formed by reducing s duryl methyl ketone (C a F) White plates

METHYL PHENYL METHYL KETONE v TOLYL METHYL KETONE**Di methyl phenyl methyl ketone v XYLIL METHYL KETONE**

Tetra-methyl-phenyl methyl ketone $C_6H_5, O \text{ etc } [5 4 3 2 1] C_6H_5Me, CO CH_3$ *c Duryl methyl ketone* (260°) Formed from c durenene, $AcCl$, and $AlCl_3$ (Claus, J pr [2] 38, 231) Brownish, strongly refracting, oil, insol water, sol alcohol and ether Oxidised by $KMnO_4$ to tetra methyl-phenyl glyoxylic and c tetra methyl benzoic acids

Phenyl-hydrazide [129°] Plates **Tetra methyl-phenyl methyl ketone** [6 4 3 2 1] $C_6H_5Me, CO CH_3$ (254°) Formed from u durenene, $AcCl$, and $AlCl_3$ in CS_2 (Claus a Foecking, B 20, 3097) Colourless oil, v sol alcohol and ether Volatile with steam Reduced by zinc dust and alcoholic KOH to the carbinol. Oxidised by $KMnO_4$ to tetra methyl phenyl-glyoxylic acid

Phenyl-hydrazide Needles, decomposing at 215°

Oxim [148°] Plates **Tetra-methyl-phenyl methyl ketone** [6.5.3.2.1] $C_6H_5Me, CO CH_3$ [68°]. (251°).

Formed by the action of AlCl_3 upon *s* durenne mixed with AcCl in CS_2 (C & F) Plates

Phenyl hydrazide Crystals, decomposing at 225°

Penta-methyl-phenyl methyl ketone $\text{C}_{11}\text{H}_{14}\text{O}$ & $\text{C}_6\text{Me}_5\text{COCH}_3$ [85°] (286°) Formed by the action of AlCl_3 on a mixture of penta-methylbenzene and AcCl dissolved in CS_2 (Jacobsen, *B* 22, 1218) Pearly plates, v sol alcohol, ether, and HOAc Oxidised by KMnO_4 to penta-methyl phenyl glyoxylic acid

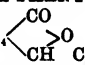

DI-METHYL-PHENYL-PHOSPHINE v

PHENYL DI METHYL PHOSPHINE

METHYL-TRI PHENYL PHOSPHONIUM

IODIDE v *Methyl iodide* of TRI PHENYL PHOSPHINE

TRI METHYL PHENYL PHTHALIDE

$\text{C}_6\text{H}_5\text{O}_2$ & C_6H_5  *Mesityl-phthalide* *Phenyl mesityl carbinol carboxylic anhydride* [164°] Formed by treating an alcoholic solution of [5 3 1 2] $\text{C}_6\text{H}_5\text{Me}$, CO C_6H_5 , CO H with zinc and HCl (Gresly, *A* 234, 237) Short thick needles

Tri-methyl-phenyl-phthalide $\text{C}_6\text{H}_5\text{O}_2$ v *Cumyl phthalide* [140°] Prepared as above, using the derivative of ψ cumene instead of that of mesitylene (G) Small needles

Methyl-di-phenyl-phthalide v **DI PHENYL**

TOLYL CARBINOL CARBOXYLIC-ANHYDRIDE

METHYL-PHENYL-PSEUDO-PICOL-STYRIL v **OXY-PHENYL DI METHYL PYRIDINE**

METHYL-PHENYL-PROPYL-ALKINE v **METHYL-OXYPROPYL ANILINE**

HEXA-METHYL-DI-PHENYL DISULPHIDE

$\text{C}_{12}\text{H}_{18}\text{S}_2$ & $(\text{C}_6\text{H}_5\text{Me})_2\text{S}$ *Mesityl disulphide* [125°] Formed by atmospheric oxidation of tri methyl phenyl mercaptan in alkaline solution (Holtmeyer, *Z* 1867, 688) Light yellow laminae or tables, insol water, sol alcohol, ether, and benzene

OCTA-METHYL-DI-PHENYL SULPHONE v

DI DURYL SULPHONE

Deca-methyl-di-phenyl sulphone $\text{C}_{22}\text{H}_{30}\text{SO}_2$ & $\text{C}_6\text{Me}_5\text{SO}_2\text{C}_6\text{Me}_5$ [93.5°] Formed by the action of ClSO_3H on penta methyl benzene (Jacobsen, *B* 20, 896) Very long, slender needles (from ligroin), v sol alcohol Yields penta methyl benzene when heated with conc HClAq at 170° , and in smaller quantity when distilled

TRI-METHYL-PHENYL-THIO-CARBAMIC

ETHER $\text{C}_6\text{H}_5\text{NSO}$ & $\text{C}_6\text{H}_5\text{Me}_2\text{NHCSOEt}$ or $\text{C}_6\text{H}_5\text{Me}_2\text{N}(\text{CSH})\text{OEt}$ *Mesityl thio urethane* [88°] Formed by heating the corresponding thiocarbimide with alcohol at 140° (Eisenberg, *B* 15, 1015) Slender needles, sol alcohol, ether, and warm alkalis

TRI-METHYL-PHENYL THIOCARBIMIDE

$\text{C}_6\text{H}_5\text{Me}$, NCS *Mesityl mustard oil* [64°] Formed by heating mesidine with CS_2 and some alcoholic potash (Eisenberg, *B* 15, 1012) Long needles, sol alcohol and ether

Tetra-methyl-phenyl-thiocarbimide

$\text{C}_{11}\text{H}_{12}\text{NS}$ & C_6HMe , NCS [65°] Formed by boiling tetra-methyl-phenyl amine [14°] with CS_2 and a little KOH (Hofmann, *B* 17, 1915) Crystalline solid

Penta-methyl-phenyl thiocarbimide

$\text{C}_{12}\text{H}_{13}\text{NS}$ & $\text{C}_6\text{Me}_5\text{NCS}$ [86°] Formed,

together with the corresponding thio-urea, by boiling penta methyl phenyl amine with CS_2 (Hofmann, *B* 18, 1827) Needles (from alcohol), volatile with steam

TRI METHYL PHENYL THIO UREA

$\text{C}_{10}\text{H}_{11}\text{N}_2\text{S}$ & $\text{NH}_2\text{CSNH C}_6\text{H}_5\text{Me}$, *Mesityl thio urea* [222°] Formed by the action of ammonia on the corresponding thiocarbimide (Eisenberg, *B* 15, 1013) Pearly plates, sol ether and hot alcohol, insol water

Hexa methyl di-phenyl thio urea $\text{C}_{12}\text{H}_{13}\text{N}_2\text{S}$

& $\text{CS}(\text{NH C}_6\text{H}_5\text{Me})_2$ *Di-mesityl thio-urea*

Formed by heating mesidine with CS_2 (Eisenberg, *B* 15, 1013) Formed also by digesting tri methyl phenyl thiocarbimide with mesidine in alcoholic solution White needles Conc H_3PO_4 converts it into the thiocarbimide

Isomeride v **DI ψ CUMYL THIO UREA**

Octo methyl di phenyl thio-urea $\text{C}_{12}\text{H}_{13}\text{N}_2\text{S}$

& $\text{SC}(\text{NH C}_6\text{HMe})_2$ [278°] Formed by the action of CS on tetra methyl phenyl amine [14°] (Hofmann, *B* 17, 1916) Four sided plates (from alcohol), sl sol alcohol

Deca methyl di phenyl-thio urea $\text{C}_{22}\text{H}_{22}\text{N}_2\text{S}$

& $\text{SC}(\text{NH C}_6\text{Me}_5)_2$ [252°] Formed by the action of CS upon penta methyl phenyl amine (Hofmann, *B* 18, 1827) White needles, sol HOAc v sl sol alcohol

TRI METHYL PHENYL-UREA v ψ **CUMYL UREA**

Hexa methyl-di phenyl-urea $\text{C}_{10}\text{H}_{11}\text{N}_2\text{O}$ & $\text{OC}(\text{NH C}_6\text{HMe}_5)_2$ *Di mesityl urea* [above 300°] Formed by the action of mesidine on tri methyl phenyl cyanate (Eisenberg, *B* 15, 1017) Minute prisms, sl sol hot alcohol, insol water

Hexa methyl di phenyl urea $\text{OC}(\text{NH C}_6\text{HMe}_5)_2$ *Di ψ cumyl urea* According to Frentzel (*C* 1888, 1361) this substance melts between 260° and 270° (cf vol 11 p 296)

METHYL-PHLOROGLUCINS v **PHLOROGLUCIN**

METHYL PHOSPHATES

Methyl-phosphoric acid $\text{MeO PO}(\text{OH})_2$ Formed by slowly adding methyl alcohol to cooled POCl_3 (H Schiff, *A* 102, 334) — BaA'' 2aq laminae, much less soluble in boiling water than in warm water — CaA'' (dried at 100°)

Di methyl phosphoric acid $(\text{MeO})_2\text{PO OH}$ Formed by pouring POCl_3 into methyl alcohol (Schiff) Acid syrup, sol alcohol and ether Its salts are more soluble than those of the preceding acid — BaA' (dried at 150°) pearly plates, nearly insol alcohol — SrA' 2aq — PbA' 2aq — CaA' (dried at 100°) very soluble nodules

Tri methyl phosphate Me_3PO_4 (197° cor) *SG* 2 1238 (Weger, *A* 221, 89) *SV* 139 5 (Lossen, *A* 254, 74)

METHYL-PHOSPHINE CH_3P & CH_3PH_2 Mol w 48 (-14°) *VD* 24 4 (calc 24) *S* (ether) 70 at 0° Formed, together with di methyl phosphine, by heating PH_3I with MeI and ZnO at 150° When water is added to the product MePH_2I is decomposed, with evolution of MePH_3 , while $\text{Me}_2\text{PH}_2\text{I}$ remains (Hofmann, *B* 4, 605) Formed also by heating chloroform with PH_3I and ZnO (Hofmann, *B* 6, 302) Gas, with powerful odour May be condensed by 2 atmospheres' pressure at 0° Fumes in the air, and takes fire when gently warmed Feeble base, being absorbed by conc HClAq or conc.

HIAq, producing crystalline salts, which are decomposed by water into MePH_2 , and the acid. When passed into fuming HNO_3 , it yields **methane phosphonic acid** or 'methyl-phosphinic acid' $\text{MePO}(\text{OH})_2$, which forms crystals, v sol water, melting at 105° . This acid is not attacked by aqua regia. It yields the salts MePO_3Ba , MePO_3Pb , and MePO_3Ag , and the chloride MePOCl_2 [32?] (163°).

Salts— MePH_2HCl four sided plates, very volatile in the air, being dissociated— MePH_2HI laminae.

Di-methyl phosphine $\text{C}_2\text{H}_5\text{P} \text{ se } (\text{CH}_3)_2\text{PH}$ Mol w 62 (25°) Obtained by the action of caustic soda on its hydro iodide, which is obtained as above described (Hofmann, B 4, 610). Very volatile liquid which takes fire in the air. May be oxidised to Me_2POOH , a waxy solid, v sol water. This acid melts at 76° , forms crystalline Me_2POOAg and is converted by PCl_5 into the chloride Me_2POCl (66°), (204°). This chloride is reconverted by water into the corresponding acid with less energy than MePOCl_2 (Hofmann, B 5, 109, 6, 307).

Tri methyl phosphine $\text{C}_3\text{H}_7\text{P} \text{ se } \text{P}(\text{CH}_3)_3$, Mol w 76 (41°)

Formation—1 By the action of MeCl upon calcium phosphide (Thénard, C R 21, 144, 25, 892)—2 From sodium or zinc phosphide and MeI (Cahours a Hofmann, A Ch [3] 41, 631, Chem Gaz 1855, 11)—3 From PCl_5 and ZnMe , (Hofmann a Cahours, C R 104, 29)—4 From PH_3 and MeI (Drechsel a Finkelstein, B 4, 354, Hofmann, B 4, 205, 430)—5 By heating CS_2 with PH_3I at 140° (Drechsel, J pr [2] 10, 180). 6 From phosphorus and MeI (Friedel a Silva, Wurtz's Dict 2, 938).

Preparation—By treating PCl_5 with ZnMe , in an atmosphere of CO_2 , decomposing the product with caustic soda, and distilling in a very slow current of hydrogen.

Properties—Volatile oil with powerful nauseous odour, heavier than water. Forms readily soluble, crystallisable salts. Unites readily with halogens, oxygen, and sulphur. With $\text{ClCH}_2\text{CO}_2\text{H}$ at 100° it yields $\text{PMe}_2\text{ClCH}_2\text{CO}_2\text{H}$ which forms the platinumchloride $(\text{C}_2\text{H}_5)_2\text{PO}_2\text{PtCl}_4$ (Meyer, B 4, 734, C J 24, 1066).

Salts— $\text{B}'\text{H}_2\text{PtCl}_4$ orange yellow crystalline pp— $\text{B}'\text{H}_2\text{PtCl}_4$ (Cahours a Gal, Z 1870, 662). Combines with CS_2 forming pale red crystals of PMe_2CS_2 , which slowly changes, in ethereal solution, into PMe_2S (Hofmann, A Suppl 1, 59).

Oxide PMe_2O [138°] (Collie, C J 53, 637) (215°). Formed by exposing PMe_2 to a slow current of dry air. Deliquescent crystals. Formed also, together with CH_3 , by distilling PMe_2OH . Yields a platinumchloride $(\text{PMe}_2\text{O})_2\text{H}_2\text{PtCl}_4\text{aq}$ crystallising in orange plates or needles.

Sulphide PMe_2S [105°]. Obtained by gradually adding flowers of sulphur to PMe_2 , or by distilling PMe_2 with cinnabar. Not formed from the oxide and H_2S or ammonium sulphide. Four sided prisms (from concentrated aqueous solution). When warmed with a solution of a silver salt Ag_2S is deposited as a black mirror (Collie).

Selenide PMe_2Se [84°]. Formed from PMe_2 and selenium. Blackens in the air, depositing selenium.

Methylo-hydroxide PMe_2OH Formed

by treating PMe_2I with moist Ag_2O . Caustic base, split up on distillation into PMe_2O and CH_3 .

Methylo-iodide PMe_2I **Tetra methyl-phosphonium iodide** Formed from PMe_2 and MeI (Hofmann a Cahours, A 104, 81). Formed also, together with PMe_2 , by heating PH_3I (1 mol) with MeOH (3 mols) at 180° (Hofmann, B 4, 208). Silvery crystals.

Methylo chloride PMe_2Cl From PMe_2OH and HCl . Deliquescent crystals, decomposed by heat into PMe_2HCl and ethylene (Collie, C J 53, 637)— $(\text{PMe}_2\text{Cl})_2\text{PtCl}_4$ glistening yellow octahedra, insol water— $\text{PMe}_2\text{AuCl}_4$: brilliant yellow needles (from boiling water).

Methylo sulphate $(\text{PMe}_2)_2\text{SO}_4$ Formed from PMe_2I and Ag_2SO_4 (Collie). Thick deliquescent needles. Does not form an alum with $\text{Al}(\text{SO}_4)_3$. Above 300° it decomposes, giving PMe_2O and PMe_2S .

Methylo carbonate $\text{PMe}_2\text{O.CO}_2\text{H}$ Decomposes above 100° into PMe_2O , CO_2 , and CH_3 (Collie).

Methylo acetate PMe_2OAc Decomposed by heat chiefly into PMe_2O and acetone, with traces of PMe_2 and MeOAc .

Benzoate PMe_2OBr Formed by neutralising a solution of PMe_2OH with HOBz (Collie, C J 53, 639). Deliquescent crystals, v sol water. Decomposes between 250° and 300° almost completely into PMe_2O and acetophenone.

Ethylo chloride PMe_2EtCl Obtained from PMe_2EtI (Collie, C J 53, 718). Decomposes above 300° into PMe_2HCl , PMe_2EtHCl , and ethylene— $(\text{PMe}_2\text{EtCl})_2\text{PtCl}_4$ octahedra.

Ethylo iodide PMe_2EtI **Tri-methyl ethyl phosphonium iodide** From PMe_2 and EtI in ether (Cahours a Hofmann, A 104, 33). Crystallises from boiling water. Deliquescent, sol ether.

Isoamyl iodide $\text{PMe}_2\text{C}_4\text{H}_9\text{I}$ Deposited slowly from an ethereal solution of PMe_2 and $\text{C}_4\text{H}_9\text{I}$ (Hofmann). Needles (from alcohol). Yields $(\text{PMe}_2\text{C}_4\text{H}_9\text{Cl})_2\text{PtCl}_4$, crystallising from boiling water in splendid needles aggregated in spherules.

Bromo ethylo-bromide $\text{C}_2\text{H}_5\text{Br}_2 \text{ se } \text{CH}_2\text{BrCH}_2\text{PMe}_2\text{Br}$ From PMe_2 and a large excess of ethylene bromide in alcoholic solution at 60° . Triclinic prisms, $a b c = 56.8 : 1 : 407$ (Hofmann, Tr 1860, 590). With Ag_2O it yields $\text{CH}_2(\text{OH})\text{CH}_2\text{PMe}_2\text{OH}$ whence the platinum chloride $(\text{CH}_2(\text{OH})\text{CH}_2\text{PMe}_2\text{Cl})_2\text{PtCl}_4$ may be got.

Ethyleno di-bromide $(\text{PMe}_2\text{Br})_2\text{O.H}_2$ Formed from ethylene bromide and excess of PMe_2 at 100° . Very deliquescent monoclinic crystals, $a b c = 1.054 : 1.1126, \beta = 87^\circ 49'$. Yields $\text{C}_2\text{H}_4(\text{PMe}_2\text{Cl})_2\text{PtCl}_4$, which crystallises from boiling HClAq in golden yellow laminae. Successive treatment with moist Ag_2O and HI forms $\text{C}_2\text{H}_4(\text{PMe}_2)_2$, crystallising in sparingly soluble needles.

Tri-methyl-tri-ethyl-di-phosphine ethyleno-di-bromide $(\text{PMe}_2\text{Br})_2\text{C}_2\text{H}_4(\text{PEt}_2\text{Br})_2$ Formed from PMe_2 and $\text{CH}_2\text{BrCH}_2\text{PEt}_2\text{Br}$. Yields a caustic hydroxide and the platinumchloride $(\text{PMe}_2\text{Cl})_2\text{C}_2\text{H}_4(\text{PEt}_2\text{Cl})_2\text{PtCl}_4$.

Tetra-methyl-di-phosphine? P_2Me_4 or $(\text{PMe}_2)_2$ (250°) Found among the products of the ac-

tion of MeCl on calcium phosphide or of MeI on sodium phosphide (Thénard, Hofmann a Cahours, *A* 104, 4) Liquid, with unpleasant odour, taking fire in the air Insol water Decomposed by HCl into PMe_3 , and a yellow powder $\text{P}(\text{Me})_2$ (?)

METHYL PHOSPHITE MeH_2PO_3 , *Methyl phosphorous acid* Formed by gradually adding PCl_3 to methyl alcohol (Schiff, *A* 103, 164) Acid syrup, resolved by heat into MeOH and phosphorous acid Its salts are slightly crystalline hygroscopic masses, v sol water, sl sol alcohol, insol ether In aqueous solution they decompose, slowly in the cold, but rapidly on heating, into MeOH and metallic phosphites — $\text{Ba}(\text{MeHPO}_3)_2 \cdot 2\text{aq}$ — $\text{Pb}(\text{MeHPO}_3)_2$

Tri methyl phosphite Me_3PO , (185°) SG 11785 Formed from PCl_3 and NaOMe (Jachin, *A* 256, 281) The compound $\text{Me}_3\text{PO} \cdot \text{PtCl}_3$ is formed by the action of MeOH on PCl_3 , PtCl_3 (Schutzenberger, *B* 2 18, 101 157) It crystallises in orange needles and yields $(\text{Me}_3\text{PO})_2 \cdot \text{PtCl}_3$ and $(\text{Me}_3\text{PO})_2 \cdot \text{PtCl}_3 \cdot \text{H}_2\text{O}$

METHYL-PHTHALIC ACID v *1,2-DIMETHYL-3-CARBOXYLIC ACID*

Di-methyl phthalic acid v *1,2-DIMETHYL-3-CARBOXYLIC ACID*

Tetra methyl phthalic acid v *1,2,3,4-TETRAMETHYL-3-CARBOXYLIC ACID*

METHYL-PHTHALIDE $\text{C}_8\text{H}_6\text{O}$ 12

$\text{C}_8\text{H}_6 \cdot \begin{smallmatrix} \text{CHMe} \\ \text{CO} \end{smallmatrix} > \text{O}$ (276°) VD 74 (obs and calc) Formed by inducing acetophenone carbonylic acid with sodium amalgam and acidifying the resulting $\text{CO} \cdot \text{Na} \cdot \text{C}_6\text{H}_5 \cdot \text{CH}(\text{OH}) \cdot \text{CH}_3$ (Gabriel a Michael, *B* 10 2205, 20 2500) Thick oil solidifying below 0 Insol water and cold alkalis, v sol alcohol and ether sl sol lichen Boiling alkalis convert it into salts of the acid, which forms a crystalline silver salt $\text{CO} \cdot \text{Ag} \cdot \text{C}_6\text{H}_4 \cdot \text{CH}(\text{OH}) \cdot \text{CH}_3$

Di methyl-phthalide $\text{C}_{10}\text{H}_8\text{O}$ 12

$\text{C}_{10}\text{H}_8 \cdot \begin{smallmatrix} \text{CO} \\ \text{CO} \end{smallmatrix} > \text{O}$ [65° (160°) at 25 mm, (271°) at 760 mm Formed by the action of zinc dust and MeI on phthalic anhydride at 100° under a slightly increased pressure (Wislicenus, *A* 218, 66) Crystallises from ether in large crystals which are doubly refracting

Reactions — 1 Converted by the action of conc KOHAq into the k salt of *o* oxy iso propyl benzoic acid — 2 Sodium amalgam yields the dihydride $\text{C}_8\text{H}_8 \cdot \begin{smallmatrix} \text{CMe} \\ \text{CH}(\text{OH}) \end{smallmatrix} > \text{O}$ [90°], a yellow amorphous powder, insol water, sol alcohol and ether, which reduces Fehling's solution and ammoniacal AgNO_3 — 3 Reduction with HI yields *o* iso propyl benzoic acid — 4 Potassium cyanide at 250° forms *o* propenyl benzoic acid $\text{CH}_2 \cdot \text{CMe} \cdot \text{C}_6\text{H}_4 \cdot \text{CO} \cdot \text{H}$ [61°]

METHYL PHTHALIMIDE v *Methylamide of PHTHALIC ACID*

METHYL-PHTHALIMIDINE $\text{C}_8\text{H}_7\text{NO}$ 12

$\text{C}_8\text{H}_7 \cdot \begin{smallmatrix} \text{CH} \\ \text{CO} \end{smallmatrix} > \text{NMe}$ [120°] (300°)

Formation — 1 By reducing methyl phthalimide $\text{C}_8\text{H}_5 \cdot \begin{smallmatrix} \text{CO} \\ \text{CO} \end{smallmatrix} > \text{NMe}$ with tin and HClAq (Graebe, *A* 247, 303) — 2 By heating a solution of phthalimidine in aqueous KOH with excess

of MeI for 6 hours at 100° (Barbier, *C. R* 107, 918) — 3 By heating phthalide with alcoholic methylamine for 12 hours at 220° (B)

Properties — Slender needles or plates, v sol^r water, alcohol, and ether Oxidised by KMnO_4 to methyl phthalimide and, finally, to phthalic acid Combines with bromine forming $(\text{C}_8\text{H}_7\text{NO})_2\text{Br}_2$, crystallising in needles [150°]

Salts — Hydrochloride [120°] Prisms $\text{B} \cdot \text{H} \cdot \text{H} \cdot \text{Cl}$, yellow prisms, sl sol cold water a **METHYL HOMO O PHTHALONITRILE** v *o* **Cyano phenyl propionitrile**

METHYLPYRAZOLENOL v *Organic SELENIUM COMPOUNDS*

METHYL PIAZTHIOLE $\text{C}_4\text{H}_5\text{N}_2\text{S}$ 12

$\begin{bmatrix} 3 & 6 \\ 5 & \end{bmatrix} \text{C}_4\text{H}_5\text{N}_2\text{S}$ [34°] (234°) Mol w

(by Rioult's method) 143 (calc 150) Formed by heating tolylene *o* diamine with H_2SO_4 at 180° (Hinberg, *B* 22 2900) Yields a per iodide when treated with I in HIAq Br in CHCl_3 forms $\text{C}_4\text{H}_5\text{N}_2\text{S}$ which crystallises in white needles; 98° A mixture of conc H_2SO_4 and HNO_3 forms $\text{C}_4\text{H}_5(\text{NO}_2)\text{N}_2\text{S}$ crystallising in colourless needles [156°]

Salt — $\text{B} \cdot \text{H} \cdot \text{PtCl}_3$, reddish yellow crystals, decomposed by water

METHYL PIPECOLINE v *DI METHYL PYR*

IMINI HEXAHYDRIDE

METHYL PIPERIDINE v *METHYL PIPRIDINE*

HEXAHYDRIDE

METHYL PROPARGYL-AMINE $\text{C}_4\text{H}_7\text{N}$ 12

$\text{C}_4\text{H}_7 \cdot \text{NH} \cdot \text{C} \equiv \text{C} \cdot \text{CH}_3$ Formed by the action of MeI on propargylamine in alcoholic solution (Paal a Hermann, *B* 22, 3083) Very volatile yellowish liquid, with ammoniacal odour — $\text{B} \cdot \text{HI}$ [83°] (groups of long hygroscopic needles — $\text{B} \cdot \text{H}_2\text{C} \cdot \text{O}$, [141] Slender white needles, sl sol alcohol

BINOL v *CANFENYL ALCOHOL*

TRI METHYL PROPYL AMMONIUM

IODIDE NMe_3PrI *Propylo iodide of trimethylamine* [190°] Formed by heating propylamine with alcoholic NMe_3 (Langeli, *G* 16, 385) Long needles Yields crystalline NMe_3PrCl and $(\text{NMe}_3\text{PrCl})_2\text{PtCl}_3$ The hydroxide NMe_3PrOH is decomposed by heat into propylene and NMe_3

METHYL-PROPYL ANILINE $\text{C}_{10}\text{H}_9\text{N}$ 12

$\text{C}_6\text{H}_5 \cdot \text{NMePr}$ (212° uncor) Liquid Prepared by the action of methyl iodide upon propylamine (Claus a Hinz, *B* 19, 2785, cf Nolting, *J* 1883, 702) — $\text{B} \cdot \text{HCl}$ very hygroscopic crystals, [106°]

Ethyl-o-iodide v *Propylo iodide* **METHYL-**

ETHYL-ANILINE

METHYL-PROPYL-BENZENE v *CYMENE*

C_9H_{10} s *Methyl di-propyl benzene* $\text{C}_{11}\text{H}_{14}$ 12 $\text{C}_6\text{H}_5\text{Me}(\text{C}_2\text{H}_5)_2$ [35] (248°-248°) Formed by

the action of H_2SO_4 on a mixture of acetone and methyl *n* propyl ketone (Jacobsen, *B* 8, 1259) Yields uvitic acid on oxidation with dilute HNO_3 .

***s*-Di methyl propyl-benzene** $\text{C}_{11}\text{H}_{16}$ *is* $\text{C}_6\text{H}_5\text{Me}_2\text{C}_3\text{H}_7$ [135] (206°-210°) Formed by the action of H_2SO_4 (3 vols) on a mixture of acetone (4 vols) and methyl propyl ketone (2 vols) (Jacobsen, *B* 8, 1259) Oxidised by boiling dilute HNO_3 to mesitylenic acid

***u*-Di-methyl-propyl-benzene** $\text{C}_{11}\text{H}_{16}$ *is* $\text{C}_6\text{H}_5\text{Me}_2\text{Pr}$ [142] (206°) Formed from bromo-*p*-xylene, propyl bromide, and sodium (Uhlhorn, *B* 23, 2350) Liquid, not solidified at -20° Yields a tri-nitro derivative [85°], and a tri-bromo-derivative [49°]

Sulphonic acid $\text{C}_6\text{H}_5\text{Me}_2\text{Pr SO}_3\text{H}$ Salts — BaA' — NaA' 1½aq —

Amide $\text{C}_6\text{H}_5\text{Me}_2\text{Pr SO}_2\text{NH}_2$ [125°] —
Anilide $\text{C}_6\text{H}_5\text{Me}_2\text{Pr SO}_2\text{NHPh}$ [216°]

***u*-Di-methyl-propyl-benzene** $\text{C}_6\text{H}_5\text{Me}_2\text{Pr}$ [134] (208°) Formed from bromo-*m*-xylene, propyl bromide, and Na (Uhlhorn) Liquid, not solid at -20° Yields a tri-nitro derivative [110°] and a tri-bromo-derivative [89°] May be oxidised to (1,3,4) di-methyl-benzoic acid

Sulphonic acid $\text{C}_6\text{H}_5\text{Me}_2\text{Pr SO}_3\text{H}$ Groups of needles — Salts — NaA' 4½aq —
 BaA' 2aq — MgA' 5aq —
Amide $\text{C}_6\text{H}_5\text{Me}_2\text{Pr SO}_2\text{NH}_2$ [102°] —

***u*-Di methyl-propyl-benzene** $\text{C}_6\text{H}_5\text{Me}_2\text{Pr}$ [124] (209°) Formed from bromo-*o*-xylene, propyl bromide and sodium (Uhlhorn, *B* 23, 2349) Liquid, not solid at -20° Yields on oxidation (1,2,4) di methyl benzoic acid [162°]

Sulphonic acid $\text{C}_6\text{H}_5\text{Me}_2\text{Pr SO}_3\text{H}$ Thin needles — Salts — NaA' 3½aq —
Amide $\text{C}_6\text{H}_5\text{Me}_2\text{Pr SO}_2\text{NH}_2$ [124°] —
Anilide $\text{C}_6\text{H}_5\text{Me}_2\text{Pr SO}_2\text{NHPh}$ [214°].

***u* Di methyl-isopropyl benzene** $\text{C}_6\text{H}_5\text{Me}_2\text{Pr}$ [134] (194°) Formed from bromo-*m*-xylene, isopropyl bromide, and sodium (U) Liquid Yields a tri-bromo-derivative [261°] and a tri-nitro-derivative [182°]

Sulphonic acid $\text{C}_6\text{H}_5\text{Me}_2\text{Pr SO}_3\text{H}$.

Needles — Salts — NaA' 4aq — BaA' 2 —
Amide $\text{C}_6\text{H}_5\text{Me}_2\text{Pr SO}_2\text{NH}_2$ [163°] —
Anilide $\text{C}_6\text{H}_5\text{Me}_2\text{Pr SO}_2\text{NHPh}$ [207°]

METHYL-PROPYL-BENZOIC ACID $\text{C}_{11}\text{H}_{14}\text{O}_2$ *is* $\text{C}_6\text{H}_5\text{Me}(\text{C}_3\text{H}_7)\text{CO}_2\text{H}$ *Carbocymelic acid* [63°] Obtained from its nitrile, which is produced by distilling potassium cymene sulphonate with KCy (Paterno a Fileti, *B* 8, 442, Paterno a Spica, *G* 9, 400)

Amide $\text{C}_6\text{H}_5\text{Me}(\text{C}_3\text{H}_7)\text{CONH}_2$ [139°] Obtained by boiling the nitrile with alcoholic potash Needles, sl sol cold water

METHYL-PROPYL-CARBINOL *v* *Sec*-AMYL ALCOHOL

Di-methyl-propyl-carbinol *is* *Tert*-HEXYL ALCOHOL

Methyl-di-propyl-carbinol *v* OCTYL ALCOHOL.

METHYL PROPYL CARBONATE $\text{C}_8\text{H}_{16}\text{O}_3$ *is* $\text{CH}_3\text{O CO OC}_3\text{H}_7$. (131° cor) SG $\frac{d}{4}$ 978 (Röse, *A* 205, 230)

METHYL-PROPYL-COUMARIN $\text{C}_{13}\text{H}_{14}\text{O}_2$ *is* *a*.

Formed by heating a mixture of thymol, malic acid and H_2SO_4 (Pechmann a Welsh, *B* 17, 1647) Fine white needles V sol alcohol, ether, benzene, acetic acid, and chloroform, v sl sol water

METHYL PROPYLENE ψ THIO-UREA

thiazole dihydride [50°] Formed by the action of methyl thiocarbimide on *B* oxy propylamine (Hirsch, *B* 23, 971) Long needles (from ligroin), v sol water Its aqueous solution is strongly alkaline — $\text{B}'\text{H PtCl}_6$ [143°] Large dark-red needles (from hot water) — $\text{B}'\text{C}_6\text{H}_5(\text{NO}_2)_2\text{OH}$ [145°] Needles — Compound with methyl thiocarbimide $\text{B}'\text{MeNCS}$ [64°] White columns (from MeOH)

Methyl propylene ψ thio-urea $\text{C}_3\text{H}_5\text{N}_2\text{S}$ *is* $\text{CHMe S} \text{ } \begin{array}{c} \text{CH}_2 \text{ NMe} \end{array} \text{C NH Imido-di methyl-thiazole}$

tetrahydride Formed from propylene ψ thio-urea, MeI, and KOH (Gabriel, *B* 22, 2989) Converted by bromine water into the acids $\text{NHMe CH}_2\text{CHMe SO}_3\text{H}$ [220°-223°] and $\text{CONH}_2\text{NMe CH}_2\text{CHMe SO}_3\text{H}$ [230°-240°]

METHYL PROPYL-ETHANE *v* *HEXANE*

METHYL ISOPROPYL FLUORENE $\text{C}_{11}\text{H}_{16}$

[97°] Formed by passing the vapour of methyl isopropyl di phenylene ketone (retene ketone) through a red hot tube (Bamberger a Hooker, *A* 229, 142) Formed also by heating this ketone with HIAq and phosphorus in sealed tubes White plates, v sol cold ether, hot alcohol, and HOAc In the fused state, or in alcoholic solution, it exhibits violet fluorescence It yields a di-nitro derivative [245°]

METHYL ISOPROPYL FLUORENE **ALCO**

Formed by the reduction of methyl isopropyl di phenylene ketone (Bamberger a Hooker, *A* 229, 144) White needles, insol water, v sol alcohol and ether Readily oxidised back to the ketone The acetate melts at 71°

METHYL PROPYL GLUTARIC ACID

$\text{CO}_2\text{H CHPr CH}_2\text{CHMe CO}_2\text{H}$ [102°] Formed from sodium propyl-malonate and bromo isobutyric ether, the product being saponified, and the resulting $(\text{CO}_2\text{H})_2\text{CHPr CH}_2\text{CHMe CO}_2\text{H}$ [168°] being decomposed by heat (Bischoff, *B* 23, 1940) White aggregates of crystals (from petroleum-ether)

DI METHYL-PROPYL GLYCOLLINE *v* *Di*-

METHYL DI-OXY PROPYL-AMINE

METHYL PROPYL-GLYOXALINE $\text{C}_8\text{H}_{12}\text{N}_2$

(226°). SG 9641 Formed by the action of propyl bromide on methyl glyoxaline (glyoxal-ethylene) (Radziszewski, *B* 16, 489) Colourless liquid

Oxal-methyl-butylene (215° at 722 mm) SG 985 From propyl glyoxaline and MeI (Rieger, *M* 9, 606) Oil, v. sl alcohol, ether, and chloroform—B⁺H₂PtCl₄, orange red prisms

METHYL PROPYL-GLYOXAL v METHYL-

PROPYL-DIKETONE

DI-METHYL PROPYLDIENE DIKETONE C₈H₁₄O₂ i.e. (CH₃CO)₂CHET *Ethyl-acetyl acetone* (179°) Prepared by heating the sodium derivative of methylene di methyl diketone with EtI at 140° (Combes, *A Ch* [6] 12, 248, *C R* 104, 920) Colourless liquid with pleasant odour, sl sol water, miscible with ether, alcohol, and chloroform Decomposed by potash into CH₃CO₂K and CH₃COCH₂Et Combines with NaHSO₄ Sodium yields (CH₃CO)₂CNaEt which reacts with alkyl iodides

METHYL PROPYL KETONE C₈H₁₆O i.e. CH₃COCH₂CH₂CH₂CH₃ *Ethyl acetone* (102°) SG 8124, 88 8044 (Perkin, *C J* 45, 479), 22 805 (F a D) H F p 72,410 H F v 69,400 (Thomson, *Th*) M M 5 499 at 16.1° (P)

Formation—1 By distilling calcic acetate (48 g) mixed with calcic butyrate (65 g), and rectifying the product The yield (10 g) is small (Semljantzin, *J pr* [2] 23, 263, cf Friedel, *A Ch* [4] 16, 366, *A* 108, 124, Grimm, *A* 157, 251)—2 By boiling ethyl acetoacetic ether with potash or baryta (Frankland & Duppa, *A* 133, 216)—3 By the action of ZnMe₂, followed by water, on butyryl chloride (Butlerow, *Bl* [2] 5, 17)—4 By the oxidation of sec n amyl alcohol (Wurtz, *A* 148, 133, Schorlemmer, *C J* 25, 1085, *A* 161, 269, Wagner & Saytzeff, *A* 179, 322)—5 By the action of water and HgBr₂ on valerylène (Kutscheroff, *B* 14, 1542)—6 By the action of KOH on (CH₃CO)₂CHET (Combes, *A Ch* [6] 12, 248)

Properties—Liquid, v. sl sol water Combines with hydrogen sodium sulphite, forming C₈H₁₆(OH)SO₃Na₂aq (Grunm) Reduced by means of sodium amalgam to sec amyl alcohol CH₃CH(OH)CH₂CH₂Et (119° cor) (Belohoubek, *Sitz W* [2] 74, 80) and a pinacone C₁₀H₂₂O (225°–230°) Yields acetic and propionic acids on oxidation (Schorlemmer), Wagner obtained butyric acid (*Bl* [2] 38, 264) PCl₅ forms CH₃CCl₂CH₂CH₂Et, whence alcoholic potash produces CH₃CH₂CH₂CH₂Et, and this is converted by alcoholic potash at 170° into CH₃CCET (56°) (Kavorsky, *J R* 1887 414) CH₃CCl₂CH₂CH₂Et is split up on distillation into HCl and C₈H₁₆Cl (c 95°) Amyl nitrite and HCl or NaOEt forms the nitroso-derivative C₈H₁₅COCHNOH (48°–51°), which is also an oxim of propyl-glyoxal From this oxim may be prepared the compounds C₈H₁₅C(NOH)CH(NOH) [168°] and C₈H₁₅C(N,HPh)CH(N,HPh) [163°] (Claisen & Manasse, *B* 22, 528)

Oxim C₈H₁₅C(NOH)CH₂ Oil Converted by gaseous HCl in HOAc at 100° into propylamine and acetic acid (Beckmann, *B* 20, 2580)

Methyl isopropyl ketone C₈H₁₆O i.e. CH₃COCH(CH₃)₂ *Di methyl acetone* 'Amyl

ene oxide' (94°) SG 2 822, 12 805 (Wino-gradoff), 12 810 (F a D) CE (0°–18°) 00118

Formation—1 By the action of baryta water on di methyl aceto acetic ether (Frankland & Duppa, *Pr* 14, 463, *A* 138, 832)—2 By the dry distillation of a mixture of calcium isobutyrate and calcium acetate (Munch, *B* 7, 1370, *A* 180, 327)—3 By the action of tin and HClAq on di nitro heptonic acid, which is one of the products of the action of nitric acid on camphor (Kachler, *A* 191, 162)—4 From amylene glycol (CH₃)₂C(OH)CH(OH)CH₃ by dehydration with P₂O₅ (Flavitzky, *B* 10, 2240)—5 From (CH₃)₂CHCH(OH)CH₂(OH) by dehydration with ZnCl₂ or P₂O₅ (F)—6 From (CH₃)₂C(OH)CH(OH)CH₃, by heating with dilute HCl at 100°, and treating the product with potash (Bauer, *C R* 51, 55, *A* 115, 91, Eltekoff, *J R* 14, 358)—7 By shaking (CH₃)₂CHCHCH with diluted H₂SO₄ (SG 1 64) (Flavitzky & Kryloff, *J R* 10, 347)—8 By oxidising MeCH(OH)Pr by CrO₃ (Wino-gradoff, *A* 191, 133)—9 By heating (CH₃)₂CB₂CHBrCH₃ with water and PbO at 150° (Eltekoff, *J R* 10, 215), or by digesting it with water alone (Niederist, *A* 196, 360, Nageli, *B* 16, 2983)—10 By heating MeCH(OH)Pr with excess of dilute (1 p c) H₂SO₄ at 100° (Kondakoff, *J R* 17, 300)

Properties—Liquid Gives the iodoform reaction with iodine and potash Forms a crystal line compound with NaHSO₄ On oxidation it yields acetone and acetic acid, and finally CO₂ and acetic acid

Oxim CH₃C(NOH)CHMe. (158°) From the ketone and hydroxylamine (Nageli, *B* 16, 2984) Formed also by heating the oxim of di methyl acetoacetic acid above 97° (Wallach, *A* 248, 178)

Reference—CHLORO METHYL ISOPROPYL KETONE

Methyl propyl diketone C₈H₁₆O₂ i.e. CH₃COCH₂CH₂CH₂CH₂CH₃ *Acetyl butyryl* (128°) SG 9343 Obtained by boiling this mono oxim with dilute H₂SO₄ (Von Pechmann, *B* 21, 2140) Yellow oil, with irritating odour like quinine

Mono oxim CH₃COCH(NOH)C₄H₉ *Isonitroso propyl acetone* [49 5°] Formed by the action of nitrous acid on propyl acetoacetic ether (Treadwell, *B* 14, 2159) Large plates With phenyl cyanate it reacts with formation of CH₃COCP₂NO CO NHPh [93°] (Goldschmidt, *B* 22, 3108), whence hydroxylamine yields CH₃C(NOH)CP₂NO CO NHPh [129°–131°]

Di-oxim CH₃C(NOH)C(NOH)C₄H₉ *Methyl propyl glyoxim* [168°] Formed by the action of hydroxylamine hydrochloride in aqueous alcoholic solution on isonitroso propyl acetone (Schramm, *B* 16, 2185) Small needles With phenyl cyanate it reacts with formation of CMe(NO CO NHPh)CP₂(NO CO NHPh), crystal lising in pearly plates [164°–170°] (Goldschmidt & Strauss, *B* 22, 3108)

Oxim phenyl hydrazide C₁₁H₁₇N₂O i.e. CMe(N,HPh)CP₂(NOH) [130 5°] Formed by the action of phenyl-hydrazine acetate on the mono oxim (Otte & Pechmann, *B* 22, 2121) Needles, sl sol dilute NaOHAq Gives a violet colour with H₂SO₄ and FeCl₃

(a) *Phenyl-hydrazide* $C_{11}H_{18}N_2O$ α Me C(N,HPH) COPr [114°] Formed by the action of phenyl hydrazine on the diketone (O a P) Insol water and ligroin, v sol alcohol and ether With conc H SO₄ and FeCl it gives a red colour

(B) *Phenyl hydrazide* $C_{11}H_{18}N_2O$ α Me CO C(N,HPH) Pr [109°] Formed from propyl acetoacetic acid by the action of diazo benzene chloride in presence of NaOAc (Japp a Klingemann, A 247, 220) Colourless needles (from benzene and ligroin)

Di phenyl-di-hydrazide $C_{15}H_{22}N_4$ α Me C(N,HPH) C(N,HPH) Pr [136.5°] Formed as a yellow pp when excess of phenyl hydrazine acetate is added to the ketone, its phenyl hydrazide, or its oxim phenyl hydrazide (Otte a Pechmann, B 22, 2121) Yellow needles (from benzene), more easily soluble than its homologues with fewer atoms of carbon in the molecule

Methyl isopropyl diketone $C_8H_{14}O_2$ α CH₃ CO CO CH(CH₃)₂ *Acetyl isobutyryl* (116°) Formed by boiling its oxim with dilute H SO₄ (Von Pechmann, B 21, 2140, 22, 2122) Yellow liquid, with irritating odour, sl sol water

Oxim CH₃ CO C(NOH) CHMe *Isontroso methyl isobutyl ketone* [75°] Formed by the action of nitrous acid on isopropyl acetoacetic ether (Westenberger, B 16, 2991) White plates, sol alcohol, ether, alkalis, and hot water

METHYL PROPYL-KETONE CARBOXYLIC ACID ν Ethyl ACETOACETIC ACID

Methyl-propyl-ketone tricarboxylic acid CH₃ CO CH(CH₃ CO H) CH(CO H) α Carboxy β acetyl glutaric acid [121°-124°] The triethyl ether is formed by the action of chloro or bromo levulic (acetyl propionic) ether upon sodio malonic ether Colourless crystalline solid At 160° it splits off CO₂ giving acetoglutaric acid The neutral NH₄ salt gives pps with AgNO₃, BaCl₂, and Pb(OAc) The zinc salt is a very soluble amorphous solid

Triethyl ether A"Et (285°-295°), oil (Conrad a Guthzeit, B 19, 43)

METHYL - ISOPROPYL - KETONE - CARB OXYLIC ALDEHYDE *Di-oxim* $C_{11}H_{18}N_2O$ α CH₃ C(NOH) CH₂ CMe CH NOH [90°] Formed from di methyl pyrrole and hydroxylamine (Ciamician, B 23, 1788) Small needles or prisms, v sol alcohol, and water, sl sol ether Reduces Fehling's solution Sodium reduces it in alcoholic solution to di methyl tetra methylene-diamine

METHYL PROPYL-DI-KETOXIM ν *Oxim of* METHYL PROPYL DIKETONE

METHYL ISOPROPYL MALONIC ACID $C_8H_{12}O_4$ α CO₂H CMePr CO₂H [124°] Formed by saponifying its ether (Van Romburgh, R T C 5, 236) Crystallises from benzene Split up at 150°-200° into CO₂ and a hexoic acid Salts—CaA', V sol water—AgA' white pp

Ethyl ether EtA" (221°) SG 11 990 Formed from sodio malonic ether, MeI, and PrI Colourless liquid with agreeable odour

METHYL PROPYL OXIDE $C_8H_{16}O$ α CH₃ O Pr (38.9°) SG 2 7471 SV 105.1 CE (0° to 10°) 00146 (Dobner, A 243, 2, cf Chancel, A 151, 305)

METHYL-PROPYL PHENOL ν CARBAORCL, CYMENOL, and THYMOL

Tetrahydride ν BORNEOL and CINEOL

DI METHYL PROPYLPHENYL AMINE

$C_{14}H_{18}(C_6H_5)_2$ NMe *Di methyl phenpropyl amine* (230° uncor) Formed by the action of sodium on a mixture of propyl bromide and di methyl p bromo aniline (Claus a Howitz, B 17, 1327). Colourless oil

Methyl iodide B'MeI [168°], plates

METHYL ISOPROPYL PHENYL CARB-AMINE ν Iso CYMYL CARBAMINE

METHYL PROPYL PHENYLENE DIAMINE

$C_6H_5Me(C_6H_5)(NH)$ Formed by reducing the di oxim of thymoquinone with tin and HCl (Liebermann, B 18, 3193) Oxidised by CrO₃ or FeCl₃ to thymoquinone—B'H₂Cl needles

METHYL ISOPROPYL DIPHENYLENE KE-

STONE $C_{11}H_{16}O$ α CO $\begin{matrix} \diagup C_6H_5 \\ \diagdown C_6H_5 \end{matrix}$ Retene-

ketone [90°] Formed by oxidising retene glycolic acid $C_{10}H_{16}O$ C(OH) CO H (Bamberger a Hooker, A 229, 136) Formed also from retene quinone by the action of alkaline KMnO₄ or by passing it over red hot Ba(OH)₂ or PbO (T. stand, B 17, 692) Yellow prismatic needles or rectangular trimetric plates (by spontaneous evaporation), v sol ligroin, benzene, chloroform, alcohol, and HOAc Volatile with steam and with vapour of alcohol Does not react with hydroxylamine or with NaHSO₃ Reacts with phenyl hydrazine Reduced by sodium amalgam to methyl isopropyl fluorene alcohol (q i), and by red hot zinc dust to methyl isopropyl fluorene

METHYL ISOPROPYL-PHENYL ETHYL

GUANIDINE ν Iso CYMYL ETHYL GUANIDINE

METHYL PROPYL PHENYL GLYOXYLIC

ACID $C_{12}H_{16}O_4$ α [2.5.1] C_6H_5MePr CO CO H Formed by oxidising the ketone $C_8H_{16}O$ CO H, with cold aqueous KMnO₄ (Claus, B 19, 233) Thick oil, easily decomposing into CO₂ and C_6H_5MePr CHO Dilute nitric acid yields $C_6H_5Me(CO_2H)_2$

METHYL PROPYL PHENYL METHYL KE-TONE $C_{11}H_{16}O$ α C_6H_5MePr CO CH₃ (248°) Formed from cymene, AcCl, and AlCl₃ (Claus a Cropp, B 19, 242)

DI-METHYL-DI-PROPYL PYRAZINE

$C_{12}H_{20}N_2$ α N $\begin{matrix} \diagup CMe \\ \diagdown CPr \end{matrix}$ N $\begin{matrix} \diagup CMe \\ \diagdown CPr \end{matrix}$ N *Di-propyl-*

ketone (233°-245°) Prepared by the reduction of the oxim of methyl propyl diketone (nitroso methyl-butyl ketone) with tin and HCl (Treadwell, B 14, 1461, 2160, Oeconomides, B 19, 2526) Oil, with narcotic odour, turning brown in the air—B'H₂PtCl₄ red octahedra,

sl sol water — B'AgNO₃aq crystals, insol cold water

METHYL-PROPYL-PYRIDINES Parvoline

The base obtained by the action of P₂O₅ on a mixture of propionic aldehyde and acetamide (Hesekiel, *B* 18, 3097) has been shown by Durkop & Göttisch (*B* 23, 685) to yield pyridine tricarboxylic acid on oxidation, and must therefore be di methyl ethyl pyridine (*q v*). Parvolines, which must be C₆H₅Me₂N, C₆H₄Me(C₂H₅)N, C₆H₃Me₂EtN, or C₆H₂Et₂N, occur in crude paraffin oil (Williams, *C J* 7, 97), in coal tar (Theniuss, *J* 1861, 502), in the product of the distillation of cinchonine with KOH (Oechsner de Coninck, *Bl* [2] 34, 214), and in putrid flesh (Gautier, *Bl* 48, 11)

Di methyl-propyl pyridine C₁₀H₁₃N *z c* C₆H₂NMePr (133) *n* Propyl lutidine *Conradine* (*c* 195°) at 718 mm Formed by distilling potassium di methyl propyl pyridine dicarboxylate with lime (Jaekle, *A* 216, 37) Colourless liquid, sl sol water, v sol alcohol and ether Its hydrochloride is crystalline — B₂H₂PtCl₆ [185°]

Isomeride *v* CORINDINE

v Methyl-isopropyl pyridine hexahydride

C₆H₁₀N *z c* CH <CH CH>NMe (167°) SG 2 8593 Formed by adding the calculated quantity of MeI to a solution of isopropyl pyridine hexahydride in MeOH, evaporating and distilling the residue with potash (Ladenburg *A* 217, 77) Oil, smelling like conine — B.HAuCl₄ [131°] Plates, sl sol water — B.H.LPtCl₆ [100°] Plates, v sol water and alcohol, insol ether — Picrate B'C₆H(NO)₂OH [149°]

Di-methyl-propyl-pyridine hexahydride

C₆H₁₀N *z c* CHPr <CH CHMe>NH Propyl lupetidine (*c* 180°) at 718 mm Obtained by reducing di methyl propyl pyridine in alcoholic solution with sodium (Jaekle, *A* 246, 46) Colourless oil Gives a brownish pp with FeCl₃, and a yellowish pp with MnSO₄ — B'H₂PtCl₆ [197°] Orange stellate needles

DI METHYL PROPYL PYRIDINE DICARBOXYLIC ACID C₈H₁₀NO₄ *z c*

CPr <C(CO₂H) CMe>N [247°] Formed by saponifying its ether, which is obtained by oxidation, with nitrous gas, from the product of the action of ammonia on butyric aldehyde mixed with acetoacetic ether (Jaekle, *A* 246, 36) Colourless prisms (containing aq) When anhydrous it melts at 247°, but at 212° when hydrated V e sol hot, m sol cold, water Yields di methyl propyl pyridine when distilled with lime *Ethyl ether Et.A* (308°) at 715 mm Light yellow oil Saponified by boiling first with aqueous, and then with alcoholic, potash — (C₆H₁₀NO₄)₂H₂PtCl₆ [187°] Orange prisms *Dihydride of the ethyl ether*

CHPr <C(CO₂Et) CMe>NH [118°] Formed by condensation of butyric aldehyde with acetoacetic ether and ammonia (Jaekle, *A* 246, 34) Yellowish white prisms, v sol alcohol and ether, insol water

Di methyl isopropyl-pyridine dicarboxylic ether. *Dihydride*

CHPr <C(CO₂Et) CMe>NH [97°] Formed by the action of alcoholic ammonia on a mixture of isobutyric aldehyde and acetoacetic ether (Engelmann, *A* 231, 47) Long prisms (from 90 p c alcohol) Oxidised by nitrous acid, in presence of alcohol, to di methyl pyridine dicarboxylic ether C₈H₁₀N(CO Et)₂

METHYL DI ISOPROPYL QUINOLINE DIHYDRIDE C₁₆H₁₇N (299°) Formed by heating di iso propyl indole with MeI and MeOH (Dennstedt, *B* 21, 3437) Oil — B'H₂PtCl₆ [177°]

METHYL PROPYL-STYRIL KETONE

C₁₁H₁₅O *z c* C₆H₄(C₂H₅) CH CH CO CH₃ *Cuminal acetone* (181° at 23 mm) Formed by the action of dilute (10 p c) NaOHAq upon a mixture of cumic aldehyde (20 g), acetone (20 g), water (300 g), and alcohol (170 g) (Claisen & Ponder, *A* 223, 147) Yellow oil

METHYL ISOPROPYL SULPHIDE C₆H₁₀S *z c* MeSPi (93°-95°) VD 45.02 Formed by dissolving sodium in an ethereal solution of isopropyl mercaptan, and slowly adding MeI to the product (Obermeyer, *B* 20, 2923)

METHYL PROPYL DITHIOCARBONATE

MePtCS O Methyl propyl xanthate SG 2 1094 (Na-amn a Scala, *G* 17, 66)

METHYL PROPYL THIO-UREA C₄H₇N₂S *z c* CH₃NH CS NHC₂H₅ [79°] Prepared from methyl thiocarbimide and propylamine, or from propyl thiocarbimide and methylamine (Otto Hecht, *B* 23, 294) Transparent glassy plates (from very dilute alcohol), sl sol cold water, m sol hot water, v sol alcohol and wood spirit, extremely sol acetone and chloroform, v sol ether benzene, and CS, v sl sol warm light petroleum

DI METHYL PYRAZINE C₆H₈N₂ *z c*

N <CMe CH>N *Ketone Di methyl aldine* (Meyer, *B* 21 19) (170°-180°) Formed by reduction of nitroso acetone with tin and HCl (Treadwell & Steiger, *B* 15, 1059, 1055) Oecnomides *B* 19, 2526 Wolff, *B* 20, 433 Formed also by heating its dicarboxylic acid Oil, with alkaloidal odour — B H PtCl₆ golden plates, sol hot water

Tetra methyl pyrazine C₈H₁₂N₂ *z c*

N <CMe CMe>N *Methyl ketone Di methyl aldine Tetra methyl aldine* [86°] (190°) Formed by reducing with tin and HCl the oxim of di methyl diketone (methyl nitroso ethyl ketone) CH₃CO C(NO₂H)CH₃ (Gutknecht, *B* 13, 1116, Treadwell, *B* 14, 1469, Braun & V Meyer, 21, 1947) An intermediate base appears to be C₈H₁₂N (Braun, *B* 22, 556) Tetra methyl pyrazine is also formed, together with CO₂ and other products, by heating CH₃CO CHBr CH₃CO₂H or CH₃CO CH(OH)CH₃CO₂H with conc NH₄Aq (Wolff, *B* 20, 427) Glistening prisms (anhydrous) or long white needles (containing 3aq) Very volatile Melts at 74°-77° when hydrated, but at 86° when anhydrous Strong characteristic smell V sol alcohol and ether By alkaline KMnO₄ it is oxidised to pyrazine tetra carboxylic acid C₈N₂(CO₂H)₄

Salts — B'HCl 2aq easily soluble, [91° anhy] — B'H₂Cl₂PtCl₆ red glistening needles, — B'H₂Cl₄PtCl₆ 4aq orange red needles.

Methylo-iodide $B''MeI$ [216°] anhy Yellow needles (containing 2aq), ν sol water and alcohol, insol ether

Methylo chloride $B''MeCl$ [α 105°], needles— $B''MeCl \cdot HCl \cdot PtCl_4$, aq orange red pyra mids (from hot water)

DI METHYL PYRAZINE DICARBOXYLIC

ACID $C_6H_4N_2O_4$, i.e. $N \langle \begin{smallmatrix} CMe & C(CO_2H) \\ C(CO_2H) & CMe \end{smallmatrix} \rangle N$ [201°] Prepared by saponification of its ether, which is formed by reducing nitroso acetoacetic ether with stannous chloride (Wleügel, *B*, 15, 1050) Formed also by oxidising di methyl di-ethyl pyrazine by aqueous $KMnO_4$, and by condensation of imido oximido butyric ether $CH_3 \cdot C(NH) \cdot C(NOH) \cdot CO_2Et$ by warm $ZnCl_2$ (Oeconomides, *B* 19, 2524)

Properties—Colourless crystals (containing 2aq), melting at 201° when anhydrous ν sol alcohol and acetone, m sol hot water and toluene, nearly insol ether, benzene, and ligroin Decomposes when heated above 200° into CO_2 and di methyl pyrazine

Salts— $BaA''3aq$ glistening crystals— $*KA''$ slender felted needles Gives amorphous pps with $FeCl_3$ and $CuSO_4$ — $Ag A''$ yellowish white pp

Ethyl ether Et_2A'' [86°] (316° cor) Long colourless needles, sol alcohol

METHYL-PYRAZOLONE ν OXY METHYL

PIRAZOLE

(a)-METHYL PYRIDINE C_6H_7N i.e.

$N \langle \begin{smallmatrix} CMe & CH \\ CH & CH \end{smallmatrix} \rangle CH$ (a) *Picoline* Mol w 93 (129°) (L), (133 4° cor) (Thorpe, *C J* 37, 223) $SG \frac{1}{2}$ 9656 (L), 9616 (T) CE (0°-10°) 000975, (0°-100°) 0010968 (T) SV 111 5

Occurrence—In bone-oil (Anderson, *A* 60, 86, Weidel, *B* 12, 2008), where it is mixed with a little (β) picoline and di methyl pyridine (Ladenburg, *B* 18, 49) It is also the chief constituent of coal tar picoline (Goldschmidt & Constam, *B* 16, 2976)

Formation—1 By heating pyridine (a) carb oxylic acid with fuming $HIAq$ at 260°, or by treating the acid with zinc and $HOAc$ (Seyfferth, *J pr* [2] 34, 244)—2 By the action of aldehyde on aldehyde ammonia (Dürkopf & Schlangk, *B* 21, 297)—3 By heating pyridine methylo iodide in sealed tubes at 300° (Ladenburg, *A* 247, 7, *C R* 103, 692)

Preparation—Crude pyridine (50 g boiling between 128° and 134°) is dissolved in $HClAq$ (170 g of 11 p.c.) and a hot solution of $HgCl_2$ (312 g) in water (4½ litres) is poured in The double salt crystallises out, and, after recrystallisation, is decomposed by aqueous $NaOH$ (Ladenburg, *A* 247, 6)

Properties—Liquid, inactive to light, miscible with water and alcohol Picoline lessens the heart's action, and acts on the nervous system somewhat like nicotine (Oechsner, *Bl* [2] 38, 547)

Reactions—1 Yields pyridine (a) carboxylic (picoline) acid on oxidation (Weidel)—2 When heated with sodium it yields di methyl dipyrindyl 3 *Methylal* and $ZnCl_2$ yield $CH_2(C_6H_7N)_2$ —4 *Chloral* forms $C_6H_7N \cdot CH_2 \cdot CH(OH) \cdot CCl_3$ [87°], the hydrochloride of which $C_6H_7N \cdot OCl \cdot HCl$ melts at 202° Alcoholic potash converts it into pyridyl acrylic acid (Einhorn & Liebrecht, *B* 20,

1592)—5 *Paraldehyde* at 260° forms allyl pyridine $C_6H_7N \cdot C_3H_5$ (190°), $SG \frac{1}{2}$ 9595 (Ladenburg, *A* 247, 26) Its aurochloride melts at 136°, its platinumchloride at 186° Allyl pyridine is reduced in alcoholic solution by sodium to conine—6 *Furfuraldehyde* and a little $ZnCl_2$ at 170° yields $C_6H_7N \cdot CH \cdot CH \cdot C_4H_3O$ [58°] (Merck, *B* 21, 2709), ν *Furfuryl vinyl pyridine* In alcoholic solution it is reduced by sodium to the hexahydride of furfuryl ethyl pyridine ($q \nu$) 7 *Glycolic chlorhydrin* at 140° forms a compound $C_6H_7N \cdot NO$, which yields the salts $B''H \cdot PtCl_4$ [200°] and $B''H \cdot AuCl_3$ [100°] (Alexander, *B* 23, 2714)

Salts— $B''H \cdot PtCl_4$, aq [178°] Monoclinic tables or prisms, sl sol water— $B''H \cdot PtCl_4 \cdot 2aq$ (Weidel)— $B''H \cdot PtCl_4$ [195°] Monoclinic plates, abc c=6636 1 9078, β =72° 46' (Stohr, *J pr* [2] 42, 420)— $B''H \cdot AuCl_3$ [168°] Needles, sl sol water— $B''HHg \cdot Cl_2$ [164°] Prisms (from dilute $HClAq$), ν sl sol cold, ν sol hot, water— $B'' \cdot ZnCl_2$ (at 120°) Crystals (from alcohol) (Lachovitch & Bandrowsky, *M* 9, 517) Picrate $B''C_6H_4(NO_2)_3OH$ [165°] M sol water (Lange, *B* 18, 3436)

(a) **Methyl pyridine tetrahydride** $C_6H_{11}N$ i.e. $NH \langle \begin{smallmatrix} CMe & CH \\ CH_2 & CH_2 \end{smallmatrix} \rangle CH$ Formed by the action of alcoholic NH_3 upon methyl ω bromo butyl ketone, probably by elimination of water from the intermediate $CH_3 \cdot CO \cdot CH_2 \cdot CH_2 \cdot CH_2 \cdot NH_2$ (Lipp, *B* 19, 284)

(a)-Methyl pyridine hexahydride $C_6H_{13}N$ i.e. $NH \langle \begin{smallmatrix} CMe & CH \\ CH_2 & CH_2 \end{smallmatrix} \rangle CH$ (a)-Methyl piperidine

(a) *Piperidine* (119°) $SG \frac{1}{2}$ 8600 Obtained by reducing (a) methyl pyridine in alcoholic solution with sodium (Ladenburg & Roth, *B* 18, 47, *A* 247, 62, *C R* 103, 747) Colourless liquid, smelling like piperidine, ν sol water, alcohol, and ether Separated by KOH from its aqueous solution Inactive, but if a crystal of hydrogen conine tartrate be added to a conc solution of the acid tartrate, crystals of the acid tartrate of dextrorotatory (a) methyl pyridine hexahydride separate, while the salt of the laevo rotatory isomeride remains as an oil The rotation of the dextro (a) methyl piperidine is $[\alpha]_D^{20}$ =21 44', while that of the laevo base is (probably) equal and opposite

Reactions—1 Treatment with Br and $NaOHAq$ yields (a) piperolein C_6H_7N , an oily base (126°), $SG \frac{1}{2}$ 880 (Ladenburg, *B* 20, 1645) Its acetyl derivative boils at about 230°—2 Combines with sulphide of carbon, forming methyl piperidine methyl piperyl di thio carbamate $C_6H_{13}N \cdot CS \cdot SC_6H_7N$, [119°], ν e sol water and alcohol

Salts— $B''HCl$ [189°] Colourless needles, ν sol water Not deliquescent— $B''HBr$ [182°] Silky matted needles, m sol water—The platinumchloride forms sparingly soluble plates

(β)-Methyl-pyridine C_6H_7N i.e. $N \langle \begin{smallmatrix} CH & CMe \\ CH & CH \end{smallmatrix} \rangle CH$ m *Picoline* (β) *Picoline* (144° cor) $SG \frac{1}{2}$ 9771 (L), 9765 (B)

Occurrence—In bone oil (Weidel, *B* 12, 2008) and in coal tar (Möhler, *B* 21, 1009)

Formation—1 By distillation of acrolein-ammonia (Bayer, *A* 155, 288, cf Claus, *A*,

Suppl 2, 134, 180, 185, 158, 222) —2 By heating CH_3Br CHBr CH_3Br with alcoholic ammonia at 250° (Baeyer) —3 By distilling strychnine with lime (Stoehr, *B* 20, 2728, Löbisch & Malfatti, *M* 9, 632) —4 By heating acetamide (10 g) with glycerin (32 g) and P_2O_5 (26 g) (Zanoni, *J* 1882, 498, Heseckiel, *B* 18, 3091) —5 Together with homologues, by distilling glycerin with $(\text{NH}_4)_2\text{SO}_4$ and a little H_2SO_4 (Storch, *B* 19, 2458) —6 One of the bases got by distilling brucine with lime (Behrend, *J pr* [2] 42, 415) —7 Together with tri methylene imine (66° – 70°) by distilling tri-methylene diamine hydrochloride (Ladenburg & Sieber, *B* 23, 2729)

Purification —By digesting in hydrochloric acid solution with NaNO_2 on a water bath, followed by crystallisation of its mercury double salt (Bachér, *B* 21, 293)

Properties —Liquid When prepared from strychnine it boils at 149° , and the base so obtained (called (β) methyl pyridine) is less soluble in water than the variety boiling at 144° , and forms a platinumchloride melting at 258° instead of 241° (Ladenburg, *B* 23, 2688) Optically inactive (Landolt, *B* 19 157) Less soluble in water than (α) picoline The absorption spectrum has been studied by Hartley (*C J* 41, 45) Oxidised by a 2 p.c. solution of KMnO_4 to pyridine (β) carboxylic (nicotinic acid)

Salts — $\text{B}' \text{H}_2\text{PtCl}_6\text{aq}$ Monoclinic prisms, v sol hot water Melts, when anhydrous, at 191° (L) or 195° (Stoehr) On heating at 120° for some time it gives off HCl , leaving $\text{B}'_2\text{HPtCl}_6$ [214°] A boiling aqueous solution deposits $\text{B}'_2\text{PtCl}_6$, while $\text{B}'_2\text{HPtCl}_6$ crystallises from the nitrate $\text{B}'\text{HAuCl}_4$ [184°] Needles (from hot water), v sol alcohol — $\text{B}'\text{HHg}_2\text{Cl}_4$ [143°] Needles (from water), plates or needles (from HClAq) or prisms (on slow crystallisation), v sol water, more sol HClAq — $\text{B}'_2\text{HgCl}_2$ white pp — $\text{B}'_2\text{H}_2\text{ZnCl}_4$ [158°] Pearly needles, v sol hot water —Picrate $\text{B}'_2\text{C}_6\text{H}_2(\text{NO}_2)_4\text{OH}$ [145°] Needles or plates, m sol water and alcohol

(β) *Methyl-pyridine hexahydrate* $\text{C}_6\text{H}_9\text{N} \cdot 6$
 $\text{NH} \begin{smallmatrix} \text{CH} & \text{CHMe} \\ \text{CH} & \text{CH}_2 \end{smallmatrix} > \text{CH}_2$ (β) *Methyl piperidine*

(β) *Pipecoline* (β) *Picoline hexahydrate* (125°) SG $\frac{2}{3}$ 8684 VD ($\text{H}=1$) 98 14 Obtained by reducing (β) picoline in alcoholic solution with sodium (Ladenburg, *A* 247, 67, Stoehr, *B* 20, 2732, Heseckiel, *B* 18, 910) Colourless liquid, smelling like piperidine, v sol water When heated with MeI it forms $\text{C}_6\text{H}_9\text{NMeI}$ [192°] The hydrochloride of (β) methyl-pyridine hexahydrate is not pptd by HgCl_2 .

Salts — $\text{B}'\text{HCl}$ Colourless needles, v e sol water and alcohol — $\text{B}'\text{HI}$ [131°] Colourless, non deliquescent needles — $\text{B}'_2\text{H}_2\text{PtCl}_6$ [192°] Orange yellow prisms, m sol water — $\text{B}'\text{HAuCl}_4$ [131°] M sol water — $\text{B}'_2\text{H}_2\text{CdI}_4\text{aq}$ White plates, melting at 145° when anhydrous $\text{B}'_2\text{H}_2\text{FeCy}_2\text{aq}$ yellow monoclinic prisms, less soluble than the ferrocyanides of homologous bases Decomposed by water at 75° —Picrate $\text{B}'_2\text{C}_6\text{H}_2(\text{NO}_2)_4\text{OH}$ [138°] Yellow pp, m sol water

(γ) *Methyl-pyridine* $\text{C}_6\text{H}_9\text{N} \cdot 3$
 $\text{N} \begin{smallmatrix} \text{CH} & \text{CH} \\ \text{CH} & \text{CH} \end{smallmatrix} > \text{CMe}$ *p Picoline* (γ) *Picoline*.
 (148 5° cor) SG $\frac{2}{3}$ 9742

Occurrence —In coal tar, from which it may be obtained by preparing its platinumchloride from the so-called lutidine (Schulze, *B* 20, 418, Ladenburg, *B* 21, 285, *A* 247, 11)

Formation —1 By heating di-chloro-pyridine (γ) carboxylic acid with conc HIAq and P at 175° (Behrmann & Hofmann, *B* 17, 2696) —2 In small quantity by heating pyridine methylo-iodide in sealed tubes at 300° , distilling the product with KOH , converting the fraction (142° – 146°) into platinumchloride, and decomposing the Pt salt by H_2S (L) —3 By distilling sparteine with lime (Ahrens, *B* 21, 828)

Properties —Oil, smelling like (α) methyl-pyridine, v sol water, alcohol, and ether Oxidised by dilute KMnO_4 to pyridine (γ) carboxylic (isomonic acid) [307°]

Salts — $\text{B}'_2\text{H}_2\text{PtCl}_6$ [231°] Four sided plates, sl sol cold water — $\text{B}'\text{HAuCl}_4$ [205°] Prisms, v sl sol water — $\text{B}'_2\text{HHg}_2\text{Cl}_4$ [129°] Needles, v sol hot, sl sol cold, water —Picrate $\text{B}'_2\text{C}_6\text{H}_2(\text{NO}_2)_4\text{OH}$ [167°] Tufts of needles, sl sol cold water

(γ) *Methyl-pyridine dihydride* $\text{C}_6\text{H}_7\text{N} \cdot 2$
 $\text{NH} \begin{smallmatrix} \text{CH} & \text{CH} \\ \text{CH} & \text{CH} \end{smallmatrix} > \text{CHMe}$ Formed from ethyl-pyrrole and HClAq at 130° (Dennstedt & Zimmermann, *B* 19, 2197) — $\text{B}'_2\text{H}_2\text{PtCl}_6$, red needles, v sol water

(γ) *Methyl-pyridine hexahydrate* $\text{C}_6\text{H}_9\text{N} \cdot 6$
 $\text{NH} \begin{smallmatrix} \text{CH}_2 & \text{CH}_2 \\ \text{CH}_2 & \text{CH}_2 \end{smallmatrix} > \text{CHMe}$ (γ) *Pipecoline* (126 5° – 129° cor) SG $\frac{2}{3}$ 8674 Obtained by reducing (γ) methyl pyridine in alcoholic solution by sodium (Ladenburg, *B* 21, 288, *A* 247, 69) Colourless hygroscopic liquid which fumes in the air, and smells like piperidine V sol water

Salts — $\text{B}'\text{HCl}$ v e sol water — $\text{B}'_2\text{H}_2\text{PtCl}_6$ [203°] Prisms, m sol water — $\text{B}'\text{HAuCl}_4$ [127°] Yellow needles sl sol water — $\text{B}'_2\text{H}_2\text{CdI}_4$ [135°] —Bismutho iodide characteristic red plates The picrate and mercury double chloride are crystalline

Methyl-pyridine dihydride $\text{C}_6\text{H}_7\text{N} \cdot 2$
 $\text{NMe} \begin{smallmatrix} \text{CH} & \text{CH} \\ \text{CH} & \text{CH} \end{smallmatrix} > \text{CH}_2$ (?) (129°) Obtained by distilling pyridine methylo iodide with KOH (2 pts) and a little water (Hofmann, *B* 14, 1498) Very pungent oil, almost insol water Absorbs oxygen from the air Combines with bromine, with iodine and with sulphur Combines with CS and with mercaptan Conc HClAq at 180° decomposes it, giving off methylamine

Methyl pyridine hexahydrate $\text{C}_6\text{H}_9\text{N} \cdot 6$
 $\text{NMe} \begin{smallmatrix} \text{CH}_2 & \text{CH}_2 \\ \text{CH}_2 & \text{CH}_2 \end{smallmatrix} > \text{CH}_2$ *Methyl piperidine*.
 (105°) (L) Formed by adding potash to the product of spontaneous union of piperidine with MeI (Cahours, *A Ch* [3] 38, 76) Formed also by heating piperidine hydrochloride (10 g) with MeOH (75 g) for 4 hours at 300° , excess of alcohol being distilled off, and the dry residue distilled with aqueous potash (Ladenburg, *A* 247, 56) Liquid — $\text{B}'\text{HCl}$ Needles — $\text{B}'_2\text{H}_2\text{PtCl}_6$ Orange crystals, v sol water

Methylo-iodide $\text{B}'\text{MeI}$ Crystalline, m sol hot alcohol When heated with solid KOH it yields only 'di-methyl-piperidine' (118°), a strongly alkaline base, which is decomposed by gaseous HCl into methyl chloride and methyl-

piperidine 'Di methyl piperidine' forms the salts C_4H_9NHCl and C_4H_9NHAc . It combines with halogens, forming crystalline C_4H_9NI , C_4H_9NCl (which yields $C_4H_9NCl \cdot AlCl_3$), and C_4H_9NBr . The latter is converted by moist Ag_2O into crystalline C_4H_9NBr , whence further treatment with moist Ag_2O produces C_4H_9NOH which is split up on distillation into H_2O and 'di methyl piperidine'. Ladenburg suggests the formula $CH_3CHCHCHCH_2NMe_2$ for 'di methyl piperidine', and Merling (*B* 19, 2628)

suggests $CH_3CH(CH_3)CHCH_2NMe_2$ for the compound $C_4H_9NBr_2$. This dibromide is accompanied by an oily isomeride which may possibly be $CH_3BrCHBrCH_2CH_2NMe_2$, which changes into the other variety on heating its alcoholic solution. The diiodide $C_4H_9NI_2$ is converted, on treatment with Ag_2O into 'di methyl piperidine' C_4H_9N , a liquid (137°–140°) which forms the salts $(C_4H_9N)H_2PtCl_6$ and $(C_4H_9N)HAuCl_4$, and a methylo iodide C_4H_9NMeI . 'Di methyl piperidine' combines with MeI forming crystalline C_4H_9NMeI [200°] whence moist Ag_2O forms strongly alkaline C_4H_9NMeOH which is split up by heat into pyridine C_4H_5N , water, NMe_3 , $MeOH$, and di-methyl piperidine. Di methyl piperidine also combines with methylene iodide forming $C_4H_9NICH_2I_2$ (Ladenburg, *B* 14, 1347). Ladenburg suggests for di methyl piperidine the formula $CH_3CH(CH_3)CHCH_2NMe_2$

Methyl pyridine from Bone oil The following salts described by Ramsay (*P M* Oct 1876 and 1877, July 1878) were prepared from a methyl pyridine obtained from Dippel's oil, which was probably (a) methyl pyridine mixed with a little (b) methyl pyridine — * $B \cdot HCl$ [160°] White deliquescent crystals — $B \cdot HBr$ [187°] Deliquescent Absorbs bromine forming $B \cdot HBr$, golden-yellow needles, sol water — $B \cdot Br$. Needles — * $B \cdot HI$ Decomposed by heat, yielding $B \cdot HI$, which crystallises in brown needles [79°] — $B \cdot ICl$ yellow tables — $B \cdot HgCl$ — $B \cdot H_2PtCl_6$ (at 100°) Converted by water at 170° into yellow flocculent $B \cdot PtCl_6$ and $B \cdot PtCl_4$, a yellowish green insoluble powder — $Platino-cyanide B \cdot H_2PtCy_4$ 4aq yellow crystals The crude bone oil picoline forms the following combinations with alkyl salts — $B \cdot MeCl$ deliquescent needles (from alcohol) — $(B \cdot MeCl)_2PtCl_6$ small cubes — $B \cdot MeI$ [227°] Long white deliquescent needles (from alcohol) — $B \cdot MeI_3$ [129°] Blush black feathery plates, insol water and CS_2 , sol alcohol and ether — $B \cdot MeNO_3$ transparent prisms — $(B \cdot C_2H_5Cl)_2PtCl_6$ — $B \cdot C_2H_5Br$ [276°] Small prisms The same picoline forms with acetyl chloride deliquescent brown crystals of $B \cdot AcCl$ According to Gardner (*B* 23, 1589) crude picoline forms with acetic and formic acids the salts $(C_4H_5N)(HOAc)$, (c 148°) and $C_4H_5N(CO_2H_2)$, (156°–159°) which distil unchanged

Di methyl-di-pyridine ($C_8H_9N_2$), *Dipicoline Parapicoline* (310°–320°) SG 112 H F p 8084 (Ramsay, that for picoline being 3759) Formed by boiling bone oil picoline (6 pts) with sodium (1 pt) for two days (Anderson, *A* 105, 844). Pale-yellow oil miscible with alcohol and ether. Bromine water gives a pp of

$C_{12}H_{11}BrN_2H_2Br_2$ — $C_{12}H_{11}N_2H_2PtCl_6$ pale yellow powder Its aurochloride is decomposed by boiling water (O de Coninck, *B* [2] 45, 131)

Methylo iodide $C_4H_9N(Me)I$ Yellow powder, v sol water, almost insol alcohol and ether Yields $C_4H_9NMe_2PtCl_6$ and $C_4H_9NMe_2I_3$

(aa) **Di methyl pyridine** C_4H_5N : e
 $N \begin{smallmatrix} \text{CMe} \text{CH} \\ \text{CMe} \text{CH} \end{smallmatrix} \text{CH}$ (aa) *Lutidine* oo *Lutidine*
 Mol w 107 (142° cor) (L), 145° (E) SG
 § 942

Occurrence — In coal tar, being obtained by extracting with H_2SO_4 ppq by alkali, and separating from the isomeride (157°) by fractionating (Lunge a Rosenberg, *B* 20, 127, Ladenburg a Roth, *A* 247, 28) It occurs also in bone oil, and may be obtained from the fraction (135°–145°) (Roth, *B* 19, 786)

Formation — 1 By the action of cinnamic aldehyde and alcoholic NH_3 on acetoacetic ether, the resulting dihydride of styryl di methyl pyridine dicarboxylic ether being saponified, oxidised by $KMnO_4$, and the di methyl pyridine tetracarboxylic acid so produced distilled with lime in a current of hydrogen (Epstein, *A* 231 18) — 2 By distilling its dicarboxylic acid with lime (Engelmann, *A* 231, 54) — 3 By distilling oxy di methyl pyridine (lutidine) with zinc dust (Courad a Epstein, *B* 20, 162)

Preparation — Claude picoline (139°–142°) from bone oil is dissolved in excess of $HClAq$ and a hot solution of $HgCl_2$ is added The double salt which is ppd is recrystallised and decomposed by aqueous $NaOH$ The base is finally separated by solid KOH (Ladenburg *A* 247, 30)

Properties — Liquid smelling and tasting like pyridine, sol cold water, the base separating again on warming Its aqueous solution ppts solutions of $ZnSO_4$, $CdSO_4$, $FeSO_4$, and $FeCl_3$ With $CuSO_4$ it gives a pale blue pp not turned black by heating With $AgNO_3$ it gives minute needles of $B \cdot AgNO_3$ Dilute $KMnO_4$ oxidises it to pyridine dicarboxylic acid [227°]

Salts — * $B \cdot HCl$ Deliquescent needles — $B \cdot H_2PtCl_6$ [208°] Orange red monoclinic plates, $a b c = 892.1 \ 660. \ 81^\circ 55'$ v sol hot, m sol cold, water, insol alcohol — $B \cdot HAuCl_4$ [124°] Yellow needles (from very dilute HCl) — $B \cdot HHgCl_2$ [186°] Thin plates (from acidulated water) — $B \cdot HHgCl_2$ (Mohler, *B* 21, 1008) — $B \cdot H_2CrO_4$ [92°] Orange prisms — $B \cdot (NH_4)_2H_2O_4$ [c 160°] — *Picrate* [159°] Yellow needles or thin plates

(aa) **Di methyl pyridine hexahydride**
 $C_8H_9N_2$: e $NH \begin{smallmatrix} \text{CHMe} \text{CH}_2 \\ \text{CHMe} \text{CH}_2 \end{smallmatrix} CH_2$ (127°–130°) SG § 8492 Formed by reducing the corresponding di methyl pyridine in alcoholic solution with sodium (Ladenburg, *A* 247, 87 *B* 18, 54) Colourless liquid, miscible with water, alcohol, and ether — $B \cdot HCl$ non deliquescent needles, m sol water — $B \cdot HBr$ Needles, v sol water — $B \cdot H_2PtCl_6$ [212°], orange red crystals

(ay) **Dimethyl pyridine** C_6H_7N : e
 $N \begin{smallmatrix} \text{CMe} \text{CH} \\ \text{CH} \text{CH} \end{smallmatrix} \text{CMe}$ *Lutidine* (157°) SG
 § 9493 S 20

Occurrence—In coal tar oil, being extracted with other bases by H_2SO_4 , (Ladenburg a Roth, *B* 18, 918, Lunge a Rosenberg, *B* 20, 131), Ladenburg, 21, 286)

Formation—1 By distilling oxy di methyl pyridine $CMe \begin{smallmatrix} \text{CH CO} \\ \text{CH CMe} \end{smallmatrix} > NH$ with zinc dust (Hantzsch, *B* 17, 2908)—2 By distilling its tri-carboxylic acid with lime (Hantzsch, *A* 215, 56)—3 By distilling with lime the acid $N \begin{smallmatrix} \text{CMe C(CO}_2\text{H)} \\ \text{CH CH} \end{smallmatrix} > CMe$ the ether of which is obtained by condensation of an equal number of molecules of acetoacetic ether, acetic aldehyde, and acetic aldehyde ammonia (Michael, *B* 18, 2020)

Preparation—The fraction of coal tar bases boiling between 155° and 160° is dissolved in dilute $HClAq$, conc $HClAq$ is then added, followed by a hot concentrated solution of $HgCl_2$. The double salt which then crystallises out is decomposed by distilling with $NaOHAq$ (Ladenburg, *A* 247, 35)

Properties—Liquid, smelling like pyridine, dissolving in 5 pts of cold water, less soluble in hot water. Miscible with alcohol and ether. Easily volatile with steam. Oxidised by $KMnO_4$ to pyridine dicarboxylic (lutidine) acid [235°]. Reacts with benzoaldehyde and $ZnCl_2$ forming styryl methyl pyridine (Bachér, *B* 21, 3071)

Salts— $B'HgCl_2$, aq Needles. Melts at 132° when anhydrous. Mohler (*B* 21, 1008) obtained from coal tar lutidine in acid solution a salt $B'HHgCl_2 \cdot B'H.PtCl_4$ [220°]. Plates or prisms— $B'HAuCl_4$, amorphous pp, changing to prisms— $*B'HCl$ slender needles— $*B'HBr$ Needles—Picrate [179°] Needles, sl sol cold water

($\alpha\gamma$) Di-methyl-pyridine hexahydrate

$NH \begin{smallmatrix} \text{CHMe CH} \\ \text{CH}_2, \text{CH}_2 \end{smallmatrix} > CHMe$ ($\alpha\gamma$) Di methyl pyridine (141°) SG 2 8615 Obtained by reducing the corresponding di methyl pyridine in alcoholic solution with sodium (Ladenburg, *A* 217, 88). Colourless strongly alkaline liquid, smelling like piperidine. Fumes with HCl . M sol water, v e sol alcohol and ether

Salts— $B'HCl$ [235°] Long colourless needles, v sol water— $B'HBr$ [142°] Short needles, v e sol water— $B'_2H.PtCl_4$ groups of yellow needles

($\beta\delta$) Di-methyl-pyridine C_4H_8N &c

$N \begin{smallmatrix} \text{CH CMe} \\ \text{CH CMe} \end{smallmatrix} > CH$ (170°) SG 2 9614 Obtained by heating with lime the di methyl pyridine carboxylic acid formed by oxidation of the ($\beta\delta$) di methyl-ethyl pyridine produced by heating propionic aldehyde ammonia with propionic aldehyde (Dunkopf a Götsch, *B* 23, 1113). Transparent, strongly refracting liquid, with a pleasant odour characteristic of (β) alkyl pyridines, m sol cold water, sl sol hot water. Yields on oxidation a pyridine dicarboxylic acid [315°]

Salts— $B'_2H_2.PtCl_4$ [256°] Dark red needles and plates, sl sol water— $B'HAuCl_4$ [149°] Yellow needles, sl sol water—Mercury double chloride [176°] Long needles, sl sol cold water

($\alpha\delta$)-Di-methyl-pyridine $N \begin{smallmatrix} \text{CMe CH} \\ \text{CH CMe} \end{smallmatrix} > OH$

(162° – 166°) Occurs in coal tar (Lunge a Rosenberg, *B* 20, 134) Yields isomochomeronic (pyridine dicarboxylic) acid on oxidation

($\alpha\gamma$)-Di-methyl-pyridine tetrahydride?

C_4H_8N &c $NMe \begin{smallmatrix} \text{CHMe CH}_2 \\ \text{CH=CH} \end{smallmatrix} > CH_2$ Formed, together with $MeCl$, hydrocarbons, methylamine, NH_3 , and other bases, by heating anhydro ecgonine with conc $HClAq$ (Einhorn, *B* 22, 1362). Oil. When heated with conc $HClAq$ at 280° it yields a mixture of bases which appear to yield methyl pyridine when distilled over zinc dust— $B'HAuCl_4$ [212°] Small needles, m sol water— $B'_2C_2H_5(NO_3)_2.OH$ Long needles, v sl sol hot water— $*B'HCl$ very hygroscopic

Di-methyl-pyridine of bone oil (156° – 159°) is a mixture of ($\alpha\gamma$) di methyl pyridine, ($\alpha\delta$)-di methyl-pyridine, (β)-ethyl pyridine, and (γ)-ethyl pyridine. The existence of these bases is shown by the production of the corresponding pyridine di and mono carboxylic acids on oxidation by $KMnO_4$ (Weidel a Herzig, *M* 1, 1, Weidel a Pick, *M* 5, 658, cf Anderson, *A* 80, 5). Bone oil also contains ($\alpha\alpha$) di methyl pyridine (*v supra*) Greville Williams (*C J* 7, 97, *P* 13, 311) obtained a lutidine from coal tar, this has since been shown to contain ($\alpha\alpha$), ($\alpha\gamma$), and ($\alpha\delta$) di methyl pyridines (*v supra*) Oechsner de Coninck (*Bl* [2] 41, 249) found (γ) ethyl pyridine (154°) in coal tar. Lutidines have also been obtained by distilling the bituminous shale of Dorsetshire (Williams) and peat (Church a Owen, *P M* [4] 20, 110). Among the products obtained by distilling cinchonine with KOH Oechsner de Coninck (*C R* 91, 296) obtained a lutidine (165°), VD 38 (calc 3.7), SG 2 959, which formed a deliquescent crystalline hydrochloride and a platinochloride $B'_2H_2.PtCl_4$ crystallising in orange red needles, converted by boiling water into $B'_2H.PtCl_4$ crystallising in yellow needles. When brucine is distilled with KOH it yields a lutidine (166°) whence $B'_2H.PtCl_4$ [180°] and $B'.PtCl_4$ [205°] (Oechsner de Coninck, *C R* 95, 298, 96, 437). Lutidine aureochloride $B'HAuCl_4$ is decomposed on boiling with water, yielding first thin red plates of $B'HAuCl_4 \cdot B'_2AuCl_4$, and then a red crystalline pp B'_2AuCl_4 (O de Coninck, *Bl* [2] 31, 634)

Di-methyl pyridine dihydride C_4H_8N (199°) VD 33 Occurs in cod liver oil (Gautier a Mourgues, *C R* 107, 111, *Bl* [3] 2, 213). Colourless strongly alkaline and caustic oil, absorbs CO_2 from the air. Poisonous. Its salts taste bitter. Oxidised by boiling aqueous $KMnO_4$ to methyl pyridine carboxylic acid and a little pyridine carboxylic acid

Salts— $*B'HCl$ confused needles, v sol water— $*B'HN_3$ Reduces $AgNO_3$ — $B'_2H_2SO_4$ Groups of deliquescent needles— $B'_2H.PtCl_4$ Lozenge shaped plates, loses HCl on boiling with water

Methyl iodide $B'MeI$ Colourless needles, sol water and alcohol. Yields a tri-methyl-pyridine dihydride on treatment with potash

Di-methyl-pyridine hexahydrate **Methyl iodide** C_4H_8NMeI [192°] Formed by heating (β) pyridine hexahydrate with MeI and $MeOH$ at 100° (Hessekel, *B* 18, 8099, *A* 247, 69). Needles (from acetone). Not decomposed by aqueous KOH . Yields $(C_4H_8NMeCl).PtCl_4$, an orange crystalline pp turned black at 234°

(e) Tri-methyl-pyridine $C_6H_3N \cdot 3e$

$N \begin{smallmatrix} \text{CMe CH} \\ \text{CMe CH} \end{smallmatrix} \text{CMe}$ (γ)-Collidine (172° cor) (H, M); [168°] (D) SG λ 917 (H), 922 (M), τ 9312 (D) Occurs in coal tar, from which it may be obtained by fractional distillation followed by ppn of the bases by K_2FeC_4 (Mohler, B 21, 1011) Formed by heating with quicklime the potassium salt of its dicarboxylic acid, which is obtained by the action of nitrous acid on its dihydride produced from acetoacetic ether and aldehyde ammonia (Hantzsch, A 215, 32) Formed also by heating acetone with NH_4Cl for 3 days at 265°, CH_4 being evolved (Riehm, A 238, 16), and by heating acetone with aldehyde ammonia for 10 hours at 200° (Dürkopf, B 21, 2713)

Properties—Liquid which turns brown in the air More than 3 times as soluble in water as aldehyde collidine Less soluble in hot than in cold water It differs also from aldehyde collidine in giving a pp with $AgNO_3$, an orange crystalline pp with CrO_3 , and an aurochloride that melts under water It is oxidised by $KMnO_4$ to $N \begin{smallmatrix} \text{C(CH}_3)_2 \text{ CH} \\ \text{C(CO}_2H)_2 \text{ CH} \end{smallmatrix} \text{CMe}$ and uvitonic acid Bromine added to its solution in CS forms unstable orange crystals of $C_6H_3NBr_2$ (Pfeiffer, B 20, 1844)

Salts— B^+HCl Slender, non deliquescent needles— $B^+H_2PtCl_6$ yellow crystalline pp— B^+HAuCl_4 [113°] (H), [115°] (M), [106°] (D) Needles (from hot water)— B^+HHgCl_2 [155°]— B^+HI — B^+TNO , [above 300°]— $B^+H_2CrO_4$ Yellow prisms, decomposing at 190°— $B^+H_2SO_4$ [203°]—Picrate [156°] (M) Silky yellow needles, sl sol water, v sol alcohol

Reference—DI BROMO TRI METHYL PYRIDINE

Tri methyl pyridine dihydride $C_8H_{12}N$ Di-hydro collidine (175°–180°) Formed by heating its dicarboxylic ether (obtained from aldehyde ammonia and acetoacetic ether) with dilute HCl aq at 130° (Hantzsch, A 215, 44) Pungent oil with alkaloidal smell Alkaline to litmus, v sol cold water Precipitates the hydrides of Mg, Zn, and Fe from solutions of their salts— $B^+H_2PtCl_6$ Minute needles which blacken at 200°— B^+HI

Polymeride $C_6H_2N_2$ Tetrahydriodicollidine (255°–260°) Formed at the same time as the preceding— $C_6H_2N_2H PtCl_6$ — $C_6H_2N_2HI$

s -Tri-methyl-pyridine hexahydride $C_8H_{11}N$ νe $NH \begin{smallmatrix} \text{CHMe CH}_2 \\ \text{CHMe CH} \end{smallmatrix} CHMe$ Copellidine (146°) SG τ 8475 Formed by reducing s tri methyl pyridine in alcoholic solution with sodium (Jaacke, A 246, 43) Formed also, together with s tri methyl pyridine, by heating acetone with aldehyde ammonia at 200° (Dürkopf, B 21, 2715) Liquid, smelling like piperidine, sl sol water, miscible with alcohol and ether Unlike s tri methyl-pyridine it gives a brownish-black pp with $Hg_2(NO_3)_2$. Gives no pps with $HgCl_2$ or picric acid

Salts— B^+HCl Needles or prisms, v e sol. water and alcohol— B^+HBr — $B^+H_2PtCl_6$ [205°] (J); [244°] (D)

Isomerides of tri-methyl-pyridine ν METHYL-ETHYL-PYRIDINE, where (α)- and (β) collidines,

aldehyde-collidine and other isomerides are described

A collidine dihydride $C_8H_{11}N$, (210°), SG τ 1029, is contained in putrid horseflesh and putrid beef, and forms a crystalline hydrochloride and platinocchloride (Gautier, Bl [2] 48, 12)

Tetra methyl pyridine dihydride $C_8H_{11}N \cdot 2e$

$NH \begin{smallmatrix} \text{CMe CMe} \\ \text{CH}_2 \text{ CMe} \end{smallmatrix} \text{CMe}$ Dihydroparvoline

(159°) Formed by heating potassium pyrrole carboxylate with MeI and MeOH at 120° (Ciamician & Anderlini, B 21, 2462) Basic liquid— B^+HAuCl_4 [110°] Yellow needles

Tetra methyl pyridine hexahydride $C_8H_{11}N$

νe $NH \begin{smallmatrix} \text{CHMe CHMe} \\ \text{CH}_2 \text{ CHMe} \end{smallmatrix} CHMe$ Parpervoline

(151°) Obtained by reducing the preceding in alcoholic solution with sodium (C & A) Liquid, smelling like pyridine Does not turn brown in air— B^+HAuCl_4 [119°] Yellow needles

Methylo iodide B^+MeI [262°] Prisms, v sol water, insol ether

A parvoline $C_8H_{11}N$ (c 200°) is present among the products of the putrefaction of horseflesh (Gautier, Bl [2] 48, 11) It is an oil which resinifies in the air, and forms a flesh coloured platinocchloride

A parvoline $C_8H_{11}N$ (188°) occurs among the bases obtained by distilling cinchonine with KOH (O de Coninck, C R 91, 296)

Penta methyl pyridine dihydride $C_9H_{11}N$

νe $NMe \begin{smallmatrix} \text{CMe CMe} \\ \text{CH CH} \end{smallmatrix} \text{CMe}$ (189°), (46° at 7 mm) Prepared by heating ν methyl pyrrole with MeI, K_2CO_3 , and methyl alcohol at 140° (Ciamician & Anderlini, Rend Accad Linc [4] 203, B 21, 2863, 22, 658) Formed also by heating tetra methyl pyridine dihydride with MeI (Anderlini, B 22, 2507) Oil, with strong alkaline reaction— B^+HAuCl_4 [100°] Yellow needles Reacts energetically with MeI, forming an oily product, whence successive treatment with $AgCl$ and $AuCl_3$ yields $C_9H_{11}NHAuCl_4$, which crystallises in thin golden yellow needles [100°]

METHYL PYRIDINE CARBOXYLIC ACID

$C_7H_7NO_2 \cdot 2e$ $N \begin{smallmatrix} \text{CMe CH} \\ \text{CH CH} \end{smallmatrix} \text{C CO}_2H$ Picoline

carboxylic acid Formed by heating methyl pyridine dicarboxylic (uvitonic) acid at 275° (Bottinger, B 14, 67, 17, 92) Fimetric crystals (containing aq), sol hot, sl sol cold, water and alcohol, nearly insol ether Sublimes without melting Forms salts both with acids and bases Yields on oxidation with $KMnO_4$ pyridine dicarboxylic (lutidmic) acid

Salts— HA^+HCl prisms— BaA^+ 11aq very soluble needles— CaA^+ aq very soluble four sided colourless prisms— CuA^+ aq blue pp— AgA^+ white pp

Methyl-pyridine carboxylic acid $C_7H_7NO_2 \cdot 2e$

$N \begin{smallmatrix} \text{CH C(CO}_2H) \\ \text{CH CH} \end{smallmatrix} \text{CMe}$ Homomocotinic acid

Methyl-carbopyridine acid [212°] Obtained by heating methyl pyridine dicarboxylic (methyl-quinolinic) acid at 170°, or by warming it with HOAc (Hoogewerf & Van Dorp, R T C 2, 21) Formed also by the slow oxidation of (β) collidine by $KMnO_4$ (O de Coninck, A Ch [5] 27, 493, Bl [2] 43, 107) Needles, v sol hot

water Oxidised by KMnO_4 to pyridine dicarboxylic (cinchononic) acid

Salts — KA' small plates — CuA' small blue crystals — AgA' needles — $\text{HA}'\text{HCl}$ small prisms — $(\text{HA}')_2\text{H}_2\text{PtCl}_6$ orange prisms — $\text{HA}'\text{HAuCl}_4$ yellow needles

(a) Methyl pyridine (β) carboxylic acid

Formed by oxidising (a) methyl (β) ethyl pyridine (aldehyde collidine) with a 2 p.c. solution of KMnO_4 , allowing the mixture to stand for 48 hours, and then heating to 60° . The filtrate from MnO_2 is neutralised by H_2SO_4 and evaporated, the residue is extracted with alcohol and the acid purified by means of its silver salt (Dukopf, *B* 18, 3132, Ladenburg, *A* 217, 43). Prisms, v.e. sol water and alcohol. On distillation with lime it yields (a) methyl pyridine (128°). KMnO_4 oxidises it to pyridine dicarboxylic (isocinchononic) acid.

Salts — $(\text{HA}')_2\text{H}_2\text{PtCl}_6$ [240°] Aggregates of needles, v. sol water, insol ether alcohol — $(\text{CuA}')_2\text{Cu}(\text{OAc})_2$ Crystalline powder, formed by boiling a solution of the acid with cupric acetate. The silver salt is amorphous. The aurichloride forms yellow needles [c 202°].

Methyl pyridine carboxylic acid $\text{C}_6\text{H}_7\text{NO}_2$ is

$\text{N} \begin{array}{c} \text{C}(\text{CO}_2\text{H}) \text{CH} \\ \diagup \quad \diagdown \\ \text{CH} \quad \text{CH} \end{array} \text{CMe (?)}$ [c 260°] Formed in small quantity, together with pyridine (α)-dicarboxylic acid, by oxidising (α) di-methylpyridine with KMnO_4 (Bichr, *B* 21, 30-0). Plates (from alcohol), v.e. sol water. It is possibly identical with the isomeride described by Bottinger (*supra*).

(β) Methyl-pyridine (β') carboxylic acid

$\text{N} \begin{array}{c} \text{CH CMe} \\ \diagup \quad \diagdown \\ \text{CH C}(\text{CO}_2\text{H}) \end{array} \text{CH}$ [216°] Formed by heating (β) methyl pyridine (αβ') dicarboxylic acid with HOAc and Ac_2O at 225° (Dukopf a. Gottsch, *B* 23, 1113). White mass, m. sol water. Its aqueous solution is not coloured by FeSO_4 .

Methyl pyridine dicarboxylic acid

$\text{C}_6\text{H}_5\text{NO}_4$ is $\text{N} \begin{array}{c} \text{CMe} \text{---} \text{CH} \\ \diagup \quad \diagdown \\ \text{C}(\text{CO}_2\text{H}) \text{CH} \end{array} \text{CO}_2\text{H}$ *Uti* tonic acid [274°] Formed by the action of ammonia on pyruvic acid (Bottinger, *A* 188, 330, 208, 138, *B* 13, 2092, 16, 35, 17, 144). Formed also by oxidising s tri methyl pyridine,

or di methyl ethyl pyridine, $\text{N} \begin{array}{c} \text{CMe CH} \\ \diagup \quad \diagdown \\ \text{CMe CH} \end{array} \text{CLt}$, with KMnO_4 (Altar, *A* 237, 191, Dukopf, *B* 21, 2717). Minute six sided trimetric plates (Friedlander, *J* 1882 367), v. sl sol cold, sl sol hot, water, m. sol NH_4Ac and HClAc , v. sol aniline, phenol, HOAc , and glycerin, sl sol isoamyl alcohol and chloroform, insol benzene and CS_2 . Gives a violet red colour with FeSO_4 . It is a powerful antiseptic. Yields (a) methyl pyridine on distillation with lime. Split up by heat into CO_2 and $\text{N} \begin{array}{c} \text{CMe CH} \\ \diagup \quad \diagdown \\ \text{CH CH} \end{array} \text{CO}_2\text{H}$. Alkaline KMnO_4 oxidises it to pyridine tricarboxylic acid. Bromine water forms bromoform, CO_2 , and formic acid.

Salts — $(\text{NH}_4)\text{HA}'$ powder — CaA' 6aq: amorphous — CaA' 4aq: prisms — BaA' 2aq:

slender needles — CuA' 4aq — $\text{Cu}(\text{OH})_2\text{A}'_2$ 9aq * PbA' dense pp — AgA' 7aq gelatinous pp

Methyl pyridine di carboxylic acid

Methyl quinolinic acid [c 183°] *S* 84 at 10° . Formed by the oxidation of (*Py* 1) methyl-quinoline (lepidine) (1 pt) by KMnO_4 ($7\frac{1}{2}$ pts) (Königs, *B* 12, 983, 14, 103, Hoogewerff a. Van Dorp, *R T C* 2, 15, *B* 13, 1639, 14, 645). Tables or prisms, sol hot, sl sol cold, water, sl sol alcohol, ether, and benzene. Decomposes on fusion into CO and methyl pyridine carboxylic acid [210°], which on further oxidation yields cinchononic acid. KMnO_4 oxidises it to pyridine (a) tricarboxylic acid. The aqueous solution of the acid gives pps with the acetates of Pb , Ba , and Cu , and a yellow colour with 1cSO_4 .

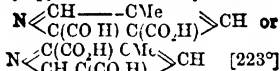

Salts — KHA' 2aq needles — KHA' 3aq — AgA' 7aq crystalline powder

Methyl pyridine dicarboxylic acid $\text{C}_6\text{H}_7\text{NO}_4$

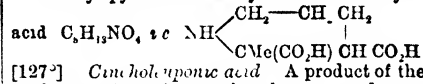

Formed from methyl pyridine tricarboxylic acid $\text{N} \begin{array}{c} \text{CMe} \text{---} \text{C}(\text{CO}_2\text{H}) \\ \diagup \quad \diagdown \\ \text{C}(\text{CO}_2\text{H}) \text{C}(\text{CO}_2\text{H}) \end{array} \text{CH}$ by heating at 150° (Weber, *A* 241, 9). Spherical groups of needles (containing aq), sl sol cold water. KMnO_4 oxidises it to a pyridine tricarboxylic acid — $\text{HA}'\text{HCl}$ aq transparent efflorescent crystals — PbA' 2aq crystalline pp.

Methyl pyridine dicarboxylic acid

Obtained by oxidising the di methyl ethyl pyridine, which is formed by the action of NH_3 on propionic aldehyde (Dukopf a. Gottsch, *B* 23, 6-8, 1110), and by the action of paraldehyde on propionic aldehyde ammonia (Dukopf a. Schlaun, *B* 21, 834). White powder (from hot water). The K , Ag , and Cu salts are sl sol water.

Methyl pyridine hexahydrate dicarboxylic

[127°] Cincholeuponic acid. A product of the oxidation of cinchonine by chromic acid mixture (Skiaup, *M* 9, 780). Prisms (containing aq), v.e. sol water, insol alcohol and ether. Ac_2O at 125° forms an amorphous acetyl derivative $\text{C}_6\text{H}_5\text{AcNO}_3$. Distillation of the lead salt over zinc dust yields a small quantity of pyridine.

Salts — PbA' powder, v.e. sol water — $\text{HA}'\text{HCl}$ [194°] Trimetric crystals [$\alpha_D = 34.4^\circ$ at 18°].

Nitrosamine $\text{C}_6\text{H}_5(\text{NO})\text{NO}_4$ [163°] Trimetric crystals, sl sol cold water, m. sol alcohol. Warm conc HClAc reproduces $\text{C}_6\text{H}_5\text{NO}_4$ and nitrous acid — BaA' (at 115°). Deliquescent amorphous powder, in sol alcohol.

In the preparation of cincholeuponic acid a base called cincholeupone $\text{C}_6\text{H}_7\text{NO}_3$ is also formed. It yields cincholeuponic acid on oxidation with chromic acid mixture, and ethylpyridine on distillation over red hot zinc dust. It forms the salts $(\text{C}_6\text{H}_7\text{NO}_3)\text{HCl}$ [200°], $\text{B}'_2\text{H}_2\text{PtCl}_6$ 8½aq and $\text{B}'\text{HAuCl}_4$ [203°], an acetyl

derivative $C_6H_4AcNO_2$ [121°], and a nitrosamine $C_6H_4(NO)NO_2$ [84°]

Methyl-pyridine tricarboxylic acid $C_6H_4NO_3$, *s.e.* $N \left\langle \begin{array}{c} CMe \\ C(CO_2H) \end{array} \right\rangle CH$ [226°] Formed

by oxidising $N \left\langle \begin{array}{c} CMe \\ C(CO_2H) \end{array} \right\rangle CH$ with $KMnO_4$ (Weber, *A* 241, 6) Spherical aggregates (containing aq) At 150° it slowly gives off CO_2 , yielding methyl pyridine dicarboxylic acid [245°–250°] — KH_2A'' , 6aq spherical aggregates — AgH_2A'' 2aq needles (from hot water)

Methyl-pyridine tricarboxylic acid

$N \left\langle \begin{array}{c} C(CO_2H) \\ C(CO_2H) \end{array} \right\rangle CMe$ *Methyl carbo-nicotinic acid* Formed by the oxidation of (α)-di-methyl pyridine dicarboxylic acid by $KMnO_4$ (Weber, *A* 241, 25) Needles (containing aq) or prisms (containing 2aq) Less soluble in water than the preceding acid Turns yellow at 205°, and completely decomposes at 260° $FeSO_4$ colours its solutions deep red The calcium salt yields (γ) methyl pyridine on distillation

Methyl-pyridine tricarboxylic acid

$N \left\langle \begin{array}{c} C(CO_2H) \\ C(CO_2H) \end{array} \right\rangle CH$ *Picoline tricarboxylic acid* [238°] Formed by the oxidation of flavenol (1 mol) with $KMnO_4$ (9 mols) (Fischer & Tauber, *B* 17, 2926) Formed also by oxidising potassium tri methyl pyridine carboxylate with aqueous $KMnO_4$ (Michael, *A* 225, 140) Slender needles (from water) Does not combine with acids On further oxidation with $KMnO_4$ it yields pyridine tetra carboxylic acid [227°] $FeSO_4$ colours its solution brownish-red

Salts — BA'' amorphous pp — Ag_2A''

Methyl-pyridine tetracarboxylic acid

$C_6H_4NO_4$, *s.e.* $N \left\langle \begin{array}{c} C(CO_2H) \\ C(CO_2H) \end{array} \right\rangle CMe$ [199°] Obtained by boiling potassium tri-methyl-pyridine dicarboxylate with a solution of $KMnO_4$ (Hantzsch, *A* 215, 57) Small prisms (from water), v e sol water, m sol alcohol, sl sol ether Gives (γ) picoline on distillation with lime Its neutral salts crystallise with difficulty Neutral solutions give pps with salts of Pb and Ag, mercurous salts, and $Ba(OAc)_2$, but no pps with dilute $BaCl_2$ or with salts of Mg, Zn, Mn, Ni, Co, and Cu, and mercuric salts — K_2H_4A'' 4aq large trimetric tables, v sol hot water, with acid reaction — KH_2A'' 2aq — Ca_2A'' 4aq, ppd by adding NH_3 and $CaCl_2$ — Mg_2A'' 6aq

Di-methyl-pyridine carboxylic acid

$C_6H_4NO_3$, *s.e.* $N \left\langle \begin{array}{c} CMe \\ CH \end{array} \right\rangle CMe$ *Lutidine carboxylic acid* Obtained by saponifying with alcoholic potash its ether, which is formed by adding acetic aldehyde (50 pts) to a mixture of aceto acetic ether (130 pts) and aldehyde-ammonia (61 pts), the reaction, which sets in at once, being completed by heating to 100° (Michael, *B* 18, 2020) Transparent prisms (containing 2 aq), v sol water and alcohol Gives (α)-lutidine on distillation with lime On oxidation with $KMnO_4$ it yields pyridine dicarboxylic (carboanichomeronic) acid

Salts. — $HA''HCl$ [166°] Large prisms or thick tables — $(HA'')_2H_2PtCl_4$ 2aq [216°]. Reddish-yellow prisms

Ethyl ether EtA' (246° uncor) Yellowish

oil, not volatile with steam — $(EtA')_2H_2PtCl_4$ [191°] Thin yellow pointed prisms, v . sl sol water and strong alcohol

Di-methyl-pyridine carboxylic acid

$N \left\langle \begin{array}{c} CMe \\ C(CO_2H) \end{array} \right\rangle CH$ *Di-methyl-picolinic acid* [153°] Formed by oxidising *s*-tri-methyl-pyridine with $KMnO_4$ (Altar, *A* 237, 188) Small crystals, v e sol water and alcohol, m sol ether Yields (α) di methyl pyridine on distillation with lime Its metallic salts are v sol water — $B'HCl$ aq minute white needles, v e sol water — $B'_2H_2PtCl_4$ 4EtOH [221°] Prisms

Di-methyl pyridine carboxylic acid

$N \left\langle \begin{array}{c} CMe \\ CMe \end{array} \right\rangle C(CO_2H)CH$ *Di-methyl-nicotinic acid* [160°] Prepared by distilling the mono ethylic ether of di methyl pyridine dicarboxylic acid $N \left\langle \begin{array}{c} CMe \\ CMe \end{array} \right\rangle C(CO_2H)CH$ (Weiss, *B* 19, 1308)

Needles (containing $\frac{1}{2}$ aq), v e sol water Oxidised by $KMnO_4$ to the corresponding pyridine tricarboxylic acid — AgA' — $HAHCl$ small prisms — $(HA')_2H_2PtCl_4$ 2aq orange needles

Di-methyl-pyridine carboxylic acid

$N \left\langle \begin{array}{c} CH \\ C(CO_2H) \end{array} \right\rangle CMe$ [151°] Formed by oxidising the parvoline obtained from propionic aldehyde and NH_3 (Dürkopff a Götsch, *B* 23, 687, 1110) — $(HA')_2H_2PtCl_4$ EtOH v sol water, sl sol alcohol Decomposes at 260°

Di-methyl-pyridine carboxylic acid

$C_6H_4Me_2NCO_2H$ Formed by saponifying, by alcoholic potash, its ethyl ether, which is produced from acetoacetic ether (30 g) by heating with formic aldehyde (5 g) and $ZnCl_2$ (30 g) for 12 hours at 100° (Canzonieri a Spica, *G* 14, 449) Silky needles, v e sol water — $HA'HCl$ aq [220°] Transparent rhombohedra (from water) — $(HA')_2H_2PtCl_4$ red crystals

Ethyl ether EtA' (260°) Oil

Di-methyl-pyridine dicarboxylic acid

$C_6H_4NO_4$, *s.e.* $N \left\langle \begin{array}{c} CMe \\ CH \end{array} \right\rangle CMe$ (α) *Di-methyl-di-methyl-pyridine dicarboxylic acid* [258°] Obtained by heating (α) di methyl pyridine tricarboxylic acid at 175° (Weber, *A* 241, 20) Formed also by oxidation of the corresponding tetra methyl pyridine (Dürkopff a Götsch, *B* 23, 1112) Needles (containing 2 aq (W) or anhydrous (D a G) Its solution is not coloured by $FeSO_4$ — PbA'' gelatinous pp, becoming crystalline on boiling — $HA''HCl$ aq slender needles, decomposed by water — $(H_2A'')_2H_2PtCl_4$ orange tables, melting above 300°

Di methyl pyridine dicarboxylic acid

$N \left\langle \begin{array}{c} CMe \\ C(CO_2H) \end{array} \right\rangle CH$ *or*
 $N \left\langle \begin{array}{c} CMe \\ C(CO_2H) \end{array} \right\rangle CMe$ [245°].

Formed by oxidising *s* tri methyl pyridine carboxylic acid in neutral solution with $KMnO_4$ (Michael, *A* 225, 187). Prisms (from water). — CaA'' — MgA'' 8aq — $(HA'')_2H_2PtCl_4$ 6aq

Di-methyl-pyridine dicarboxylic acid

$N \left\langle \begin{array}{c} CMe \\ CMe \end{array} \right\rangle C(CO_2H)CH$ *Lutidine dicarboxylic acid* Formed by saponifying with alcoholic potash its ether, which is produced by passing nitrous acid gas into di methyl isopropyl dicarboxylic acid

oxylic ether in alcohol (Engelmann, *A* 231, 50) Its ether is also one of the products of the action of acetoacetic ether on hexamethylene tetramine at 170° (Griess, *B* 21, 2740) The same ether appears to be formed by oxidising with nitrous acid gas the product obtained by the action of phenyl acetic aldehyde on aceto acetic ether and ammonia (Jeauraud, *B* 21, 1784) Slender needles (containing $\frac{1}{2}$ aq) Melts at a very high temperature ν sol cold water, alcohol, and ether KMnO_4 oxidises it to pyridine tetracarboxylic acid On distillation it yields CO_2 and di-methyl pyridine carboxylic acid Distillation over CaO yields (aa) di methyl pyridine

Salts — $\text{BaA}''2\text{aq}$ — $\text{PbA}''2\text{aq}$ amorphous pp changing to stout prisms — $\text{H}_2\text{A}''\text{HCl}2\text{aq}$ prisms

Mono ethyl ether EtHA'' [131°] Obtained by decomposing the di ethyl ether (1 mol) with alcoholic KOH (1 mol) (Weiss, *B* 19, 1308) Needles (from water) Its neutral solution is ppd by salts of Ag , Hg , and Cu — $\text{EtHA}''\text{HCl}2\text{aq}$ [90°] Needles (from water)

Diethyl ether Et.A'' [72°] (302°) Long white needles — $\text{Et.A}''\text{HAcCl}$, ν sol alcohol

Di methyl pyridine dicarboxylic ether di hydride $\text{C}_6\text{H}_7\text{NMe}_2(\text{CO}_2\text{Et})_2$ [170°] Formed by heating acetoacetic ether (20 g) with ZnCl_2 (20 g) and hexamethylene tetramine (4 g) at 100° (Griess a Harrow, *B* 21, 2740) Four sided plates or needles, almost insol water, sl sol cold alcohol and ether, ν sol chloroform By treatment with nitrous acid, or even by solution in hot dilute HCl , it is oxidised to $\text{C}_6\text{H}_7\text{NMe}_2(\text{CO}_2\text{Et})_2$.

Di methyl pyridine tricarboxylic acid

$\text{C}_{10}\text{H}_9\text{NO}_5 \cdot \frac{1}{2} \text{N} \left\langle \begin{smallmatrix} \text{CMe} \\ \text{C}(\text{CO}_2\text{H}) \end{smallmatrix} \right\rangle \text{CMe}$ *Lu thidine tricarboxylic acid Dimethylcarbodinicotinic acid* [212°] Formed by oxidation of potassium tri methyl pyridine dicarboxylate with KMnO_4 in a solution kept neutral by CO_2 (Hantzsch, *A* 215, 52, Weber, *A* 241, 20) Crystallises from water in hard crusts composed of rhombohedra (containing 2aq) Split up by heat into CO_2 and ($\alpha\gamma$)-di-methyl pyridine di carboxylic acid Yields ($\alpha\gamma$) di methyl pyridine on distillation with lime Its neutral solutions give no pps with salts of Cu , Ag , or Pb , nor with FeCl_3 , but with $\text{Hg}(\text{NO}_3)_2$ a pp soluble in hot water

Salts — $\text{KH}_2\text{A}'''2\text{aq}$ — $\text{Ba.A}'''(8?)\text{aq}$ minute needles — $\text{Mg.A}'''10\text{aq}$ — $\text{Ca.A}'''8\text{aq}$ — $\text{Ag.A}'''$

Di methyl pyridine tricarboxylic acid

$\text{N} \left\langle \begin{smallmatrix} \text{CMe} \\ \text{C}(\text{CO}_2\text{H}) \end{smallmatrix} \right\rangle \text{CMe}$ S 178 at 8° Formed by oxidising potassium styryl di methyl pyridine dicarboxylate with cold aqueous KMnO_4 (Epstein, *A* 231, 11) Crystallises from water in prisms (containing aq), almost insol water, alcohol, ether, benzene, and chloroform Turns brown at about 220° but decomposes without melting Gives (aa) di methyl pyridine on distillation with lime A solution of its ammonium salt gives pps with CaCl_2 , CaSO_4 , $\text{Hg}_2(\text{NO}_3)_2$, AgNO_3 , SnCl_4 , $\text{Pb}(\text{OAc})_2$ and $\text{Bi}(\text{NO}_3)_3$, but not with BaCl_2 , MgSO_4 , MnSO_4 , and alum, nor, in the cold, with ZnSO_4 or CuSO_4 FeCl_3 gives a reddish colour

Salts.— $\text{H}_2\text{A}'''\text{HCl}$ needles, decomposed by

water and by alcohol — $\text{Ph.A}'''\text{aq}$. — $\text{Cu}(\text{NH}_4)\text{A}'''4\text{aq}$ — $\text{Ag}_2\text{A}'''8\text{aq}$

Tri-methyl pyridine carboxylic acid

$\text{C}_6\text{H}_{11}\text{NO}_5 \cdot \frac{1}{2} \text{N} \left\langle \begin{smallmatrix} \text{CMe} \\ \text{C}(\text{CO}_2\text{H}) \end{smallmatrix} \right\rangle \text{CMe}$ *Collidine carboxylic acid* [155°] Obtained by saponifying with alcoholic potash its ethyl ether, which is obtained by passing nitrous acid into its dihydride (Hantzsch, *A* 215, 42) and by heating the mono-ethyl ether of tri methyl pyridine dicarboxylic acid (Michael, *A* 225, 131) Crystallises from water in short needles or cubes (containing 2aq) Melts at 110° when hydrated, or 155° when anhydrous On oxidation with KMnO_4 it yields di methyl pyridine dicarboxylic acid, methyl pyridine tricarboxylic acid, and pyridine tetracarboxylic acid

Salts — KA' needles (from alcohol) — $\text{CaA}'\text{aq}$ — $\text{HA}'\text{HCl}$ needles or prisms. — $(\text{HA}')_2\text{H}_2\text{PtCl}_6\text{aq}$

Ethylether EtA' (256°) SG 15 10815 Liquid, ν sol ether, alcohol, benzene, and chloroform, insol water, sol dilute acids — $(\text{EtA}')_2\text{H}_2\text{PtCl}_6$ [193°] Prisms (from alcohol) — $\text{EtA}'\text{MeI}$ [128°] Needles, ν sol water and alcohol, insol ether With AgO it yields crystalline $\text{C}_{10}\text{H}_{11}\text{NO}_53\text{aq}$, whence $\text{C}_{10}\text{H}_{11}\text{NO}_5\text{HCl aq}$ (Hantzsch, *B* 19, 35)

Tri methyl pyridine dihydride carboxylic ether $\text{C}_6\text{H}_7\text{NMe}_2\text{CO}_2\text{Et}$ Formed by warming $\text{C}_6\text{H}_7\text{NMe}_2(\text{CO}_2\text{Et})_2$ with HClAq (of 25 p.c.) at 100° (Hantzsch, *A* 215, 40) Feebly basic oil. — $(\text{HA})_2\text{H}_2\text{PtCl}_6$ minute needles

Tri methyl pyridine dicarboxylic acid

$\text{C}_{10}\text{H}_{11}\text{NO}_5 \cdot \frac{1}{2} \text{N} \left\langle \begin{smallmatrix} \text{CMe} \\ \text{C}(\text{CO}_2\text{H}) \end{smallmatrix} \right\rangle \text{CMe}$

Formed by saponifying with alcoholic potash its ether, which is obtained by the action of nitrous acid gas and alcohol upon its dihydride, which is itself produced by the action of aldehyde-ammonia on aceto acetic ether (Hantzsch, *A* 215, 26) Fluffy mass of needles (from hot water), melting above 300°, ν sl sol cold, ν sol hot, water, ν sl sol alcohol and ether Oxidised by KMnO_4 to di methyl pyridine tricarboxylic acid, methyl pyridine tetra carboxylic acid, and pyridine pentacarboxylic acid Decomposed by heat into CO_2 and tri methyl pyridine carboxylic acid Bromine acting on an aqueous solution of the K salt yields di bromo- α tri methyl pyridine The salts which it forms with alkalis and alkaline earths are very soluble, crystallise badly, have an alkaline reaction, and split up on heating into α tri-methyl-pyridine and carbonates FeCl_3 gives an intense red colour to a solution of the K salt. — KA'' — $(\text{CaA}'')_2\text{CuO}11\text{aq}$ — $\text{Ag}_2\text{A}''8\text{aq}$ — $\text{H}_2\text{A}''\text{HCl}2\text{aq}$ — $(\text{H}_2\text{A}'')_2\text{H}_2\text{PtCl}_6$

Di-methyl ether Me.A'' [32°] (386°). Formed by oxidation of its dihydride by nitrous acid (Hantzsch, *B* 16, 1947) White needles, ν sol water — $\text{Me.A}''\text{HCl}2\text{aq}$ long glistening prisms melting, when anhydrous, at 142° — $(\text{Me.A}'')_2\text{H}_2\text{PtCl}_6$ [200°] Orange spangles. — $\text{Me}_2\text{A}''\text{HAcCl}$ [105°] Slender light yellow needles. — $\text{Me}_2\text{A}''\text{HNO}_3$ [140°] Prisms

Mono ethyl ether EtHA'' 2aq Formed from the neutral ether by boiling with the calculated quantity of potash dissolved in alcohol. Needles in radial groups (from alcohol), ν sol

water, v. al sol ether Melts, when anhydrous, at 157° — $\text{EtEtA}''\text{HCl}$ [178°] Cubes — (EtEtA''), H_2PtCl_6 2aq prisms (from cold water) Melts, when anhydrous, at 219° — BaEtA'' , 3aq — $\text{BaEt}_2\text{A}''$, aq — $\text{CaEt}_2\text{A}''$, 8aq needles — $\text{CuEt}_2\text{A}''$ — $\text{CdEt}_2\text{A}''$, 4aq — $\text{ZnEt}_2\text{A}''$, 6aq — $\text{AgHEt}_2\text{A}''$, aq monoclinic prisms

Di-ethyl ether EtA'' (308°–310°) SG 15 1087 Formed from its dihydride (*v. infra*) by treatment with HNO_3 , or, better, by alcohol and nitrous acid gas (Hantzsch, *A* 215, 21) Bright yellow viscid oil with faint odour and burning taste Not volatile with steam It has no action on litmus It does not ppt metallic salts With HgCl_2 it gives, only after a time, silky needles of a double compound It dissolves in dilute acids — $\text{EtA}''\text{HCl}$ very hygroscopic — (EtA''), H_2PtCl_6 rose-coloured tables [184°] — $\text{EtA}''\text{HNO}_3$ needles [92°] $\text{Et}_2\text{A}''\text{HI}$ [170° – 173°] Dark plates, which dissolve with rotation in cold water — $\text{Et}_2\text{A}''\text{HI}$, violet pyramids

Methylo iodide of the diethyl ether EtA''MeI [140°] Formed by heating the ether with MeI and MeOH at 120° Crystalline mass, more soluble in water or alcohol than $\text{Et}_2\text{A}''\text{HI}$ It is ppd unaltered from its aqueous solution by NaOH Its aqueous solution is acid to litmus It is not affected by fuming HCl at 150° or by alcoholic NH_3 at 150° Concentrated aqueous KOH forms methyl di-carbo-collidylum dehydride $\text{C}_{11}\text{H}_{11}\text{NO}_4$ This substance crystallises in needles, [92°], v. e sol alcohol, v. al sol cold water, and distils without decomposition at a temperature far above 360° It has neither acid nor basic properties When heated with H_2SO_4 at 150° – 180° it yields CO_2 , HOAc, and methyl pseudo lutidostyryl $\text{C}_9\text{H}_{11}\text{NO}$ When 'methyl dicarbo collidylum dehydride' is heated in a current of HCl it loses CO_2 and forms methyl-carbo collidylum dehydride $\text{C}_9\text{H}_{11}\text{NO}_3$ This is also an indifferent body, it crystallises in needles [103°], v. sol water, and boils above 340° On heating with H_2SO_4 it evolves acetic acid and gives methyl pseudo lutidostyryl (Hantzsch, *B* 17, 1023)

Methylo-chloride of the diethyl ether EtA''MeCl Formed by treating $\text{Et}_2\text{A}''\text{MeI}$ with AgCl (Hantzsch, *B* 17, 1019) Crystals Yields (EtA''), Me_2PtCl_6 , which crystallises in thick yellow prisms

Tri methyl-pyridine dihydride dicarboxylic acid $\text{C}_{10}\text{H}_8\text{NO}_4$, $\text{e NH} < \text{CMe C(CO}_2\text{H)} > \text{CHMe}$

Methyl ether MeA'' [156°] Formed by the action of methyl acetoacetate on aldehyde ammonia (Hantzsch, *B* 16, 1946) When heated with HCl it exchanges CO_2Me for H and yields the methyl ether of the monocarboxylic acid On oxidation with nitrous acid it gives $\text{C}_9\text{Me}_2(\text{CO}_2\text{Me})\text{N}$

Di-ethyl ether EtA'' [131°] Formed by heating acetoacetic ether (52 g) with aldehyde ammonia (13.5 g) (Hantzsch, *A* 215, 8)

Properties — Compact colourless tables with many facets (from alcohol), with bright-blue fluorescence V. al sol boiling water, al sol cold alcohol, ether and CS_2 , m sol benzene, v. sol boiling alcohol, v. e sol chloroform. Boils above 315° with decomposition

Reactions — 1 Boiling conc KOHAq has no action — 2 Alcoholic NH_3 at 150° has no action — 3 Alcoholic potash slowly decomposes it, forming NH_3 and K_2CO_3 . — 4 Boiling dilute acids do not dissolve it, it forms no platinumchloride — 5 Conc H_2SO_4 dissolves it, but on pouring into water it is reppd unchanged — 6 Warm conc HCl completely destroys it, forming CO_2 , EtCl , NH_3 , aldehyde, and acetone — 7 HCl passed into an ethereal solution removes the H_2 (Hantzsch, *A* 215, 37), and forms other products — 8 Aqueous HCl (25 p.c.) at 100° forms hydro tri methyl pyridine mono carboxylic ether — 9 Dilute HCl at 130° forms ethyl chloride, CO_2 , and tri methyl pyridine dihydride Another product is an oil composed of a ketone $\text{C}_9\text{H}_{11}\text{O}$ (208° – 209°), V D 4.20, which combines with NaHSO₃, and with bromine, and with hydroxylamine yields crystals [76°] — 10 Nitrous acid removes H_2 , leaving tri methyl pyridine dicarboxylic ether — 11 Bromine dissolved in CS_2 forms a dibromide of di bromo tri methyl pyridine dihydride carboxylic ether $\text{NC}_9\text{H}_8\text{Br}_2(\text{CO}_2\text{Et})_2\text{H}_2\text{Br}_2$ [88°] This is extremely soluble in boiling alcohol, and crystallises as yellow twin crystals Fuming HNO_3 converts it into the di bromide of di bromo tri methyl pyridine di carboxylic ether [102°] — 12 Chloride forms the di chloride of penta chloro tri methyl pyridine dicarboxylic ether, crystallising as woolly needles [150°]

Tetra methyl pyridine dihydride carboxylic ether $\text{C}_{10}\text{H}_{12}\text{NO}_4$, e e
 $\text{NMe} < \text{CMe C(CO}_2\text{Et)} > \text{CHMe}$ [86°] Formed by the action of paraldehyde and H_2SO_4 on methyl amido oxy butyric ether (Kuckert, *B* 18, 620), and, in small quantity, by the action of methylamine on a mixture of acetoacetic ether and aldehyde (Hantzsch, *B* 18, 2580) Crystals, with blue fluorescence

METHYL-PYRIDINE-HYDRIDES *v.* METHYL PYRIDINE

DI - METHYL - DIPYRIDYL $\text{C}_{10}\text{H}_{12}\text{N}_2$, e e
 $\text{NO}_2\text{H}_2\text{Me C}_9\text{H}_8\text{MeN}$ *Dipicolyl* [84°] (230° – 298°) Obtained by treating (a) picoline with sodium at 80° – 90° , exposing the product to air, and fractionally distilling (Ahrens, *B* 21, 2930, Heuser, *J pr* [2] 42, 430) Very deliquescent yellowish needles With water it forms a compound (containing 4aq) melting at 38° When oxidised by potassium permanganate it yields $\text{NC}_9\text{H}_8\text{Me C}_9\text{H}_8\text{N CO}_2\text{H}$ [193°], which on heating by itself or with HOAc yields methyl dipyridyl [94°] — $\text{B}''\text{H}_2\text{Cl}_2$ Hygroscopic plates (from alcohol) Picrate $\text{B}''2\text{C}_9\text{H}_8(\text{NO}_2)_3\text{OH}$ [240°] — $\text{B}''\text{H}_2\text{Cl}_6\text{HgCl}_2$ [220°] — $\text{B}''\text{H}_2\text{PtCl}_6$ small plates, v. al sol water, v. sol HClAq Discolours at 235° , but only partially decomposed at 275° — $\text{B}''2\text{HAuCl}_4$ nodules (from conc HClAq) decomposes at 200° (A), [210°] (H) — The tin double salt melts at 180°

Di methyl-dipyridyl dodecahydride $\text{C}_{12}\text{H}_{18}\text{N}_2$, e e $\text{MeNC}_9\text{H}_8\text{C}_9\text{H}_8\text{NMe}$ *Di-methyl dipyridyl*, (230° – 235°) Formed, together with tri methyl dipyridyl dodecahydride, by treating the product of the action of MeI upon dipyridyl dodecahydride (dipyridyl) with Ag_2O (Liebrecht, *B* 19, 2595) Liquid, miscible with water, but separating on addition of NaOH — $\text{B}''\text{H}_2\text{Cl}_2(\text{HgCl}_2)_2$

flocculent pp, sol hot water — $B'H_2PtCl_4$, small dark red crystals

Tri-methyl dipyriddy dodecahydride $C_{11}H_{22}N_2$, α, β NMe C_4H_7 , C_4H_7 Me NMe (205° — 212°) Formed as above Yellowish oil, insol water — $B'H_2PtCl_4$, yellowish red crystals, v e sol water

TRI METHYL-PYRIDYLENE DIHYDRIDE DI-METHYL DIKETONE $C_{12}H_{11}NO_2$ α, β N $\langle CMe CH(CO CH_3) \rangle CMe$ [153°] (250° *in vacuo*) Formed by heating methylene di-methyl diketone (2 mols) with aldehyde-ammonia (1 mol) on the water bath (Combes, *B* [2] 51, 15) Hexagonal prisms (from alcohol), insol water

METHYL PYRIDYL ACETYLENE TETRA-HYDRIDE $C_8H_9NMe C H$ Formed by boiling the hydrobromide of anhydro eegonine dibromide with aqueous K_2CO_3 (Eichengrün a Einhorn, *B* 23, 2879) Oil — $B'H_2AuCl_4$ [179°]

DI METHYL DI PYRIDYL PROPANE DO DECAHYDRIDE $C_{11}H_{12}N_2$ α, β ($C_4H_7NMe CH$), CH_2 *Methyl iodide* $B'Me I$ Obtained by heating ($C_4H_7N CH_2$), CH_2 , with MeI (Ladenburg, *B* 21, 3102) White non hygroscopic crystals, v sol hot water The aurochloride $B'(H_2AuCl_4)$ [171°] obtained from the methyl iodide, crystallises from water in needles

(*Py* 15) **DI METHYL PYRIDYL-(Py 3)-QUINOLINE** $C_{10}H_{11}N$ α, β

$C_2NH_2Me, C_4H_7 \begin{matrix} \diagup CH CH \\ \diagdown N CH \end{matrix}$ *Lutidyl quinoline*

[109°] Colourless glistening crystals Formed by heating *m*-amido phenyl di methyl pyridine $C_2NH(CH_3) C_4H_7NH$ with glycerine, nitrobenzene, and H_2SO_4 The chloride and nitrate form white needles, the platino chloride small orange needles, the auro chloride long golden yellow needles (215°) (Lepetit, *G* 20, 2399, (*G* 17, 473))

METHYL - PYROCATECHIN $C_8H_9O_2$ α, β $C_4H_7Me(OH)$ [134] Formed by heating creosol $C_8H_9Me(OH)(OH)$ [134] with HCl (H Müller, *C N* 10, 269) Formed also by the dry distillation of di oxy toluene ((α) homo protocatechuic acid (Tiemann a Nagai, *B* 10, 210) and from $C_4H_7Me(NO)(OH)$ [134] by displacement of NO by OH (Neville a Winther, *B* 15, 2983) Liquid, which may be distilled, v e sol water, alcohol, and ether Reduces Fehling's solution and ammoniacal $AgNO_3$ in the cold $FeCl_3$ gives a green colouration, turned reddish-violet by ammonia

Mono methyl ether $C_8H_9Me(OH)(OMe)$ [134] *Isocresol* (α 185°) Prepared from $C_4H_7Me(NH_2)(OMe)$ [134] by the diazo reaction (Limpach, *B* 22, 350) Yellow liquid, v sol alcohol and ether, sl sol water Volatile with steam

Mono methyl ether $C_8H_9Me(OMe)(OH)$ [134] v CREOSOL

Isomerides v Methyl ethers of PYROCATECHIN

TETRA-METHYL PYROCROLL $C_8H_9N_2O_2$ α, β $NO, HMe, \begin{matrix} CO \\ CO \end{matrix} C_4H_7Me, N$ [272 5°] Formed, together with ($\alpha\beta$)-di methyl pyrrole, by heating ($\alpha\beta$)-di-methyl pyrrole ($\alpha\beta$) dicarboxylic anhydride at 850° (Magnanini, *B* 21, 2877, 22, 2502) Trimetric yellow needles (by sublimation), insol

water, v sol chloroform Its molecular weight was determined by Raoult's method Boiling alcoholic KOH gives

$NO, C_4H_7Me, CO NO, HMe, CO, K$

METHYL - PYROGALLOL $C_8H_9O_2$ α, β $C_4H_7(CH_3)(OH)$, [129°] Prepared by heating the dimethyl ether with HCl to 150° Sublimes in small needles Sl sol benzene

Dimethyl ether $C_8H_9(CH_3)(OH)(OMe)$, [36°] (265°) Crystalline Occurs together with the dimethyl ether of pyrogallol in beech wood tar, oil, from which it can be isolated by means of its benzoyl compound [118°] (Hofmann, *B* 12, 1371) With bromine it yields $C_6Br_2(CH_3)(OH)(OMe)_2$ [126°] If a mixture of the sodium salts of the dimethyl ethers of pyrogallol and methyl pyrogallol is oxidised by heat in the air or with C_2Cl_6 eupitonic acid (pitakal) is formed

METHYL-PYROMUCIC ACID $C_8H_9O_4$ α, β $C_4H_7MeO CO H$ [108°] Formed by the oxidation of methyl furfuraldehyde (Hill, *B* 22, 608) and by the action of conc KOH aq upon that aldehyde (Bicler a Tollens, *A* 28, 123) Needles, more soluble than pyromucic acid in water, benzene, and chloroform With $NaOH$ and H_2SO_4 it gives a deep green colour on warming $FeCl_3$ gives a brown pp

Reaction — Bromine (2 mols) added to its aqueous solution gives off CO and forms an acid $C_8H_9O_4$ (? acetylacrylic), which crystallises in broad flat needles [123°], s 67 (in the cold). This acid is v sol alcohol, ether, and hot water, it forms an addition product [108°] with bromine, a silver salt $AgC_4H_7O_3$, crystallising in slender needles, and a phenyl hydrazide [157°] apparently identical with that of acetyl acrylic acid (Hill a Hendrixson, *B* 23, 422, cf Bender, *B* 21, 2494, Decker, *B* 21, 2937)

Salt — $AgC_4H_7O_3$, slender needles (from hot water), sl sol hot water

DI-METHYL-PYRONE v Anhydride of DI-METHYLENE DI-METHYL DIKETOYL

Di-methyl-pyrone carboxylic acid v Di-HYDRACTIC ACID

Di-methyl-pyrone dicarboxylic acid v *Anhydride of DI-METHYLENE DI-METHYL TRIKETOYL*

METHYL PYRROLE C_4H_5N α, β $NMe \begin{matrix} CH CH \\ CH CH \end{matrix}$ *Methyl pyrrolone* (113°)

(*B*), (114° i v) (*C* a *D*) SG 12 9203 (*B*) Formed by the dry distillation of methylamine mucate (*C* a Bell, *B* 10, 1866) Formed also by treating potassium pyrrole with MeI (Ciamician a Dennstedt, *B* 17, 2951) Liquid Resolved by heating with KOH into pyrrole and $MeOH$ When v methyl pyrrole (3 g) is heated with $MeOH$ (5 g), MeI (7 g), and K_2CO_3 (3 g) for 10 hours at 140° there is formed a tri methyl pyrrol (160°-165°) and penta methyl pyridine dihydride C_8H_9Me, NMe (Ciamician a Anderlin, *B* 22, 656) Methyl pyrrole acts on alloxan in warm aqueous solution forming $C_8H_9N_2O$, α, β $NH_2, CO NH CO CO CO C_4H_7NMe$, which crystallises in white plates, sol hot water, sl sol alcohol and cold water (Ciamician a Silber, *B* 19, 1710)

v-Methyl-pyrrole dihydride C_8H_9NMe , *Methyl-pyrrolone* (80°) Formed by reduction of *v*-methyl pyrrole with zinc dust and $HOAc$ (Ciamician a Magnaghi, *B* 18, 725) Colour-

less, strongly alkaline liquid, miscible with water. Tertiary base. Its hydrochloride forms colourless crystals. — $B^*H_2PtCl_4$, trimetric crystals, v. s. sol water (Le Valle, *G* 15, 490)

Methylpyrrole iodide C_4H_5NMeI [286°] Obtained by the action of MeI on the above or on pyrrole dihydride (Ciamician, *B* 16, 1541, *G* 15, 492) Pearly plates. Yields the platinum-chloride ($C_4H_5NMe_2Cl$), $PtCl_2 \cdot xaq$

Methylpyrrole tetrahydride C_4H_9N v. s. $NMe \begin{smallmatrix} CH_2CH_2 \\ CH_2CH_2 \end{smallmatrix}$. **Methyl pyrrolidine** (82°)

Formed by heating the dihydride with fuming $HIAq$ and amorphous phosphorus at 250° (Ciamician & Magnaghi, *G* 15, 493) Liquid, miscible with water

Methylpyrrole iodide C_4H_5NMeI Formed by the action of MeI on methyl pyrrole tetrahydride or on pyrrole tetrahydride. Deliquescent needles, v. s. sol alcohol, insol ether and $NaOHaq$. Ag_2O yields $C_4H_5NMe_2OH$, which is decomposed by distillation into MeOH and C_4H_5NMe . Distillation of the iodide with solid KOH yields C_4H_5NMe [89°–92°]

(a) **Methyl pyrrole** C_4H_5N v. s. C_4H_5NMe NH (a) **Homopyrrole** (148°) Occurs, together with the (b) isomeride, in bone oil. The fraction 140°–150° is boiled with KOH, and the potassium derivatives that separate are washed with ether, decomposed by water, and fractionally distilled (Ciamician, Dennstedt, a Zimmermann, *B* 19, 178, 2200, 22, 1918, Weidel a Ciamician, *B* 13, 77) The isomerides may also be separated by conversion into their carboxylic acids, separation of these by means of their lead salts, and dry distillation of their calcium salts (Ciamician, *B* 14, 1053)

Properties—Liquid, smelling like chloroform. Turns brown in air. Resinified by HCl, but more slowly than pyrrole, gives a white pp. with $HgCl_2$. Forms a potassium compound C_4H_5NMeK , which combines with CO_2 at 200°, forming (a) methyl pyrrole carboxylic acid. The potassium compound reacts with chloroform, yielding chloro methyl pyridine. Potash fusion yields pyrrole (a) carboxylic acid. Oxidising agents form HOAc, ammonia, and CO_2 . HCl passed into its ethereal solution ppts di-methyl di-pyrrole hydrochloride ($C_4H_5N_2$), HCl, whence cold dilute H_2SO_4 forms di-methyl indole (c 275°), of which the picrate melts at 156° (Dennstedt, *B* 21, 3439). On heating with phthalic anhydride and HOAc at 240° there is formed a yellow compound $C_8H_5NO_2$ [157°], which appears to be the anhydride of an acid, which may be obtained from it by boiling with dilute KOH aq, acidifying, and extracting with ether. This acid forms colourless crystals, and melts at 170°–172° (Ciamician a Zimmermann, *B* 19, 2203)

(b) **Methylpyrrole** C_4H_5NMe (143°) Occurs in bone oil (v. supra) Liquid. Resembles the (a) isomeride in its reactions. Potash fusion yields pyrrole (b) carboxylic acid. CO_2 acting on its potassium compound forms (b) methyl pyrrole carboxylic acid. HCl passed into its ethereal solution forms the hydrochloride of (b)-dimethylpyrrole ($C_4H_5N_2$), HCl, and when dilute H_2SO_4 is allowed to act for 24 hours on this hydrochloride there is formed a di-methyl indole of which the picrate melts at 149° (Dennstedt, *B* 21, 3439). On heating (b) methyl pyrrole (5 g) dissolved in

HOAc (3 vols) with phthalic anhydride (10 g) for 5 hours at 200° there is formed a compound $C_{12}H_9NO_2$ [215°], which may be purified by crystallisation from alcohol and sublimation, and obtained as lemon yellow needles, insol water (Ciamician a Dennstedt, *B* 17, 2957, *I* 9, 2201) Dilute KOH converts the compound $C_4H_5NO_2$ into an acid $C_4H_5NO_3$, which forms colourless crystals (from ether), and melts at 159°

Acetyl derivative of methyl pyrrole C_4H_5NMeAc (197°) Formed, together with methyl pyrrol methyl ketone, by boiling methylpyrrole with NaOAc and Ac_2O (Ciamician a Silber, *B* 19, 1409) Liquid. Volatile with steam, almost insol water. Easily saponified by alkalis

Methylpyrrole-tetrahydride C_4H_9N v. s. $CH_2CHMe \begin{smallmatrix} CH_2CH_2 \\ CH_2CH_2 \end{smallmatrix} NH$ **Methyl pyrrolidine** (97° at

737 mm iV) Formed by reduction of oxy methyl pyrrole dihydride (from γ amino valeric acid) in boiling amyl alcohol with metallic sodium (Tafel, *B* 20, 250) Colourless mobile liquid. Very volatile at the ordinary temperature. Boiling MeI and MeOH form crystalline $C_4H_5NMeNHMeI$

Salts (Tafel a Neugebauer, *B* 22, 1865) — B^*HCl [210°–220°] Colourless prisms — $B^*H_2PtCl_4$ aq golden needles (from hot water) — $B^*H_2AuCl_4$ [140°–144°] Golden crystals, v. sol water and alcohol — $B^*H_2C_2O_4$ [165°–168°] Small needles

Nitrosamine $C_4H_5(NO)N$ Yellow oil. **Methyl pyrrole tetrahydride** $NH \begin{smallmatrix} CH_2CHMe \\ CH_2CH_2 \end{smallmatrix}$ (104°) SG $\frac{d}{4}$ 8654 This base is formed by the dry distillation of the hydrochloride of methyl tetramethylene-diamine $NH_2CH_2CH_2CH_2CH_2NH_2$ (Oldach, *B* 20, 1657) Liquid, fuming in the air, and smelling like piperidine

Salts—Hydrochloride very deliquescent — $B^*H_2PtCl_4$ [194°] Long prisms — $B^*H_2AuCl_4$ [170°] Minute tables, v. sol water — $B^*HI(BI)_2$ — $B^*C_6H_5(NO_2)_2OH$ [105°]

Nitrosamine $C_4H_5(NO)N$ (224°)

Di-methylpyrrole $C_4H_5N_2$ v. s. $NH \begin{smallmatrix} CMeCH \\ CMeCH \end{smallmatrix}$ (165°) Occurs in bone oil (Weidel a Ciamician, *B* 13, 78)

Formation—1 By the action of alcoholic potash at 150°–160° on its dicarboxylic ether, which is formed by reduction of a mixture of acetoacetic and isonitroso acetoacetic ethers with zinc dust and acetic acid (Knorr, *B* 17, 1638) — 2 By heating its mono (or di) carboxylic acid, obtained from di acetyl succinic ether (Knorr, *B* 18, 1565) — 3 By heating acetyl acetone $CH_3COCH_2CH_2COCH_3$ with a slight excess of alcoholic NH_3 for an hour at 150° (Paal, *B* 18, 2254)

Properties—Colourless liquid with unpleasant odour, almost insol water, v. s. sol alcohol and ether. Very volatile with steam. Gives a white pp. with $HgCl_2$. Slowly resinified by HCl. Its vapour colours pine-wood moistened with HCl red. Bromine-water gives a white pp. $FeCl_3$ gives a brownish red colouration. H_2SO_4 added to its acetic acid solution mixed with phenanthraquinone gives a deep brownish red colour. H_2SO_4 and isatin give a green colour, changing on warming to brownish red. Phenyl glyoxylic

acid and sulphuric acid also give a brownish-red colour. Hydroxylamine acting on its alcoholic solution forms the di-oxim of acetylacetone $\text{CH}_3\text{C}(\text{NOH})\text{CH}_2\text{CH}_2\text{C}(\text{NOH})\text{CH}_3$ [186 5°] (Ciamician & Zanetti, *B* 22, 3177).

Acetyl derivative $\text{C}_6\text{H}_5\text{MeNAc}$ Liquid, not solidified at -20° , v sl sol water. Saponified by potash. Does not reduce AgNO_3 in very dilute ammoniacal alcoholic solution.

Di-methyl-pyrrole tetrahydride $\text{C}_6\text{H}_{11}\text{N}$ $\text{NH} \begin{smallmatrix} \text{CHMeCH}_2 \\ \text{CHMeCH}_2 \end{smallmatrix}$ (107° 1 V) Formed by distilling the hydrochloride of hexylene diamine $\text{NH}_2\text{CHMeCH}_2\text{CH}_2\text{CHMeNH}_2$ obtained by reducing the phenyl hydrazide of acetylacetone (Tafel, *B* 22, 1854; Tafel & Neugebauer, *B* 23, 1547). Colourless oil, smelling like piperidine, miscible with water, alcohol, and ether. Its hydrochloride crystallises in needles [188° – 190°]— $\text{B}'_2\text{H}_3\text{C}_2\text{O}_4$, small needles (from alcohol)— $\text{B}'_2\text{H}_3\text{PtCl}_6$, golden prisms.

Nitrosamine $\text{C}_6\text{H}_8\text{MeNNO}$ (135° at 60 mm) Yellow oil, lighter than water, sl sol cold water, v sol ether and alcohol. Conc H_2SO_4 dissolves it without becoming coloured, but on warming the liquid becomes yellow and gives off gas. The nitrosamine may be reduced to an only hydrazine, which on oxidation with HgO yields the tetrazone $\text{C}_4\text{H}_4\text{N}_4$ [43°].

Di-methyl-pyrrole $\text{C}_6\text{H}_8\text{N}$ $\text{NH} \begin{smallmatrix} \text{CMeCH} \\ \text{CHCMe} \end{smallmatrix}$ (171° cor) Formed by distilling its carboxylic acid (Knorr, *A* 236, 326). Liquid, with blue fluorescence and characteristic sweet odour, sl sol water, v sol alcohol, ether, and benzene. Its aqueous solution becomes red on warming with FeCl_3 .

Di-methyl-pyrrole tetrahydride $\text{C}_6\text{H}_{10}\text{MeNMe}$ (89°–92°) Formed by distilling the methyl iodide of methyl pyrrole tetrahydride with KOH (Ciamician & Magnaghi, *G* 15, 485). Liquid, miscible with water. Its hydrochloride is deliquescent.

Methyl iodide $\text{C}_6\text{H}_8\text{MeNMe}_2\text{I}$ Small needles (from alcohol), v e sol water. Ppd from its aqueous solution by addition of KOH . On distillation with KOH it yields trimethylamine and butene C_4H_8 .

Tri-methyl-pyrrole $\text{C}_6\text{H}_{11}\text{N}$ (180°–195°) Occurs in bone oil (fraction 180°–205°), from which it is isolated by conversion into the potassium compound (Ciamician & Dennstedt, *B* 14, 1340). Colourless oil. Sol acids, sl sol water. Turns brown in air. Its vapour turns pine wood moistened by HCl red. Reduces PtCl_4 . Gives a white pp with HgCl_2 . Potassium acts on it very slowly with production of the solid compound $\text{C}_6\text{H}_{10}\text{NK}$. Conc HClAq at 120° forms ammonia and a di-methyl pyridine dihydride $\text{C}_6\text{H}_{10}\text{N}$.

Tri-methyl-pyrrole $\text{C}_6\text{H}_{11}\text{N}$ (150°–165°) Prepared by heating methyl pyrrole (3 g) dissolved in MeOH (5 g) with MeI (7 g) and K_2CO_3 (3 g) for 10 hours at 140° . The product is acidified and distilled with steam (Ciamician & Anderlini, *B* 22, 656).

Tri-methyl-pyrrole $\text{C}_6\text{H}_{11}\text{N}$ $\text{NMe} \begin{smallmatrix} \text{CMeCH} \\ \text{CMeCH} \end{smallmatrix}$ (173° cor) Formed by heating its dicarboxylic acid at 260° (Knorr, *A* 236,

304). Liquid, volatile with steam; v sol alcohol and ether. Boiling aqueous FeCl_3 gives an intense red colour.

Tri-methyl-pyrrole tetra-hydride $\text{C}_6\text{H}_{11}\text{N}$ $\text{NH} \begin{smallmatrix} \text{CHMeCH}_2 \\ \text{CHMeCH}_2 \end{smallmatrix}$ (116°) at 750 mm Formed

by the action of MeI on $\text{NH} \begin{smallmatrix} \text{CHMeCH}_2 \\ \text{CHMeCH}_2 \end{smallmatrix}$ (Tafel & Neugebauer, *B* 23, 1549). Liquid, sl sol water— $\text{B}'\text{HCl}$ glittering white prisms— $\text{B}'_2\text{H}_3\text{PtCl}_6$, yellow oil, sl sol alcohol.

Methyl iodide $\text{B}'\text{MeI}$ [256°] Colourless prisms, v sol water, sl sol warm alcohol.

A tri-methyl pyrrole tetrahydride

$\text{NH} \begin{smallmatrix} \text{CH}_2\text{CMe} \\ \text{CMeCH}_2 \end{smallmatrix}$ appears to be formed by distilling oxy tri-methyl pyrrole dihydride with zinc dust (Weil, *A* 232, 213).

METHYL-PYRROLE-DISAZO COMPOUNDS v Dis azo compounds

(a) **METHYL-PYRROLE CARBOXYLIC ACID** $\text{C}_6\text{H}_8\text{NO}_2$, $\text{e C}_6\text{H}_8\text{MeN CO}_2\text{H}$ (a) *Homo pyrroline carboxylic acid* *Carbohomo-pyrroline acid* [169 5°] When crude potassium methyl pyrrole is heated in a current of CO_2 at 190° there is formed a mixture of the potassium salts of (a) and (b)-methyl pyrrole carboxylic acids. These acids may be separated by lead acetate, which ppt (b) acid only (Ciamician, *G* 11, 230, *B* 14, 1056). Colourless scales, sol water. Yields (a) methyl pyrrole on distillation with lime (b) **Methyl-pyrrole carboxylic acid** $\text{C}_6\text{H}_8\text{NO}_2$, $\text{e C}_6\text{H}_8\text{MeN CO}_2\text{H}$ [142 4°] Obtained as above, forms a minutely crystalline mass. Its Ca salt yields (b) methyl pyrrole on distillation with lime.

Methyl pyrrole carboxylic acid $\text{C}_6\text{H}_8\text{NO}_2$, $\text{e C}_6\text{H}_8\text{MeN CO}_2\text{H}$ [135°] Formed by heating its methylamide with alcoholic potash at 120° (Chichester & Bell, *B* 10, 1861, 11, 1810).

Methylamide $\text{C}_6\text{H}_8\text{MeN CO NHMe}$ [90°] Formed, together with methyl pyrrole, by heating methylamine mucate in a paraffin bath (Bell). Scales or prisms, sol water, volatile with steam.

Di-methyl-pyrrole carboxylic acid $\text{C}_6\text{H}_8\text{NO}_2$, $\text{e NH} \begin{smallmatrix} \text{CMe}=\text{CH} \\ \text{C(CO}_2\text{H)} \end{smallmatrix}$ [137°] Formed by the prolonged action of boiling aqueous KOH on tetra-methyl pyrrolyl pyrrole carboxylic acid or on tetramethylpyrrocol, which is itself obtained by heating di-methyl pyrrole dicarboxylic acid (Magnanini, *B* 22, 38, *Rend Accad Linc* [4] 4, 475). Crystals, v sl sol cold water, dissolves in warm water with partial decomposition into CO_2 and di-methyl pyrrole. Decomposes on fusion. Boiling Ac_2O converts it into tetra-methyl pyrrocol and di-methyl pyrrolyl methyl ketone. A solution of its ammonium salt gives with lead acetate a white pp, sol excess, with cupric acetate a green crystalline pp, and with FeCl_3 a dark red pulverulent pp.

Di-methyl pyrrole carboxyl derivative $\text{C}_6\text{H}_8\text{N}_2\text{O}_2$, $\text{e CHCMe} \begin{smallmatrix} \text{C CO N} \\ \text{C(CO}_2\text{H)} \end{smallmatrix} \begin{smallmatrix} \text{CMe}=\text{CMe} \\ \text{CH} \end{smallmatrix}$. **Tetra-methyl pyrrolyl-pyrrole carboxylic acid.** Formed by boiling tetra-methyl-pyrrocol with alcoholic

potash, diluting with water, and ppg with acetic acid (Magnanini, *B* 22, 35, *Rend Accad Linc* [4] 4, 468). At 145° it gives off CO₂ and leaves a residue which may be crystallised from alcohol. Boiling aqueous potash forms di methyl pyrrole carboxylic acid. On warming solutions of the salts a pp of tetra methyl pyrrocol is formed. The lead and silver salts are white pps, the ferric salt a red pp, and the cupric salt a green pp —BaA'. Tables

Methyl ether MeA' [163°] Formed from the silver salt and MeI. Monoclinic tables, $a b c = 701 \text{ } 1 \text{ } 443, \beta = 80^\circ 59'$. Insol water, sl sol benzene, v sol CHCl₃. Yields MeOH and tetramethylpyrrocol on fusion.

Di methyl pyrrole carboxylic acid C₅H₅NO₂ $\text{NH} \begin{array}{c} \text{CMe} \text{ C}(\text{CO}_2\text{H}) \\ \text{CH} = \text{CMe} \end{array}$ [183°] Obtained from its ether, which is produced by heating the mono ethyl ether of di methyl pyrrole dicarboxylic acid $\text{NH} \begin{array}{c} \text{CMe} \text{ C}(\text{CO}_2\text{Et}) \\ \text{C}(\text{CO}_2\text{H}) \text{ CMe} \end{array}$ (Knorr, *A* 236, 325). Crystalline flocculi. Split up on melting into CO₂ and di-methyl pyrrole. Boiling Ac₂O forms di methyl pyrrol methyl ketone CH₃CO C₅H₄NMe₂ [122°].

Ethyl ether EtA' [76°] (291° cor) Crystalline mass, v sol alcohol and ether. *Anilide* C₅H₄Me₂N CONHPh [80°] Formed by heating the mono anilide of di methyl pyrrole dicarboxylic acid.

Di methyl-pyrrole carboxylic acid C₅H₅NO₂ $\text{NH} \begin{array}{c} \text{CMe} \text{ CH} \\ \text{CMe} \text{ C} \text{ CO}_2\text{H} \end{array}$ Obtained by saponifying with aqueous NaOH its ether, which is formed by heating the mono ethyl ether of di methyl-pyrrole dicarboxylic acid $\text{NH} \begin{array}{c} \text{CMe} \text{ C} \text{ CO}_2\text{H} \\ \text{CMe} \text{ C} \text{ CO}_2\text{Et} \end{array}$ (Knorr, *B* 18, 1564). Slender needles. Split up at 210–213° into CO₂ and the corresponding di-methyl pyrrole.

Salts —PbA' microcrystalline pp —AgA' white pp.

Ethyl ether EtA' [118°] (290° at 731 mm) Formed as above, and also by slowly adding conc NH₄Aq to a mixture of molecular proportions of chloro acetone and acetoacetic ether. Flat prisms, volatile with steam. Sol alcohol and ether, insol water.

Di-methyl-pyrrole dicarboxylic acid C₅H₄NO₂ $\text{NH} \begin{array}{c} \text{CMe} \text{ C}(\text{CO}_2\text{H}) \\ \text{C}(\text{CO}_2\text{H}) \text{ CMe} \end{array}$

Preparation —NaNO₂ (2pts) in conc aqueous solution is added to acetoacetic ether (7pts) dissolved in HOAc. Zinc dust (25 pts) is added to the well cooled product. On adding water the di ethyl ether is deposited in needles, and this is saponified by boiling NaOHaq (Knorr, *A* 236, 317, *B* 17, 1638).

Properties —Crystalline flakes, v sol water and alcohol, less sol ether. Rapidly turns red in air. Decomposes completely at 260° into CO₂ and di-methyl pyrrole, without melting. It reduces boiling ammoniacal AgNO₃. It forms normal and acid salts which are mostly amorphous.

Mono-ethyl ether HEtA' $\text{NH} \begin{array}{c} \text{CMe} \text{ C}(\text{CO}_2\text{Et}) \\ \text{C}(\text{CO}_2\text{H}) \text{ CMe} \end{array}$ [202°]. Formed by

boiling the di-ethyl ether with alcoholic potash. Needles (from alcohol), sl sol cold alcohol, insol water. Split up on fusion into CO₂ and di methyl pyrrole carboxylic ether. Its lead and silver salts are white amorphous pps. When heated with Ac₂O in a sealed tube at 200° it yields $\text{NH} \begin{array}{c} \text{CMe} \text{ C}(\text{CO}_2\text{Et}) \\ \text{C}(\text{CO}_2\text{H}) \text{ CMe} \end{array}$ [148°], and this ether gives on saponification a crystalline acid [150°–158°], which on dry distillation is split up into CO₂ and di methyl pyrrol methyl ketone [123°] (Magnanini, *B* 21, 2865).

Di-ethyl ether C₅H₄NO₂ or Et₂A' [135°] Formed as above. White matted needles, insol water, acids, and alkalis, sol alcohol and ether. Split up by heat into CO and di methyl pyrrole. Alcoholic potash forms a pp of C₅H₄N₂KNO₄.

Mono anilide C₅H₄N₂O₂ $\text{NH} \begin{array}{c} \text{CMe} \text{ C}(\text{CONHPh}) \\ \text{C}(\text{CO}_2\text{H}) \text{ CMe} \end{array}$ Formed by boiling its ethyl ether (*v infra*) with alcoholic potash. Slender needles which soften at 180° and decompose at 198° into CO₂ and the anilide of di-methyl pyrrole carboxylic acid. Boiling dilute H₂SO₄ decomposes it in the same way.

Ethyl ether of the mono-anilide C₅H₄N₂O₂Et [216°] Formed by the action of zinc dust on a mixture of equivalent quantities of acetoacetic anilide and nitroso acetoacetic ether dissolved in HOAc (Knorr, *A* 236, 327). Crystals, sol hot alcohol and HOAc. Yields di methyl pyrrole on warming with conc H₂SO₄.

Ethyl ether of the isomeric mono anilide C₅H₄N₂O₂Et $\text{NH} \begin{array}{c} \text{CMe} \text{ C}(\text{CO}_2\text{Et}) \\ \text{C}(\text{CONHPh}) \text{ CMe} \end{array}$ [180°] Formed by the action of zinc dust on a mixture of equivalent quantities of acetoacetic ether and nitroso acetoacetic ether dissolved in HOAc (Knorr). Needles (from alcohol). Yields di methyl pyrrole on warming with H₂SO₄.

Di-anilide $\text{NH} \begin{array}{c} \text{CMe} \text{ C}(\text{CONHPh}) \\ \text{C}(\text{CONHPh}) \text{ CMe} \end{array}$ [255°] Formed by the action of zinc dust on a mixture of equivalent quantities of acetoacetic anilide and nitroso acetoacetic anilide (Knorr). Needles (from alcohol). Yields di methyl pyrrole on warming with H₂SO₄.

Anhydride C₅H₄NO₂ $\text{N} \begin{array}{c} \text{CMe} \text{ C}(\text{CO}_2\text{H}) \\ \text{G} = \text{CMe} \end{array}$ Formed by boiling di CO

methyl pyrrole dicarboxylic acid with Ac₂O (Magnanini, *B* 21, 2876). Powder, almost completely insol water, alcohol, and ether. Turns brown at 300° and at a higher temperature it splits up into di methyl pyrrole and tetra methyl pyrrocol —MgA₂ needles, m sol water —AgA' yellow amorphous sediment.

Ethyl ether of the anhydride C₅H₄EtNO₂ [270°] Formed by boiling di methyl pyrrole dicarboxylic ether with Ac₂O. White, sparingly soluble needles.

Di-methyl-pyrrole dicarboxylic acid $\text{NH} \begin{array}{c} \text{CMe} \text{ C} \text{ CO}_2\text{H} \\ \text{CMe} \text{ C} \text{ CO}_2\text{H} \end{array}$ [250°] Formed by dissolving di acetyl succinic ether in aqueous NH₃, and saponifying the resulting ether with alcoholic potash (Knorr, *B* 18, 302, 1558). Needles

(from alcohol) Decomposes at its melting point into CO₂ and (aa') di-methyl pyrrole — BaA'' small needles — CuA'' 3ag slender green needles — xAg₂A'' microcrystalline powder

Mono ethyl ether HEtA'' [227°] Slender crystals Evolves CO₂ at its melting point, giving di methyl pyrrole carboxylic acid It has acid properties, and its Cu, Co, and Ni salts form white felted needles

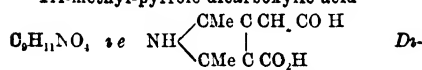

Di ethyl ether EtA'' [99°] Colourless crystals, sol alcohol, CHCl₃, and HOAc, sl sol ether, nearly insol water Has weak basic and acid properties — (C₄H₇NO, HCl), PtCl₂, Orange red crystals — C₄H₇NO, KNO₃, slender felted needles

Tri-methyl-pyrrole dicarboxylic acid

saponifying with alcoholic potash its di ethyl ether which is produced by boiling di aceto succinic ether with methylamine in glacial acetic acid solution (Knorr, B 18, 303, A 236, 304) Slender needles, insol water, sl sol ether, sol alcohol Split up at 260° into CO₂ and tri methyl pyrrole — KHA'' — NH₄HA'' — BaA' — CoA''

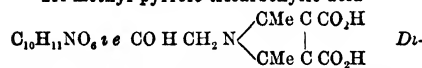

Ethyl ether EtA'' [72°] Tri-methyl-pyrrole dicarboxylic acid

methyl pyrrole carboxy acetic acid [196°] Formed by saponification by aqueous NaOH liq from its ether which is obtained by boiling aβ di acetyl glutaric ether with a solution of NH₃ in HOAc (Knorr, B 19, 48) Slender prisms Imparts a red colouration to acidified pine wood

Di ethyl ether EtA'' [110°] Glistening plates, v sol alcohol and ether, insol water

Tri-methyl-pyrrole tricarboxylic acid

methyl pyrrole dicarboxy acetic acid Obtained by saponifying its ether which is produced by boiling di acetyl succinic ether with glyccoll and HOAc (Knorr, A 236, 315) Crystalline pp, decomposed at 214° giving off CO₂ — K₂A''' — Ag HA''' crystalline pp

Di ethyl ether EtA''' [169°] Formed as above Plates, insol water, v sol alcohol, ether, and alkalis — Pb(EtA'''), prisms

METHYL-PYRROLIDINE v METHYL PYRROLE TETRAHYDRIDE

METHYL-PYRROLINE v METHYL PYRROLE and its Dihydrate

TETRA- METHYL- PYRROYL- PYRROLE CARBOXYLIC ACID v DI METHYL PYRROLE CARBOXYLIC ACID

DI-METHYL PYRRYL-BENZOIC ACID v PHENYL DI-METHYL-PYRROLE CARBOXYLIC ACID

METHYL-PYRRENE-DIBENZOIC ACID v DI PHENYL-METHYL PYRROLE DICARBOXYLIC ACID

v METHYL-PYRRENE DI METHYL DI-KETONE C₈H₁₁NMe(CO Me)₂ v *Methyl di acetyl pyrrole* [184°] Formed by heating v-methyl pyrrole with acetic anhydride for 8 hrs at 250° Colourless needles V sol alcohol, ether chloro

form, benzene, and hot water (Ciamician a. Silber, B 20, 1368, G 17, 134)

METHYL PYRRYL-GLYOXYLIC ACID

Formed by boiling methyl pyrrol methyl ketone with dilute alkaline KMnO₄ (De Varda, B 21, 2871, *Rend Accad Linc* [4] 4, 755, 758) Light yellow needles (from benzene) Bromine added to its solution in glacial acetic acid forms C₆HBr MeN CO CO₂H crystallising in yellow prisms [160°], oxidised by fuming HNO₃ to the methylamide of di bromo maleic acid — AgA' white pp

METHYL PYRRYL KETONE v PYRRYL

METHYL KFTONE

METHYL-PYRRYL METHYL KETONE

(210°) Formed by the action of AcO and NaOAc upon methyl pyrrole from bone oil (Ciamician a. Silber, B 19, 1408, 20, 2604, G 16, 352, 17, 269) Small white needles (from water), v sol alcohol, ether, and benzene Not decomposed by boiling alkalis Yields a methyl pyrrol glyoxylic acid on oxidation Bromine in CS₂ gives C₆HBr NO crystallising in needles [162°], which is oxidised by HNO₃ to di bromo maleic imide at — 18° Ammoniacal AgNO₃ gives with the ketone a white pp of C₆H₇MeAcNag

v METHYL- PYRRYL METHYL KETONE

CH₃CO C₆H₇NMe *Pseudo acetyl methyl pyrrole* (201°) Prepared by boiling v methyl pyrrole (10 g) with AcO (70 g) and NaOAc (12 g) for 12 hours (Weidel a. Crammian, B 13, 76, Ciamician a. Dennstedt, B 17, 2932, De Varda, B 21, 2972) Colourless liquid, sl sol water Not hydrolised by boiling KOHAq Reduces warm ammoniacal AgNO₃, forming a silver mirror

Di-methyl-pyrryl methyl ketone C₆H₇NO₂ i.e.

NH $\begin{array}{c} \text{CMe CH} \\ | \\ \text{C(CO CH}_3) \end{array}$ CMe [128°] Obtained by distillation of its carboxylic acid (Magnanini, *Rend Accad Linc* [4] 4, 832, B 21, 2867) Monoclinic crystals, a b c = 402.1 857, β = 78° 16' At 100 it sublimes in needles V sol hot water, v sol alcohol, benzene, and HOAc, sl sol petroleum Not affected by boiling conc KOHAq Yields a phenyl hydrazide

Di-methyl-pyrryl methyl ketone

action of AcO on the corresponding di methyl pyrrole (Dennstedt a. Zimmermann, B 19, 2195) Crystals Reduces AgNO₃ in very dilute alcoholic solution

DI-METHYL-PYRRYL METHYL KETONE CARBOXYLIC ACID C₆H₇NO₃ i.e.

by saponification of its ethyl ether, which is prepared by heating the mono ethyl ether of di methyl pyrrole dicarboxylic acid (1 pt) with Ac₂O (5 pts) at 205° in sealed tubes (Magnanini, *Rend Accad Linc* [4] 4, 830, B 21, 2865) Needles (from HOAc), almost insol water and cold alcohol, v sl sol ether, CHCl₃, and benzene Completely decomposed on fusion into CO₂ and di methyl pyrrol methyl ketone When heated with isatin and conc H₂SO₄ it gives a green

colour A solution of its ammonium salt gives pps with lead, copper, ferric, cobalt, and mercuric salts

Ethyl ether EtA' [143°] Slender needles, v. sol hot water, alcohol, and ether

DI-METHYL-o-PYRRYL-PHENOL $C_{12}H_{13}NO$

1.6 [2 1] $C_6H_4(OH)N < \begin{smallmatrix} CMe \\ CMe \end{smallmatrix} CH >$ *Oxy phenyl-di methyl pyrrole* [95°] Formed by warming acetyl acetone with *o* amido phenol in alcoholic solution (Paal, B 19, 558) White plates (from alcohol), turning red in air, sl sol water, v sol alcohol and ether Dissolves in alkalis, and is reprecipitated as needles by CO_2 —NaA' crystalline—The picrate crystallises in reddish brown plates

(a) **METHYL-PYRRYL STYRYL KETONE** $C_9H_9(CH_3)COCHCHC_6H_5$, [193°] Formed by boiling (a) methyl pyrrol methyl ketone and benzoic aldehyde with dilute caustic potash (Dennstedt a Lehne, B 22, 1918) Sulphur yellow needles (from alcohol)

(b) **Methyl-pyrrol styryl ketone** $C_{11}H_{13}NO$ $\approx C_9H_9(CH_3)COCHCHC_6H_5$, [156°–157°] Formed from (b) methyl pyrrol methyl ketone, benzoic aldehyde, and dilute caustic potash (D a L) Small light yellow plates, v sol alcohol

(aB') **Dimethyl-pyrrol styryl ketone**

$< \begin{smallmatrix} CH \\ CMe \end{smallmatrix} CMe > CCOCHCHC_6H_5$, [188°] Formed from (aB')-di-methyl-pyrrol methyl ketone, benzoic aldehyde, and KOHAq Yellow shining plates (from alcohol) (Dennstedt, B 22, 1921)

(aB') (?) **Di-methyl-pyrrol styryl ketone** $C_9H_9(CH_3)_2COCHCHC_6H_5$, [166°] Formed like the preceding Small yellow plates or needles (from boiling alcohol) (Dennstedt, B 22, 1926)

METHYL-PYRUVIC ACID v **ETHYL GLYOXYLIC ACID** Its nitrile is described as **PROPRIONYL CYANIDE**

Tri-methyl-pyruvic acid $C_6H_9O_3$ $\approx CMe_3COCO_2H$ [88°] (186°) Formed, together with a little CMe_3CO_2H , by oxidising pinacol with warm alkaline $KMnO_4$ (Glucksmann, M 10, 770) Small colourless prisms (from ether), sl sol cold water, v sol hot water, m sol ether Volatile with steam Gives a silver mirror with ammoniacal $AgNO_3$ May be reduced to $CMe_3CH(OH)CO_2H$ and oxidised to CMe_3CO_2H

Salts—NaA'—CaA' 3aq—AgA'

Phenyl-hydrazide $C_{12}H_{15}N_3O_2$ [158°] Long needles

METHYL-QUINALDINE v **DI METHYL QUINOLINE**

METHYL-QUINALDINIUM HYDRATE v **Methyl hydrate of (Py 3) METHYL-QUINOLINE**

METHYL-QUINAZOLINE DIHYDRIDE C_8H_9N , $\approx C_6H_5 < \begin{smallmatrix} CH_2NH \\ N \\ CMe \end{smallmatrix} >$ Formed by distilling the acetyl derivative of *o* amido benzyl amine (Gabriela Jansen, B 23, 2812) Colourless tenacious liquid, sol water Its solution has a bitter taste and alkaline reaction—B'HCl prisms, v sol water—B'H₂PtCl₄—Chromate reddish-yellow needles—Picrate [200°] Long needles

DI METHYL-QUINOGEN v **DI METHYL DIKETONE**, *Reaction 6*

METHYL-QUININE v **QUININE**

METHYL-(pseudo)-QUINISATIN $C_{16}H_{19}NO$

$\approx C_6H_5 < \begin{smallmatrix} CO \\ NMe \end{smallmatrix} CO > (?)$ [c 120°–122°]. Formed

by oxidation of (Py 1 2) di oxy (Py 4) methyl-(Py 3) pseudo oxy-quinoline

$C_6H_5 < \begin{smallmatrix} C(OH) \\ NMe \end{smallmatrix} C(OH) >$ with Fe_2Cl_6 V. sol ordinary solvents

Dissolves in alkalis with a yellow colour (Friedlander a Muller, B 20, 2015)

METHYL-QUINIZABIN v **DI OXY METHYL-ANTHRAQUINONE**

METHYL QUINOLINIC ACID v **METHYL-PYRIDINE DICARBOXYLIC ACID**

(Py 1) **METHYL-QUINOLINE** $C_{10}H_9N$ \approx

$C_6H_5 < \begin{smallmatrix} CMe \\ N \\ CMe \end{smallmatrix} CH >$ *Lepidine Cincholepidine*

Mol w 143 (265° V) (K), (263° V) (D) S G \approx 1.0995, d_4^{20} 1.0862 (K)

Formation—1 Obtained, together with quinoline, by distilling cinchonine with aqueous KOH (Greville Williams, *Pr E* [3] 21, 377)—2 By distilling the hydrochloride of quinoline tetrahydride (Py 1) carboxylic acid (tetrahydrocinchonic acid) with zinc dust (Weidel, M 3, 75)—3 Formic aldehyde or methylal is mixed with acetone, the mixture is saturated with HCl, and heated with a solution of aniline in conc HCl The bases are separated from the product by potash and fractionally distilled, the equations being $CH_3O + CH_3COCH_3 = H_2O + CH_3CHCOCH_3$, and the following $CH_3CHCOCH_3 + C_6H_5NH_2 = C_{10}H_9N + H_2O + H_2$ (Beyer, *J pr* [2] 82, 127)—4 By heating oxy-(Py 1) methyl-quinoline with zinc dust (Knorr, A 236, 94)—4 By heating cinchene with HOAc at 200° (Koenigs, B 23, 2677)

Preparation—1 The fraction 250°–260° of the distillate from cinchonine and KOHAq is converted into acid sulphate, the acid sulphate of (Py 1) methyl quinoline being insoluble in alcohol, whilst the acid sulphate of quinoline is soluble (Hoogewerf a Van Dorp, R T C 2, 1) 2 Obtained in pure state by the action of KOH upon cinchonine in presence of superheated steam (Krakau, Bl [2] 45, 248)

Properties—Oil, solidifying when cooled below 0°, sl sol water, miscible with alcohol, ether, benzene, and ligroin Smells like quinoline Turns brown in air and light According to Oechsner de Coninck (Bl [2] 38, 546), two lepidines (268°) and (268°) are obtained by distilling cinchonine or brucine, and the base of higher boiling point alone solidifies in a freezing mixture

Reactions—1 *Oxidation* with $KMnO_4$ in alkaline solution gives methyl pyridine dicarboxylic acid and, finally, pyridine tricarboxylic acid (Hoogewerf a Van Dorp, B 13, 1639) Oxidation by $K_2Cr_2O_7$ and H_2SO_4 yields quinoline (Py 1) carboxylic (cinchonine) acid—2 By adding sodium amalgam to lepidine O Greville Williams (C N 37, 85) obtained a base which formed a red crystalline nitrate $C_{10}H_9N_2HNO_3$ 3 When heated with an equivalent quantity of benzoic aldehyde and $ZnCl_2$ it yields styryl-quinoline (Heymann a Königs, B 21, 1424)—4 When heated with isoamyl iodide it yields the amylo iodide (which may be extracted by

repeatedly boiling the product with water) and also an insoluble residue whence boiling alkalis liberate 'lepamine' $C_{20}H_{21}N$, (Greville Williams, *C. J.* 16, 375) Lepamine is a fragrant oil (d 275°), V D (obs and calc 10.4) Lepamine yields the salts $C_{20}H_{21}N \cdot H_2Cl_2$ (melting below 100°) and $C_{20}H_{21}N \cdot H \cdot PtCl_5$.—5 By the action of a boiling aqueous solution of caustic potash upon mixtures of the alkyl iodides of lepidine and quinoline, blue or green substances, called cyanines are obtained (*v* QUINOLINE)

Salts — $B \cdot HCl$ needles — $B \cdot H \cdot PtCl_5 \cdot 2aq$ orange-red triclinic needles [226° – 230°] (Knorr), [α 253°] (Königs) — $B \cdot H \cdot AuCl_4$ [188°] Prismatic needles Decomposed when heated for some time at 110° — $B \cdot H \cdot CdCl_2$ — $B \cdot HNO_3$ slender prisms — $B \cdot H_2SO_4$ [229°] S (alcohol) 4 at 18° , 1.1 at 78° (Krakau, *J. R.* 17, 362) — $B \cdot H_2Cr_2O_7$, yellow needles (from hot water) which decompose at 110° — $B \cdot AgNO_3$, white needles — Tartrate $B \cdot C_4H_4O_6 \cdot aq$ Crystallises from alcohol — Picrate $B \cdot C_6H_3(NO_2)_3OH$ [208°] (H & D), [213°] (Krakau) Small yellow needles (from alcoholic solutions)

Methyl iodide $B \cdot MeI$ [174°] Yellow prisms (from alcohol) (Hoogewerf & Van Dorp, *R. T. C.* 2, 41, 318)

Ethyl iodide $B \cdot EtI$ [143°] Prisms

Isoamyl iodide $B \cdot C_5H_{11}I$ [160°] Yellow prisms (Hoogewerf & Van Dorp, *R. T. C.* 3, 352)

Chloro-lepidine *v* CHLORO METHYL QUINOLINE

(Py 1)-Methyl quinoline tetrahydride

$C_{10}H_{13}N$ *vs* $C_6H_5 \cdot \begin{smallmatrix} CHMe \\ NH \end{smallmatrix} \begin{smallmatrix} CH_2 \\ CH_2 \end{smallmatrix}$ (250° – 253° i V) at 740 mm Formed by adding sodium to a boiling alcoholic solution of oxy (Py 1) methyl-quinoline (Knorr & Klotz, *B.* 19, 3300) Formed also by the action of tin and HCl on lepidine Colourless oil, with pungent odour

(Py 2) Methyl quinoline $C_6H_5 \cdot \begin{smallmatrix} CH \\ N \end{smallmatrix} \begin{smallmatrix} CH \\ CH \end{smallmatrix}$

[10° – 14°] (250° at 710 mm) Obtained by heating (Py 2) methyl quinoline (Py 3) carboxylic acid with soda lime or alone at 160° By CrO_3 and H_2SO_4 it is oxidised to quinoline (Py 2) carboxylic acid [273°] (Doebner & Miller, *B.* 17, 1716, 18, 1642) Formed also by saturating a mixture of propionic aldehyde and methylal with HCl and heating the product with aniline and conc HClAq (Miller & Kinkel, *B.* 20, 1916) Prisms or colourless liquid

Salts — $B \cdot H_2PtCl_6 \cdot 2aq$ orange-yellow needles — $B \cdot H \cdot AuCl_4$ [145°] Prismatic yellow needles, sol hot water, sl sol cold — Picrate $B \cdot C_6H_3(NO_2)_3OH$ [187°], fine yellow needles

Methyl iodide $B \cdot MeI$ [221°], long yellow needles, sparingly sol alcohol

Amyl iodide $B \cdot C_5H_{11}I$ [215°], yellow needles

(Py 2) Methyl quinoline dihydride

$C_{10}H_{11}N$ *vs* $C_6H_5 \cdot \begin{smallmatrix} CH \\ NH \end{smallmatrix} \begin{smallmatrix} CHMe \\ CH_2 \end{smallmatrix}$ Is one of the

products formed by the action of methyl iodide (*In* 2) methyl indole (methyl ketole) (Fischer & Steche, *A.* 242, 858) Oil Forms a nitrosamine.

(Py 3) Methyl quinoline $C_{10}H_9N$ *vs*

$C_6H_5 \cdot \begin{smallmatrix} CH \\ N \end{smallmatrix} \begin{smallmatrix} CH \\ CMe \end{smallmatrix}$ (2) Methyl-quinoline Quinaldine (240° at 720 mm) (D & M), (246° 5° i V) at 724 mm (P & B), (240° uncor) (Drewson) Occurs in coal tar (Jacobsen & Reimer, *B.* 16, 1084)

Formation — 1 By heating a mixture of aniline, nitrobenzene, and H_2SO_4 with ethylene glycol or paraldehyde (Doebner & Miller, *B.* 14, 2812) — 2 By adding a little NaOH to an aqueous solution of equivalent quantities of *o* amido benzoic aldehyde and acetone (Friedlander & Gohring, *B.* 16, 1835) — 3 By the reduction of *o* nitro styryl methyl ketone with $SnCl_2$ (Drewson, *B.* 16, 1953) — 4 By heating a mixture of aniline, aldol, and HCl (Doebner & Miller, *B.* 16, 2464, 17, 1699) — 5 By heating a mixture of aniline, acetal, and H_2SO_4 (D & M) — 6 By heating a mixture of aniline, nitrobenzene, lactic acid, and H_2SO_4 (Wallach & Wusten, *B.* 16, 2007) — 7 By heating crotonic aldehyde with aniline, nitrobenzene, and H_2SO_4 (Skraup, *B.* 15, 897) — 8 By distilling its carboxylic acid with lime (Beyer, *J. pr.* [2] 33, 413, Rohde, *B.* 22, 267) — 9 By heating chloro methyl quinoline (vol ii p 82) with HI in HOAc in sealed tubes at 260° (Conrad & Lumpach, *B.* 20, 955) — 10 By heating methyl indole (methyl ketole) with bromoform and alcoholic NaOH and reducing the resulting bromo methyl quinoline [78°] with P and HI at 180° (Magnanini, *B.* 20, 2610, 21, 1940, *G.* 17, 246) — 11 By heating methyl indole (methyl ketole) with conc HCl at 225° (Magnanini, *B.* 20, 2609) — 12 By heating ethyl acetanilide with $ZnCl_2$ at 225° (Pictet & Bunzl, *B.* 22, 1847)

Preparation — A mixture of aniline (2 pts), paraldehyde (3 pts), and conc HClAq (4 pts), is heated on a water bath for a few hours (Doebner & Miller, *B.* 16, 2464)

Properties — Oil, smelling like quinoline, al sol water It gives with $AgNO_3$ a compound crystallising in white needles Not affected by nitrous acid A solution of chloride of iodine in HCl forms deep yellow needles of a chloro iodide [151°] (Dittmar, *B.* 18, 1612)

Reactions — 1 Scarcely attacked even after long boiling with chromic acid mixture, but completely oxidised by CrO_3 in HOAc CrO_3 and H_2SO_4 yield quinoline (Py 3) carboxylic acid — 2 $KMnO_4$ oxidises it to acetyl *o* amido benzoic acid (Doebner & Miller, *B.* 15, 3075) — 3 Cold conc HNO_3 forms (B 3) and (B 4) nitro (Py 3) methyl quinolines Boiling conc HNO_3 forms nitro quinoline carboxylic acid [220°] — 4 Tin and HCl reduce it to a tetrahydride — 5 On heating with sulphur H_2S is evolved and the product contains a base $C_{10}H_{11}N \cdot aq$ [162°] which crystallises from alcohol in white needles (Von Miller, *B.* 21, 1828) — 6 Combines at once with formamide forming a white mass, which crystallises from alcohol or ether in needles of $C_6H_5 \cdot MeN \cdot C(OH) \cdot NH_2$ [76°], and is decomposed by water (Cleva, *B.* 20, 76) — 7 Combines with aldehydes, forming aldol like products which readily split off water (Von Miller, *B.* 20, 2041) Thus paraldehyde when heated with quinaldine for 5 hours at 210° yields (Py 3) allyl quinoline (249° – 253°) (Eisele, *B.* 20, 2043), isobutyric aldehyde with $ZnCl_2$,

forms $C_{11}H_{11}NO$ [98°] (Brünner, *B* 20, 2041); *p* nitro benzaldehyde at 120° unites forming $C_8H_7NCH_2CH(OH)C_6H_4NO_2$ [160°] which when heated with Ac_2O loses water and becomes *p* nitro styryl quinoline (Bulach, *B* 20, 2046, *B* 22, 285) In like manner, when quinaldine (1 mol) is heated with furfuraldehyde (1 mol) and a little $ZnCl_2$ for 2 hours at 100° the product is $C_8H_7NCHCH_2C_4H_3O$ which crystallises from ligroin in tufts of needles (Srpek, *B* 20, 2044) — 8 When heated with *phthalic anhydride* and $ZnCl_2$ at 200° it yields 'quinoline yellow' $C_8H_7NCHC_2O_2C_6H_4$ which crystallises from alcohol in golden needles [235°], may be sublimed, and is insol water, v sl sol ether, m sol boiling alcohol, v sol $HOAc$ It dyes silk and wool yellow (Jacobsen & Reimer, *B* 16, 1082)

Salts — The nitrate and hydrochloride are easily soluble — $B'H_2PtCl_6$ [226°] (F & G), [229°] (P & B), [230°] (Beyer) Sparingly soluble orange prisms — *Aurochloride* yellow crystalline pp — $B'HHgCl_2$ [165.5°] White needles — $B'HI$ [186°] V sol water — $B'HSO_4$ [213°] Deliquescent prisms (Hoogewerf & Van Dorp, *R T C* 3, 344) — $B'H_2CrO_4$ long yellowish red needles, sol hot, sl sol cold, water — *Picrate* $B'CH(NO_2)_2OH$ [191°] Needles, sl sol water and cold alcohol

Methylo-iodide $B'MeI$ [195°] Lemon-yellow needles, v sol water, sol alcohol, insol ether Yields $(B'MeCl)_2PtCl_6$ crystallising in orange tables, $(B'MeCl)_2AuCl_3$ crystallising from hot water in lemon yellow needles, and $(B'Me)_2Cr_2O_7$ crystallising in orange plates, sl sol water, exploding at 90°

Methylo oxide $(B'Me)_2O$ Formed by adding aqueous KOH to the methylo iodide (Bernthsen & Hess, *B* 18, 32, Moller, *A* 242, 302) Yellow amorphous flakes, sl sol water, v sol alcohol and ether Easily decomposes, becoming red *HIAq* converts it into $B'MeI$, while *HCl* yields $B'MeCl$

Ethylo iodide $B'EtI$ *Ethyl quinaldinum iodide* [234°] Prepared by heating quinaldine with *EtI* at 100° Yellow prisms (from alcohol), decomposed on fusion (Hoogewerf & Van Dorp, *R T C* 3, 345, 350, Spaltholz, *B* 16, 1851) Aqueous KOH converts it into the flocculent oxide $(B'Et)_2O$ which readily changes on exposure to air to a crimson resin The oxide yields the following salts $B'EtAuCl_4$ golden needles — $(B'EtCl)_2PtCl_6$ ruby red prisms, sol hot water — $(B'Et)_2Cr_2O_7$ Reddish yellow needles, exploding at 100° On heating quinoline ethylo iodide (2 pts) with quinaldine ethylo iodide (1 pt) and aqueous KOH diethyl isocyanine iodide is formed, which crystallises from its crimson alcoholic solution in lustrous green prisms (v QUINOLINE)

Propylo iodide $B'PrI$ [167°] Obtained by heating its components on the water bath (Moller, *A* 242, 306) Small greenish yellow prisms (from alcohol), sl sol cold, v sol hot, alcohol and water Gives with aqueous KOH a yellow amorphous oxide $(B'Pr)_2O$, sol alcohol and ether It yields the salts — $(B'PrCl)_2PtCl_6$ crystallising in orange plates, $B'PrAuCl_4$ crystallising in canary yellow needles, v sl sol cold water, and $(B'Pr)_2Cr_2O_7$ crystallising in brownish red prisms

Isobutylo-iodide $B'CH_3I$ [172°] Obtained by cohobating its components at 115° (M). Straw yellow plates, sol hot alcohol Yields an unstable oxide which on heating changes to a violet colouring matter

Isoamyllo-iodide $B'C_4H_9I$ [175°] Formed by cohobating its components for 12 hours at 145° Small yellow prisms, v sol water and hot alcohol Converted by aqueous KOH into an oxide which condenses to a crimson dye on heating

(Py 3)-Methyl-quinoline tetrahydride

[248° at 710 mm] Formed by reducing $CH_3COCH_2CH_2C_6H_4NO_2$ [1.2] (Jackson, *B* 14, 890) It is also a product of the action of *HCl* on a mixture of aldehyde and aniline (Doebner & Miller, *B* 17, 1698) Prepared by reducing quinaldine with tin and *HCl* (Doebner & Miller, *B* 16, 2467) Colourless liquid with pleasant smell, sl sol water, v sol alcohol, ether, and benzene $FeCl_3$ gives a blood red colour to aqueous solutions of its salts, CrO_3 acts in like manner Nitrous acid produces an oily nitrosamine and a crystalline nitro nitrosamine [152°] (Moller, *A* 242, 314) Heated with benzoic chloride it gives a green dye stuff — $B'H PtCl_6$ yellow needles

v Methyl quinoline dihydride $C_{10}H_{11}N$ & c

$C_6H_7 \begin{array}{l} \swarrow CHCH_3 \\ | \\ \searrow NMeCH_3 \end{array}$ This base is probably formed by heating v methyl indole with *MeI* (Fischer & Steche, *B* 20, 2201)

v Methyl quinoline tetrahydride $C_{10}H_{11}N$ & c

Prepared by heating quinoline tetrahydride with *MeI* (Hoffmann & Konigs, *B* 16, 731), or by reduction of quinoline methylo iodide with tin and *HCl*, the yield by the latter process being 50 p c of the theoretical (Feer & Konigs, *B* 18, 2388) Oil Resembles quinine in physiological action, and has been used as a febrifuge Nitrous acid gives a yellowish red colouration in dilute solutions Gives a green dye stuff on heating with benzo trichloride

Salts — $B'HClaq$ [244°] Prepared by heating quinoline tetrahydride with *MeOH* and conc *HClAq* at 160° (Ostermayer, *B* 18, 595) Crystallises from alcohol or chloroform in tetrahedra, v sol alcohol, sl sol ether — $B'HCuCl$ [86°] Large yellow needles — $B'HPtCl_6$ [177°] Red crystalline pp — *Picrate* [125°] Long yellow needles

Nitroso derivative $C_{10}H_{12}(NO)N$ Green plates, v sol alcohol, ether, and benzene, sl sol ligroin Does not give Liebermann's reaction Not affected by boiling *NaOHAc*

Methylo hydroxide $*B'MeOH$ Strong alkaline base, sol water

Ethylo-iodide $C_6H_9NMeEtI$ [179°] Formed from ethyl quinoline tetrahydride and *MeI* (Claus & Stegehlitz, *B* 17, 1331) Crystals Not affected by *KOHAc* With *Ag_2O* it gives a crystalline base V sol water, insol ether — $(C_6H_7MeEtCl)_2PtCl_6$

References — AMIDO METHYL HYDRO QUINOLINE, NITRO METHYL QUINOLINE TETRAHYDRIDE, and OXY METHYL QUINOLINE TETRAHYDRIDE

N CH [68°] (290° i V) at 737 mm.

formed by distilling (Py 8, 2, 1) oxy di methyl-quinoline with zinc-dust (Knorr, A 245, 362). On oxidation by chromic acid mixture it yields Py 2)-methyl quinoline (Py 1)-carboxylic acid (Santz, B 23, 2257) — $B'H_2PtCl_4$ 2aq [240°] — $3'HauCl_4$ [177°] Plates — $B'H_2Cr_2O_7$, red needles — Picrate $B'O_4H_4(NO_2)_3OH$ [c 205°] Yellow needles

Methylo-iodide $B'MeI$ [191°] Light-yellow needles (from alcohol)

(Py 1, 3) Di-methyl-quinoline

$C_8H_8 \begin{smallmatrix} < CMe & CH \\ & N & CMe \end{smallmatrix}$ (264° uncor) SG 1.061

Formation — 1 By saturating a mixture of paraldehyde (120 g) and acetone (200 g) with gaseous HCl, allowing the mixture to stand for a day or two and then pouring it slowly into a solution of aniline (200 g) in conc HClAq (400 g) in this reaction the ketone $CH_3CHCHCOCH_3$ is doubtless first formed (O Beyer, J pr [2] 32, 125, 33, 401) — 2 Together with methane, by heating acetone with aniline hydrochloride at 180°, the yield being 3 p.c. of the theoretical (Riehm, A 238, 3, B 18, 3296) — 3 Together with the bases C_8H_8N CMe₂ (228°), V D 66 4 (calc 36 5), and $C_8H_8N(?)$ (275°), by heating aniline with acetone and a dehydrating agent such as $ZnCl_2$ or P_2O_5 — 4 By heating aniline with mesityl oxide at 180° (Engler a Riehm, B 18, 2245) — 5 By heating acetanilide with acetone, the yield being 8 p.c. of the theoretical — 6 From acetone and benzanilide — 7 By the action of NaOHAq on a mixture of o amido acetophenone and acetone (O Fischer, B 19, 1037) — 8 By dissolving the anilide of methylene di methyl diketone (acetyl acetone) in conc H_2SO_4 , warming, diluting with cold water, and neutralising with NH_3 (Combes, C R 106, 142)

Properties — Oil, with sweetish smell, somewhat like quinoline, volatile with steam. Not affected by nitrous acid

Reactions — 1 CrO_3 oxidises it to (Py 3)-methyl quinoline (Py 1) carboxylic acid — 2 By heating with phthalic anhydride and a little $ZnCl_2$ at 200° it is converted into a 'phthalone' $C_8H_8N C_2O_2 C_6H_5$, which crystallises from alcohol in orange needles [238°] (Beyer, J pr [2] 33, 407)

Salts — $B'HCl$ slender, stellate flat needles (by sublimation), v sol water and alcohol — $B'H_2PtCl_4$ [229°] — $B'H_2PtCl_4$ 2aq — $B'H_2ZnCl_4$ 1½aq — $B'H_2SO_4$ [225°–228°] Concentric needles, v sol water, sl sol alcohol — $B'H_2Cr_2O_7$, [172°] Orange needles, v sol hot, v sl sol cold, water — $B'O_4H_4(NO_2)_3OH$ [190°] Needles (from acetone)

Methylo-iodide $B'MeI$ [226°]

Ethylo-iodide $B'EtI$ [314°]. Needles (from alcohol)

Di-methyl-quinoline $C_8H_8(C_2H_5Me_2N)$. [65°] (267°) at 713 mm Occurs among the products of the action of aniline on a mixture of isobutyric aldehyde, methylal, and HCl (Von Miller a Kinkel, B 20, 1937) Monoclinic prisms — $B'H_2PtCl_4$ 2aq [268°] Groups of needles (from HClAq) — $B'O_4H_4(NO_2)_3OH$ [220°] Aggregates of tables (from hot alcohol)

(Py 1, 4) Di-methyl-quinoline tetrahydride

$C_8H_8 \begin{smallmatrix} < CHMe & CH_2 \\ & NMe & CH_2 \end{smallmatrix}$ (255° i.v.). Formed by adding Na to a boiling alcoholic solution of oxy-

(Py 1, 4)-di-methyl-quinoline (methyl-lepidone) (Knorr a Klotz, B 19, 3302) Colourless liquid

(Py 3 4) Di-methyl-quinoline tetrahydride

$C_8H_8 \begin{smallmatrix} < CH_2 & CH_2 \\ & NMe & CHMe \end{smallmatrix}$ (248°) at 710 mm Formed by heating (Py 3) methyl-quinoline tetrahydride with MeI (Doeberner a Miller, B 16, 2468) Formed also by reducing the methylo iodide of (Py 3) methyl quinoline with tin and HCl (Feer a Königs, B 18, 2388) Colourless liquid On heating with benzotrichloride it gives a green dye stuff — $B'H_2PtCl_4$ sparingly soluble red granular pp

Methylo-iodide $B'MeI$. [205°] Colourless needles, v e sol water and hot alcohol, insol ether (Moller, A 242, 318) Not acted on by alkalis, but converted by moist Ag_2O into the ammonium base, which is split up by distillation into MeOH and (Py 3, 4) di-methyl quinoline Yields the salts $(B'Me)_2PtCl_4$ crystallising from water in small brick-red crystals, $B'MeAuCl_4$ crystallising in lemon yellow needles, and $(B'Me)_2Cr_2O_7$ crystallising in small hexagonal plates

Di methyl-quinoline $C_{11}H_{11}N$ (245°) Occurs in commercial quinaldine (Einhorn, B 18, 3144) — $B'H_2PtCl_4$ [238°]

(Py 1, 2, 4) Tri-methyl-quinoline dihydride

$C_{12}H_{12}N$ s.e. $C_8H_8 \begin{smallmatrix} < CMe & CMe \\ & NMe & CH_2 \end{smallmatrix}$ (244° i.v.) at

a little MeOH for 20 hours at 100° (Fischer a Steche, B 20, 818, A 242, 353). Formed by heating (In 1, 2) di methyl indole with MeOH and MeI in sealed tubes at 100° (Fischer a Steche, A 242, 364, Wolff, B 21, 125) Formed also by heating indole with MeI, MeOH, and Na CO₃ at 130° (Giamcian a Zatti, B 22, 1980, Zatti a Ferrarini, B 23, 2302, Fischer a Meyer, B 23, 2631) Formed likewise by heating scatole (1 pt) with MeI (2½ pts) and MeOH (1 pt) for 12 hours at 130° (F a M) Oil, turning red in air, miscible with alcohol, ether, benzene, and chloroform Nitrous acid gives a reddish brown oil, becoming crystalline $FeCl_3$ added to its solution in HClAq ppts golden yellow plates or needles of a compound v sol. hot water, v sl sol conc HClAq

Salts — The hydrochloride is v sol water — Platinochloride [c 212°] — $B'H_2SO_4$ plates — $B'HI$ [253°] Prisms (from alcohol) — $B'O_4H_4(NO_2)_3OH$ [148°] Golden-yellow needles (from alcohol)

(Py 1, 2, 4) Tri-methyl-quinoline tetrahydride

$C_8H_8 \begin{smallmatrix} < CHMe & CHMe \\ & NMe & CH_2 \end{smallmatrix}$ (?) (239° i.v.) at 749 mm

Formed by reducing the dihydride with zinc and HClAq (Fischer a Steche, A 242, 356) Colourless liquid, sl sol water, v sol ether, alcohol, and benzene $FeCl_3$ gives a brown amorphous pp in its solution in HClAq — Picrate [162°] (F a S), [164°] (Giamcian a Zatti, B 22, 1981), yellow plates (from alcohol) — Platinochloride bright-red crystals

Methylo-iodide $B'MeI$ [251°]. Plates or needles (from alcohol), m sol water

(Py 1, 3, 4) Tri-methyl-quinoline tetrahydride $C_8H_8 \begin{smallmatrix} < CHMe & CH_2 \\ & NMe & CHMe \end{smallmatrix}$ Hydro-iodide

B'HI [215°] Formed from (*Py* 1, 3)-di-methyl-quinoline by reducing in alcoholic solution with Na and heating the product with MeI and MeOH at 100° (Fischer & Meyer, *B* 23, 2681).

(*Py* 1, 2, 4)-Tri-methyl-quinoline tetrahydride $C_8H_8 \begin{smallmatrix} CHMe \\ CHMe \\ CHMe \\ CHMe \end{smallmatrix}$. Hydro-iodide

B'HL [205°] Formed like the preceding from (*Py* 1, 2)-di-methyl-quinoline (F. A. M.). Crystalline

(*B* 1, 2, 4)-Tri-methyl-quinoline $C_{12}H_{12}N \begin{smallmatrix} CHMe \\ CHMe \\ CHMe \\ CHMe \end{smallmatrix}$ (43°) (286° uncor)

Formed by heating ψ cumidine [63°] with glycerin, nitrobenzene, and H_2SO_4 (Berend, *B* 18, 376) White prisms — $B'HNO_3$, sparingly soluble needles — $B'H_2SO_4$, white prisms — $B'_2H_2PtCl_6$ 2aq very sparingly soluble orange-red needles

(*B* 2, 4, *Py* 3) Tri-methyl-quinoline $C_{12}H_{12}N \begin{smallmatrix} CHMe \\ CHMe \\ CHMe \\ CHMe \end{smallmatrix}$ *op Di methyl quin-*

aldine [46°] (260°) at 719 mm Formed by heating *m*-xylidine with paraldehyde and conc HClAq on the water-bath (Panajotoff, *B* 20, 32) Small plates (from alcohol) or monoclinic prisms (from petroleum-ether), insol water, v e sol alcohol Readily volatile with steam Yields on oxidation (*B* 4, *Py* 8)-di-methyl-quinoline (*B* 2) carboxylic acid Forms, with chloral, a compound $C_7H_7O_2Na$, melting at 108°, and crystallising in yellowish needles, v sol alcohol

Salts — $B'HCi$ white needles — $B'_2H_2PtCl_6$ 2aq orange-yellow needles, sl sol water — $B'H_2SO_4$ aq white needles, v sol water and alcohol, sl sol ether — $B'HNO_3$, transparent triclinic prisms — $B'_2H_2Cr_2O_7$, orange yellow needles — $B'_2H_2(NO_3)_2 \cdot OH$ [185°] Yellow needles

Methylo-iodide $B'MeI$ aq Yellow needles, v sol water

Tetrahydride $C_8H_8 \begin{smallmatrix} CH_2 \\ CH_2 \\ CH_2 \\ CH_2 \end{smallmatrix}$

(200°–250°) Formed by reducing the base with tin and HCl (P) — $B'_2H_2PtCl_6$, orange plates

(*B* 1 or 3, 2, *Py* 8) Tri-methyl-quinoline $CMe CMe C CH CH$ or $CMe CH C CH CH$

$CH OH C N CMe$ or $CMe CH C N CMe$ Formed from *o*-xylidine, aldehyde, and HCl (Merz, *B* 17, 1158) Monoclinic crystals — $B'_2H_2PtCl_6$, minute needles

(*B* 2, *Py* 1, 3)-Tri-methyl-quinoline $CMe CH C Me CH$

$CH CH C N CMe$ [64°] (P), [40°] (O); (278°) (P), (281°) (O) Formed by saturating a mixture of acetone (40 g) and paraldehyde (30 g) with HCl at 0°, allowing to stand 12 hours in a freezing mixture, pouring into a solution of *p*-toluidine (65 g) in fuming HClAq (180 g) and heating on the water bath for 7 hours (Pätzinger, *J pr* [2] 88, 41) Formed also by dissolving the *p*-toluide of methylene di-methyl diketone $CH_2 CO CH_2 C(NC_2H_5)_2 CH_2$ in conc H_2SO_4 , warming, diluting, and neutralising with NH_3 (Combes, *C R* 106, 145) White needles, containing water of crystallisation which is given off in a desiccator, the anhydrous base crystallising in tables and absorbing water (1 mol) from the air Sl sol water, v sol alcohol, ether, and petroleum-ether. Volatile with steam.

It has a bitter, acid taste, and an irritating vapour

Salts — $B'HCi$ 2aq white needles, v e sol hot water and alcohol [260°] — $B'_2H_2PtCl_6$ 2aq yellow needles, v sl sol water, almost insol alcohol [220°] (O) — $B'_2H_2SO_4$ [222°] White needles or rhombohedra (containing aq), m sol cold alcohol — $B'_2H_2Cr_2O_7$, Yellowish red needles, v sl sol cold water — $B'_2H_2(NO_3)_2 \cdot OH$ [201°] Greenish-yellow needles (from hot acetone)

Methylo-iodide $B'MeI$ [226°] Needles (containing aq), sol water, alcohol, and ether

(*B* 2, *Py* 2, 3) Tri-methyl-quinoline $CMe CH C CH CMe$ [87°] (285°) Formed

from tiglic aldehyde (1 mol), *p*-toluidine (4 mols) and HCl (8 mols) (Von Miller & Ohler, *B* 23, 2268) White nodules (from ligroin), insol water, m sol ligroin, v sol ether Yields on oxidation (*Py* 2, 8) di-methyl-quinoline (*B* 2)-carboxylic acid [270°]

Salts — $B'_2H_2PtCl_6$ 2aq laminae — The chromate crystallises in orange laminae, v sl sol water — The hydrochloride and sulphate are v e sol water — Picrate [212°] Straw coloured laminae

(*B* 4, *Py* 1, 3) Tri-methyl-quinoline

$CH CH C CMe CH$ $CH CMe C N CMe$ (280°) Formed by the action of H_2SO_4 on the *o*-toluide of methylene dimethyl diketone $CH_2 CO CH_2 C(NC_2H_5)_2 CH_2$ (Combes, *C R* 106, 145) Oil — Platinichloride [257°]

(*B* 4, *Py* 3, 4)-Tri-methyl-quinoline tetrahydride $CH CH C CH_2 CH_2$ (244°) Formed by the action of MeI on (*B* 4, *Py* 3) di-methyl-quinoline tetrahydride (Doebner & Miller, *B* 16, 2470) Colourless liquid

(*Py* 1, 2, 3) Tri-methyl-quinoline

$C_8H_8 \begin{smallmatrix} CMe \\ CMe \\ CMe \\ CMe \end{smallmatrix}$ [65°] (285°) Formed by heating the amide of di-methyl ethylidene diketone $CH_2 CO CHMe C(NC_2H_5)_2 CH_2$ with H_2SO_4 , and separated by passing NH_3 through the diluted product (Combes, *C R* 106, 144) — $B'_2H_2PtCl_6$ [215°]

Tri-methyl-quinoline $C_{12}H_{12}N$ (270°–280°) A by product in the preparation of quinaldine from paraldehyde, aniline, and HCl (Doebner & Miller, *B* 18, 3352) — $B'_2H_2PtCl_6$ 2aq pale-yellow needles

(*B* 1, 2, 4, *Py* 8)-Tetra-methyl-quinoline

$CMe CH C CH CH$ $CH CMe C N CMe$ [c 20°] (300°) Formed by heating solid ψ cumidine [63°] with paraldehyde and HClAq at 105° (Doebner & Miller, *B* 17, 1710) Crystalline, v sol alcohol and ether, insol water — $B'_2H_2Cr_2O_7$, long yellow needles

(*B* 2, 4, *Py* 1, 3)-Tetra-methyl-quinoline

$CMe CH C Me CH$ $CH CMe C N CMe$ [84°] (285° uncor).

Formed from acetone and *m*-xylidine (Levin & Riehm, *B* 19, 1894) White plates (from ether) — $B'H_2SO_4$, [235°–242°]; needles, v sol water, m. sol alcohol — $B'HCi$: white needles (by sublimation). — $B'_2H_2PtCl_6$ — $B'_2H_2Cr_2O_7$, orange needles, sl sol water

Tetramethylquinoline $C_{12}H_{12}N$ (265°–273°). Occurs in crude quinaldine, obtained from par

aldehyde, aniline, and HClAq (Einhorn, *B* 18, 3145) On oxidation with CrO_3/Cl_2 it yields an aldehyde $\text{C}_8\text{H}_7\text{NO}$, crystallising from water in needles (containing 8aq), melting at 74° when hydrated and 102° when anhydrous, it is oxidised by ammoniacal AgNO_3 to an acid crystallising in needles [224°]

Salt $-\text{B}'\text{H}_2\text{PtCl}_4$

Formation -1 By boiling α mixture of aniline and pyruvic acid with water, or by boiling anilpyruvic acid with water In this reaction $\text{CH}_3\text{CHCHCOCO}_2\text{H}$ may perhaps be assumed as an intermediate acid (Böttinger, *B* 14, 90, 133, *A* 191, 321) -2 By oxidising (Py 1, 3) di methyl quinoline with CrO_3 (Beyer, *J pr* [2] 33, 411, Seltz, *B* 23, 2257) -3 By heating isatin with acetone and dilute ($5 p c$) NaOHAq (Pfitzinger, *J pr* [2] 38, 582)

Properties $-\text{Lamins}$ or needles (containing aq), sol water and alcohol, ν e sol dilute acids Tastes bitter

Reactions -1 Yields quinaldine on distillation with lime (Kusel, *B* 19, 2249) -2 Oxidised by KMnO_4 to pyridine tricarboxylic acid -3 Bromine in chloroform forms an oily addition-product, which gives up all its bromine on treatment with boiling water (Böttinger, *B* 16, 2357)

Salts $-\text{HA}'\text{HCl}$ aq needles, loses its HCl when treated with cold water $-(\text{HA}')_2\text{H}_2\text{PtCl}_4$ 2aq $-\text{HA}'\text{HBr}$ 2aq $-\text{BaA}'_2$ aq $-\text{AgA}'$ small plates.

(Py 2) Methyl quinoline (Py 3)-**carboxylic acid** $\text{C}_8\text{H}_7\text{N} \begin{smallmatrix} \text{CH CMe} \\ \text{N C CO}_2\text{H} \end{smallmatrix}$ [144°] Formed by oxidation of (Py 2, 3)-methyl ethyl-quinoline (derived from aniline and propionic aldehyde) with CrO_3 and H_2SO_4 (Doebner & Miller, *B* 17, 1715, 18, 1641) Long silky needles or monoclinic prisms (from ether alcohol), sol hot water and alcohol Split up at 160° into CO_2 and (Py 2) methyl-quinoline $-\text{CuA}'_2$ sl sol water.

(Py 3) Methyl quinoline (Py 2) **carboxylic acid** $\text{C}_8\text{H}_7\text{N} \begin{smallmatrix} \text{CH C CO}_2\text{H} \\ \text{N CMe} \end{smallmatrix}$ *Quinaldine carboxylic acid* [234°] Formed by saponification of its ether, which is produced by the action of o -amido-benzoic aldehyde on an alkaline aqueous solution of acetoacetic ether (Friedländer & Göhring, *B* 16, 1836, *B* 19, 37) Formed also by oxidising (Py 2, 3)-di methyl quinoline with

chromic acid (Rohde, *B* 22, 287) Colourless needles, sl sol water, m sol alcohol. Split up on fusion into CO_2 and quinaldine.

Ethyl ether EtA'. [71°] Long white needles, insol water. May be distilled.—(EtA'), H_2PtCl_6 2aq sparingly soluble yellow needles.

Methyl iodide of the ethyl ether EtA'MeI [205°] Orange needles, sl sol cold water and alcohol, v sol hot water. Ag_2O converts it into the oxide ($\text{EtA}'\text{Me}$), O, an amorphous pp which, when freshly prepared, is sol benzene and chloroform, insol water, alcohol, ether, and ligroin, after a time it becomes insol benzene and chloroform. The oxide decomposes when heated between 180° and 240° HCl converts it into $\text{EtA}'\text{MeCl}$, which yields ($\text{EtA}'\text{MeCl}$), PtCl_4 , crystallising in golden plates [217°]

(*Py* 1) Methyl-quinoline (*B* 2) carboxylic acid $\text{CO}_2\text{H} \cdot \text{C} \cdot \text{CH} \cdot \text{C} \cdot \text{Me} \cdot \text{CH} \cdot \text{HC} \cdot \text{CH} \cdot \text{C} \cdot \text{N} \cdot \text{CH}$ *Lepidine p carboxylic acid* [250°–270°] Obtained by oxidation of the corresponding di methyl quinoline by chromic acid mixture (K Daniel, *B* 23, 2264) Stellate groups of needles Yields lepidine on distillation with soda lime

Methyl-quinoline carboxylic acid $\text{C}_{11}\text{H}_9\text{NO}_2$ $\text{C}_6\text{H}_5(\text{C}_5\text{HMeN} \cdot \text{CO}_2\text{H})$ [190°] Formed by oxidising the fraction 275°–285° (? di methyl quinoline) of the product of the action of aniline on a mixture of isobutyric aldehyde, methylal, and HCl (Von Miller a Kinkelin, *B* 20, 1940) Small crystals, m sol water and alcohol, gives off CO_2 on fusion

(*Py* 4) Methyl quinoline tetrahydride (*B* 3)-carboxylic acid

$\text{CH} \cdot \text{CH} \cdot \text{C} \cdot \text{CH}_2 \cdot \text{CH}_2 \cdot \text{CO}_2\text{H} \cdot \text{C} \cdot \text{CH} \cdot \text{C} \cdot \text{NMe} \cdot \text{CH}_2$ *Karoline m-carboxylic acid* [164°] Obtained by heating quinoline tetrahydride (*B* 3) carboxylic acid with MeI at 150° (Fischer a Korner, *B* 17, 765) Needles, sl sol water, v sol alcohol.

(*Py* 4) Methyl quinoline tetrahydride

(*Py* 1) carboxylic acid $\text{C}_6\text{H}_4 \cdot \text{CH}(\text{CO}_2\text{H}) \cdot \text{CH}_2 \cdot \text{N}(\text{CH}_3) \cdot \text{CH}_2$

Methyl tetrahydro cinchoninic acid Formed by heating the hydrochloride of quinoline tetrahydride (*Py* 1) carboxylic acid with MeOH and MeI at 100°, and decomposing the resulting salt with Ag_2O (Weidel, *M* 3, 66) Crystallises from cold alcohol in large prisms (containing 2aq), v sol water and alcohol, nearly insol ether. Reduces warm ammoniacal AgNO_3 . Decomposes on distillation, yielding an anhydride $\text{C}_{22}\text{H}_{19}\text{N}_2\text{O}$, which is a colourless oil (298° at 744 mm), insol ether, alcohol, and dilute acids, and is converted by heating with HClAq at 150° into MeCl and quinoline tetrahydride (*Py* 1) carboxylic acid (Weidel a Hazura, *M* 5, 643) On heating the anhydride with aqueous KOH it is converted into 'homohydrocinchoninic acid' $\text{C}_{11}\text{H}_{11}\text{NO}_2$, which crystallises in nearly leaflets [125°], insol water, sol alcohol and ether, and forms a hydrochloride $\text{C}_{11}\text{H}_{11}\text{NO}_2\text{HCl}$, crystallising in trimetric prisms ($a b c = 93 \cdot 1 \cdot 2 \cdot 07$), and a methyl iodide $\text{C}_{11}\text{H}_{11}\text{NO}_2\text{MeI}$ aq, forming monoclinic crystals, converted by Ag_2O into $\text{C}_{11}\text{H}_{11}\text{MeNO}_2$ aq, crystallising in glittering prisms, v sol water

Salts—The metallic salts are extremely deliquescent.— $\text{HA}'\text{HCl}$ aq large monoclinic

crystals—(HA'), H_2PtCl_6 large orange crystals.

— $\text{HA}'\text{Hlaq}$ large monoclinic crystals

(*B* 2, *Py* 3) Di-methyl-quinoline (*Py* 1)-carboxylic acid $\text{CMe} \cdot \text{OH} \cdot \text{C} \cdot \text{C}(\text{CO}_2\text{H}) \cdot \text{CH} \cdot \text{OH} \cdot \text{CH} \cdot \text{C} \cdot \text{N} \cdot \text{CMe}$

[262°] Formed by the action of aqueous NaOH on a mixture of *p* methyl-satin and acetone (Pfitzinger, *J pr* [2] 38, 584) Shining plates (from water)

(*B* 4, *Py* 3)-Dimethyl-quinoline (*B* 2)-carboxylic acid

$\text{CO}_2\text{H} \cdot \text{C} \cdot \text{CH} \cdot \text{C} \cdot \text{CH} \cdot \text{CH} \cdot \text{CH} \cdot \text{CMe} \cdot \text{C} \cdot \text{N} \cdot \text{CMe}$

Formed by oxidising (*B* 2, 4, *Py* 3) trimethyl-quinoline with CrO_3 and dilute H_2SO_4 (Panajotoff, *B* 20, 38) Needles (by sublimation), sl sol water and cold alcohol. On distillation with lime it gives (*B* 4, *Py* 3)-di-methyl-quinoline

Salts—(HA'), H_2PtCl_6 4aq orange needles.— BaA'_2 white needles, v sol water— AgA'_2 amorphous precipitate becoming crystalline— $\text{C}_6\text{H}_5(\text{NO}_2)\text{OH}$ [221°] Yellow needles, sl sol water, v sol alcohol

(*Py* 2, 3) Di methyl-quinoline (*B* 2)-carboxylic acid $\text{CO}_2\text{H} \cdot \text{C} \cdot \text{CH} \cdot \text{C} \cdot \text{CH} \cdot \text{CMe} \cdot \text{HC} \cdot \text{CH} \cdot \text{C} \cdot \text{N} \cdot \text{CMe}$ [270°]

Formed by oxidising (*B* 2, *Py* 2, 3 tri methyl quinoline (Miller a Ohler, *B* 23, 2268) Silky needles, sl sol water and alcohol. Gives on distillation (*Py* 2, 3) di methyl quinoline [63°]

— CuA'_2 aq (*Py* 3)-Methyl-quinoline (*B* 2, *Py* 1) di carboxylic acid $\text{CO}_2\text{H} \cdot \text{C} \cdot \text{CH} \cdot \text{C} \cdot \text{C}(\text{CO}_2\text{H}) \cdot \text{CH} \cdot \text{CH} \cdot \text{CH} \cdot \text{C} \cdot \text{N} \cdot \text{CMe}$

Formed by heating *p* amido benzoic acid (30 g) with pyruvic acid (20 g) and aldehyde (12 g) in alcoholic solution on a water bath (Von Miller a R Meyer, *B* 23, 2262) White powder, insol alcohol and other solvents. Cakes together at 160° Gives quinaldine on distillation with lime— CuA'_2 green crystalline pp

(*Py* 3)-METHYL-QUINOLINE (*B* 3)-CARBOXYLIC ALDEHYDE $\text{C}_{11}\text{H}_9\text{NO}$

$\text{CH} \cdot \text{CH} \cdot \text{C} \cdot \text{CH} \cdot \text{CH} \cdot \text{COH} \cdot \text{C} \cdot \text{CH} \cdot \text{C} \cdot \text{NMe}$ [61°] Prepared by adding KMnO_4 to a dilute solution of sodium methyl quinolyl acryic acid covered with benzene and frequently shaking (Eckhardt, *B* 22, 277) Slender hair like crystals (containing $1\frac{1}{2}$ aq!) Melts at 61° when anhydrous and 73° when hydrated. V sol dilute HClAq , sl sol acetic acid, v sol alcohol, ether, and benzene, m sol ligroin and hot water. Volatile with steam. Reduces ammoniacal AgNO_3 . Gives a crystalline sulphate, and a red colour with phenyl hydrazine acetate. Ag_2O oxidises it to the corresponding carboxylic acid [285°] On heating with methyl-quinoline and ZnCl_2 for 2 hours at 150° it yields a condensation product [69°]

Salts— $\text{B}'\text{HCl}$ pale yellow needles— $\text{B}'\text{H}_2\text{PtCl}_6$ [211°] Triclinic crystals (from alcohol containing HCl)— $\text{B}'\text{C}_6\text{H}_5(\text{NO}_2)\text{OH}$ [182°] Needles, blackening at 174°

Phenyl-hydrazide $\text{C}_{11}\text{H}_9\text{N}_2$ The salt $\text{C}_{11}\text{H}_9\text{N}_2\text{HCl}$ separated as brick-red hair-like crystals on adding a hot solution of phenyl hydrazine hydrochloride to a hot solution of the base in HClAq . In presence of H_2SO_4 the salt ($\text{C}_{11}\text{H}_9\text{N}_2$), (H_2SO_4) 9aq separates in small brick red needles

(Py. 8) Methyl-quinoline (B 2)-carboxylic aldehyde $\text{CHO} \cdot \text{C} \cdot \text{CH} \cdot \text{C} \cdot \text{CH} \cdot \text{CH}$
 $\text{OH} \cdot \text{CH} \cdot \text{C} \cdot \text{N} \cdot \text{CMe}^*$ [106°]

Formed by oxidising the corresponding methyl-quinolyl acrylic acid with KMnO_4 , accompanied by agitation with benzene (Miller & Kinkelin, B. 18, 3237). Needles (from water), m sol ligroin and hot water, v sol alcohol, ether, benzene, and acids. On heating with quinaldine at 150° it forms $\text{C}_{10}\text{H}_7\text{N} \cdot \text{CH} \cdot \text{CH} \cdot \text{C}_6\text{H}_5\text{NMe}$, a yellow insoluble substance melting above 300°.— $\text{B}_2\text{H}_6\text{PtCl}_4 \cdot 2\text{aq}$ orange prisms.

Phenyl hydrazide $\text{C}_{17}\text{H}_{11}\text{N}_3$. [160°]. Golden prisms (from alcohol).

(B 2, 4) Di methyl quinoline (Py 8) carb-oxylic aldehyde $\text{CH} \cdot \text{CMe} \cdot \text{C} \cdot \text{CH} \cdot \text{CH}$
 $\text{C} \cdot \text{CH} \cdot \text{C} \cdot \text{N} \cdot \text{CMe}$ [107°]

Formed by oxidising (B 2, 8) di methyl quinolyl-acrylic acid with KMnO_4 (Panajotoff, B. 28, 1471). Yellowish plates, v sol alcohol and ether, sl sol water. Sol acids, insol alkalis.

Tri-methyl-quinoline carboxylic aldehyde $\text{C}_{13}\text{H}_{11}\text{NO}$ [101.5°]. Formed from tetra methyl-quinoline (derived from paraldehyde, aniline, and HCl) by treatment with CrO_3Cl , followed by water (Einhorn, B. 18, 3144). Crystallises from water in needles (containing 3aq) which melt at 74°. When anhydrous it melts at 101.5°. It reduces ammoniacal AgNO_3 , forming a mirror. It yields an oxim [203°] and a phenyl-hydrazide [207°].

METHYL-QUINOLINE MERCAPTAN *o*. METHYL-QUINOLYL MERCAPTAN

(B 2) METHYL-QUINOLINE (B 4)-SULPHONIC ACID $\text{C}_{10}\text{H}_7\text{NSO}_3$, *o*

$\text{C}(\text{CH}_3) \cdot \text{CH} \cdot \text{CH} \cdot \text{C}(\text{SO}_3\text{H}) > \text{C}_6\text{H}_4\text{N}$ *p*-Toluquinoline sulphonic acid. Formed by boiling a mixture of *p*-toluidine sulphonic acid, nitrobenzene, glycerin, and H_2SO_4 (Fischer & Wittmack, B. 17, 441). Formed also by the sulphonation of (B 2) methyl-quinoline (Herzfeld, B. 17, 1552). Colourless plates, sl sol boiling water— KA' v sol water— BaA'_2 (dried at 130°) amorphous, sl. sol water.

(B 4) Methyl-quinoline (B 1)-sulphonic acid $\text{CH} \cdot \text{C}(\text{SO}_3\text{H}) > \text{C}_6\text{H}_4\text{N}$. Obtained by heating *o*-toluidine sulphonic acid $\text{C}_6\text{H}_4\text{Me}(\text{NH}_2)\text{SO}_3\text{H}$ [124] with glycerin, nitrobenzene, and H_2SO_4 (Herzfeld, B. 17, 904). Formed also by sulphonating (B 4) methyl quinoline (Herzfeld, B. 17, 1550). Flat prisms (from water), v sol water— KA' long soluble tables— BaA'_2 soluble trimetric tables.

(B 4) Methyl-quinoline (B 2)-sulphonic acid $\text{SO}_3\text{H} \cdot \text{C} \cdot \text{CH} > \text{C}_6\text{H}_4\text{N}$. Formed by heating *o*-toluidine sulphonic acid $\text{C}_6\text{H}_4\text{Me}(\text{NH}_2)\text{SO}_3\text{H}$ [125] with glycerin, nitrobenzene, and H_2SO_4 (Herzfeld, B. 17, 903). Colourless sparingly soluble prisms.

(Py 8) Methyl-quinoline (B. 2)-sulphonic acid $\text{SO}_3\text{H} \cdot \text{C} \cdot \text{CH} \cdot \text{C} \cdot \text{CH} \cdot \text{CH}$
 $\text{CH} \cdot \text{CH} \cdot \text{C} \cdot \text{N} \cdot \text{CMe}^*$ Quinaldine *p*-sulphonic acid. Formed in small quantity in the sulphonation of quinaldine. Prepared by heating amido-benzene-*p*-sulphonic acid (100 pts) with paraldehyde (80 pts) and HCl (100 pts) for 2 hours on the water-bath (Doebner & Miller, B. 17, 1708). Small monoclinic crystals, v sol. hot

water. On fusion with KOH it yields oxy-methyl-quinoline [213°].

(Py 8) Methyl-quinoline (B. 4)-sulphonic acid $\text{CH} \cdot \text{CH} > \text{C} \cdot \text{CH} \cdot \text{CH}$
 $\text{CH} \cdot \text{C}(\text{SO}_3\text{H}) \cdot \text{C} \cdot \text{N} \cdot \text{CMe}^*$ Quinaldine *o*-sulphonic acid. Formed, in small quantity, in sulphonating quinaldine (Doebner & Miller, B. 17, 1708). Long flat triclinic prisms, v sol. hot water. On fusion with potash it yields oxy-methyl quinoline [74°].

(Py. 8) Methyl-quinoline (B 1 or 8)-sulphonic acid $\text{CH} \cdot \text{C}(\text{SO}_3\text{H}) \cdot \text{C} \cdot \text{CH} \cdot \text{CH}$
 $\text{CH} \cdot \text{CH} > \text{C} \cdot \text{N} \cdot \text{CMe}$ or

$\text{CH} \cdot \text{CH} > \text{C} \cdot \text{CH} \cdot \text{CH}$
 $\text{C}(\text{SO}_3\text{H}) \cdot \text{CH} \cdot \text{C} \cdot \text{N} \cdot \text{CMe}$ Quinaldine *m*-sulphonic acid. The chief product of the sulphonation of quinaldine (Doebner & Miller, B. 17, 1708). Glistening monoclinic prisms, sol hot, sl sol cold, water. On fusion with potash it gives oxy methyl quinoline [234°]. Distillation with KCy yields the nitrile of the corresponding carboxylic acid (Richard, B. 23, 3488).

(Py 1) Methyl-quinoline sulphonic acid $\text{C}_6\text{H}_4(\text{SO}_3\text{H}) < \text{CMe} \cdot \text{CH}$
 $\text{N} \cdot \text{CH}$ Lepidine sulphonic acid.

Formed by heating 'homohydrocinchononic acid' $\text{C}_{16}\text{H}_{19}\text{NSO}_3$ with H_2SO_4 at 180° (Weidela Hazura, M. 5, 652). Crystallises from water in thin plates (containing aq), nearly insol cold, v. sol. hot water.

(Py 1) Methyl quinoline (B 2) sulphonic acid $\text{SO}_3\text{H} \cdot \text{C} \cdot \text{CH} \cdot \text{C} \cdot \text{Me} \cdot \text{CH}$
 $\text{HC} \cdot \text{CH} \cdot \text{C} \cdot \text{N} = \text{CH}$ Formed by heating lepidine (1 pt) with H_2SO_4 (8 pts) at 300° (Busch & Koemigs, B. 23, 2680). Silky needles (containing 2aq), v sol hot water— AgA' aq. white jelly, becoming crystalline.

(Py 1, 3) Di-methyl-quinoline sulphonic acid $\text{C}_{11}\text{H}_{11}\text{NSO}_3$, *o* $\text{C}_6\text{H}_4(\text{SO}_3\text{H}) < \text{CMe} \cdot \text{CH}$
 $\text{N} \cdot \text{CMe}$ Formed by sulphonating the corresponding di methyl-quinoline (Beyer, J. pr. [2] 33, 407). Tables or flat needles, not melting below 303°. On fusion with potash it yields oxy di methyl quinoline [44°].

(B 1, 4) Di-methyl-quinoline (B 2) sulphonic acid $\text{SO}_3\text{H} \cdot \text{C} \cdot \text{CMe} > \text{C}_6\text{H}_4\text{N}$. *p*-Xyloquinoline sulphonic acid. Formed by heating (B 1, 4)-di-methyl-quinoline with fuming H_2SO_4 . Formed also from xyldine sulphonic acid by heating with nitrobenzene, glycerin, and H_2SO_4 (Nöbling & Frühling, B. 21, 3157)— KA' needles or plates, v. sol water— BaA'_2 aq plates, v. sol. hot water— $\text{BaA}'_2 \cdot 2\text{aq}$.

(B 1, 4)-Di-methyl-quinoline (B. 8)-sulphonic acid $\text{SO}_3\text{H} \cdot \text{C} \cdot \text{CMe} > \text{C}_6\text{H}_4\text{N}$. Formed by heating xyldine sulphonic acid (derived from *p*-xylene sulphonic acid) with nitrobenzene, glycerin, and H_2SO_4 (Nöbling & Frühling, B. 21, 3156). Short white plates, sl sol cold water, v. sol hot water and dilute acetic acid— KA' aq v. e sol. water— BaA'_2 aq. needles, v. sol. hot water.

(B 2, 4)-Di-methyl-quinoline sulphonic acid $\text{C}_6\text{HMe}(\text{SO}_3\text{H})(\text{C}_6\text{H}_4\text{N})$. Formed by heating the corresponding di-methyl-quinoline with fuming H_2SO_4 at 165° (Berend, B. 17, 2716). Minute needles (from alcohol-ligron).

(B 2, 4, Py 3)-Tri-methyl-quinoline (B 1)-sulphonic acid. Formed from the corresponding tri-methyl-quinoline by heating with H_2SO_4 at 125° (Panajotoff, B 20, 36) Small yellow needles (from dilute HCl aq), not melting at 260°. Insol cold water — BaA, 384g silky needles

METHYL-QUINOLINIC ACID v METHYL-PYRIDINE DICARBOXYLIC ACID

METHYL-QUINOLINIUM HYDRATE v.

Methylo-hydrate of QUINOLINE

(Py 1)-**METHYL-(Py 3 B 3)-DIQUINOLYL**

[188°]. Obtained by heating flavamine (10 pts), with nitrobenzene (5 pts), glycerin (30 pts), and H_2SO_4 (80 pts) (Fischer, B 19, 1036) Colourless crystals. Strong base. Its salts with mineral acids have a splendid blue fluorescence in dilute solution

Methylo-sodide B'Mel fine yellowish needles, easily soluble in water

Di-(Py 3) methyl-di-quinolyl $C_{22}H_{26}N_4 \cdot n$

$\begin{array}{c} H \text{ OH} \\ \diagdown \quad \diagup \\ \text{Me. N} > C_6H_5 \end{array} \begin{array}{c} \text{CH CH} \\ \diagdown \quad \diagup \\ N \quad \text{OMe} \end{array}$ [207°] (above 360°) Prepared by gradually adding paraldehyde (90 g) to a solution of benzidine (80 g) in conc HCl aq (400 g) at 100°. After heating for ten hours the product is diluted with water, treated with $NaNO_2$, boiled, and pptd by KOH. Hins, A 242, 326) Slender white needles, sol alcohol, benzene, and chloroform, sl sol water and ether. — $B''H_2PtCl_2$ 2aq light yellow pp, sl sol. hot water — $B''H_2HNO_3$ small colourless needles, v sol water, sl sol alcohol — $B''H_2Cr_2O_7$, slender yellow needles, sl sol hot water

Di-methyl-di-quinolyl $C_{22}H_{26}N_4$ [162°] Formed by heating quinaldine with sulphur (Von Miller, B 21, 1928) Crystallises from alcohol in white needles (containing aq) Its picrate crystallises in needles. The platinum-chloride forms needles, v sl sol water

Tetra-methyl-di-quinolyl $C_{22}H_{26}N_4 \cdot n$
 $\begin{array}{c} CH \text{ OMe} \\ \diagdown \quad \diagup \\ \text{OMe N} > C_6H_5 \end{array} \begin{array}{c} \text{CH CH} \\ \diagdown \quad \diagup \\ N \quad \text{OMe} \end{array}$

Tetra-methyl diquinolyl [232°] Formed by heating benzidine with acetone and conc HCl aq at 180° (Schestopal, B 20, 2506) White plates, insol water, sl sol ether, v sol alcohol. When heated with benzoic aldehyde and $ZnCl_2$ at 180° it forms a compound crystallising from alcohol in yellow needles

Salts — $B''H_2Cl$. Needles, v sol water and alcohol — $B''H_2SO_4$. Needles (from water) or prisms (from alcohol) — $B''H_2PtCl_2$ needles — $B''H_2Cr_2O_7$, needles, sl sol cold water — Picrate insol water and cold alcohol. — $B''H_2Cl$, 2HCl flesh coloured needles

Methylo-sodide B'Mel, [270°].

Ethylo-sodide B'EtL, [158°].

(Py 3)-**METHYL QUINOLYL-(B 2)-ACRYLIC ACID** $C_{11}H_{11}NO_2 \cdot n$.

Quinaldine-acrylic acid Obtained by heating a mixture of paraldehyde (40 g), *p*-amido-cinnamic acid hydrochloride (50 g.), and conc. HCl (50 g) (Miller & Kunkeln, B 18, 8285) Small concentric needles. Decomposes between 240° and 250°. Sol hot alcohol, sl sol. cold alcohol and water. By an alkaline solution of $KMnO_4$ it is

oxidised to methyl-quinoline carboxylic aldehyde C_9H_9MeCHO

Salts — $A'H_2HCl$ aq easily soluble concentric prisms — $A'H_2HNO_3$ aq needles or prisms, sl sol dilute HNO_3 — $(A'H_2HCl) \cdot PtCl_2$ 2aq, reddish-yellow prisms

(Py 3)-Methyl-quinolyl (B 3)-acrylic acid

$C_{11}H_{11}NO_2 \cdot n$. $CO_2H \text{ CH CH } C \text{ OH } C \text{ N } CMe$ [246°] Obtained by heating *m*-amido-cinnamic acid with paraldehyde and conc HCl aq at 150° (Eckhardt, B 22, 272) Small white monoclinic prisms (from alcohol), tending to become yellow, sl sol ether, chloroform, and petroleum ether, m sol alcohol, benzene, and acetone. When heated above its melting point a small sublimate of slender needles [223°] is obtained. $KMnO_4$ oxidises it to the corresponding methyl-quinoline carboxylic aldehyde. On warming with chloral on the water bath two compounds are formed. One of these compounds $C_{11}H_{11}NO_2 \cdot CH_2CH(OH)CO_2H$ crystallises from alcohol in prisms [201°], which dissolve in nitric acid with violet fluorescence, and which yield the salts $C_{11}H_{11}Cl_2NO_2 \cdot HCl$ [over 300°] and $AgC_{11}H_{11}Cl_2NO_2$ crystallising in slender needles. The other compound $C_{22}H_{26}Cl_2N_4O_2$ crystallises from alcohol in needles [128°] which dissolve in nitric acid with blue fluorescence, and which forms a salt $C_{22}H_{26}Cl_2N_4O_2 \cdot HCl$ [217°]

Salts — $HA'HCl$ aq deliquescent trimetric needles — $(HA') \cdot H_2PtCl_2$ 2aq yellow needles or plates — $HA'HNO_3$ aq needles, sol water — $HA'C_6H_5(NO_2)OH$ aq [152°] Bundles of slender needles, sol alcohol, hot water, and HOAc, sl sol ether — CaA' 3aq slender needles (from water), v sol dilute HCl aq and acetic acid — AgA' 2aq minute crystalline lancelets — AgA' 4aq needles

(Py 3)-Methyl-quinolyl-(B 1?)-acrylic acid $C_{11}H_{11}NO_2$. Formed on one occasion in the preparation of the preceding isomeride (E) Crystallises in yellowish monoclinic plates (containing aq) [184°] and in white crystals (containing $\frac{1}{2}$ EtOH) [204°] Its ammoniacal solution, unlike that of its isomeride, is not pptd. by salts of Ba, Ca, and Mg

(B 2, 4)-Di-methyl-(Py 3)-quinolyl-acrylic acid $\begin{array}{c} CMe \text{ CH } C \text{ CH CH} \\ \diagdown \quad \diagup \\ CH \text{ CMe } C \text{ N } C \text{ CH CH } CO_2H \end{array}$ Formed by boiling the compound of chloral and (B 2, 4, Py 3) tri-methyl-quinoline with aqueous K_2CO_3 (Panajotoff, B 20, 42) Yellowish needles, decomposing at 180°, forming a product melting at 210°

METHYL-QUINOLYL-AMMONIUM IODIDE v. Methylo-sodide of QUINOLINE

(Py 1)-**METHYL-QUINOLYL ETHYL SULPHIDE** $C_9H_9 \begin{array}{c} \text{CMe CH} \\ \diagdown \quad \diagup \\ N \quad \text{CSEt} \end{array}$ Formed by treating methyl-quinolyl mercaptan with NaOEt and EtI (Roos, B 21, 628) Oil, volatile with steam — $B''H_2PtCl_2$ 4aq — $B''HI$ [214°] Long yellow needles

(Py 3)-Methyl-quinolyl ethyl sulphide $C_9H_9 \begin{array}{c} \text{C(SeEt) CH} \\ \diagdown \quad \diagup \\ N = \text{CMe} \end{array}$ [56°]. Formed from sodium methyl-quinolyl mercaptide and EtI (R). White needles, v. sol. alcohol and ether, insol. water

together with benzoyl methyl-indole by heating methyl-indole (methyl ketone) with benzoyl chloride and ZnCl_2 . Also formed by oxidation of the leuco-compound benzylidene-methyl-indole. Amorphous yellow pp, v sol alcohol and ether, or yellowish-red prismatic crystals, sl sol alcohol, v sl sol ether. The amorphous modification is converted into the crystalline by long boiling with water. It dissolves in acids and in alcoholic NaOH or KOH with a red colour. Its salts are red dyestuffs closely resembling rosaniline. By zinc-dust and NH_3 it is reduced to benzylidene-methyl indole [248°]—B'HCl small metallic green crystals, sl sol water (Fischer & Wagner, B 20, 815).

METHYL SALICYLIC ACID v **OXY-TOLUIC ACID** and the *Methyl derivative of o-OXY BENZOIC ACID*

METHYL-SALICYLIC ALDEHYDE v *Methyl derivative of o OXY BENZOIC ALDEHYDE*

u-Di-methyl-succinic acid $\text{C}_6\text{H}_8\text{O}_4$, i.e. $\text{CO}_2\text{H} \cdot \text{CH}_2 \cdot \text{CMe}_2 \cdot \text{CO}_2\text{H}$ *Isodipic acid* *Isobutane dicarboxylic acid* Mol w. 146 [140°] H C v 671,400 H Cp 671,700 H F 237,800 (Stohmann, Kleber, & Langbein, J pr [2] 40, 212)

Formation.—1 From its imide, which is formed, together with di-methyl malonic acid, by oxidising mesitylic acid $\text{C}_6\text{H}_3\text{NO}_2$ with KMnO_4 in acid solution (Pinner, B 15, 582)—2 By boiling with HClAq the isobutane tricarboxylic ether $\text{CO}_2\text{Et} \cdot \text{CMe}_2 \cdot \text{CH}(\text{CO}_2\text{Et})_2$ obtained by the action of α -bromo isobutyric ether on sodio malonic ether (Leuckart, B 18, 2350, Bischoff, B 23, 1943). Formed also by heating

the corresponding isobutane tricarboxylic acid (Barnstein, A 242, 133)—3 By oxidising with chromic acid mixture the terpene $\text{C}_{10}\text{H}_{16}$, obtained from copaiba balsam (Levy & Englander, A 242, 192)—4 By oxidising tropilene C_8H_8 with nitric acid (S G 138) (Ladenburg, A 217, 139)—5 By heating its nitrile (obtained from isobutylene bromide and KC_y) with HClAq at 150° (Hell & Rothberg, B 22, 1740)

Properties.—Thick colourless prisms (from benzene), crystallising from water in efflorescent monoclinic forms, $a b c = 2.029 : 1.191$; $\alpha = 118^\circ 36'$, $\beta = 95^\circ 16'$, $\gamma = 101^\circ$ V sol water, alcohol, ether, and acetone, v sl sol chloroform and ligroin. At about 185° it splits up into CO_2 and its anhydride.

Salts—**KHA** 2 $\frac{1}{2}$ aq small prisms (P)—**KHA** 5aq (B)—**NaHA** 3 $\frac{1}{2}$ aq Monoclinic prisms, $a b c = 1.8365 : 1.41801$, $\beta = 90^\circ 43'$ (L & E)—**NaA** 11aq needles, v sol water—**NH₄HA**—(NH $_4$) $_2$ A—**BaA** 2aq (B)—**BaA** 2 $\frac{1}{2}$ aq monoclinic plates, $a b c = 1.601 : 1.1790$, $\beta = 97^\circ 26'$ Sl sol hot, m sol cold, water, insol alcohol (L & E)—**CaA** 7aq minute plates, sl sol water, insol alcohol—**CdA** 6aq—**CuA** 2aq—**PbA** 7aq—**Ag₂A**: white pp, v sl sol water

Methyl ether Me_2A (200°) SG $\frac{1}{2}$ 10568

Ethyl ether EtA . (215°) SG $\frac{1}{2}$ 10134 (B), II 9976 (L & E)

Anhydride $\text{CMe}_2\text{CO} \cdot \text{CO} \cdot \text{O}$ [29°] (218°) (B), (220°) (L & E)

Chloride $\text{C}_2\text{H}_5\text{Me}_2(\text{C}_2\text{O}_2\text{Cl}_2)$ (201°) (B), (193°) (L & E) Formed by heating the acid with PCl_5 at 125° Reacts with phenyl hydrazide, forming the compound $\text{CMe}_2\text{CO} \cdot \text{CO} \cdot \text{N} \cdot \text{NHPh}$ [182°], which yields a nitrosamine [76°]

Imide $\text{CMe}_2\text{CO} \cdot \text{CO} \cdot \text{NH}$ [106°] Formed from the chloride and NH_3 Plates (from ether) Yields $\text{C}_2\text{H}_5\text{KNO}_2$ 2 $\frac{1}{2}$ aq, crystallising in prisms, v. sol alcohol

Nitrile $\text{CN} \cdot \text{CH}_2 \cdot \text{CMe}_2 \cdot \text{CN}$ *Isobutylenes cyanide* (219°) Formed by leaving a mixture of isobutylene bromide and alcoholic KC_y to stand for two weeks, heating to 140° to expel alcohol, and extracting the residue with ether (Hell & Rothberg, B 22, 1740) Clear liquid, v sol water

Anti-s-di-methyl succinic acid $\text{C}_6\text{H}_8\text{O}_4$, i.e. $\text{CO}_2\text{H} \cdot \text{CHMe} \cdot \text{CHMe} \cdot \text{CO}_2\text{H}$ *Maleonoid di-methyl succinic acid* *Butane dicarboxylic acid* [120°] (O & R, H & R, B & V), [124°] (Z) S 30 at 14°

Formation.—1 Together with the isomeric 'para' or fumaroid acid [194°] by reduction of di-methyl maleic acid (Otto & Rössing, B 20, 2738)—2 Together with the isomeric acid [194°] by heating with HClAq the mixture of their ethers obtained by adding α -bromo-propionic ether to an alcoholic solution of α -cyano propionic ether and NaOEt (Zelinsky, B 21, 8160)—3 A mixture of the ethers of the two isomeric s-di-methyl-succinic acids is also formed, with other bodies, when α -bromo-propionic ether is heated with finely-divided silver (Hell & Rothberg, B 22, 60)—4 The mixture of 'anti-' and 'para' di-methyl succinic acids is also formed by hydro-

lysis of butane tricarboxylic acid derived from sodium methyl malonic ether and a bromo propionic ether (Leuckart, *B* 18, 2346, Bischoff a Voit, *B* 22, 889) —5 From its anhydride, which is formed, together with the anhydride of the fumaroid isomeride, by heating the fumaroid acid [194°] for several hours at 200° (Bischoff a Voit, *B* 23, 641)

Properties — Concentrically grouped prismatic needles, more sol hot than cold water, v sol ether, alcohol, acetone, and chloroform, sl sol CS₂, and benzene, almost insol ligroin. A neutral solution of its ammonium salt gives a yellowish red pp with FeCl₃, a greenish blue pp with cupric sulphate, but no pp with salts of Ba, Zn, Mg, Co, and Ni. Bromine at 130° converts it into di methyl maleic acid [95°]

Salts — CaA'' 2aq crystalline powder, sl sol cold water — BaA'' 3aq thin plates, sl sol water — Ag.A'' white crystalline pp

Methyl ether Me.A'' (200°) From Ag.A'' and MeI at 100° Oil, with pleasant odour (Zehnsky a Krapivin, *B* 22, 646)

Ethyl ether Et.A'' (220°) SG § 1 0218, $\frac{1}{2}$ 1 0072 (Z a K), $\frac{1}{2}$ 1 0315 (B a V) H C 1,296,860 (Ossipoff, *C* R 109, 224) Oil, decomposed by heat into the anhydride and Et.O

Chloride (186°-197°)

Imide $\begin{matrix} \text{CHMe CO} \\ \text{CHMe CO} \end{matrix} > \text{NH}$ [106°] (B a V).

[110°] (Z a K) Obtained by distilling the dry ammonium salt in gaseous NH₃. Stellate groups of prisms (from dilute alcohol) or thin needles (from benzene), v sol water, alcohol, benzene and chloroform, sl sol ether, v sl sol ligroin reconverted into the acid [120°] by alkalis

Anilide CONHPh CHMe CO CONHPh [222°] Formed from the chloride and aniline. Needles (from alcohol)

Phenyl-imide $\begin{matrix} \text{CHMe CO} \\ \text{CHMe CO} \end{matrix} > \text{NPh}$ [146°]

Formed by heating the acid (1 mol) with aniline (2 mols) till the aniline begins to distil. Slender needles, v sol alcohol, ether, and benzene, sl sol water

Anhydride $\begin{matrix} \text{CHMe CO} \\ \text{CHMe CO} \end{matrix} > \text{O}$ [87°] When

formed by heating the 'anti' acid to 200°, it yields only the 'anti' acid again when heated with water, but when formed from the 'para' acid by like treatment the product (a mixture of anhydrides?) yields a mixture of 'para' and 'anti' acids, the amount of the latter increasing with the duration of the heating. Formed also from the 'anti' acid by heating with AcCl. In all cases it melts at 87°. When heated with bromine in chloroform at 90° it yields di methyl-maleic acid

'Para' s-di-methyl-succinic acid C₆H₁₀O₄, i.e. MeCH(CO₂H)CHMeCO₂H *Fumaroid variety* of s di methyl succinic acid *Isocadic acid* *Hydroxyprocionchonic acid* [194°] (O a B), (B a V) (192°) (Z) H F 238,000 H C v 670,700 H C p 671,000 (Stohmann, Kleber, a Langbein, *J* pr [21 40, 212] S 1 at 22°

Formation —1 By heating a bromo propionic acid with reduced silver at 155° (Wishnecus, *B* 2, 720, cf anti-di methyl succinic acid, *Formation* 3) —2 By boiling (aβ) di-methyl-acetyl succinic ether with conc alcoholic KOH (Hardtmuth, *A* 192, 143) —8 By

boiling an aqueous solution of sodium di-methyl-maleate with sodium amalgam (Weidel, *A* 173, 109, *M* 3, 612) —4 From its amide which is formed by the action of NH₃ on an oily product of the action of bromine on a solution of cyanoethine in dilute H₂SO₄ (E von Meyer, *J* pr [2] 26, 358) —5 Together with the isomeride [120°] by the reduction of di methyl maleic anhydride by HIAq at 220° or by sodium amalgam (Otto a Beckurts, *B* 18, 838, Otto a Rössing, *B* 20, 2736) —6 By heating cyano-di methyl succinic acid with HClAq (Zehnsky, *B* 21, 3166) —7 Together with the 'anti' isomeride, by all the modes of formation described above for that acid —8 By heating the 'anti' isomeride for several hours with conc HClAq at 180°-190° (Bischoff a Voit, *B* 23, 643)

Properties — Small triclinic needles (from alcohol), sl sol water, m sol alcohol. On heating at 200° it yields a mixture of its anhydride and that of the 'anti' acid, after several hours' heating it is almost wholly converted into the anhydride of the 'anti' acid. Its neutral solution is ppd by FeCl₃, CuSO₄, BaCl₂, and lead acetate. On treatment with bromine it yields di methyl-maleic acid

Salts — NH₄HA'' (dried at 100°). Monoclinic prisms, v sol water — CaA'' 2aq prisms (Bischoff a Rach, *A* 234, 76) — CaA'' aq (Z) — CaA'' 1½aq (W) Monoclinic needles — SrA'' — BaA'' 4aq — PbA'' — PbA'' ½aq short prisms — CuA'' — Ag₂A''

Methyl ether Me.A'' (199°) Oil (Zehnsky a Krapivin, *B* 22, 650) Yields the acid [192°] on saponification

Ethyl ether Et.A'' (220°) SG § 1 013, $\frac{1}{2}$ 1 002 H C 1,303,570 Oil, with pleasant odour. Yields on saponification a mixture of the acids [120°] and [192°]

Chloride (186°-197°)

Imide $\begin{matrix} \text{MeCH} - \text{CO} \\ \text{CHMe CO} \end{matrix} > \text{NH}$ [78°] From the

ether and NH₃. Crystallises from benzene. Yields only the 'para' acid on saponification

Anilide MeCH(CONHPh)CHMe CONHPh [235°] From the chloride and aniline. Needles, sol ether and HOAc. Yields only the 'para' acid on saponification

Phenyl imide $\begin{matrix} \text{MeCH} - \text{CO} \\ \text{CHMe CO} \end{matrix} > \text{NPh}$

[126°] Formed by heating the acid with aniline. Caustic potash converts it into a mixture of 'anti' and 'para' acids

Anhydride $\begin{matrix} \text{MeCH} - \text{CO} \\ \text{CHMe CO} \end{matrix} > \text{O}$ [88°]

Formed from the acid and AcCl. May be reconverted into the original acid. By heating the 'para' acid to 180°-196° a mixture of anhydrides [87°] is formed, which yields on saponification a mixture of 'anti' and 'para' acids

Derivative — v Di-chloro-di-methyl-succinic acid

Tri-methyl-succinic acid C₆H₁₂O₄, i.e. CO₂H CHMe CMe₂ CO₂H [105°] *Electrical conductivity* Bischoff, *B* 23, 1466 Formed by the hydrolysing action of H₂SO₄ on pentane tricarboxylic ether obtained from sodium methyl-malonic ether and a bromo isobutyric ether (Bischoff a Mintz, *B* 23, 649) Yields an anhydride melting between 67° and 89°

This acid is probably identical with s-di-

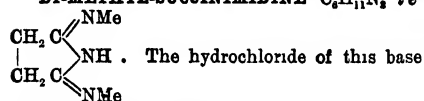

methyl-glutaric acid (Bischoff & Jannanicker, *B.* 23, 3408)

Tetra-methyl-succinic acid $C_8H_{14}O_4$, *see* CO_2H CM_2 , CM_2 , CO_2H *Hexane dicarboxylic acid* Mol w 174 [192] Formed, together with the isomeric tri-methyl-glutaric acid [97], by heating α -bromo isobutyric ether (3 pts) with dry silver powder (2 pts) at 125° for 8 hours. The product is fractionally distilled, and the fraction 200°–250° saponified by heating with $HBrAq$ at 100°. The resulting acids may be separated by steam distillation, tetra methyl-succinic acid alone passing over (Hell, *B* 7, 320, 10, 2229, Auwers & V Meyer, *B* 22, 2014, 3005, 23, 299)

Properties—Short branching crystals, melting at 200° when quickly heated, and 192° when slowly heated, sl sol cold water, m sol hot water, ether, chloroform, and CS_2 , v sol alcohol and benzene, almost insol ligrom

Anhydride [147°] (230.5) Formed by heating the acid alone, with $HClAq$ at 200°, or with $AcCl$ at 100°. Formed also by treating the acid (6 g) with red phosphorus (8 g) and bromine (16 g). Slender needles (from ligrom). May be sublimed. Soon becomes resinous. Nearly insol cold water and cold Na_2CO_3Aq , slowly dissolved by these liquids on heating, being converted into the acid

DI-METHYL-SUCCINIMIDINE $C_6H_{11}N_2$, *see*

is formed by the action of methylamine on succinimido-ether— $BHCl$ glistering prisms, [248°], v sol water, sl sol alcohol (Pinner, *B* 16, 1658)

METHYL-SUCCINURIC ACID *Amide*

NH_2 , CO NMe , CO CH_2 , CH_2 , $CONH_2$ (?) [205°–207°] Formed from methyl succinyl-urea CO $\begin{array}{l} \nearrow NMe \\ \searrow NH \end{array}$ CO CH_2 and alcoholic NH_3 at 100° (Menschutkin, *A* 178, 210) Plates, v sl sol boiling alcohol

DI-METHYL-SULPHAMIC ACID $C_2H_7NSO_3$, *see* NMe_2 , SO_2 , OH [165°] Formed, together with hydrogen di methyl ammonium sulphate NMe_2H , O SO_2 , OH , by boiling its chloride with water (Behrend, *B* 15, 1610, *A* 222, 130) Large six sided plates (from alcohol), v sol water, m sol alcohol, sl sol ether. By boiling with water, alkalis, or dilute nitric acid, it is converted into $(NMe_2H)_2SO_3H$. It expels CO_2 from carbonates

Salts— BaA' , aq plates, v sol water— PbA' , aq— AgA' , aq v e sol water, ppd by adding ether to its alcoholic solution

Ethyl ether EtA' From the chloride and $NaOEt$ Oil

Chloride NMe_2 , SO_2 , Cl (183° at 760 mm., 114° at 75 mm.) Formed by heating dimethylamine hydrochloride (1 mol) with SO_2Cl_2 (1½ mols) on the water-bath, the yield being 50 p c of the theoretical. The product is mixed with water, and the chloride extracted with ether, shaken with aqueous Na_2CO_3 , dried over $CaCl_2$, and distilled (Behrend). Golden yellow oil, partially decomposing on distillation with evolution of HCl . V sol alcohol, ether, benzene, and chloroform, insol water, $HClAq$, and $KOHAg$

Boiling water decomposes it into HCl , H_2SO_4 , NMe_2 , SO_2 , OH , and dimethylamine. Sodium-amalgam reduces it to H_2S , dimethylamine, and H_2SO_4 . Tin and $HClAq$ act in like manner. Zinc dust yields tetra methyl sulphamide

Amide v **DI-METHYL-SULPHAMIDE**

Dimethylamide v **TETRA-METHYL-SULPHAMIDE**

Di-ethyl-amide NMe_2 , SO_2 , NEt_2 (229°) From the chloride and NEt_2H Oil, partially decomposed on distillation

***n*-DI-METHYL-SULPHAMIDE**

NMe_2 , SO_2 , NH_2 [96°] Formed by passing NH_3 into the chloride of di methyl sulphamic acid (Behrend, *B* 15, 1611, *A* 222, 126) Six sided prisms with pyramidal ends, v sol water and alcohol, m sol ether

***s* Di methyl-sulphamide** $NHMe$, SO_2 , $NHMe$ [78°] Prepared by the action of methylamine on SO_2Cl_2 in ethereal solution at 0° (Franchimont, *R T C* 3, 418) Prisms, v e sol water and alcohol, v sl sol benzene. Tastes sweet. Nitric acid converts it into SO , $(NMe_2NO)_2$

Tetra methyl sulphamide SO , $(NMe_2)_2$ [73°] Formed from SO_2Cl_2 and $NHMe_2$ dissolved in chloroform (Behrend, *B* 14, 722, *A* 222, 119) Formed also from NMe_2 , SO_2 , Cl and $NHMe$. Colourless plates (from alcohol), v sol alcohol and ether, v sl sol water, aqueous acids and alkalis. May be sublimed. Dry HCl at 120° decomposes it into NMe_2 , SO_2 , Cl and $NHMe$. Conc HNO_3 yields NMe_2NO_2 (Franchimont, *R T C* 3, 420)

METHYL SULPHATES **Mono-methyl sulphate** CH_3O , SO_2 , OH *Methyl sulphuric acid* Formed by mixing methyl alcohol (1 pt) with H_2SO_4 (2 pts), allowing the hot mixture to cool, diluting with water, adding $BaCO_3$, filtering and evaporating. The barium salt thus obtained is then decomposed by H_2SO_4 (Dumas & Pélégot, *A Ch* [2] 58, 54, 61, 199, *A* 15, 40, Kane, *P M* 7, 397) Formed also from Cl , SO , OH and methyl alcohol (Claesson, *J pr* [2] 19, 240) Liquid, not solidified at -30° , v e sol water, m sol alcohol, miscible with dry ether. Yields Me_2SO , and H_2SO_4 on distillation. When the potassium salt is heated with potassium acetate methyl acetate is formed, methyl ethers of other acids are formed in like manner

Salts— $KMeSO_3$, aq very deliquescent monoclinic tables, $a b c = 742$ 779 1, $\beta = 86^\circ 51'$ (Schabus, *J* 1854, 552)— $Ca(MeSO_3)_2$ very deliquescent octahedra— $Ba(MeSO_3)_2$ 2aq monoclinic tables, $a b c = 824$ 1 907 1, $\beta = 83^\circ 30'$ *S G* 192 2 273— $Pb(MeSO_3)_2$ aq long deliquescent prisms, v sol water— $UO_2(MeSO_3)_2$ aq very deliquescent crystals (Pélégot, *A* 56, 231)

Chloride MeO , SO_2 , Cl (132.5°) at 722 mm. Formed from SO_2Cl_2 (1 mol) and $MeOH$ (1 mol) (Behrend, *J pr* [2] 15, 32) Formed also from $MeOCl$ and SO_2 (Sandmeyer, *B* 19, 861) Pun gent oil, decomposed by water into HCl and MeO , SO_2 , OH

Di-methyl sulphate Me_2SO_4 . Mol w 126 (188°) *S G* 21 1 324 (*D* & *P*)

Formation—1 From Me_2O and SO_3 —2 By dry distillation of $MeHSO_4$ (Dumas & Pélégot, Claesson, *J pr* [2] 19, 244, *B* 13, 1699)—3. By distilling methyl alcohol (1 pt) with conc H_2SO_4 (9 pts), washing the distillate with water,

drying the oily layer with CaCl_2 , and rectifying (Dumas & Péligot, *A Ch* [2] 58, 32)

Properties—Oil, decomposed by boiling water and by alkalis into MeOH and H_2SO_4 . An ethereal solution of NH_3 forms $\text{MeO SO}_2 \text{ONH}_2\text{Me}$. Distillation with fused NaCl forms MeCl and Na_2SO_4 . Distillation with KOBz yields MeOBz and K_2SO_4 . Sodium formate yields methyl formate and sodium sulphate. It forms double compounds with sulpho acetates, sulpho benzoates, and isethionates (Geuther, *A* 218, 288)

METHYL SULPHIDE $(\text{CH}_3)_2\text{S}$ Mol w 62 (41°) (R), (37°) (K) SG ⁴⁰ 845 H.F.p 12,730 H.F.v 11,570 SV 75.6 (Lossen, *A* 254, 71) Formed by passing MeCl into a solution of K_2S in MeOH (Regnault, *A Ch* [2] 71, 391, *A* 34, 26) Prepared by distilling a concentrated solution of MeNaSO_4 (from 500 c.c. MeOH) with aqueous KOH (500 g) that has been previously half saturated with H_2S , the yield being moderate (150 g). Colourless mobile liquid with very unpleasant odour (Klaason, *B* 20, 3407)

Reactions—1 Takes fire when dropped into dry chlorine, but if the temperature be kept low only substitution products $(\text{CH}_3\text{Cl})_2\text{S}$, $(\text{CH}_3\text{Cl})_3\text{S}$, and $(\text{CCl}_3)_2\text{S}$ may be obtained (Riche, *A Ch* [3] 43, 283) The compound $(\text{CCl}_3)_2\text{S}$ boiled at 156°–160° and gave a V D 5.68 (calc 9.41) —2 *Iodoacetic ether* forms $\text{S}(\text{CH}_2\text{CO}_2\text{Et})_2$, tri-methyl-sulphine iodide, and $\text{Me}_3\text{S}(\text{CH}_2\text{CO}_2\text{Et})_2$ (Letts, *Tr E* 28, 618) —3 *Bromoacetic ether* forms $\text{Me}_3\text{SBrCH}_2\text{CO}_2\text{Et}$ which crystallises in pearly scales and yields when treated with moist Ag_2O unstable $\text{Me}_3\text{S}(\text{OH})\text{CH}_2\text{CO}_2\text{Et}$ (Letts)

Combinations— Me_3SBr Crystals (Cahours, *A* 135, 355) When dissolved in water it gives off HBr . When its alcoholic solution is treated with zinc and the product evaporated and mixed with HgCl_2 , there is formed a pp of $(\text{SMe}_2)_2\text{HgCl}_2\text{ZnBr}$ (Patein, *Bl* [2] 50, 201) — Me_3SiI Crystals resembling iodine — Me_3SHgCl , — $(\text{Me}_3\text{S})_2\text{PtCl}_2$ (Lorr, *A* 107, 234) Yellow crystalline powder Melts with decomposition at 218° (Blomstrand, *J pr* [2] 38, 365) — $(\text{Me}_3\text{S})_2\text{PtCl}_2$ [159°] Formed by the action of Me_3S on potassium platinum chloride at 60° (Blomstrand, *J pr* [2] 38, 358) Exists in two allotropic forms, crystallising in lemon yellow monoclinic crystals, and in yellow dimetric plates (containing CHCl_3) — $(\text{Me}_3\text{S})(\text{Et}_3\text{S})\text{PtCl}_2$ Formed from $(\text{Et}_3\text{S})_2\text{PtCl}_2$ and Me_3S — $(\text{Me}_3\text{S})_2\text{PtCl}_2\text{Br}_2$ — $(\text{Me}_3\text{S})_2\text{PtBr}_4$ reddish brown monoclinic crystals (from chloroform) — $(\text{Me}_3\text{S})_2\text{PtBr}_2$ Formed from $(\text{Me}_3\text{S})_2\text{PtSO}_4$ and KBr (B) Yellow monoclinic crystals — $(\text{Me}_3\text{S})_2\text{PtI}_2\text{Cl}_2$ greenish black crystalline powder — $(\text{Me}_3\text{S})_2\text{PtI}_2\text{Br}_2$ — $(\text{Me}_3\text{S})_2\text{PtI}_4$ black crystalline powder — $(\text{Me}_3\text{S})_2\text{PtI}_2$ [172°] Formed from $(\text{Me}_3\text{S})_2\text{Pt}(\text{NO}_3)_2$ and KI (B) Red crystals — $(\text{Me}_3\text{S})_2\text{Pt}(\text{NO}_3)_2$ [156°] Formed from $(\text{Me}_3\text{S})_2\text{PtCl}_2$ and AgNO_3 (B) Small brownish needles — $(\text{Me}_3\text{S})_2\text{Pt}(\text{NO}_3)_2$ Formed from $(\text{Me}_3\text{S})_2\text{PtSO}_4$ and potassium nitrite (B) Small white plates, soluble in chloroform — $(\text{Me}_3\text{S})_2\text{PtSO}_4$ 2aq [91°] Formed from silver sulphate and $(\text{Me}_3\text{S})_2\text{PtCl}_2$ Yellowish crystalline mass, v sol water — $(\text{Me}_3\text{S})_2\text{PtCrO}_4$ reddish-brown pp got by adding K_2CrO_4 to a solution of $(\text{Me}_3\text{S})_2\text{PtSO}_4$. Sl sol water, insol alcohol and chloroform

Methylo-sodide SMe_2I **Tri-methyl-sulphine iodide** Formed, even in the cold, by the

union of Me_3S with MeI (Cahours, *C R* 80, 1817, 81, 1163, *A Ch* [5] 10, 13, *A* 135, 355, 136, 151) Formed also by heating MeI at 100° with ppd As_2S_3 or with Na_2S (Klinger, *B* 15, 881, *A* 252, 357) and by heating Se_2I with MeOH at 140° (Klinger & Maassen, *A* 252, 252) Large prisms (from water), v sol hot water, sl sol alcohol, insol ether Its aqueous solution is partially decomposed on evaporating at 100°, forming Me_3S and iodine Moist Ag_2O yields SMe_2OH , a strongly alkaline base whence the other salts may be prepared by neutralisation with acids An aqueous solution of SMe_2I gives with alcoholic HgCl_2 a pp of Me_3SIHgI which forms pale yellow needles, nearly insol water and ether, sol alcohol (Patein, *Bl* [3] 2, 159) Bromine forms Me_3SIBr , which separates from hot alcohol in orange-red crystals [95°] which in alcoholic solution give with platinum chloride a pp of $(\text{Me}_3\text{SiCl})_2\text{PtCl}_4$ (Dobbin & Masson, *C J* 47, 56) Tri-methyl sulphine di-bromo-iodide is converted by dry NH_3 into $\text{Me}_3\text{SIBr.N.H}_3$, an amorphous light green mass [75°–80°] Chlorine forms Me_3SiCl , which separates from alcohol in yellow crystals [104°], converted by aqueous ammonia into iodide of nitrogen and by gaseous ammonia into $\text{Me}_3\text{SiCl.2NH}_3$, an unstable compound which loses ammonia and absorbs water when exposed to air (D & M) The compound $(\text{Me}_3\text{Si})_2\text{As}_2\text{I}_4$ is formed by heating As_2S_3 with MeI at 100° and crystallises in blue black needles (Klinger & Maassen, *A* 252, 260) The compound $\text{Me}_3\text{SISnI}_2$ crystallises in yellow needles, sl sol cold water The compound $(\text{Me}_3\text{Si})_2\text{CdI}_2$ formed by heating CdS with MeI at 100°, crystallises from water or alcohol in white needles, melting at 185° when slowly heated and 195° when quickly heated, and converted by aqueous CdI_2 into $\text{Me}_3\text{SiCdI}_2$ [168°]

Methylo-chloride Me_3SiCl From the base and HCl Deliquescent prisms Gives the salts $(\text{Me}_3\text{SiCl})_2\text{PtCl}_2$ crystallising from hot water in sparingly soluble orange-yellow prisms and Me_3SAuCl crystallising in thick prisms, v e sol water Me_3SiCl shaken with an ethereal solution of iodine yields reddish black crystals of $\text{Me}_3\text{Si}_2\text{Cl}$, which is probably also formed from Me_3SiI and ICl (Dobbin & Masson) Me_3SiCl is converted by ICl into Me_3SiCl_2 Dry chlorine forms Me_3SiCl_2 , a yellow liquid, solidifying on exposure to air Decomposed by water, alcohol, and ether, into Me_3SiCl and chlorine

Methylo-bromide Me_3SBr Formed from $\text{Me}_3\text{S OH}$ and HBr Also formed from Me_3S and MeBr Prisms, v sol water Converted by iodine in ethereal solution into Me_3SIBr . With ICl it forms $\text{Me}_3\text{SiClBrI}$ as yellow crystals [87°], completely decomposed at 190°

Methylo-sulphhydrate $\text{Me}_3\text{S SH aq}$ From $\text{Me}_3\text{S OH}$ and H_2S (Brown & Blaikie, *J pr* [2] 23, 395)

Methylo-sulphide $(\text{Me}_3\text{S})_2\text{S}$ **Tri-methyl-sulphine sulphide** An aqueous solution of this body may be got by saturating one half of a conc solution of $\text{Me}_3\text{S OH}$ with H_2S , and adding the other half This solution, if allowed to evaporate in dry air or in coal gas, when it reaches a certain strength forms Me_3S , thus $(\text{Me}_3\text{S})_2\text{S} = 3\text{Me}_3\text{S}$ (Crum Brown & Blaikie, *Pr E* 9, 563, *C N* 37, 130) On gently heating a solution of $(\text{Me}_3\text{S})_2\text{S}$ in a sealed tube, Me_3S

separates as an upper layer. The aqueous solution has the characters of an alkaline sulphide, dissolving sulphur (forming $(\text{Me}_2\text{S})_2\text{S}_2$) and Sb_2S_3 . Acids decompose it with evolution of H_2S .

Methylo-thiosulphate $(\text{Me}_2\text{S})_2\text{S}_2\text{O}$, aq. Formed by exposing an aqueous solution of $(\text{Me}_2\text{S})_2\text{S}$ to atmospheric oxidation. Formed also by exposing $(\text{Me}_2\text{S})_2\text{S}_2$ to air. Hygroscopic four-sided prisms, sl sol alcohol. Decolourises a solution of iodine. At 135° it is decomposed into Me_2S and $\text{Me}_2\text{S O SO}$, SMe , a white crystalline mass $[100^\circ]$ which does not act upon iodine but slowly oxidises to sulphate (Crum Brown & Blaikie, *J pr* [2] 23, 395).

Methylo-sulphate $(\text{Me}_2\text{S})_2\text{SO}_3$, aq. Formed from the hydroxide by saturating one half of its solution with SO_2 , and adding the other half (Crum Brown & Blaikie, *Pr E* 9, 712). Crystals. Gives off water of crystallisation at 140° . At 170° it gives off Me_2S , leaving a liquid residue, which solidifies on cooling, and is apparently $(\text{Me}_2\text{S})_2\text{SO}_3\text{Me}$.

Methylo-dithionate $(\text{Me}_2\text{S})_2\text{S}_2\text{O}_6$, 6aq. Formed from $\text{Me}_2\text{S OH}$ and dithionic acid. Deliquescent cubes, insol alcohol. Decomposes at 220° into SO_2 and $(\text{Me}_2\text{S})_2\text{SO}_3$, and the latter then further decomposes into Me_2S and $\text{Me}_2\text{S SO Me}$.

Methylo-metaphosphate $\text{Me}_2\text{S PO}_3$. From AgPO_3 and Me_2SI . Hygroscopic glassy mass, giving off Me_2S on heating.

Methylo-ferrocyanide $(\text{Me}_2\text{S})_2\text{FeCy}_2$, 9aq. From Me_2SI and silver ferrocyanide. Transparent green plates, which lose their water in a desiccator, and then give off Me_2S at 220° .

Methylo-ferricyanide $(\text{Me}_2\text{S})_2\text{FeCy}_2$, 7½aq. From Me_2SI and silver ferricyanide (Crum Brown & Blaikie, *Pr E* 10, 253). Pale orange efflorescent plates.

The **methylo-chromate** and **methylo-iodate** explode at 100° .

Methylo-carbonate $(\text{Me}_2\text{S})_2\text{CO}_3$. Formed from Me_2SI and Ag_2CO_3 , the liquid being evaporated to a syrup and left to crystallise over H_2SO_4 . Deliquescent prisms, with strong alkaline reaction. At 100° it is split up into CO_2 , water, Me_2S , and methyl alcohol.

Methylo-oxalate $(\text{Me}_2\text{S})_2\text{C}_2\text{O}_4$, aq. Formed from $\text{Ag}_2\text{C}_2\text{O}_4$ and Me_2SI . Deliquescent crystals. Split up at 140° into Me_2S and methyl oxalate.

Methylo-acetate $\text{Me}_2\text{S OAc}$. Formed from Me_2SI and AgOAc (Crum Brown & Blaikie, *Pr E* 10, 53, *C N* 39, 51). Split up at 100° into Me_2S and MeOAc .

Methylo-benzoate $\text{Me}_2\text{S OBz}$. From the iodide and AgOBz . Thin plates (from alcohol). Decomposed by heat into Me_2S and MeOBz .

Ethylo-iodide SMe.EtI . **Di-methyl-ethyl-sulphide iodide** $[110^\circ]$. Formed either from Me_2S and EtI or MeEtS and MeI (Klinger & Maassen, *A* 243, 212, 252, 246, *cf* Kruger, *J pr* [2] 14, 193). Hygroscopic crystalline mass, v sol alcohol, insol ether. Yields on distillation Et_2SI and Me_2SI . In alcoholic solution it reacts with AgCy at 90° , forming SMe.EtCyAgCy , a deliquescent crystalline body, v sol alcohol, insol ether, and decomposed by heat into AgCy and SMe.EtCy (Patein, *C R* 106, 861). Forms the following compounds — $(\text{Me}_2\text{SEtI})_2\text{CdI}_2$, $[180^\circ]$, crystallising in small

needles, sl sol water — $\text{Me}_2\text{SEtICdI}_2$, $[99^\circ]$, crystals falling from hot conc CdI_2 aq in long needles. — $\text{Me}_2\text{SEtIHgI}_2$, $[66^\circ]$ (Patein, *Bl* [3] 2, 159).

Ethylo-chloride Me_2SEtCl . The following compounds of this body have been prepared (Klinger & Maassen, *A* 243, 212) — $\text{Me}_2\text{SEtCl}(\text{HgCl}_2)$, $[119^\circ]$, long needles, insol. hot water — $\text{Me}_2\text{SEtCl}(\text{HgCl}_2)_2$, $[200^\circ]$, white crystalline powder, slightly soluble in water — $(\text{Me}_2\text{SEtCl})_2\text{PtCl}_4$, $[c\ 213^\circ]$, small orange crystals, sl sol water, insol alcohol and ether — $\text{Me}_2\text{SEtClAuCl}_2$, $[244^\circ]$, long yellow needles, m sol hot water.

Di-methyl disulphide $\text{C}_2\text{H}_6\text{S}_2$, *re* Me_2S_2 , (117°) (C), $(112^\circ$ at 744 mm) (Pierre, *A* 80, 128) *SG* 1.046 (C) *VD* 3.30 *SV* 100.6 (Lossen, *A* 254, 71). Formed by passing MeCl through an alcoholic solution of K_2S_2 , or by distilling $\text{Ca}(\text{SO}_3\text{Me})_2$ with K_2S_2 (Cahours, *A Ch* [3] 18, 157, *A* 61, 92). Liquid, with intolerable odour of onions, v sl sol water, miscible with alcohol and ether. Burns with blue flame. Chlorine converts it first into crystalline $\text{Me}_2\text{S}_2\text{Cl}_2$, and finally into a liquid mixture of $(\text{CCl}_3)_2\text{S}$ and SCl_2 (Riche, *A* 92, 356). Dilute nitric acid converts it into methyl methane thiosulphonate MeSO_2SMe .

Derivative — *v* **PER-CHLORO-METHYL DI-SULPHIDE**.

Di-methyl trisulphide Me_2S_3 , (170°) at 760 mm *SG* 1.2162, $\frac{1}{2}$ 1.2059, $\frac{1}{3}$ 1.199. Formed together with Me_2S and S from methyl mercaptan and S_2Cl_2 (Klason, *B* 20, 3414). Formed also from MeCl and K_2S_3 (Cahours). Pale yellow liquid, with very disagreeable odour.

Derivative — *v* **HEXA-BROMO DI-METHYL TRI-SULPHIDE**.

METHYL SULPHITE $\text{C}_2\text{H}_5\text{SO}_3$, *re* $\text{SO}(\text{OMe})_2$, (121.5°) *SG* 1.0456 *VD* 3.68 (calc 3.80). Formed by the action of methyl alcohol on S_2Cl_2 or on SOCl_2 (Carius, *A* 110, 209, 111, 93). Colourless liquid, with pleasant odour, miscible with alcohol and ether. It dissolves slowly in water with evolution of SO_2 and formation of MeOH .

METHYL SULPHOCYANIDE $\text{C}_2\text{H}_5\text{NS}$, *re* MeSCy , (133°) *SG* 1.115 (C), $\frac{1}{2}$ 1.069 (Nasini & Scala, *G* 17, 66) *R_n* 33.8 *SV* 78.1 (Lossen, *A* 254, 73) *H F p* — 31,410 *H F v* — 31,990 (Thomsen, *Th*). Obtained by distilling potassium sulphocyanide with calcium methyl sulphate (Cahours, *A Ch* [3] 18, 261, *A* 61, 95). Liquid with alliacious odour, v sl sol water, miscible with alcohol and ether. Boiling nitric acid oxidises it to methane sulphonic acid. Chlorine acts upon it according to the equation — $3\text{MeSCN} + 11\text{Cl}_2 = \text{Cl}_3\text{Cy}_2 + 2\text{CCl}_4 + \text{CCl}_3\text{Cl} + 9\text{HCl}$ (James, *J pr* [2] 85, 462). Cold aqueous KOH does not attack it, but alcoholic potash forms Me_2S , ammonia, KCy , and K_2CO_3 . Alcoholic KSH forms KSCy and Me_2S . When heated at 180° it partially changes to methyl thiocarbimide.

Methyl polysulphocyanide $(\text{CH}_3\text{CNS})_n$ (?) $[188^\circ]$. Prepared by heating methyl sulphocyanide to 180° with a trace of HCl (Hofmann, *B* 13, 1349). Sublimable. Colourless crystals. Sol acetic acid, insol acids and alkalis. By heating with alcoholic NH_3 to 150° it gives a well-crystallising base.

METHYL-SULPHONAMIDES v. METHYL**SULPHAMIDES**

DI-METHYL-SULPHONE $\text{O}_2\text{H}_2\text{SO}_2$ *ie* Me_2SO_2 . Mol w 94 [109°] (238°) R_{∞} 82.09 in a 2.46 aqueous solution (Kanonnikoff, *J R* 15, 451) Formed by oxidising Me_2S with fuming HNO_3 (Saytzeff, *A* 144, 148) or with aqueous KMnO_4 (1.30) (Beckmann, *J pr* [2] 17, 454) Thick needles (from alcohol) Not affected by reducing agents

DI METHYL-SULPHONE DI-CARBOXYLIC ACID $\text{O}_2\text{S}(\text{CH}_2\text{CO}_2\text{H})_2$ *Sulphono di acetic acid* [182°] Formed by oxidation of thio di glycollic (sulphido diacetic) acid in alkaline solution with KMnO_4 (Lovén, *B* 17, 2817) Long trimetric tables V sol water, alcohol, and ether At 200° it splits up into di methyl sulphone and CO_2

Salts — $\text{A}^+\text{Ba}^+\text{aq}$ fine felted sparingly soluble needles — $\text{A}^+\text{Ba}^+\text{aq}$ small prisms

Ethyl ether A^+Et , thick oil

Amide $\text{O}_2\text{S}(\text{CH}_2\text{CONH}_2)_2$ glistening plates, v sol hot water, slightly in cold

METHYL-SULPHONIC ACID v METHANE SULPHONIC ACID

METHYL SULPHOXIDE $(\text{CH}_3)_2\text{SO}$ The nitrate $(\text{CH}_3)_2\text{SOHNO}_3$ is formed by oxidising methyl sulphide with conc HNO_3aq and crystallises in deliquescent needles, whence BaCO_3 sets free the oxide (Saytzeff, *A* 144, 148) Oil, v sol water Solidifies when strongly cooled Reduced by zinc and H_2SO_4 to methyl sulphide Me_2S

METHYL-SULPHURIC ACID v METHYL SULPHATES**METHYL SULPHYDRATE v METHYL MERCAPTAN****METHYL-TARCONIC ACID v NARCOTINE**

DI-METHYL TARTARIC ACID $\text{C}_4\text{H}_6\text{O}_6$ *ie* $\text{CO}_2\text{H CMe}(\text{OH})\text{CMe}(\text{OH})\text{CO}_2\text{H}$ *Di oxy di methyl succinic acid* Formed, together with lactic acid, by the action of zinc and a little HCl aq on pyruvic acid in alcoholic solution (Böttger, *A* 188, 315, *B* 9, 1064, 1621) Syrup — KHA^+ small six sided plates, v sl sol water — KA^+ needles, m sol water — BaA^+ $3\frac{1}{2}$ aq prismatic needles, sl sol water — CaA^+ crystalline pp, nearly insol water

METHYL-TAURINE v METHYL AMIDO ETHANE SULPHONIC ACID**METHYL-TAURO GAMINE v METHYL GUANIDO ETHANE SULPHONIC ACID****METHYL TEREPHTHALIC ACID v TOLUENE DICARBOXYLIC ACID**

Di methyl terephthalic acid *v* XYLENE DICARBOXYLIC ACID

METHYL-TELLURIDE v TELLURIUM, ORGANIC COMPOUNDS

METHYL TETRADECYL KETONE $\text{C}_{15}\text{H}_{32}\text{O}$ *ie* $\text{CH}_3\text{CO C}_{13}\text{H}_{27}$ [43°] (231°) Formed by distilling a mixture of barium pentadecanoate and barium acetate (Krafft, *B* 15, 1707) Yields myristic and acetic acids on oxidation

DI-METHYL THETINE $\text{C}_4\text{H}_8\text{SO}_4$ *ie*

$\text{CH}_3\text{C}(\text{SM}_2)\text{C}(\text{O})\text{O}$ *Anhydride of the methylohydroxide of the methyl derivative of thio glycollic acid* Obtained by decomposing its hydrobromide with moist Ag_2O , or its sulphate with

baryta (Crum Brown & Letts, *Tr E* 28, 571, *B* 6, 1384, 7, 695) Crystals (containing aq) Hygroscopic, but gives up the water over H_2SO_4 V sol water, m sol alcohol Neutral in reaction Decomposes when heated into CO_2 and $(\text{Me}_2\text{S})_2\text{CO}$, the methylo-carbonate of di methyl sulphide Yields di methyl sulphone when oxidised by KMnO_4 The following compounds may be styled its salts — $\text{Me}_2\text{SBr CH}_2\text{CO}_2\text{H}$ Formed from bromo-acetic acid and Me_2S Large deliquescent rectangular plates (from alcohol) Acid to litmus With lead oxide it forms $\text{C}_4\text{H}_8\text{SO}_4\cdot 2\text{PbBr}_2$ Decomposed by heat or by boiling alcohol into SMe_2Br , methyl bromide, and $\text{S}(\text{CH}_2\text{CO}_2\text{H})_2$ (Letts, *Tr E* 28, 591) Yields methane sulphonic acid on oxidation (Letts, *Tr E* 28, 601) — $(\text{C}_4\text{H}_8\text{SO Br})_2\text{PtBr}_2$ (?) dark red crystals — $\text{Me}_2\text{SOCl CH}_2\text{CO}_2\text{H}$ Formed from the sulphate and BaCl_2 Deliquescent crystals, v sol water, v sl sol alcohol — $(\text{C}_4\text{H}_8\text{SO}_4)_2\text{HI}$ (?) — $\text{Me}_2\text{SOCl CH}_2\text{CO}_2\text{H}$ Formed by leaving di methyl thetine in contact with dilute HIAq Crystals, insol water, sol alcohol and ether — $\text{SO}_4(\text{SMe CH}_2\text{CO}_2\text{H})_2$ *Di methyl thetine sulphate* Formed from $\text{Me}_2\text{SBr CH}_2\text{CO}_2\text{H}$ and silver sulphate Crystalline mass, sol water, v sl sol alcohol Acid to litmus When heated over 140° it fuses and splits up into CO_2 and $(\text{Me}_2\text{S})\text{SO}_4$, the methylo sulphate of di methyl sulphide — $\text{Me}_2\text{S}(\text{NO}_2)_2\text{CH}_2\text{CO}_2\text{H}$ From $\text{Me}_2\text{SBr CH}_2\text{CO}_2\text{H}$ and AgNO_3 Colourless crystals with acid reaction Yields di methyl sulphone when oxidised by conc HNO_3

METHYL-THIALDINE $\text{C}_4\text{H}_7\text{NS}$ [79°] Obtained on treating crude thio acetic aldehyde with an aqueous solution of methylamine (W Markwald, *B* 19, 2378) Long needles (from alcohol), insol water, sl sol cold alcohol, v e sol hot alcohol and ether Its solutions possess a feeble alkaline reaction Volatilises in steam with partial decomposition With acids it forms very soluble salts

μ - METHYL - THIAZOLE $\text{C}_3\text{H}_5\text{NS}$ *ie* $\text{S CMe} \gg \text{N}$ (128° cor) Formed by boiling CH CH_2 (128° cor) Formed by boiling thioacetamide $\text{CH}_3\text{CS NH}_2$ with chloro acetal (Hantzsch *A* 250, 270), or with di chloro di ethyl oxide (Hantzsch, *B* 21, 943) Mobile liquid, miscible with water Its hydrochloride and hydrobromide form hygroscopic needles. With mercuric chloride it forms compounds melting at 112° and 154° $\text{B}^+\text{H PtCl}_6$ [199°] Hexagonal plates or flat needles (from water) — Picrate [146] Yellow needles, sl sol water, v sol alcohol and benzene

(a)-Methyl-thiazole $\text{S} \begin{array}{c} \text{---CH} \\ \text{CH CMe} \end{array} \gg \text{N}$ (132°) Obtained by distilling oxy methyl thiazole (from chloro acetone and metallic sulphocyanides) with zinc dust (Hantzsch *A* Arapides, *B* 21, 942), *A* 249, 24) Formed also by boiling with alcohol the diazo compound derived from amido methyl thiazole (from chloro acetone and thio urea) (Popp, *A* 250, 277) Colourless liquid, sinking under water, but slowly dissolving, v sol alcohol and ether The hydrochloride is deliquescent. It forms two compounds with HgCl_2 , melting at 119° and 148° The aurochloride melts at 185°, and the picrate at 174° — $\text{B}^+\text{H}_2\text{PtCl}_6$ [204°] Orange prisms, m sol water, sl sol alcohol.

$\alpha\mu$ Di-methyl-thiazole C_4H_6NS $\epsilon\epsilon$
 $S \text{ CMe} \searrow N$ (145° cor) SG 15 1 0601 Formed from thioacetamide and chloro-acetone (Hantzsch, B 21, 943, A 250, 265) Colourless liquid, more sol cold than hot water Reduced in alcoholic solution by sodium to ethylamine and propyl mercaptan (Schatzmann, A 261, 1) — $B'H_2PtCl_6$ [216°] Prisms, m sol water — $B'HCl(HgCl_2)_4aq$ [110°] White needles, v e sol water — $B'(HgCl_2)_2$ [177°] Sl sol cold water, v e sol dilute $HClAq$ — *Picrate* [138°] *Methylo-sodide* $B'MeI$ Pointed crystals, v sol water

$\beta\mu$ Di-methyl-thiazole $S \text{ CMe} \searrow N$ (150° cor) Formed by condensing thioacetamide with (α)-chloro propionic aldehyde (Hubacher, A 259, 240) Oil, v sl sol water, v sol alcohol and ether Volatile with steam — $B'H_2PtCl_6$ [202°] — *Picrate* [167°]

Tri-methyl-thiazole C_5H_8NS $\epsilon\epsilon$
 $S \text{ CMe} \searrow N$ (167°) SG 15 1 013 Formed by heating thioacetamide with chloro methyl ethyl ketone at 100° (Poubelle, A 259, 258) Liquid, m sol cold, insol hot, water — $B'HCl$ [174°] — $B'H_2PtCl_6$ [233°] — *Aurochloride* [156°] — *Picrate* [133°] *Mercuric double chloride* [119°]

METHYL-THIAZOLE CARBOXYLIC ACID

$C_4H_5NSO_2$ $\epsilon\epsilon$ $S \text{ CMe} \searrow N$ [145°] Formed by heating the dicarboxylic acid [169°] at 171° (Roubleff, A 259, 271) Small needles or prisms, v sol cold, v e sol hot, water, m sol alcohol, sl sol ether, almost insol benzene

Methyl-thiazole carboxylic acid

$CO_2H \text{ CMe} \searrow N$ [257°] Formed by saponifying its ether with alcoholic potash (Wohmann, A 259, 299) Pearly plates (from water) or needles (from alcohol), sl sol ether and hot water, almost insol benzene

***Ethyl ether* EtA'** [28°] (233° i V) at 726 mm Obtained from amido methyl thiazole carboxylic ether by diazotisation, conversion into chloro methyl thiazole carboxylic ether [51°] and reduction of this by zinc dust and $HOAc$ Flat prisms, volatile with steam

Methyl-thiazole dicarboxylic acid

$S \text{ C(CH}_3)_2 \searrow N$ [169°] Formed by condensing thioacetamide with chloro oxalacetic ether and saponifying with alcoholic soda (Roubleff, A 259, 268) Long white needles, v sol cold water, sl sol ether and benzene — BaA'' 2aq needles. — HgA'' 3½aq crystalline pp

Di-methyl thiazole carboxylic acid

$S \text{ CMe} \searrow N$ [227°] Formed by saponifying its ether (R) Silky needles or small prisms, sl sol hot water, m sol alcohol and ether May be sublimed Yields on distillation with lime di-methyl thiazole — AgA' white needles, sol hot water — $HA'HCl$ plates

***Ethyl ether* EtA'** [51°] (242° cor)

Formed from thioacetamide and chloro acetoacetic ether (Hantzsch, A 250, 269) Needles (from ether), insol water, v sol alcohol and ether

METHYL-THIAZYL-PROPIONIC ETHER

$S \text{ CMe} \searrow N$ Formed by condensing $CH \text{ O CHMe CO}_2Et$ bromo methyl-acetoacetic ether with thioacetamide in the cold (Roubleff, A 259, 262) Thick oil When saponified and heated with lime it yields methyl ethyl thiazole

($\alpha\alpha'$)-METHYL-THIENYL-GLYOXYLIC ACID

$C_8H_8SO_2$ $\epsilon\epsilon$ $S \text{ C(CH}_3)_2 \searrow N$ [80°] Formed by oxidising ($\alpha\alpha'$) methyl thienyl methyl ketone with alkaline $KMnO_4$ (Ruffi, B 20, 1747) — CaA' 2aq needles — BaA' 2aq needles — AgA' ($\alpha\beta$) - Methyl - thienyl - glyoxylic acid $SC_6H_4Me \text{ COCO}_2H$ [142°] Formed by oxidising (a) methyl (b) thienyl methyl ketone with an aqueous solution of $KMnO_4$ and KOH (Ruffi, B 20, 1748) Needles (from water), subliming even in the cold

Phenyl hydrazide

$SC_6H_4Me \text{ C(N,HPH) CO}_2H$ [141°] Crystalline *Oxim* $SC_6H_4Me \text{ C(NO}_2\text{H) CO}_2H$ [104°]

($\alpha\alpha'$)-Di-methyl-(β)-thienyl-glyoxylic acid

$S \text{ CMe} \searrow N$ Formed by oxidation of ($\alpha\alpha'$) di-methyl (β) thienyl methyl ketone with alkaline $KMnO_4$ (Ruffi) Oil, slowly solidifying Yields leuco thiophene green when heated with di-methyl aniline and $ZnCl_2$ — AgA'

METHYL THIENYL KETONE v THIENYL

METHYL KETONE

(a) METHYL-THIENYL METHYL KETONE

C_8H_8SO $\epsilon\epsilon$ $S \text{ C(CH}_3)_2 \searrow N$ [25°] (233° cor) Formed by the action of $AcCl$ on (a) methyl thiophene in presence of $AlCl_3$ (Demuth, B 18, 3025, 19, 1859, Ernst, B 19, 3275) Large tables On oxidation with $KMnO_4$ it yields thiophene dicarboxylic acid Fuming HNO_3 forms a nitro derivative [121°] *Oxim* $C_8H_8S(NO_2H)$ [125°] Needles (from dilute alcohol)

***Phenyl hydrazide* $C_8H_8S(N_2,HPH)$** [128°] Needles (from alcohol)

(β) - Methyl - thienyl methyl ketone

$C_8H_8SMe \text{ CO CH}_3$ (216° cor) Formed from (β) methyl thiophene and $AcCl$ in presence of $AlCl_3$ (Demuth, B 18, 3025)

($\alpha\beta'$) - Di-methyl - thienyl methyl ketone

C_8H_8SO $\epsilon\epsilon$ $S \text{ CMe} \searrow N$ or $S \text{ CMe} \searrow N$ (227°) Formed by the action of $AcCl$ on ($\alpha\beta'$) di-methyl thiophene dissolved in ligroin in presence of $AlCl_3$ (Zelninsky, B 20, 2019) Liquid Coloured red by isatin and H_2SO_4

Oxim $C_8H_8S(NO_2H)$ [70°] Needles

***Phenyl hydrazide* $C_8H_8S(N_2,HPH)$** [70°]

Di-methyl-thienyl methyl ketone

$SC_6H_4Me \text{ CO CH}_3$ (224°) SG 15 1 091 Formed from the di-methyl thiophene of coal tar by treatment with $AcCl$ and $AlCl_3$ (Messinger, B 18, 2301) Liquid Gives a red colour with isatin and H_2SO_4 Oxidised by alkaline $KMnO_4$ to thiophene dicarboxylic acid

Oxim $C_8H_8S(NO_2H)$ [65°] Needles

TETRA-METHYL-THIO-ANILINE v TETRA

METHYL-DI-AMIDO-DI-PHENYL SULPHIDE

METHYL-THIOCARBAMINE CYAMIDE v.

CARBIMIDO METHYL THIO UREA

METHYL-THIOCARBAMINE-ETHYL-CY-AMIDE v ETHYL CARBIMIDO METHYL THIO UREA.**DI-METHYL-THIOCARBAZIC ACID**

C_2H_5NS , \pm NMe , $NHCS$ SH [112°] Formed from di methyl-hydrazine and CS_2 (Renouf, *B* 13, 2172) Colourless plates

METHYL-THIOCARBIMIDE CH_3NCS Mol w 73 [34°] (119°) VD 2.42 (calc 2.53) SG $\frac{4}{3}$ 1.069 R₂ 35.75 (Nasini & Scala, *G* 17, 66) HFp -24.520 HFv -25.100 HO (gas) 392,000 (Thomsen, *Th* 4, 197) Formed by the action of $AgNO_3$ or $HgCl_2$ on the product of the union of CS_2 on methylamine (Hofmann, *B* 1, 172) Formed also by heating pure methyl sulphocyanide for some time at 180°-185° (Hofmann, *B* 18, 2196) Pungent crystals Reacts with sodium cyanamide and alkyl iodides, forming methyl-alkyl cyano tho-ureas Thus $CN.HNa$ and MeI give $CH_3NHCSNCyCH_3$ [c 195°], while allyl iodide yields the compound $NHMeCSNCyC_2H_5$ [78°], propyl iodide forms $NHMeCSNCyC_3H_7$ [91°], and benzyl chloride forms $NHMeCSNCyCH_2Ph$ [173°] (Hecht, *B* 23, 1658)

METHYL THIOCARBONATES

Methyl dithiocarbonic acid $C_2H_5S_2O$ \pm CH_3OCS SH *Methyl xanthic acid* *Methyl xanthoquinic acid* *Xantho methylic acid* The potassium salt of this acid is formed by adding CS_2 to a solution of KOH in methyl alcohol (Dumas & Peligot, *A Ch* [2] 24, 55, Desains, *A Ch* [3] 20, 504) It crystallises in silky fibres, SG $\frac{15}{8}$ 1.6878 (Clarke, *B* 11, 1505) Iodine converts it into $(CH_3OCS)_2S_2$ With EtI it yields $MeOCSSEt$ (184°) - PbA_2

Methyl dithiocarbonate $CH_3OCSSCH_3$ (163°) (S), (171°) (C) SG $\frac{15}{8}$ 1.176 (S), $\frac{15}{8}$ 1.143 (O) Formed from CH_3CS SK and MeI (Salomon, *J pr* [2] 8, 117) Formed also together with CO and S by heating the compound $(CH_3OCS)_2S_2$ (*v supra*) (Cahours, *A Ch* [3] 19, 158)

Methyl trithiocarbonate Me_3CS_3 (200°-205°) SG $\frac{15}{8}$ 1.159 Formed by distilling a mixture of concentrated solutions of K_2CS_3 and $Ca(SO_4Me)$ (Cahours, *A Ch* [3] 19, 163) Yellow liquid with pungent odour, nearly insol water, miscible with alcohol and ether Combines with bromine forming red crystals of $Me_3CS_3Br_2$ (Berend, *A* 128, 833)

METHYL THIO-COUMARILIC ACID $C_6H_5(CH_3)O CO SH$

Ethyl ether $C_6H_5(CH_3)O CO SEt$ [92°], glistening yellow needles, v sol ether, sl sol alcohol Formed by heating methyl-coumarilic-ethyl-ether with P_2S_5 By treatment with alcoholic KOH it is reconverted into methyl coumarilic acid (Hantzsch, *B* 19, 2400)

METHYL-THIOFORMALDINE $C_2H_5S_2N$ \pm $(CH_2)_2S_2NMe$ [65°] (c 185°) Formed from an aqueous solution of formic aldehyde by successive addition of H_2S and methylamine (Wohl, *B* 19, 2346) Needles (from ether) with unpleasant smell, insol water, sol acids and alcohol, v sol ether Volatile with steam On boiling it is converted into a substance melting at 130°-140° - B/HCl [188°] White needles, v sol water Its solution is ppd by $AgNO_3$, $HgCl_2$, and platinum chloride.

Methylo-iodide $BMeI$ [161°-163°]. Slender needles, v sol water Gives rise to $B/MeCl$ and $(B/MeCl)_2PtCl_4$

METHYL-THIOHYDANTOIN $C_2H_5N_2SO$ \pm

$NH C \begin{smallmatrix} S CH_3 \\ NMe CO \end{smallmatrix} (?)$ Formed by warming methyl thio urea with chloro-acetic acid and water (Andreasch, *M* 6, 840) Thick prisms or needles (from water), sol hot water and alcohol Boiling $KOHAq$ yields thioglycolic acid Nitrous acid forms a nitrosamine $C_2H_5(NO)N_2SO$ which is an orange red powder, sol hot water

(a) Di methyl-thiohydantoin $C_4H_9N_2SO$ \pm

$NMe C \begin{smallmatrix} S CH_3 \\ NMe CO \end{smallmatrix} [71°]$ Formed by heating di methyl thio urea with chloro acetic acid in aqueous solution (Andreasch, *M* 8, 408) Long colourless prisms, v sol water, alcohol, and ether Smells like nicotine Hot aqueous alkalis convert it into thioglycolic acid Nitrous acid forms an isonitroso compound $C_4H_9N_2SO_2$ [220°]

(B) Di-methyl-thiohydantoin

$NH C \begin{smallmatrix} S CMe_2 \\ NH CO \end{smallmatrix} [114°]$ Formed from di-argentic thiohydantoin and MeI (Andreasch, *M* 8, 416) Thin plates, v sol water, sl sol alcohol Oxidised by $KClO_3$ and HCl to urea and other products

DI-METHYL-THIONINE C_4H_9NS \pm

$N \begin{smallmatrix} C_2H_5 \\ C_2H_5 \end{smallmatrix} \begin{smallmatrix} S \\ S \end{smallmatrix} \begin{smallmatrix} NHMe \\ NMe \end{smallmatrix}$ Obtained by the action of

$FeCl_3$ upon methyl *p* phenylene diamine in the presence of H_2S and HCl The free base is a crystalline powder, sl sol ether and alcohol, insol water The blue alcoholic solution has a strong red fluorescence The hydrochloride is easily sol water with a blue colour and reddish-brown fluorescence The hydriodide (B/HI) is a dark-blue powder, sol hot water and alcohol, sl sol cold water, dyes silk blue The free base by boiling with water is converted into methyl-thionoline with evolution of NH_3Me By treating the product with 70 p.c. H_2SO_4 , a second molecule of NH_3Me is split off and thionol

$N \begin{smallmatrix} C_2H_5 \\ C_2H_5 \end{smallmatrix} \begin{smallmatrix} OH \\ S \end{smallmatrix} \begin{smallmatrix} OH \\ O \end{smallmatrix}$ is formed (Bernthsen & Goske, *B* 20, 931)

METHYL-THIONOLINE $N \begin{smallmatrix} C_2H_5 \\ C_2H_5 \end{smallmatrix} \begin{smallmatrix} S \\ S \end{smallmatrix} \begin{smallmatrix} NHMe \\ O \end{smallmatrix}$

Formed by boiling di-methyl thionine with water, methyl-amine being evolved By treatment with 70 p.c. H_2SO_4 , a second molecule of methyl-amine is split off, and there is formed

thionol $N \begin{smallmatrix} C_2H_5 \\ C_2H_5 \end{smallmatrix} \begin{smallmatrix} OH \\ S \end{smallmatrix} \begin{smallmatrix} OH \\ O \end{smallmatrix}$ (Bernthsen & Goske,

B 20, 932)**Di-methyl-thionoline v METHYLENE VIOLET.****METHYL-THIOPARABANIC ACID**

$C_6H_5N_2SO_2$ \pm $CS \begin{smallmatrix} NMe CO \\ NH CO \end{smallmatrix}$ *Oxalyl methyl-thio urea* [105°] Prepared by passing cyanogen into an alcoholic solution of methyl thio urea and boiling the ppd CSN_2H_2MeCy with $ocno$.

HClAq (Andreasch, *B* 14, 1447, *M* 2, 277) Yellow plates, sol water, alcohol, and ether May be sublimed Converted by warming with aqueous AgNO₃ into methyl parabanic acid

Di-methyl-thioparabanic acid C₈H₈N SO₂ 2 e

CS <NMe CO
NMe CO> *Thiocholestrophane Oxalyl-di methyl-thio-urea* [113°] Prepared by passing cyanogen into an alcoholic solution of *s* di-methyl-thio urea and boiling the ppd cyanide with HClAq (Andreasch) Yellow monoclinic tables, sl sol cold water, v e sol alcohol, and ether Split up by boiling alkalis into di methyl-thio urea and oxalic acid On heating with BaCO₃ and water it gives di methyl oxamide and CSO Boiling aqueous AgNO₃ forms cholestrophane

(a) METHYL-THIOPHENE C₈H₈S 2 e

S <CMe CH
CH CH *Thiotolene* (111°) Occurs in coal tar (V Meyer, *B* 18, 3009) Formed by the action of sodium on a mixture of (a) iodo thio phene and MeBr (V Meyer a Kreis, *B* 17, 1562, Egli, *B* 18, 544) Formed also by the action of P₂S₅ on acetyl propionic (levulic) acid (Kues, *B* 19, 556) Oil Forms a tri bromo-derivative [87°]

(β)-Methyl-thiophene S <CH CMe
CH CH *Thio*

tolene Occurs, together with the preceding isomeride, in crude toluene from which it may be separated by shaking with H₂SO₄, and passing steam through the boiling acid diluted with 20 p c water The mixture of methyl thiophenes so obtained boils at 113 cor and has a S G $\frac{13}{4}$ = 1.0194 (Meyer a Kreis, *B* 17, 787, Schulze, *B* 17, 2853) Formed by distilling sodium pyrotartrate with P₂S₅ (Volhard a Erdmann, *B* 18, 455) Oil Oxidised by alkaline KMnO₄ to (β) thiophenic acid Gives a tri bromo-derivative [34°], and a bromo di nitro derivative [125°]

Di-methyl-thiophene C₈H₈S *Thioxene* Crude thioxene is obtained in considerable quantity by passing steam through sulphuric acid used in purifying xylene diluted with 20 p c of water and heated to boiling (Schulze, *B* 17, 2853)

(aβ') - Di-methyl-thiophene S <CMe CH
CH CMe

m Thioxene (138° cor) S G $\frac{22}{5}$ 9956 V D 4.02 (calc 3.9) Formed by distilling β acetyl-isobutyric acid with P₂S₅ (Zelinsky, *B* 20, 2018) Gives on oxidation methyl-thiophene carboxylic acid and thiophene dicarboxylic acids

Di methyl thiophene SC₂H₅Me₂ (139° cor) S G $\frac{31}{4}$ 9777 Formed from iodo (β) methyl-thiophene, MeI and sodium (Demuth, *B* 19, 1856) Liquid

(aa') - Di-methyl-thiophene S <CMe CH
CMe CH

Thioxene (137° cor) S G $\frac{13}{5}$ 9755 Occurs in coal tar Prepared from crude thioxene by conversion into iodo di methyl thiophene and reducing this body with zinc dust and alcoholic NaOH (Messenger, *B* 18, 565, 1606) Formed by heating acetonil acetone (di methyl ethylene diketone) CH₃COCH₂CH₂COCH₃ (3 pts) with powdered P₂S₅ (2 pts) for an hour at 140°-150°, the yield is 50-60 p c of the theoretical (Paal, *B* 18, 2252) Formed also from (a) iodo (a') methyl-thiophene by leaving it for some weeks in contact with sodium and MeI (Ruffi, *B* 20, 1747)

Colourless mobile liquid of slight odour Dissolves sulphur considerably Gives a red colour with isatin and H₂SO₄, a violet with phenanthraquinone and H₂SO₄, and a reddish-brown with phenyl glyoxylic acid and H₂SO₄ By KMnO₄ it is oxidised to thiotolene carboxylic acid [142°] The di bromo-derivative melts at [47°-50°], and the tri bromo derivative at [144°] It also forms a bromo-derivative [194°], a second di bromo-derivative [46°], a per-bromo-derivative C₈Br₈S [114°], and oily iodo and nitro-derivatives (Messinger) With phenanthraquinone, HOAc, and H₂SO₄ (Laubenheimer's reagent) it gives a reddish-violet colouration

(ββ') Di methyl-thiophene S <CH CMe
CH CMe

(145°) S G $\frac{23}{4}$ 1.0078 Formed by distilling sodium-*s*-di methyl succinate with P S₅ (Zelinsky, *B* 21, 1836) Yellow oil With a trace of isatin in conc H SO₄ it gives an emerald green colour On oxidation it yields an acid crystallising in needles [139°], sl sol cold water

(aβ) - Di-methyl-thiophene S <CMe CMe
CH CH

om Thioxene (137° cor) S G $\frac{21}{5}$ 9938 Formed by distilling β acetyl *n* butyric acid with P S₅ (Paal a Fuschel, *B* 20, 2559, Grunewald, *B* 20, 2585) Colourless, strongly refracting oil In the indophenine reaction it gives a bluish violet colour Laubenheimer's reagent yields a reddish violet colour KMnO₄ oxidises it to methyl thiophene carboxylic acid and thiophene (ββ') di carboxylic acid

Tri-methyl-thiophene C₉H₁₀S 2 e

S <CMe CMe (162°) Formed by distilling S <CH CMe CH CMe CH₃ CO CHMe CHMe CO₂H with P₂S₅ (Zelinsky, *B* 20, 2025)

Tetra-methyl thiophene C₉H₁₂S 2 e

S <CMe CMe (184° uncor) S G $\frac{31}{4}$ 9442 S <CMe CMe Formed from tri methyl thiophene by treatment of this substance (12 g) dissolved in petroleum ether with iodine (48.5 g) and HgO (21 g), distilling with steam, and allowing the iodo tri methyl thiophene which comes over to stand with MeI and sodium (Zelinsky, *B* 21, 1837) Oil Does not give the indophenine reaction

METHYL URAMINE An old name for METHYL GUANIDINE

METHYL UREA $C_2H_5N_2O$ *s.e.* NH . CO $NHMe$ [102°] Formed from methyl cyanate and ammonia, or by evaporating a mixture of potassium cyanate and methylamine sulphate (Wurtz, *C* 32, 414) It is also a product of the action of HCl and $KClO_4$ on caffeine (Fischer, *A* 215, 257) It may be prepared by boiling its acetyl derivative with conc HNO_3 (Hofmann, *B* 14, 2734)

Properties — Deliquescent prisms, v e sol water and alcohol Its aqueous solution is neutral to litmus, and yields with nitric acid a pp of the nitrate $C_2H_5N_2OHNO_3$ [128°], which is converted by fuming nitric acid into methylamine and ammonium nitrate (Franchimont, *R T C* 3, 220)

Nitrosamine NH_2CO $N(NO)Me$ [124°] Formed by adding $NaNO_2$ to a solution of methyl urea nitrate containing ice (Von Bruning, *B* 21, 1810, *A* 253, 6) Yellow plates or tables (from ether), v sol hot water, alcohol, and ether Decomposed by long boiling with water Exhibits Liebermann's reaction On reducing with zinc dust and $HOAc$ it yields methyl - semi - carbazide NH_2CO $NHMeNH_2$ whence, by heating with conc $HClAq$ for 6 hours at 100°, methyl hydrazine is got

Acetyl derivative $NHAc$ CO $NHMe$ [180°] Formed from methyl urea and Ac_2O Formed by the action of boiling dilute $NaOH$ on a mixture of bromoacetamide (CH_2CO $NHBr$) and acetamide This mixture is prepared by adding aqueous (10 p.c) $NaOH$ to acetamide (10 pts) mixed with bromine (13.5 pts) until the colour changes from red to yellow (Hofmann, *B* 14, 2725, 15, 408) In this reaction methyl cyanate is perhaps first formed and then unites with acetamide Monoclinic prisms (Haushofer, *J* 1882, 365), sol alcohol, ether, and hot water Split up by alkalis into NH_3 , CO_2 , methylamine, and acetic acid Boiling conc $HClAq$ forms acetic acid and methyl urea

s Di-methyl-urea $C_4H_{10}N_2O$ *s.e.* $CO(NHMe)_2$ [102.5°] (269°) Formed by the action of methylamine on methyl cyanate (Wurtz, *Rép*

chim pure, 1862, 199) According to Wurtz, the same body when prepared by the action of cold water on methyl cyanate melts at 99.5° and boils between 273° and 288° *s* Di methyl-urea crystallises easily, is v sol water and alcohol, and forms a hygroscopic nitrate $C_4H_{10}N_2OHNO_3$ [c 65°] which is decomposed by fuming HNO_3 , forming methylamine (Franchimont, *R T C* 3, 222)

Cyano-acetyl derivative $C_5H_8N_2O_2$ *s.e.* $NHMe$ CO NMe CO CH_2Cy Formed from *s* di-methyl urea and cyano acetyl chloride (Mulder, *B* 12, 466) Crystals, not melted below 260° Gives with bromine water the compound $CO \begin{cases} NMe CO \\ NMe CO \end{cases} CBr_2$ Conc HNO_3 forms, on warming, two purple-red compounds

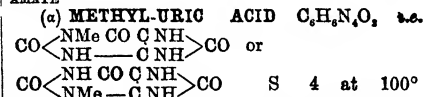

u Di methyl urea NMe_2CO NH_2 [180°]. Formed by evaporating the mixed solutions of potassium cyanate and dimethylamine sulphate (Franchimont, *R T C* 2, 122, 3, 222) Large hard crystals with sweet taste, sl sol alcohol and ether Boiling Ac_2O forms NMe_2Ac and cyanuric acid Aldehyde in the cold slowly forms $CH_3CH(NHCO$ $NMe_2)_2$ [160°] Chloral forms $CCl_3CH(OH)NHCO$ NMe_2 [156°] and $C_2H_5Cl_2N_2O_2$ [74°] (Van der Zande, *R T C* 3, 222) Nitrate $B'HNO_3$ [101°] Very large crystals Converted by fuming HNO_3 into dimethyl nitramine — Oxalate $B'H_2C_2O_4$ *aq* Decomposes at 105° — Picrate $B'C_6H_3(NO_2)_3OH$ [130°] Decomposes on fusion (Van der Zande)

Tri-methyl-urea $C_4H_{11}N_3O$ *s.e.* NMe_2CO $NHMe$ [76°] (232° cor) Formed by mixing ethereal solutions of methyl cyanate and dimethylamine (Franchimont, *R T C* 3, 226) Crystallises well from ether, v sol water and alcohol, sol benzene Fuming HNO_3 forms di methyl nitro amine (NMe_2NO_2) and methylamine

Tetra methyl urea $C_4H_{12}N_4O$ *s.e.* $CO(NMe_2)_2$ (177° v) $SG \pm 972$ Prepared by passing dimethylamine into a solution of di methyl chloro formamide $ClCONMe_2$ (derived from $COCl_2$ and NMe_3) in benzene (Michler a Escherich, *B* 12, 1162, Franchimont, *R T C* 3, 228) Oil, v sol alcohol and ether With conc HNO_3 (*S* *G* 1.5) it yields NMe_2NO_2 and dimethylamine

Reference — CHLORO METHYL UREA

METHYL URETHANE v METHYL CARBAMATE

Formed by heating at 150° acid lead urate with MeI diluted with ether (Hill, *B* 9, 370, 1090, *Am S* [3] 12, 428) Thin prisms, sl sol boiling water, insol alcohol and ether Sol conc H_2SO_4 and reppd by water Oxidised by alkali $KMnO_4$ to methyl allantoin $C_4H_8N_4O_3$ [225°] $KClO_4$ and HCl oxidise it to urea and methyl-alloxan By heating with $HClAq$ it is split up into glycoecoll, methylamine, CO_2 , and NH_3 (Fischer, *B* 17, 1776)

Salts — K_2A'' 3aq Ppd by adding alcohol to aqueous solution — KHA'' 3aq — NaA'' 3aq — $NaHA''$ 3aq — CaA'' 3aq — BaA'' 4aq — BaA'' 3aq; tufts of delicate needles

Methyl uric acid $C_5H_7MeN_3O_6$. Possibly identical with the preceding. Prepared by fusing urea (3 mols) with methyl amido acetic acid (1 mol), extracting the fusion with water, ppg by ammoniacal $AgNO_3$ and magnesium mixture, digesting the pp with an alkaline sulphide, filtering, acidifying, and evaporating to a small bulk (Horbaczewski, *M* 6, 859). Formed also by heating methyl hydantoin with amyl allophanate or with biuret (Horbaczewski, *M* 8, 584). Micaceous scales, sol boiling water and alkalis, sl sol cold water, dilute acids, alcohol, and ether. Gives the murexide reaction. On heating with $HClAq$ at 170° it gives a product (probably methylamine) which gives the carbamide reaction.

(β)-Methyl-uric acid $C_5H_7MeN_3O_6$ $\pm e$
 $CO \begin{matrix} \text{NH} & CO & C & NMe \\ \diagdown & & \diagup & \\ & C & & NH \end{matrix} CO$ Tri oxy methyl
 purin S 05 at 100°

Formation — 1 By heating the di methyl derivative of chloro di oxy methyl purin with $HClAq$ at 130° (Fischer, *B* 17, 332) — 2 By heating di chloro oxy methyl purin with $HClAq$ at 140° (Fischer, *B* 17, 1777) — 3 Occurs in small quantity, together with a much larger quantity of (α)-di methyl uric acid, by heating neutral lead urate with MeI at 100° (F).

Properties — Slender crystals. Sol alkalis. Reduces ammoniacal $AgNO_3$ in the cold. Gives the murexide reaction. On heating with PCl_5 it yields di chloro-oxy methyl purin. On oxidation with HNO_3 or with $KClO_3$ and HCl it gives methyl-urea and alloxan. Split up by heating with $HClAq$ into CO_2 , methylamine, NH_3 , and glycecoll.

(α)-Di-methyl-uric acid $C_5H_7Me_2N_3O_6$ $\pm e$
 $C_5H_7Me_2N_3O_6$, $C_5H_7Me_2N_3O_6$ [above 340°] S 5 at 100° , 06 at 20° . Prepared by heating neutral lead urate with MeI in ether for 20 hours at 165° (Mabery a Hill, *Am* 2, 306, *P Am* 4, 15, 256, *B* 11, 1329, Fischer, *B* 17, 1779). Slender monoclinic prisms (containing aq), sl sol water, sol conc H_2SO_4 and $HClAq$, insol alcohol and ether. When heated with conc $HClAq$ at 170° it is resolved into CO_2 , ammonia, NH_3 , and glycecoll. Nitric acid oxidises it, forming methyl alloxan and methyl urea. HCl and $KClO_3$ form methyl urea, methyl alloxan, and a small quantity of a compound $C_5H_7N_3O_6$, [160°]. The ammonium salt is decomposed on boiling its solution with separation of the free acid (difference from (α)-methyl uric acid).

Salts — K_2A' 4aq silky needles, v sol water — KHA' 11aq needles, sol water — Na_2A' 44aq needles, sol water — $NaHA'$ 2aq small needles, sol water — BaA' 3aq flat prisms, m sol hot water — BaH_2A' 23aq

(β)-Di-methyl-uric acid
 $CO \begin{matrix} \text{NH} & CO & C & NMe \\ \diagdown & & \diagup & \\ & C & & NH \end{matrix} CO$ Tri oxy-methyl-
 purin Formed by the action of H_2SO_4 at 140° on the di ethoxy-compound obtained by treating di-chloro-oxy di methyl purin with alcoholic $NaOH$. Formed also by heating di chloro oxy-di-methyl purin with fuming HCl at 130° (Fischer, *B* 17, 337, 1779). Colourless crystal line powder, v sl sol water, alcohol, and ether. Melts at a very high temperature.

Reactions — On heating with HCl it is split up into saccosine, methylamine, CO_2 , and NH_3 , PCl_5 converts it back into di chloro oxy-di-methyl purin. By $K_2Cr_2O_7$ and H_2SO_4 it is oxidised to cholestrophane. By oxidation with HNO_3 or $KClO_3$ and HCl it chiefly gives a body $C_5H_7N_3O_6$, which forms large colourless crystals [174°], v sol water, and decomposed on boiling with baryta water into mesoxalic acid, urea, and probably di methyl urea.

Tri-methyl-uric acid $C_5H_9N_3O_6$ $\pm e$.
 $MeN-CO \begin{matrix} \text{OC} & C & NMe \\ \diagdown & & \diagup \\ & C & \\ & \text{NH} & \end{matrix} CO$ or $HN-CO \begin{matrix} \text{OC} & C & NMe \\ \diagdown & & \diagup \\ & C & \\ & MeN & \end{matrix} CO$

[345°] Formed by heating the lead salt of (β)-di methyl uric acid with methyl iodide (Fischer, *B* 17, 1782). Fine white needles. Sublimable. Sol hot water, sl sol alcohol and chloroform. Dissolves in alkalis. Gives the murexide reaction strongly. Is very unstable towards acids. $C_5H_9N_3O_6$ fine white needles.

Tetra-methyl-uric acid $C_5H_9N_3O_6$ $\pm e$
 $CO \begin{matrix} NMe & CO & C & NMe \\ \diagdown & & \diagup \\ & C & \\ & NMe & \end{matrix} CO$ [218°] Formed by heating the silver salt of tri methyl uric acid with methyl iodide (Fischer, *B* 17, 1784). Distils undecomposed. Fine white needles. V sol hot water, less sol cold, sl sol ether. Has no acid properties. It is readily decomposed by alkalis, with evolution of methyl amine. It gives the murexide reaction.

METHYL-URIC ACID $C_5H_7O_6$ $\pm e$.
 $CO_2H \begin{matrix} CH & CHMe \\ \diagdown & & \diagup \\ & C & \\ & Me & \end{matrix} CO$ or $CO_2H \begin{matrix} CH & CH \\ \diagdown & & \diagup \\ & C & \\ & Me & \end{matrix} CO$

[98°] Formed by heating methyl methionine acid to 250° as long as CO_2 is evolved (Fittig, *A* 250, 205). Needles (from water) or prisms (from other solvents), m sol hot, v sl sol cold, water, v sol cold, v e sol hot alcohol, v sol petroleum ether, $CHCl_3$, benzene, ether, and $HOAc$, volatile with steam. Yields on distillation CO_2 and oxy di methyl pentamethenyl hydride.

Salts — $(C_5H_7O_6)_2Ba$ 4aq trimetric plates, $a b c = 0.9937 \times 1.49021 = A'$, Ca 4aq pearly plates, insol alcohol — AAg small prisms (from water).

Ethyl ether $A'Et$ (219°) Colourless oil, heavier than water, volatile with steam.

METHYL-VALERIC ACID v $Hfpxic$ acid
METHYL-VALEBOLACTONE v *Lactone* of Ox_1 hexoic acid

METHYL-VANILLIN v *Di methyl derivative* of **PROTocatechuic aldehyde**

DI-METHYL-DI-VANILLIN v *Tetra methyl derivative* of **TETRA OXY DI PHENYL DICARBOXYLIC ALDEHYDE**

DI-METHYL-VINYL-AMINE *Methylhydroxide* C_5H_9NO $\pm e$ $NMe_2(C_2H_5)OH$ *Neurine*. Formed by the action of moist oxide of silver on di methyl bromo vinyl methyl bromide $NMe_2(CH_2CH_2Br)Br$, the product of the union of trimethylamine with ethylene bromide (Hofmann, *C R* 47, 558, *Chem Gaz* 1858, 434, Baeyer, *A* 140, 311). It is also a product of the decomposition of protagon by baryta (Liebreich, *B* 2, 12), and of the putrefaction of flesh (Brieger, *B* 16, 1190, 1406, 17, 516, 1137). It is extremely soluble in water, and is extracted from the solution by ether with great difficulty (Marino, *G* 13, 441). Its solution is strongly alkaline, and fumes with HCl . On evaporating

its solution it decomposes with evolution of NMe_3 . Its aqueous solution is poisonous, and antagonistic to atropine as regards the heart and glandular system (Cervello, *Arch Ital Biol* 7, 232)

Methylo chloride $\text{*NMe}_3(\text{C}_2\text{H}_5)_2\text{Cl}$ Very deliquescent needles — $(\text{NMe}_3(\text{C}_2\text{H}_5)_2\text{Cl})_2\text{PtCl}_2$, yellow crystals, readily changing to neurine platinumchloride $(\text{NMe}_3(\text{C}_2\text{H}_5\text{OH})\text{Cl})_2\text{PtCl}_2$ — $\text{NMe}_3(\text{C}_2\text{H}_5)_2\text{AuCl}$, yellow needles

METHYL VINYL KETONE CARBOXYLIC ACID $\text{CH}_3\text{COCHCHCO}_2\text{H}$ β -Acetyl acrylic acid [125°] Formed by the action of aqueous sodium carbonate on β bromo acetyl propionic acid $\text{CH}_3\text{COCHBrCH}_2\text{CO}_2\text{H}$ in the cold (Wolf, *B* 20, 425) Plates, v sol alcohol and ether, m sol cold water — CaA_2 nodules, v sol water — ZnA^+ , amorphous — AgA^+ , stellate groups of needles

Phenyl hydrazide
 $\text{PhNHNCMeCH}_2\text{CH}_2\text{CO}_2\text{H}$ [157°] Formed from the acid and phenyl hydrazine (Decker, *B* 21, 2937) or by saponifying its ether Lemon-yellow needles, m sol hot water, v sol alcohol and ether

Ethyl ether *EtA **Phenyl hydrazide**
 $\text{PhNHNCMeCHCHCO}_2\text{Et}$ [117°] Formed from bromo acetyl propionic ether and phenyl hydrazine (Bender, *B* 21, 2493) Yellow spangles, sl sol cold, v sol hot alcohol On reduction with tin and HClAq it yields methyl indyl acetic acid

Isomeride v TETRIC ACID

METHYL-VIOLET A violet dye obtained by the oxidation of di methyl aniline It consists of a mixture of hexa and penta methyl tri amido tri phenyl carbinols (q) (Fischer, *B* 16, 706, 2904)

DI-METHYL-XANTHINE v THEOBROMINE and THEOPHYLLINE

Tri-methyl-xanthine v CAFFEINE

METHYL-XYLENE v MESITYLENE and ψ CUMENE

METHYL-XYLIDINE $\text{C}_6\text{H}_5\text{N}^+\text{H}^-$
 $\text{C}_6\text{H}_5\text{Me}_2\text{NMe}$ One of the products obtained by heating di methyl aniline hydro iodide at 225° (Hofmann, *B* 5, 712) Oil

Di methyl-xyldine $\text{C}_6\text{H}_5\text{N}^+\text{H}^-$
 $\text{C}_6\text{H}_5\text{Me}_2\text{NMe}_2$ (196°) SG 9293 Obtained by heating methyl xyldine with MeI (Hofmann, *B* 5, 712) Oil

Di-methyl-xyldine $\text{C}_6\text{H}_5\text{Me}_2\text{NMe}$ (203°) Obtained by methylation of crude xyldine (H) — B^+MeI

Di methyl-xyldine $\text{C}_6\text{H}_5\text{Me}_2\text{NMe}$ [87°] A by product in the preparation of methyl aniline (Sesemann, *B* 6, 445) Long needles (from ligron) — B^+EtBr

Di-methyl-xyldine [134] $\text{C}_6\text{H}_5\text{Me}_2\text{NMe}$ (204°) Formed by heating xyldine hydrobromide with MeOH (Baur a Staedel, *B* 16, 32) Oil — $\text{B}^+\text{H}_2\text{PtCl}_2$, small yellow crystals

METHYL XYLAL KETONE v XYLAL METHYL KETONE

METHYSTICIN $\text{C}_{11}\text{H}_{14}\text{O}_3$ (P), $\text{C}_{11}\text{H}_{16}\text{O}_3$ (D) [189°] (D), [137°] (P) Extracted by means of alcohol from Kawa root, the root of *Piper methysticum* (Gobley, *J Ph* [3] 37, 19, O'Rorke, *C R* 50, 498, Nölting a Kopp, *Monat Scient* [8] 4, 9, 20, Czuent, *An* 1, 150, Davidoff, *J R*

19, 522, Pomeranz, *M* 9, 863, 10, 785) White tasteless prismatic needles, sl sol hot water, ether, and ligroin, v sol hot alcohol, benzene, and chloroform Dissolves in NaOHAq , but on heating the solution methystic acid is formed On fusion with KOH protocatechuic acid is formed Boiling with KOH forms piperonal Alkaline KMnO_4 oxidises it to piperonylic acid Acetyl derivative $\text{C}_{11}\text{H}_{14}\text{Ac}_2\text{O}_3$ [123°] Benzoyl derivative $\text{C}_{11}\text{H}_{14}\text{Bz}_2\text{O}_3$ [148°] Methystic acid $\text{C}_{11}\text{H}_{12}\text{O}_3$ [180°] When 10g of methysticin are warmed with 6 pc NaOHAq 5g of methystic acid are formed. Methystic acid when heated at 180° evolves CO_2 , and the product, after cooling, melts at 93° KMnO_4 oxidises methystic acid to piperonal [37°] and piperonylic acid $\text{C}_8\text{H}_8\text{O}_3$ [227°] Dilute mineral acids convert it into methysticol. Ac_2O has no action

Methysticol $\text{C}_{11}\text{H}_{12}\text{O}_3$ $\text{CH}_2\text{<O>C}_6\text{H}_4(\text{C}_2\text{H}_5\text{O})$ $\left[\begin{smallmatrix} 1 \\ 2 \end{smallmatrix} \begin{smallmatrix} 4 \end{smallmatrix} \right]$ [94°] Formed by warming methysticin or methystic acid with dilute HClAq or H_2SO_4 (Pomeranz, *M* 10, 792) Prisms, insol alkalis, v sol alcohol and ether Forms a phenyl hydrazide melting at 143° According to Davidoff methysticin is $\text{C}_{10}\text{H}_{12}\text{O}_3$ and is decomposed by alcoholic NH_3 into 'methysticin hydrate' $\text{C}_8\text{H}_{10}\text{O}_3$ and a compound $\text{C}_8\text{H}_{11}\text{NO}_2$ which crystallises from water in yellow needles The 'methysticin hydrate' is also formed by the action of alcoholic KOH on methysticin It melts at 159°, forms the crystalline salts $\text{K}_2\text{C}_8\text{H}_9\text{O}_3$ and $\text{Ba}(\text{C}_8\text{H}_9\text{O}_3)_2$, the ether $\text{EtC}_8\text{H}_9\text{O}_3$ [100°] and the benzoyl derivative $\text{C}_8\text{H}_9\text{Bz}_2\text{O}_3$ [122°]

METINULIN v INULIN

MICROCOSMIC SALT Sodium ammonium-hydrogen phosphate, $\text{Na}(\text{NH}_4)\text{HPO}_4 \cdot 4\text{H}_2\text{O}$, v. PHOSPHORIC ACIDS AND PHOSPHATES

MILK Milk is the secretion of the mammary glands, to the naked eye it appears to be a white fluid, which in thin layers has a bluish tint Its reaction is alkaline in herbivorous animals and in woman, acid in carnivorous animals Its specific gravity varies greatly, averaging between 1.028 and 1.035 On microscopic examination milk is found to be an emulsion, consisting of a clear fluid which has a light straw colour, in which are suspended numerous minute fat globules of varying size, each enclosed in an envelope of casein Numerous particles of casein and nuclei are also seen (Kehrer, *Arch Gynaek* 2, 1) The clear fluid in which these float contains proteids, lactose, and mineral salts in solution During the first few days after parturition the milk contains a larger proportion of solid constituents, and is found microscopically to contain, besides the ordinary fat globules, a number of the secreting epithelium cells of the mammary gland of which the protoplasm has undergone fatty degeneration, this secretion has received the name *colostrum* The name *uterine milk* is given to the whitish secretion of the uterine glands which is poured out from them during the early months of pregnancy in certain animals

The following tables adapted from Charles's *Physiological Chemistry*, p 383, after Gorup Besanez, Liebermann, Gautier, &c, give quantitative statements of the constituents which occur in the milk of the commoner animals. —

Constituents	Woman Milk	(Colo- strum)	Ass	Ow	Goat	Sheep	Mare
Water	87.65	84.08	90.70	88.56	86.78	83.31	82.84
Solids	12.35	15.92	9.30	13.44	13.24	16.69	17.16
Proteids	8.07	8.23	1.70	4.08	4.23	5.73	1.64
Fats	8.81	5.78	1.55	4.03	4.48	6.05	6.87
Milk sugar	5.01	6.51	5.80	4.60	3.91	3.96	8.65
Mineral salts	0.17	0.35	0.50	0.73	0.62	0.68	

The Ash of Milk in 100 parts

	Woman's Milk (Wildenstein)	Cow's Milk (Weber)	(Haidlen)
Sodium . .	4.21	6.88	8.27
Potassium . .	31.59	24.71	15.42
Chlorine . .	19.06	14.39	16.96
Calcium . .	18.78	17.31	
Magnesium . .	0.87	1.90	56.52
Phosphoric acid	19.00	29.13	
Sulphuric acid	2.64	1.15	
Ferric oxide	0.10	0.33	0.62
Silica	trace	0.09	

The most abundant salts are thus the phosphates. The excess of potassium over sodium salts is the opposite to what obtains in blood plasma and most other fluids of the body. (See also Bunge, *Dissert* Dorpat, 1874, *Zeit Physiol Chem* 13, 399). The iron in milk appears to be combined with nuclein (Bunge).

Condensed Milk (Cane Sugar added).

Water	29 to 24
Solids	71 to 76
Casein	16 to 18
Milk sugar	8 to 18
Cane sugar	27 to 29
Ash	2 to 2.5
P ₂ O ₅	0.2 to 0.7

Swiss Condensed Milk (benzoic acid added—Flieschmann)

Water . .	52.31	Milk sugar	17.43
Fat . .	18.09	Ash	2.78
Proteid . .	12.13	Benzoic acid	1.74

Gases of milk at 0° 41 metre pressure (Pflüger)

Carbonic acid	7.6 in 100 vols of milk
Oxygen	0.1
Nitrogen	0.7

Certain preparations (Koumiss, Kephir) are now made from mare's and cow's milk, in which the alcoholic fermentation is allowed to take place, and which are valuable stimulants in cases of disease, especially of disordered digestion (for references on this subject v Maly's *Jahrsber* 14, 187).

The proteids of milk—The most abundant is casein. This is coagulated by rennet, and the more soluble precursor in the milk of the curd should be more accurately called *caseinogen* (v PROTEIDS). Albumin (*lact-albumin*) which is very similar to serum albumin is also present. Other proteids have also been described in milk, but their presence is doubtful, thus peptone is described by Schmidt Mulheim (*Pf* 28, 287), by Dogiel (*Zeit Physiol Chem* 9, 591), and by Biel (*Maly's Jahrsber* 15, 198), hemi albumose by

J Schmidt (*Maly's Jahrsber* 14, 175). These proteids appear to be primary albumoses formed by the acidification and boiling employed to separate the casein and albumin (Neumeister, *Zeit Biol* 24, 271). True peptone is always absent (Neumeister, *loc cit*, Sebelien, *Zeit Physiol Chem* 13, 135, Halliburton, *Journal of Physiol* 11, 449). Whey proteid (Hammarsten), the lacto-protein of some observers, is a by product of the action of rennet on caseinogen. Two other proteids, lacto globulin, which is identical with paraglobulin (J Sebelien, *Maly's Jahrsber* 15, 184), and lacto syntonn, which resembles acid albumin in its properties (J Biel, *loc cit*), are also stated to occur in small quantities, but the evidence that they exist is not conclusive (Halliburton, *loc cit*). In koumiss the proteids are stated to consist of albumin, syntonn, and peptone (A Dochmann, *Maly's Jahrsber* 11, 190). In colostrum casein is absent, or nearly so, being replaced by globulin (Sebelien).

The fats of milk—When milk stands, some of the fatty globules rise to the surface, and some of these are possibly freed from their proteid casing (Müller), thus forms the layer of cream. Butter is the name generally given to the fat itself, which is separated from the milk globules by mechanical agitation (churning), a certain amount of casein is, however, generally present in butter, and about one third of the fat of the milk remains in the butter milk. The fats present are olein, much palmitin, much less stearin, and about two per cent of the total fats consist of the triglycerides of butyric, caproic, and caprylic acids, with traces of myristic and arachidic acids. Cow's butter contains about 68 per cent palmitin and stearin, 30 per cent olein, and 2 per cent the other fats just mentioned. Rancidity is due to the development of free fatty acids, acrolein, &c., and, according to Hagemann, of lactic acid from the lactose admixed with fat in the butter.

Lactose or milk sugar (C₁₂H₂₂O₁₁) may be obtained from milk by evaporation in rhombic crystals containing one molecule of water of crystallisation, which is given off at 140°. It dissolves in 6 parts of cold and 2.5 parts of boiling water. It is not so sweet as cane sugar, its specific rotation is (α)_D = 59.3°. Dilute acids and hydrolytic ferments convert lactose into galactose, which is a glucose, and capable of undergoing the alcoholic fermentation, and which yields mucic acid when treated with nitric acid. Lactose reduces alkaline solutions of copper salts, and when oxidised yields mucic, saccharic, tartaric, and oxalic acid. Lactose does not itself undergo the alcoholic fermentation, but when much yeast is added fermentation occurs after some time, manite being formed. In presence of casein, &c., it undergoes the lactic acid fermentation, and it is the occurrence of this to which the souring of milk is due.

Preservation of milk.—Many different antiseptics have been suggested for the preservation of milk, e.g. salicylic acid, ether, benzene, chloroform, borax, boroglyceride, &c. Preservation is, however, usually effected by evaporating the milk to a thick syrup and adding considerable quantities of cane sugar. (For recent papers on this subject v A Mayer, *Maly's Jahrsber* 12, 168; P Biedert, Jacobi, Dietzsch, *ibid* 169,

O Loew, *ibid* 171, Morgen & Fleischmann, *ibid* 13, 174, A Baginsky, 175)

Alterations in milk—Many drugs taken in medicinal doses appear in the milk, *eg* salts of arsenic, antimony, lead, mercury (?), zinc, &c, also organic acids and alkaloïds. In various diseases the proportion of solids to water and of the different solid constituents is altered, thus in osteo malacia the lime salts are increased. Blood and pus may occur in milk, a blue colour sometimes observed is due to the growth of a chromogenic bacterium (*vibrio*), which, however, appears to be different from that which produces the blue colour in pus (J Reiset, *C R* 96, 682, 745). In tubercular diseases of cattle there is risk of contamination with tubercle bacilli, milk may also act as the carrier of other infections (scarlet fever, typhoid, &c)

ANALYSIS OF MILK

Qualitative—The specific gravity, which is increased by the removal of the cream, and reaction are ascertained in the usual way, the milk may then be examined microscopically. Casein may be precipitated by acetic or hydrochloric acid, by saturation with magnesium sulphate, or by rennet coagulation. The precipitate contains also the fat which may be separated from the casein by ether. The filtrate contains the sugar, salts, and the other proteids of the milk, which may be identified by their usual tests. The butter is best obtained from milk by adding half its bulk of 10 p.c. caustic potash solution, and then shaking the mixture rapidly with twice its volume of ether, on evaporating the ethereal extract the fat is left as a residue. The milk globules may be separated from the rest of the milk by filtration through porcelain under pressure.

Quantitative—**Solids** To 10 grains of dry sand add 5 c.c. of milk, and dry at 100° to constant weight. The increase in weight gives the solids, in 5 c.c. of milk. Below 10.5 p.c. of solids in cow's milk indicates dilution.

Butter This may be estimated by weighing the amount of residue from an ethereal extract of milk to which an equal volume of 10 p.c. caustic potash has been added. The normal minimum for fats is about 2.75 p.c. (Cameron). There are also various optical methods which depend on the degree of opacity of milk, which varies directly as the number of globules present, galactoscopes have been invented by Donné and Vogel. (On the lacto butyrometer, an instrument for estimating the fat by the ether method, *v* Tollens & Schmidt, *Maly's Jahrsber* 8, 140, Kehrer, *ibid* 11, 179, F Soxhlet, 180, Egger, 181, M Schmöger, 182.) **Cream** This may be roughly estimated by allowing the cream to rise in a narrow graduated vessel, the thickness of the layer being read off at the end of 24 hours. Good milk should yield 10 to 15 p.c. of cream. **Proteids** Pfeiffer's method is a good one, the casein is precipitated by acetic or hydrochloric acid, and freed from fat by ether, after filtering off the casein the albumin is precipitated in the filtrate by boiling, and after that has been removed the albumose is precipitated by tannin. It must, however, be remembered, as stated above, that albumose is an artificial product. Each of these precipitates is collected, dried, and weighed

(*Maly's Jahrsber* 13, 170, *v* also Parr, *ibid* 15, 185) J Sebelien (*Zeit Physiol Chem* 13, 135) estimates the proteids by the amount of nitrogen in the precipitates produced by various reagents. **Lactose** The casein, fat, and albumin having been removed, the milk sugar is converted into dextrose by boiling with sulphuric acid, and this is estimated by Fehling's solution or by the polarimetric method.

[In addition to the papers already quoted abstracts of the most important of recent papers on milk analysis will be found in *Maly's Jahrsbericht* as follows: J Forster, 11, 177, Giunti, 178; Weiske & Kennepohl, 187, de Leon, 12, 151; Knaach, 165, Stenberg, 161, Emmerich, 165, Fleischmann & Morgen, 166, Jorgensen, 167, F Hofmann, 177, Liebermann, 13, 168, C H Wolff, 169, Schrodtt & Haussen, 14, 180, *v* also Schmidt Mulheim, *Pf* 30, 602.] *Fleischmann, Das Molkerwesen*, and Tatlock, *The Produce of the Dairry*, Glasgow, 1888, should be also consulted. MILK SUGAR *v* SUGAR

MILLET OIL Appears to contain an acid $C_{11}H_{22}O_2$. On fusion with potash oil of millet yields acetic and lauric acids. On distillation it yields an acid $C_8H_{16}O_2$ or $C_9H_{18}O_2$ (216°–220°). Oxidation by $KMnO_4$ forms an hexoic acid $C_8H_{16}O_2$, and two oxy acids $C_{11}H_{20}(OH)_2O_2$ [60°], and oxy hexoic acid [108°], which yields an acetyl derivative $C_8H_{11}(OAc) CO_2H$ [71°] (Kaasner, *Ar Ph* [3] 25, 1081).

MILLON'S REAGENT A solution of mercuric nitrate containing nitrous acid, prepared by dissolving mercury (1 pt) in HNO_3 (1 pt) diluted with water (4 pts). It gives a red coagulum when warmed with albumen (Millon, *A* 72, 349).

MINERAL ACIDS A term sometimes applied to acids formed of elements other than carbon. The term is chiefly applied to the stronger commonly used acids, sulphuric, nitric, and hydrochloric.

MINERALOGICAL CHEMISTRY Mineralogical chemistry is that part of chemistry which relates to the mineral products of nature, it is also a part of mineralogy, the science which treats, not only of the chemical characters of these products, but also of their physical and geometrical characters, of their modes and places of occurrence, and of their classification.

Mineral products, as they are found in nature, frequently retain much the same character over a considerable extent of country and sometimes for a considerable depth, to such a product the term *rock* is applied, and to each kind of rock is given a special name. Mineral products are either simple or mixed. When simple they cannot be resolved, by mechanical or optical means, into matter presenting different characters, simple mineral products are briefly designated as *minerals*. Rocks are almost always mixed products. Generally the presence of different substances is obvious to the unaided eye, and the constituents can be readily separated from each other by mechanical means. From the rock termed *granite*, for example, may be got at least three kinds of matter: firstly, a substance yielding rhomboidal fragments when broken (*felspar*), secondly, a glassy substance yielding only irregular fractures

(quartz); and thirdly, a substance which may readily be split into very thin plates (*mica*). By no mechanical process can these substances be resolved into others having different characters, hence they are termed *minerals*, and as they present manifold differences from each other they have received distinctive names. Some times the composite nature of a rock is not evident until a slice, made sufficiently thin to be transparent, is examined with a microscope. Or, again, a rock, as for example *marble*, may consist wholly of a single kind of matter.

All simple minerals having the same essential characters are said to belong to the same *species*, those belonging to the same species may likewise have one or more unessential, yet more or less important, characters in common, and are then said to constitute a *variety* of that species.

It is the province of the mineralogist to discover what characters are presented by minerals, to name the characters, to determine their relative importance, to name the species and their varieties, to classify the species, and so on. Such a study of minerals must have been in progress since the earliest times. Even before 800 B.C. the study was so far advanced that minerals were classified as *metals* (i.e. those having a metallic lustre), *stones*, and *earths*, the characters then recognised as pertaining to *stones*, and used in their discrimination, were succinctly referred to by Theophrastus as follows—

‘There are in stones of different kinds many peculiar qualities, of which colour, transparency, brightness, density, hardness, and the like are frequent, though other more remarkable properties are not so common. But besides these qualities there are others such as their acting upon other bodies, or being subject or not subject to be acted upon by them. Some are fusible, others will never liquefy in the fire, some may be calcined, others are incombustible to which it may be added that in the action of fire on them they show also many other differences. Some, as amber have an attractive quality. Others serve for the trial of metals, as the Lydian stone. But the most known and general properties of stones are their several fitnesses for the various kinds of work, some of them are proper for engraving on, others may be shaped by the turner’s tools, others may be cut or sawn, some also there are which no iron instruments will touch, and others which can with difficulty, or scarcely at all, be cut by them.’

In this way it was possible even for the Ancients, without any knowledge of either crystalline form or chemical composition, to determine more or less satisfactorily the species met with in the mineral kingdom.

The definition and classification of species by means of what have been termed ‘external characters’ (such as crystalline form, cleavage, density, hardness, colour, lustre, &c.)—i.e. characters which can be determined without involving a total change of the characters of the mineral—had been found so far satisfactory that the external characters were used both for the definition and classification of the species by the best mineralogists even so lately as the early part of the present century. The most important of the external characters is now recognised to be the crystalline form. It was shown in the year 1772 that all the crystalline forms of the same substance, whether the substance is natural or artificial, are so closely related to each other that they are derivable by simple laws from a single form, and it has

since been proved that the whole series of crystalline forms of the same substance can be defined by means of numerical values which fix the shape of one of its forms, hence the limitation of each species to specimens which can be referred to one fundamental crystalline form became a necessity (v. CRYSTALLISATION, vol. II p. 278).

The recognition of chemical elements and chemical compounds, and of the constancy of the proportion of the elements in each compound, the setting forth of the atomic theory and chemical formulae, and the development of analytical methods, had great influence on the advance of mineralogy. When the specimens belonging to a species which had been defined by means of external characters were subjected to chemical analysis, it was discovered that in many cases there was a large variation in the proportion, and even in the nature, of the constituent chemical elements. For a time it was supposed that, while some substances have a great tendency to crystallise, others are comparatively inert, that, for example, the crystalline form of dolomite (carbonate of calcium and magnesium) is due entirely to the crystallising power of the carbonate of calcium, and that the carbonate of magnesium is either a mere inactive inclusion, or so feeble a crystalliser as to be completely overpowered by the carbonate of calcium. The explanation of these variations of chemical composition within species, as defined by means of the external characters, was eventually furnished by the principle of *Isomorphism* (q.v.), and it then became possible to define a species by means of a combination of only two characters—chemical composition and crystalline form. In other words, it was found that all specimens which can be referred to the same fundamental crystalline form and to the same chemical type have all other essential characters in common, though they may differ in the less important ones, such as colour or transparency. For example, if the forms of crystals can be referred to the same fundamental figure, the differences of crystalline development are themselves unessential, hence the substances popularly known as *dogtooth spar* and *needle spar*, which can be crystallographically referred to the same rhombohedron, and chemically are carbonate of calcium, are regarded as varieties of the species *calcite*, which includes all specimens having these two fundamental characters in common. Similarly, colour is another unessential character the specimens belonging to the species *fluor*, for instance, show a remarkable variation in colour. In some cases a variety characterised by a particular colour receives a distinctive name, *emerald* and *aquamarine*, for example, are respectively dark green and light bluish green varieties of the species *beryl*. It is very seldom, however, that varieties are really worthy of being distinguished by special names, and in almost every species the transition from one variety to another is so gradual that it is often impracticable to decide on the single variety to which a specimen may be satisfactorily referred. On the other hand there are specimens which, though chemically carbonate of calcium, can all be referred to a single fundamental crystalline form quite distinct from that of

calcite They are therefore regarded as belonging to a distinct species and are grouped together under the name of *aragonite*. That such a separation is a legitimate one is shown by the fact that the two species, as thus defined, differ in other important characters, such as cleavage, hardness, specific gravity, optical constants, &c. Hence the chemical compound calcium carbonate is said to be *dimorphous*, but, as already indicated, the difference between the two kinds of substance is much more than one of form. Titanic oxide, again, is met with in nature as three different kinds of substance, each presenting its own set of characters, they are necessarily to be regarded as distinct species, and have received the specific names *rutile*, *anatase*, and *brookite*. titanic oxide is said to be *trimorphous*. The variety of chemical composition among specimens regarded as belonging to a single mineral species, and which is explicable on the above mentioned principle of isomorphism, is well illustrated by the results of analyses of specimens of *tetrahedrite* (or *grey copper ore*). The crystals of this mineral belong to the cubic system and are hemisymmetrically developed, being all closely related in figure to the regular tetrahedron, chemically they can be referred to the general formula $4R'SR''S_3$, where R' includes chiefly Cu, Fe, Zn, Ag, and Hg, and R'' includes Sb, As, and Bi. The composition shows the following variations: copper 15 to 42 p.c., iron 1 to 7, zinc 0 to 7, silver 0 to 31, mercury 0 to 17, antimony 12 to 30, arsenic 0 to 20, bismuth 0 to $1\frac{1}{2}$, a few of the varieties, those containing noteworthy proportions of silver or mercury, for instance, have been distinguished by special names. The difficulty of deciding whether a mineral product is to be regarded as a distinct species or as a variety of another species presents itself in the case of the specimens to which the name of *tennantite* has been given, crystallographically they show the same relationship to the regular tetrahedron which characterises the specimens of *tetrahedrite*, and chemically they are represented by the same general formula $4R'SR''S_3$, they are distinguished, however, by the absence of antimony (and bismuth) as in the chemical composition of the specimens belonging to the above crystallographic and chemical type there is thus a sudden transition from 12 p.c. of antimony (generally accompanied by more or less arsenic) to zero, the specimens of *tennantite* are generally regarded as entitled to rank as a distinct species. Similarly *aragonite*, *witherite*, *strontianite*, and *cerussite* belong to one chemical type $R''CO_3$, and are almost identical in their fundamental crystalline forms, for the several minerals R'' is essentially Ca, Ba, Sr, and Pb they are regarded as distinct species because in nature there is found no gradual transition of chemical composition. On the other hand, the isomorphous rhombohedral carbonates belonging to the above chemical type $R''CO_3$, where R'' is Ca, Mg, Fe, or Mn, present such a gradual shading into each other, both chemically and physically, that a perfect definition of species is impossible. Another instructive illustration of this difficulty is furnished by the group of minerals to which the name *garnet* has been given. The garnets crystallise in the cubic system, and in their forms the do-

decahedron is prominently developed, chemically they are represented by the general formula $3R''O R'''O_2 \cdot 3SiO_2$. They have in general very similar physical characters, though they differ considerably both in colour and specific gravity, they have in fact every claim to recognition as a natural family or group. But the differences of chemical composition are remarkable. R' and R'' are essentially, for *grossularite*, Ca and Al, for *pyrope*, Mg and Al, for *almandite*, Fe⁺ and Al, for *spessartite*, Mn and Al, for *andradite*, Ca and Fe⁺⁺⁺, for *brockbergite*, Ca, Mg, and Fe⁺⁺⁺, for *uvarovite*, Ca and Cr. As the above kinds of garnet are connected by various transitions, it may easily be imagined that the garnet group presents great difficulty as regards the definition of its species, and that it is possible to introduce a large number of unnecessary names into the science.

There are other natural groups or families, however, as for example, the *augite*, *hornblende*, *scapolite*, *felspar*, *mica*, *chlorite*, and *tourmaline* groups, in which the representation of the chemical composition of the whole group by a single chemical formula presents great difficulties. Indeed, the formulæ which are employed in mineral chemistry are at present for the most part empirical, constitutional formulæ, such as are employed in organic chemistry, are almost unknown. Much work must be done before we obtain a real insight into the structure of the more complex silicates. For attempts in this direction the student may refer to the following —

Minerals are of interest to the chemist as the source of the various chemical elements, the characters of which, and of their combinations, it is his province to study. A few of these elements are found in the uncombined state, notably carbon, sulphur, arsenic, bismuth, copper, silver, gold, and platinum. Some are present in large proportion in numerous mineral species, the latter themselves plentifully dispersed through the earth's crust, others are found in few mineral species, and these only in small quantities and in few localities.

It is the province of the mineralogical chemist to determine the chemical composition of each species and variety, and to represent it by means of an empirical or constitutional formula. A considerable number of minerals are pure or nearly pure chemical compounds of simple constitution, and these are specially interesting to the chemist, as they often furnish him with beautifully crystallised specimens of compounds which, as laboratory products, are either amorphous or are obtained as minute crystals only with much expenditure of time and trouble, among such compounds we may especially note the sulphides of lead, zinc, copper, iron, antimony, and arsenic, the various sulpharsenites

and sulphantimonites, the oxides of aluminium, iron, titanium, silicon, and tin, various silicates, molybdate, tungstate, and chromate, of lead, tungstate of calcium, the sulphates and carbonates of calcium, strontium, barium, and lead, various phosphates, arsenates, and vanadates, of copper, lead, and calcium

Time and energy are now rarely expended in the chemical analysis of a substance unless there is something extraordinary in its external characters, and it is by means of these characters that it is possible to describe for future recognition the substance of which an analysis has been made

Mineralogical chemistry deals, too, with the classification of all the chemical compounds met with in the mineral kingdom, in fact, the arrangement in large groups is now generally based on chemical composition, though the definition of the species is made to rest also on the crystalline form. The system of classification now generally adopted is as follows —

Division I Native elements, metallic and non metallic

Division II The compounds of metals with elements of the arsenic and sulphur groups, viz arsenides, sulphides, arseno sulphides, sulpho salts, and their analogues

Division III Chlorides, and their analogues

Division IV Compounds of oxygen (a) oxides, (b) oxy salts, namely, (1) carbonates, (2) silicates and titanates, (3) molybdates and tungstates, (4) chromates and sulphates, (5) borates, (6) nitrates, and (7) phosphates, arsenates, and vanadates

For details v Groth's *Tabellarische Uebersicht der einfachen Mineralien*, Braunschweig, 1889

The mineralogical chemist observes the reactions of minerals with various reagents, both in the wet and dry way, and on a large or a microscopic scale, and by a classification of reactions he provides means for the determination of the species by chemical methods

To the mineralogical chemist is further assigned the most important task of discovering the modes in which the various chemical compounds may be produced artificially, and the investigation of the processes and reactions by which these chemical compounds have been actually produced in nature. In this respect *pseudomorphs* (i.e. minerals presenting a form characteristic not of their own but of some other substance) are of great value. They are always results of chemical change, and are produced in various ways. Some are merely due to the investment of a substance afterwards removed from beneath the crust, these have been termed *epimorphs*. For example, hollow, well defined scalenohedra of *limonite* (hydrated ferric oxide) are met with, they owe their form to crystals of calcite upon which the limonite has been deposited. In other cases the original mineral is altered throughout its mass, and suffers a loss of a chemical constituent, as when *galena* (sulphide of lead) is found with the form of *anglesite* (sulphate of lead). Or, again, there has been an addition of a chemical constituent, as when *chessylite* (a hydrated carbonate of copper) is found with the form of *cuprite* (oxide of copper). Or, again, there has been an exchange of chemi-

cal constituents, as when *galena* is found with the form of *pyromorphite* (phosphate and chloride of lead), or *calcite* with the form of *gypsum*. Sometimes there is a complete exchange of material without loss of form, as when copper is found with the form of *aragonite*. Pseudomorphs illustrate the decomposing influences to which many minerals have been subjected, and throw valuable light on the order of succession in which, and the conditions under which, particular minerals have been formed and deposited and in furnishing sure proofs of conversions which we cannot hope to effect in the laboratory, they afford a knowledge of facts which can be arrived at in no other way

The following works, relative to the artificial production of substances met with as minerals, may be consulted —

MINT The oil of spear mint (*Mentha viridis*) contains $C_{10}H_{16}O$ (225°), S G 952, and a terpene (Gladstone, J 1863, 548, cf Kane, A 32, 286)

Peppermint v MENTHOL

MOCHYLIC ALCOHOL $C_{15}H_{26}O$ [234°] Present in bird lime as mochyl palmitate $C_{15}H_{31}O_2$ (Divers a Kawakita, C J 53, 274) Slender lustrous prisms, insol water, v sl sol petroleum ether, v sol ether, m sol alcohol. Dissolves like birdlime in conc H_2SO_4 with a red colour. Heated with palmitic acid in sealed tubes to 160° a substance very similar to bird lime is obtained. Yields on distillation a hydrocarbon $C_{15}H_{32}$

MOLECULAR CONSTITUTION OF BODIES, THEORIES OF The theory of the molecular constitution of matter now universally accepted was held long before any crucial proof was given of its necessity. For though such phenomena as the enormous changes in volume which take place when a gas condenses to a liquid point most strongly to some such view, they cannot be held to be conclusive, unless it is considered axiomatic that a perfectly homogeneous structure is incapable of dilatation or contraction. The first attempt to give more elaborate reasoning in favour of the molecular theory of the constitution of matter seems to have been made by Cauchy, and was founded upon the dispersion which light experiences when it passes through transparent bodies. Since the velocity of light when passing through such bodies depends upon the wave length of the light, and also on the nature of the body, Cauchy argued, that since a velocity is not of the same dimensions as a length, the velocity cannot depend upon the wave length absolutely, but must depend merely upon its ratio to some other length, now the only length available is one derived from the body itself, and since the dispersion does not depend upon the dimensions of the transparent body, this length must be one intrinsic to the body, the body therefore cannot be homogeneous and without structure or

there would be no such length available; the body must therefore be coarse grained. This reasoning, however, is not quite conclusive, for light of different wave lengths has different times of vibration, and the phenomenon of dispersion might be expected if there were any time connected with the structure of the body which could come into comparison with the time of vibration of the light. Dispersion proves that the transparent body is coarse grained, either with respect to space or time, but does not prove that it is necessarily coarse grained with regard to space on a scale comparable with the wave length of light. In fact, in the theories which have been put forward to explain dispersion, this phenomenon is made to depend upon the ratio of the time of vibration of light to some time of vibration of the molecules of the system. A less ambiguous proof of the molecular structure of gases was given by Osborne Reynolds in his paper '*Some Dimensional Properties of Matter in the Gaseous State*' (*T* 1879). This proof was founded on the phenomenon called the 'thermal effusion' of gases. This phenomenon is of the following kind.—If we have a vessel divided into two portions by a porous diaphragm, say of stucco or meerschäum, and the gas on one side of the diaphragm is kept at a different temperature from that on the other side, it is found that, in order to prevent the gas flowing from the cold to the hot side of the diaphragm, the pressure of the gas on the hot side must be greater than that on the cold side, and that the difference of pressure required to prevent the flow obeys different laws according as the gas is dense or rare. If the gas is dense, this difference of pressure varies inversely as the density of the gas, while if the gas is rare, the difference of pressure varies directly as the density. Reynolds found that the density of the gas at which the law changed from one form to the other depended upon the fineness of the pores of the diaphragm, the finer the pores, the greater was the density at which the law changed. Thus, since the law connecting the difference of pressure with the density depends upon the diameter of the pores of the diaphragm, there must be some length in the gas with which this diameter of the pores can come into comparison, the gas must therefore have structure, and since the density of the gas when the law changes is greater for small pores than for large ones, the structure of the gas must be finer at great densities than at low ones. The investigations of Sir William Thomson (*Popular Lectures and Addresses*), Loschmidt, and others, have gone further than this, and have not merely furnished proofs that matter has structure, but have given limits below which the coarse grainedness of matter cannot lie. These investigations are founded on considerations about surface tension, the difference of potential which occurs when two metals are put in metallic connexion, the amount of polarisation at the surface of an electrode and an electrolyte, the viscosity, the diffusion, and the conductivity for heat, of gases. It will be sufficient for us to show how one of these leads to a limit for the dimensions of molecular structure, and we will take the one depending on the surface tension. The surface-

tension of a film of liquid is not likely to alter until the thickness of the film falls below the distance at which one molecule ceases to exert an appreciable influence on another, for it is only the molecules within a film of this thickness which can exert any influence on those at the surface, so that if we can find a limit to the thickness of a film which possesses an unaltered surface tension, we shall have a quantity comparable with the distance up to which one molecule exerts an appreciable effect on another. When a film is stretched, work is done on it against surface-tension, and this work is stored up in the film, so that if the surface-tension were the same for an infinitely thin film as for one of finite thickness, an infinite amount of work could be stored up in the film. But the greatest amount of energy which can be stored up in, say, a gram of water must be less than the amount required to separate the molecules to such a distance that they no longer exert any influence on each other, but this is exactly what is done when the water is vaporised, so that the greatest amount of energy which can be stored up in a gram of water is less than the amount required to convert it into steam. To convert one gram of water at 15° into steam requires the expenditure of $621 \times 4.2 \times 10^7$ ergs. If T be the surface tension of water, and if the gram of water is stretched into a thin film whose thickness is x , the work done in stretching it is $\frac{2T}{x}$, but this is not all the energy which

is communicated to the film, for, unless heat is supplied to the film as it stretches, it will cool, the amount of heat which must be supplied to the film, when measured in mechanical units, is about half the work done in stretching the film, so that the total energy communicated to the film is $3T$, this must be less than the work required

to vaporise the film, so that $\frac{3T}{x}$ must be less than $536 \times 4.2 \times 10^7$, or putting T at 15° equal to 74 , x cannot be less than 8.5×10^{-7} cm, that is, a thickness of 10^{-6} cm must be comparable with the range of molecular action of the water molecules.

Quincke (*P* 137, 402) investigated the range of molecular forces, by finding the thickness of a silver film which when deposited on glass just began to alter the capillary ascent or depression of water in contact with the glass. The results of this, and other investigations with a similar object, are summarised in the following extract from a paper by Rucker (*C J Trans* 1888 260) —

Table of properties of thin films and of molecular magnitude

Thickness of film = 118×10^{-7} cm

Superior limit to the radius of molecular action, deduced from Plateau's experiments (*Statique des Liquides*, 1873, i 210) on the pressure of a soap bubble, by using Maxwell's theory that the surface tension first diminishes when the thickness of the film equals the range of molecular action, $96 \times 10^{-7} - 45 \times 10^{-7}$

Between these limits the thickness of a film begins to be unstable, that is, the surface tension

begins to diminish Hence the radius of molecular action must be $< 96 \times 10^{-7}$ and $> 22 \times 10^{-7}$ cm

$$50 \times 10^{-7} \text{ cm}$$

Value of the range of molecular action deduced by Quincke (*P* 137, 402) from experiments on capillary elevation

$$12 \times 10^{-7} \text{ cm}$$

Average thickness of black soap films, measured by two independent methods

As the tension of a black film is equal to that of a thick film, the surface tension, which begins to diminish at 50×10^{-7} cm, must increase again, and reach its original value at 12×10^{-7} cm This is also about the thickness below which, according to O Wiener (*W* 31, 629), a thin silver plate will no longer produce the same effect on the phase of reflected light as a thick silver plate would do

$$10.5 \times 10^{-7} \text{ cm}$$

Thickness of the permanent water film observed by Bunsen (*W* 24, 322) on unwashed glass at a temperature (23°C) at which the vapour pressure of water is small

$$4 \times 10^{-7} \text{ to } 3 \times 10^{-7} \text{ cm}$$

Average distance from centre to nearest centre of molecules in gases under standard conditions, calculated by Meyer (*Die kinetische Theorie der Gase*)

$$3 \times 10^{-7} \text{ cm}$$

Thickness of metal films required to polarise platinum completely (Oberbeck, *W* 31, 331)

$$10^{-7} \text{ to } 2 \times 10^{-8} \text{ cm}$$

Thickness of electric double layer, according to Oberbeck and Falck (*W* 21, 157)

$$2 \times 10^{-8} \text{ cm}$$

Smallest thickness of silver which affects the phase of reflected light (Wiener, *l.c.*)

$$1.4 \times 10^{-8} \text{ to } 1.1 \times 10^{-8} \text{ cm}$$

Diameter of gaseous hydrogen molecule

$$7 \times 10^{-8} = 2 \times 10^{-8} \text{ cm}$$

This is given by combining (1) the specific inductive capacity and coefficient of viscosity, (2) the refractive index and coefficient of diffusion, (3) the law of expansion and the thermal conductivity

Average distance between centre of molecules supposed arranged uniformly in liquids and solids according to Thomson

$$2 \times 10^{-8} \text{ cm}$$

Inferior limit to the diameter of a gaseous molecule according to Thomson These results may be shortly summed up as follows —

10^{-7} cm		
118 × 1	Superior limit to range of molecular action	Plateau, Maxwell.
96—45	Range of unstable thickness begins.	Reinold and Rücker
59	Superior limit to range of molecular action	Plateau.
50	Magnitude of range of molecular action	Quincke
12	Range of unstable thickness ends.	Reinold and Rücker
12	Action of silver film on phase of reflected light alters.	Wiener
10.5	Thickness of permanent water film on glass at 23°	Bunsen.
4—3	Mean distance between centres of nearest molecules in gases at 760 mm and 0°C	O Meyer

10^{-7} cm.		
3—1	Thickness of metal films which polarise platinum	Oberbeck.
1—0.02	Thickness of electric double layer	Lippmann and Oberbeck.
2	Smallest appreciable thickness of silver film.	Wiener
14—11	Diameter of gaseous hydrogen molecule	Exner O Meyer Van der Waals.
07—02	Mean distance between centres of nearest liquid molecules	W Thomson.
02	Inferior limit to diameter of gaseous molecule.	W Thomson

Having obtained some idea of the coarseness of the structure of matter, we shall now consider various theories of that structure In order to see what has been explained by these theories, and what remains to be explained, let us enumerate the most important properties of matter in that state of aggregation when the properties are the most simple, *z.e.* the state of a so called 'perfect' gas

1 The relation between pressure, density, and temperature is expressed by the laws of Boyle and Charles, $p = \kappa \rho \theta$, when p is the pressure, ρ the density, and θ the absolute temperature of the gas, and κ is a quantity which remains constant for the same gas For different gases κ is inversely proportional to their combining weights In all such gases there is the same number of molecules in unit volume, provided the pressure and temperature are the same

2 The gases possess viscosity The coefficient of viscosity (unless the density is very greatly reduced) is independent of the density, but depends upon the temperature The most recent experiments show that the viscosity varies as the two third power of the absolute temperature (Barus, *Bulletin of the U S Geological Survey*, No 54, 1889)

3 The gases conduct heat with a facility depending on the temperature

4 They diffuse into each other with a rapidity depending upon the density and the temperature

5 They possess specific heats of various kinds, the ratio of the specific heat under constant pressure to that under constant volume being 1.4 for most gases

6 They exhibit phenomena of the type of those which occur in the radiometer

7 When they are raised to a high temperature they become luminous, and give out rays of definite periods, the periods being independent of the temperature They absorb light of the same periods as those they give out when hot

8 They possess very different electrical properties For low differences of potential they insulate almost perfectly, but when the electric intensity is raised sufficiently a spark passes through them, and the electricity is discharged

9 The various gases exhibit very different chemical properties

According to the kinetic theory of gases a gas consists of a great number of small particles called molecules, moving about with great velocity in all directions, but continually either striking against each other, or coming so near together that they exert forces on each other which produce effects somewhat similar to those produced by the collision of two elastic balls This theory has been shown by Maxwell and

Clausius (Maxwell's *Theory of Heat*, O E Meyer's *Die kinetische Theorie der Gase*) to be sufficient to explain all those properties of gases included under (1). These properties are independent of the nature of the molecule, and of the exact way in which two molecules act upon each other. They could be deduced equally well whether we supposed the molecules to be hard elastic spheres, or systems attracting or repelling each other when they come near to gether, or vortex rings. When we consider other properties besides those included in (1), we find the explanation less satisfactory. The theory gives an explanation of the viscosity, diffusion, and conduction of heat, but the exact way in which these properties vary with the temperature depends upon the nature of the action between the molecules. Two cases have been worked out by Maxwell. In the first case the molecules were supposed to be hard perfectly elastic spheres, and which only acted upon other molecules when in collision with them. According to this hypothesis, the coefficient of viscosity would be proportional to the square root of the absolute temperature. The other case which has been worked out by Maxwell is that in which the molecules are regarded as systems repelling each other with forces which vary inversely as the fifth power of the distance between them. According to this hypothesis, the coefficient of viscosity would be proportional to the absolute temperature. The experiments of Barus (*l c*) and others show that the coefficient of viscosity obeys neither of these laws, but varies more quickly with the temperature than the result obtained on the first hypothesis, and more slowly than that obtained on the second. Neither of these theories of the action of one molecule on another can be the true one. Sutherland (*P M* 24, 113, 168), by considering the results of Thomson and Joule's experiments on the cooling of gases passing through a porous plug, arrives at the conclusion that the force between two molecules must be inversely as the fourth power of the distance between them. The value of the temperature coefficient of the viscosity on this hypothesis has not, however, been worked out.

The fact that the ratio of the specific heat at constant pressure to the specific heat at constant volume is the same for the perfect gases with the same number of atoms in the molecule has not been explained by the kinetic theory, and in fact the results we should expect from the kinetic theory are so different from those actually observed that they constitute perhaps the gravest difficulty which the kinetic theory has yet encountered. The results to which the kinetic theory leads are easily found. Let T_m be the total kinetic energy of the molecules in unit mass, β the ratio of this to the energy due to the translatory motion of their centres of gravity, p the pressure, v the volume of unit mass, and θ the absolute temperature. Then

$T_m = \frac{3}{2} \beta p v$, so that k the specific heat at constant volume will equal $\frac{3 \beta p v}{2 \theta}$. If the pressure is kept constant, then, in addition to the energy spent in warming the gas, an amount

of work— $p \times$ (change in volume for one degree)—is done, but when the pressure is constant the volume is proportional to the absolute temperature, so that the change in volume for one degree = v/θ . Thus, if k_p be the specific heat at constant pressure, then

$$k_p = \frac{3 \beta p v}{2 \theta} + \frac{p v}{\theta},$$

$$\text{so that } \frac{k_p}{k_v} = \frac{3}{2} \beta + 1$$

or if the ratio of the specific heats be denoted by γ

$$\gamma = 1 + \frac{2}{3\beta}, \quad \beta - 1 = \frac{5 - 3\gamma}{3(\gamma - 1)}$$

Now $\beta - 1$ is the ratio of the internal energy of the molecules to that due to the motion of translation of their centres of gravity, and we see from the preceding equation that this depends only upon the ratio of the two specific heats, the constancy of this ratio for different gases shows that the proportion which the vibratory energy bears to the energy of translation must be the same for all such gases, so that at the same temperature the vibratory energy of all these gases must be the same. Now the number of lines visible in the spectrum of the various gases is very different, and we should therefore expect the gases to have very different capacities for vibratory energy. The fact that it is not so seems to indicate that the vibratory energy is not due, at any rate at low temperatures, to those quicker modes of vibration which manifest themselves as light, but must be due to some other modes common to all gases. This mode in a diatomic gas may, possibly, be the motion of the atoms relatively to each other, and this view is strengthened by the fact that the ratio of the vibratory to the translatory energy increases with the number of atoms in the molecule. Thus, if we take Dulong's values of the ratio of the specific heats for hydrogen, carbon dioxide, nitrous oxide, and ethylene, the values of the ratio of the vibratory energy to the energy of translation are respectively 75, 11, 11, and 2, thus, for these gases the ratios are very approximately proportional to the number of atoms in the molecule, and the result suggests that the vibratory energy at these low temperatures is that of the atoms in the molecule relatively to their common centre of gravity, and not of the quicker modes of vibration corresponding to the luminous rays. If experiments on the ratio of the specific heats could be made at temperatures high enough to produce luminosity of the gas, it is possible that the results might be different from those made at lower temperatures, and that they might be found to vary from gas to gas.

Theories of the Constitution of the Molecule
The kinetic theory of gases, as developed by Clausius and Maxwell, dealt chiefly with the behaviour of a large number of molecules, and said little about the constitution of individual molecules. Quite recently, however, Sir W Thomson (*Lectures on Molecular Dynamics and the Wave Theory of Light*) and Lindemann (*Ueber Molekularphysik, Physikalisch Gesellschaft, Königsberg, 39 [1888]*) have discussed the properties of a molecule consisting of a number of spherical

shells, one inside the other, each shell being connected to the one next it by an elastic spring. The external spherical shell is supposed to be acted on by the ether, or, what is the same thing, by a periodic force whose period is that of the vibrations which the ether is transmitting. We may say in passing that many of the results obtained do not depend upon this special view of the construction of the molecule, but would be true if we supposed the molecule to be a dynamical system whose configuration could be fixed by n co ordinates, that is, a system possessing n degrees of freedom. The behaviour of such systems when light falls upon them is investigated in the papers above mentioned, and expressions are obtained for the refractive index of a medium consisting of molecules of this kind for light of any period. These expressions explain the dispersion of light, and the results deduced from them agree with those found by experiment, they also explain the anomalous dispersion of the rays whose periods nearly coincide with those which are absorbed by the medium—a subject which was investigated experimentally for several substances, especially a solution of fuchsin in alcohol, by Kundt and Christoffel—the periods of vibration of the glowing gas being the periods of vibration of the spherical shells which constitute the molecule. The nature of the molecules assumed in this theory imposes a limit to the amount of energy due to the relative motions of the shells, for it is evident that the amplitude of vibration of any shell cannot be greater than the difference between its radius and that of a neighbouring shell. Thus, on Lindemann's theory, the internal kinetic energy reaches a maximum, and when it has reached this maximum any further exposure to light must lead to an increase in the translatory energy, and thus to an increase in the temperature of the system made up of such molecules.

Lindemann explains the development of heat which occurs on chemical combination by the transference of the internal kinetic energy into translatory energy, the substances after combination possessing less internal energy than before, the heat being produced by a loss of kinetic energy, and not, as in the ordinary explanation, by a loss of the potential energy of separation. If this view is correct, however, the internal kinetic energy must in certain gases be enormously greater than the translatory energy, thus, for example, in the combination of hydrogen and oxygen enough heat is produced to raise the temperature of the mixture nearly $20,000^{\circ}\text{C}$, and even assuming that after combination there is no internal kinetic energy, the internal kinetic energy before combination must be about 70 times the translatory energy. It is very difficult to see how this can be reconciled with the value found by experiment for the ratio of the specific heat at constant pressure to that at constant volume.

According to Lindemann, the electric properties of bodies are to be explained by internal kinetic energy due to vibrations which are too quick to be visible, in fact, roughly speaking, electricity is ultra violet light. This view is open to many difficulties, one of which is that it would not lead us to expect the great differ-

ence that exists between the electrical properties of the atom and the molecule. A molecule seems to be almost electrically neutral, thus it is impossible to communicate a charge of electricity to the molecules of a gas, though when the molecule is split up into atoms it exhibits most energetic electrical properties. Karl Pearson (*Proc London Math Soc*, 20, 38) has developed a theory in which the molecules are supposed to be made up of spheres vibrating in an uncompressible fluid, he obtains results similar to those of Sir W Thomson and Lindemann. In fact, as we said before, many of these results do not depend upon the nature of the molecule, but would be true if we supposed the molecule to be a dynamical system possessing n degrees of freedom.

Evidence as to molecular structure afforded by the spectra of bodies.—If we consider the oscillations of a dynamical system possessing n degrees of freedom, we find that there are n periods of vibration given by the roots of a determinantal equation, and that the relation between these roots depends on the nature of the system, a system could be constructed having n periods of any given value. If, however, the system possesses an infinite number of degrees of freedom, there will be an infinite number of periods, but the periods will be connected by more or less simple relations. Thus, if the vibrating system were like a stretched string, the periods would be proportional to the natural numbers, while if it were like a bar, the periods would be proportional to the natural numbers for the longitudinal and torsional vibrations, and to the roots of the equation $\frac{1}{x} \left\{ \epsilon^{\frac{1}{x}} + \epsilon^{-\frac{1}{x}} \right\} = \pm 2$ for the transver-

sal vibrations. If the system were a circular membrane, the frequencies would be proportional to the roots of an equation formed by equating a Bessels function to zero. If the system were a uniform elastic sphere, the frequencies would be the roots of a complicated equation given by Chree in the *Transactions of the Cambridge Philosophical Society* (14, 316, 317). Other periods which have been worked out are those of circular vortex rings. The frequencies of the higher vibrations about the circular form are proportional to $\sqrt{n(n-1)}$, where n is a large natural number, and the vibrations about the circular cross section are proportional to the natural numbers (J J Thomson, *On the Motion of Vortex Rings*, 35, 74). Many investigations have been made with the object of finding whether or not there are simple harmonics—that is, frequencies proportional to the natural numbers—in the spectra of bodies. In the case of the spectrum of hydrogen, Johnstone Stoney finds that the wave lengths 4102 37, 4862 11, 6563 93, which occur in this spectrum, are very accurately in the ratio $\frac{1}{32} : \frac{1}{7} : \frac{1}{5}$. Schuster, however, in his 'Report on the Genesis of Spectra' (*B A Reports*, 1882) says

'Other writers, as, for instance, Sorét (*P M* 1871 464), have from time to time drawn attention to harmonic ratios in various spectra, and the author of this report has during the last ten years collected a large quantity of material bearing on the question. The results have, on

the whole, not been favourable to the theory of harmonic ratios. In any spectrum containing a large number of lines it is clear that, owing to accidental coincidences, we shall always be able to find ratios which agree very closely with the ratios of small integer numbers. It is only by means of a systematic investigation that we can find out whether these coincidences are due to any real cause. We must, by means of the theory of probabilities, calculate the number of the coincidences, which we might expect to find on the supposition that the lines are distributed at random throughout the whole range of the visible spectrum. If on calculating out all fractions which can be formed in a spectrum by any pair of lines the number of ratios agreeing within certain limits with ratios of integer numbers greatly exceeds the most probable number, we should have reason to suppose that the lines are not distributed at random, but that the law suggested by Messrs. Lecoeq de Boisbaudran and Stoney is a true one.

The results of a long investigation conducted in this manner tend to show that the number of harmonic ratios is, if anything, smaller than was to be expected on the hypothesis of no connexion.

The simple harmonic ratio is not, perhaps, *a priori* the most probable relation between the periods. Balmer (*W* 25, 80) has shown that the wave lengths of a series of hydrogen lines are expressed by the formula $\frac{Cm^2}{m^2 - 4}$, where m

is an integer. Hagenbach (*Verhand d Naturforsch Ges zu Basel*, 1886) has compared the results of this formula with Cornu's measurements of the wave lengths of the hydrogen lines, the result of the comparison is given in the following table—

$$\lambda = 3645.42 \frac{m^2}{m^2 - 4}$$

Line	m	Calculated wave length	Observed wave-length	Difference
H α	3	6562.8	6563.1	+ 3
H β	4	4860.6	4860.7	+ 1
H γ	5	4339.8	4339.5	- 3
H δ	6	4101.1	4101.2	+ 1
H ϵ	7	3969.5	3969.2	- 3
H ζ	8	3888.4	3888.1	- 3
H η	9	3834.8	3834.9	+ 1
H θ	10	3797.3	3797.3	0
H i	11	3770.0	3769.9	- 1
H κ	12	3749.6	3750.2	+ 6
H λ	13	3733.8	3734.1	+ 3
H μ	14	3721.4	3721.1	- 3
H ν	15	3711.4	3711.2	- 2

These results seem to show that the hydrogen molecule is a system possessing an infinite number of degrees of freedom, and not a finite number of rigid particles mutually attracting each other.

It is worthy of notice that when m is large the formula previously quoted for the frequency of vibrations of a circular vortex ring becomes $\lambda = \frac{Cn}{n^4 - \frac{1}{2}}$ which is of the same type as Balmer's

A very striking feature in the spectra of some elements is the recurrence in the spectra of certain groups of lines—for example, triplets in the magnesium, doublets in the sodium, spectrum—and the most promising way of finding whether there is anything corresponding to overtones in the spectrum would be the investigation of the relation between the frequencies of the lines in these groups as they recur in the spectrum. It is stated by Schuster that no simple harmonic relations exist between these

groups. Deslandres (*C R* 104, 972) has shown that the periods of the recurring bands in the nitrogen spectrum are connected by a relation of the form $An + B$, where n is an integer.

The first explanation of the existence of these groups which suggests itself is that corresponding to a triplet we have three, to a doublet two, similar systems near together. Each of these systems, if free from the other's influence, would vibrate with the same period, but when placed so near together that they influence each other, the system of three will have three, and that of two will have two, nearly equal periods.

The theory of the oscillation of such systems shows that the gravest mode of the combined system will be lower, and the highest higher, than that of the original system. Thus in a triplet corresponding to each line of the original system, there will be three lines. If this view is correct, then any 'element' in whose spectrum doublets or triplets occur is capable of being split up into simpler systems, and the lines of the substance into which it is split up will be intermediate between those of the doublets or triplets. Thus, we should expect to find a tendency for these doublets to disappear as the temperature is raised. Though there does not seem much evidence to show that this tendency is widespread, it does appear to exist in the case of calcium, for in the drawing of the spectrum of this element given in Lockyer's *Studies in Spectrum Analysis* (191) there is in the violet end of the spectrum a doublet where the spark is taken without a jar in the circuit, but when a large jar is placed in the circuit the doublet is replaced by a single line intermediate to those of the doublet.

The widening of the lines of the spectrum of a gas when the pressure is increased might be explained on similar principles. A molecule when free from the influence of other molecules vibrates in certain definite periods, and shows sharp bright lines in its spectrum, when, however, it gets under the influence of another similar molecule its periods are slightly altered, and for each of the original periods we have two periods, the one graver and the other higher than the original period, the departure from the original period depending on the distance between the molecules. Thus, in the case of a gas so dense that the molecules influence each other, the molecules, instead of emitting light of a definite period, would emit light of different periods, some higher and some lower than the undisturbed one, thus, instead of a bright line in the spectrum, we should have a luminous band stretching across the original bright line.

Connexion between spectra of elements and those of their compounds—One of the most interesting subjects in connexion with molecular theories, and one from which we may hope to gain great insight into molecular structure, is the connexion between the spectrum of a compound and the spectra of its constituents. Mitscherlich showed that compounds have emission spectra of their own. A considerable amount of work bearing on the subject has been done by Gladstone and Dale, Abney and Festing, Kundt, and others, who have investigated the absorption spectra of compounds. But, however important these researches are from other points of view,

they cannot be said to have as yet thrown much light on the structure of matter

A relation between the lines in the spectrum of a compound and the lines in the spectra of its elements, based on a mathematical theory, which, however, does not seem yet to have been published, has been enunciated by Grunwald, who states (*P M* (6) 84, 354) —

'Let a be a primary chemical element, which is chemically combined with other elements in a gaseous substance A , and occupies the volume $[a]$ in the unit volume of A . Let the substance A combine chemically with another gaseous substance B , to form a third C . In this combination let the element a pass into a different chemical condition a' , giving up (or in exceptional circumstances taking up) a certain quantity of heat in order to permit the new compound to form, and in consequence chemically contracting (or exceptionally expanding). Let the volume which it occupies in the body C , after the new condition of chemical equilibrium has been established, be $[a']$, then the quotient $[a]/[a']$ is generally a very simple rational number in accordance with a known fundamental law of chemistry. If this is the case the wave-lengths λ of all the rays which belong to the element a in the line-spectrum of the free substance A , and are therefore radiated by it are related to the wave-lengths λ' of the corresponding rays which the same element emits in the new chemical condition a' , in which it exists in the more complex substance A within the newly formed compound C , as the corresponding volumes $[a]$ and $[a']$ '

This relation has been tested in the case of water vapour, as however both this substance and hydrogen have a good many lines in their spectra, it is not surprising that coincidences occur between the observed and calculated values of the wave lengths of the lines in the water vapour spectrum. We must, therefore, suspend our opinion as to the value of the relation given by Grunwald until the theoretical grounds on which it is based have been published. See also Ames (*N* 40, 19)

In a binary compound, AB , we may suppose that the atoms A and B are dynamical systems, which in the molecule of the compound are near together, and that the proximity of A causes the periods of B to be slightly different from the periods when B is vibrating by the influence of other systems, and *vice versa*. Then the theory of the vibrations of such a system shows that if p_1, p_2, \dots, p_n are the frequencies of A when free, q_1, \dots, q_n those of B , $\delta p_1, \delta p_n, \delta q_1, \delta q_n$, the increase in the frequencies p_i, \dots , respectively, due to the proximity of the two systems, then

$$p_1 \delta p_1 = \frac{f_{11}^2}{p_1^2 - q_1^2} + \frac{f_{12}^2}{p_1^2 - q_2^2} + \dots$$

With similar expression for δq_1 &c. The quantities f_{11} are quantities depending on the proximity of the systems

From this relation we see that the effect on the period, say p_1 , of the first system of the existence of a period, say q_2 , in the second, is to quicken the period of the first, if the first is quicker than the second, and to retard it, if it is slower than the second. If we observe the spectra, this result could be expressed by saying that the effect of the annexation was to make the line of B repel the lines of A . Thus on this theory the spectrum of the compound may be got by superposing the spectra of its constituents, A and B , and then supposing the lines of A to repel those of B , and the lines of B to repel those of A , the repulsion increasing with the proximity of the lines. Thus if we take two elements A and B , such that A and B have two lines nearly coinci-

dent, then in the compound AB these lines will be considerably displaced and the distance between them increased

Arrangement of the atoms in the molecule on the supposition that the atoms are vortex rings
There is one theory of the structure of the molecule which is worth mentioning, as it affords a possibility of the explanation of that remarkable alternation of properties with atomic weight which is expressed by the periodic law. If we assume that a molecule is built up of a number of vortex rings placed close together, then a section of the molecule, by a plane through the centre at right angles to the planes of the ring, will consist of two groups, each consisting of a number of small circles. The arrangement of the circles in either group will be very much the same as the arrangement, when in steady motion, of the cross sections of the same number of uniform straight parallel vortex columns with circular sections. These, when in steady motion, arrange themselves in a definite way, which may easily be discovered without calculation, as the arrangement is very nearly the same as that of the same number of equal uniform parallel magnets under the attraction of a magnetic pole, some distance away from the nearer poles of the parallel magnets, and of opposite sign to these poles. These magnets will take up definite positions of equilibrium, under the action of their mutual repulsion and the external attraction. The figures of equilibrium of the magnet are given by Mayer (*N* 18, 253) and Monckman (*Proc Camb Phil Soc* 6, 169). If we examine these figures, we see that as the number of magnets increase there is a tendency for certain peculiarities to recur, as, for example, the number of planes of symmetry, and the nature of the simpler groups of which we may imagine the more complex ones to be made up. Thus, if we imagine the molecules of all elements to be made up of the same primordial atom, and interpret increasing atomic weight to indicate an increase in the number of such atoms, then, on this view, as the number of atoms is continually increased, certain peculiarities in the structure will recur, which in all likelihood would be accompanied by a recurrence of some of the properties of the elements

Electrical theory of molecular structure — There is another view of molecular structure which is almost forced upon us by the laws of electrolysis, this is, that the forces between the atoms in the molecule are electrical in their origin. On this theory, the atoms in the molecule of a compound are supposed to be charged with definite quantities of electricity, the quantity of electricity on the atom being the same for all elements of the same valency, and being positive or negative, according as the element is electro positive or electro negative. The charge on an atom of a divalent element is assumed to be twice, and that on an atom of a trivalent element three times, the charge on the atom of a monovalent element (*v* Von Helmholtz [*Fara day Lecture*], *C J* 39, 277). This view of the structure of the molecule at once explains Faraday's law of electro chemical decomposition. It also explains the difference which exists between the electrical properties of the molecule and the atom, for in the molecule the positive and ne-

gative charges neutralise each other's effect at points outside the molecule, the free atom is, however, essentially charged and therefore capable of producing electrical effects. When we dissociate a gas into atoms, the dissociated gas, on this theory, consists of an equal number of electrically charged particles, some being charged with positive electricity, and an equal number (if the constituents of the molecule are of the same valency) charged with negative electricity. This collection of electrified particles would behave like a conductor of electricity, so that, if this theory of the structure of the molecule is correct, a gas whose molecules are dissociated by heat into atoms ought to be a conductor of electricity. J J Thomson (*P M* [6] 29, 358, 441) has recently made a series of experiments on the conduction of electricity through very hot gases, and has found that while some of these hot gases (hydriodic acid gas, for example) allow electricity to pass through them with ease, others (such as nitrogen) only allow it to do so with great difficulty, and it was found that whenever the electricity passed with ease through a hot gas, the dissociation of the gas could be detected by chemical means. These experiments are, therefore, in accordance with the result of this theory of molecular structure. On this view of molecular structure the 'bonds of affinity' of chemists have a distinct physical meaning, as they are the tubes of electrostatic force connecting the atoms.

A difficulty which arises on this theory, and one that seems to show that it requires modification, is the existence at low temperatures of what are called by chemists unsaturated compounds. For, according to this view of the structure of matter, an unsaturated compound is one in which there are not equal and opposite quantities of electricity in each molecule, so that the molecules of an unsaturated gas, being electrically equivalent to a number of positively and negatively charged particles, ought to be have like a conductor. But gases which are unsaturated at low temperatures, such as NO, behave at these temperatures with respect to electricity like saturated gases, they transmit electric induction. For example, a gold leaf electroscope will work perfectly well inside a glass vessel containing NO, and its leaves will be attracted by an electrified body outside the electroscope, and a current of electricity cannot be driven through a tube containing such gases by a battery containing only a small number of cells. We must therefore conclude that electrically such gases are saturated.

Maxwell, in the article on the 'Constitution of Bodies,' *Encyclopædia Britannica*, introduced the idea that in solids the molecules might arrange themselves in groups, some of which under the action of stresses might split up and form other stable groups in which the molecules are differently arranged, these new groups returning only slowly to their original configuration after the stresses are removed. This behaviour of the molecular groups shows itself in the 'elastic after effect' produced by torsion in metal wires and glass fibres. Ewing (*P M* [6] 30, 205) has lately applied the same idea to explain the behaviour of iron when magnetised, and has devised a model which illustrates very clearly

the breaking up of the old groups and the formation of new ones J J T

MOLECULAR WEIGHTS The article **ATOMIC AND MOLECULAR WEIGHTS**, in vol 1, describes the limits within which the term molecular weight may be applied with safety to solid and liquid bodies (*v* especially pp 347-350). Since that article was printed, an advance has been made in the methods by which the molecular weights of bodies which cannot be gasified without decomposition may be determined. This advance is based, for the most part, on the researches of Raoult. As the result of a long series of investigations into the lowering of the freezing point of water and various other solvents, produced by dissolving therein quantities of various compounds proportional to the formula-weights, or reacting weights, of these compounds, Raoult finds that such quantities of chemically similar compounds generally produce equal lowerings of the freezing points of water and some other solvents (Raoult's Memoirs will be found in *A Ch*, *v* especially [6] 8, 817).

Let P grams of a compound be dissolved in 100 g of water or other solvent, and let the observed lowering of freezing point of the solvent be C , then $\frac{C}{P}$ is called by Raoult the *coefficient of lowering of freezing point* for the compound in question. Putting M as the reacting-weight, or formula weight, of the compound, then $\frac{C}{P}M$ is called the *molecular lowering of freezing point* for this compound.

Raoult finds that $\frac{C}{P}M$ is generally constant for all the members of a series of chemically similar compounds. Thus, Raoult gives the following values for $\frac{C}{P}M$, water being the solvent —

- 19, for many organic compounds,
- 35, for salts of monovalent metals with monobasic acids,
- 40, for normal salts of monovalent metals with dibasic acids.

Raoult also gives the following values for $\frac{C}{P}M$, benzene being the solvent —

- 49, for many organic compounds,
- 25, for the lower members of homologous series of alcohols.

Other values for $\frac{C}{P}M$ were found when other solvents, *e g* acetic acid, were used.

Another form in which Raoult's results may be put is the following $-\frac{P}{C}$ = grams of dissolved body, in 100 g solvent, that lower freezing point of solvent 1°. Now $\frac{P}{C} \times c = M$, where c = constant determined experimentally for each series of chemically similar compounds, and for each solvent.

If the value of $\frac{C}{P}M$ is known for a group of compounds, or if the value of c is known in the

expression $\frac{P}{C} \times c = M$, it is possible to find the formula-weight of a member of this group. Thus, in the case of ether, the following data were obtained —

(i) 4.47 g ether were dissolved in 100 g water, the freezing point of the water was lowered by 1.05° , hence $\frac{C}{P} = \frac{1.05}{4.47} = 23^\circ$. But the

value of $\frac{C}{P}M$ for organic compounds generally dissolved in water is 19, hence, for ether, $M = \frac{19}{23} = 82$

(ii) 2.721 g ether were dissolved in 100 g benzene, the freezing point of the benzene was lowered by 1.826° , hence $\frac{P}{C} = 1.49$, $\therefore c = 1.49$ g ether in 100 g benzene lower the freezing point by 1° . But the constant for such organic compounds as the ethers dissolved in benzene is 49, hence, for ether, $M = 1.49 \times 49 = 73$

(iii) The value found for $\frac{C}{P}$ when ether was dissolved in acetic acid was 529° . But the value of $\frac{C}{P}M$ for organic compounds generally dissolved in acetic acid is 39, hence, for ether, $M = \frac{39}{529} = 74$

The mean of these three results gives 76.6 for the formula weight of ether, the molecular weight of ether gas, determined by applying Avogadro's law, is 74.

The empirical law of Raoult—quantities of chemically similar compounds proportional to the reacting weights, or formula weights, of these compounds produce equal lowerings of the freezing points of water and some other solvents—has been developed by van't Hoff, Arrhenius, and others (especially *Z P C* 1, 481 [translation in *P M*, August 1888], and *Z P C* 1, 631, 2, 284, 491). If an aqueous solution of a substance is contained in a vessel the walls of which are permeable by water molecules but not by the molecules of the dissolved substance, and the vessel is immersed in water, water will enter the vessel, and the pressure on the walls will increase until equilibrium results, after which no more water will enter. The pressure on the walls of the vessel is called *osmotic pressure*. If the vessel were furnished with a movable piston, the same condition of equilibrium might be attained, without the entry of water into the vessel, by compressing the solution with a pressure equal to the osmotic pressure. With such an arrangement the concentration of the liquid could be altered by increasing or decreasing pressure by means of the piston, as the process is reversible, the second law of thermodynamics may be applied.

The experiments of de Vries (*Z P C* 2, 415, 8, 103), Pfeffer (*Osmotische Untersuchungen* [Leipzig, 1887]), and others, show that the osmotic pressures of dilute aqueous solutions are proportional to the concentrations of these solutions. Now, to say that change of concentration of dilute solutions is proportional to the pressure exerted by the solutions, is equivalent

to saying that Boyle's law holds good for dilute solutions. Moreover, the proportionality of concentration to osmotic pressure may be deduced theoretically. If we assume, as seems justifiable, that osmotic pressure is due to the impact of the molecules of the dissolved substance, then the number of impacts in unit time must be proportional to the number of molecules in unit volume (on this point v. L. Meyer, *Z P C* 5, 23, and van't Hoff's reply, *Z P C* 5, 174, cf. Bredig, *Z P C* 4, 444). But this is the molecular conception of gaseous pressure. Hence, as in gases volume is inversely as pressure, the same proportionality should hold good in dilute aqueous solutions, in other words, Boyle's law should apply to these solutions. Van't Hoff then proceeds to deduce, by thermodynamical reasoning, that osmotic pressure is proportional to absolute temperature, concentration being constant. This conclusion is equivalent to saying that the law of Charles holds good for dilute aqueous solutions, inasmuch as concentration of solution corresponds with gaseous volume.

The experimental results of Pfeffer and of Soret (*A Ch* [5] 22, 293) are in keeping, on the whole, with the statement that the laws of Boyle and Charles hold good in dilute aqueous solutions.

Solutions which exert equal osmotic pressures are called *isotonic* solutions. Thermodynamical reasoning applied to these solutions leads to the conclusion that the osmotic pressure of a specified mass of a gasifiable substance in dilute solution is the same as the pressure exerted by the same mass of the same substance existing as a gas at the same temperature. If, then, osmotic pressure may be substituted for gaseous pressure, Avogadro's law may be extended to substances in dilute solution. This extension of the law of Avogadro is thus stated by van't Hoff: '*Equal volumes of different solutions, at the same temperature and osmotic pressure, contain equal numbers of molecules, which numbers are the same as would be contained in equal volumes of gases at the same temperature and pressure*'. This is van't Hoff's law of osmotic pressure. Various proofs of the accuracy of this law have been given.

To apply this law, it is necessary to find the mass of a substance present in a solution which is *isotonic* with another solution containing a known mass of a body of known molecular weight. The two solutions then contain equal numbers of molecules of the dissolved substances, and as the molecular weight of one substance is known, the molecular weight of the other can be found. There are many practical difficulties in determining whether or not two solutions are isotonic. Now van't Hoff has shown by thermodynamical reasoning (*Z P C* 1, 496) that solutions of different bodies in the same solvent, having equal freezing points, are isotonic at their freezing points. Put into other words, this conclusion asserts that solutions which have equal freezing points contain equal numbers of molecules in equal volumes, or, that solutions which contain equal numbers of molecules in equal volumes, and are therefore isotonic, have equal freezing points. But this is the law of lowering of freezing points am-

prically established by Raoult. In place of the somewhat vague term reacting weight, or formula weight, used in stating the law (*v supra*), we are now justified in employing the more definite term molecular weight. This law, as developed by van't Hoff, asserts that the product of the lowering of the freezing point of a 1 p.c. solution into the molecular weight of the dissolved body is a constant for different bodies dissolved in the same solvent. For solutions of most organic compounds in water, the constant is about 18.9.

Van't Hoff then proceeds to show that the molecular lowering of freezing point of a dilute solution bears a simple relation to the latent heat of fusion of the solvent (for proof *v Z P C* 1, 496-7). This relation is expressed, for very dilute solutions, by the equation

$$t = 0.1976 \frac{T^2}{W}$$

where t = molecular lowering of freezing point, already expressed as $\frac{C}{P}M$ (p. 417), T = freezing

point of solvent stated in absolute measure, and W = latent heat of fusion of solvent in gram-units (cf. Eykman, *Z P C* 3, 203, and especially *ib Z P C* 4, 512). If this conclusion is granted, it follows that equal numbers of molecules of all bodies dissolved in the same solvent must lower the freezing point to the same extent, provided the solutions are very dilute.

Let us take a case to exhibit the application of the law of molecular lowering of freezing point in the form given to it by van't Hoff. Thymol is dissolved in phenol, and the lowering of the freezing point of the phenol is observed. The constant for molecular lowering of freezing point of phenol is first calculated by van't Hoff's formula: the freezing point of the phenol used was 38° , in absolute measure this is $273^\circ + 38^\circ = 311^\circ$, the latent heat of fusion of the phenol was found to be 25, hence

$$t = 0.197 \frac{311^2}{25} = 76 \quad \text{The solution of thymol used}$$

contained 401 g thymol in 7559 g phenol, the freezing point was lowered by 2.49° , stating these results in parts of thymol per 100 of phenol, we find that 5.3 g thymol dissolved in 100 g phenol lowered the freezing point through 2.49° . Then $\frac{5.3}{2.49} = 2.12$, i.e. 2.12 g thymol in

100 g phenol lowered the freezing point through 1° . But this quantity, 2.12, is $\frac{1}{16}$ th of the molecular weight of thymol, therefore molecular weight of thymol = $2.12 \times 76 = 161$. The molecular weight calculated from the formula $C_{11}H_{19}O$ is 150.

In applying the law of molecular lowering of freezing point it is necessary to work with dilute solutions. The freezing point varies somewhat with concentration, in some cases this variation is very marked. Beckmann (*Z P C* 2, 742) recommends that a series of observations should be made, concentration varying so that the lowering of freezing point may range from $c. 2^\circ$ to $c. 2^\circ$. If possible, observations should be made with solutions in different solvents, care being taken to select solvents which do not react chemically, so far as is known, with the dissolved body, and the results should be checked by ob-

servations of the lowering of vapour pressure of some solvent produced by dissolving in it the substance whose molecular weight is being determined (*v infra*).

To sum up this part of the subject. Known weights of the substance, the molecular weight of which is to be determined, are dissolved in known weights of the solvent, so that the concentration of the solutions varies from, say, 1 to 5 or 6 p.c., the freezing point of each solution is determined. The freezing point of the solvent is determined. Two methods of calculation may then be adopted—

(i) The lowering of freezing point, brought about by 1 g of the substance dissolved in 100 g of solvent, is calculated from each observation made, let this = A . The value of the constant expressing the molecular lowering of freezing point of the solvent by the class of bodies to which the substance under examination belongs is known,

let this be C . Then $\frac{C}{A}$ gives approximately the

molecular weight of the substance.

(ii) The weight of the substance which would lower the freezing point of the solvent by 1° is calculated from each observation made, let this be B . Then $B \times C$ gives approximately the molecular weight (C has the same meaning as in (i)).

The values found for mol. w. from the different observations are compared, if the differences are small, the mean is taken, if there are marked differences, experiments are made with other solvents. It may be that the substance undergoes dissociation in all solvents, and that, therefore, the method is inapplicable (*v infra*).

The molecular lowering of freezing point of the solvent may be calculated by the use of van't Hoff's formula ($t = 0.1976 \frac{T^2}{W}$), provided the

latent heat of fusion of the solvent is known, the value thus found should agree with the constant determined by experiment.

The solvents commonly employed are water, benzene, phenol, and glacial acetic acid, naphthalene has also been used for some hydrocarbons, Eykman (*Z P C* 4, 512) recommends urethane, phenyl propionic acid, the higher acids of the acetic series, stearin, and *p*-toluidine. Various modifications of Raoult's original apparatus have been devised, references to the papers in which the most important are described will be found at the end of this article.

There are many apparent exceptions to Raoult's law, and therefore to van't Hoff's law of osmotic pressure. These exceptions are explained by the hypothesis, put into definite form by Arrhenius (*Z P C* 1, 631), that bodies whose behaviour is not directly expressed by these laws are partially dissociated in solution. Here again there is a marked analogy between gases and dilute solutions, as the pressure of the vapour obtained by heating ammonium chloride is greater than the pressure calculated by Avogadro's law, on the assumption that the vapour consists of molecules of NH_4Cl , but as the observed pressure agrees with the calculated pressure when it is assumed that the vapour consists of equal numbers of molecules of NH_3 and HCl , so the apparently abnormal osmotic pres-

tures of many solutions are brought into agreement with van't Hoff's law by assuming that the bodies in these solutions are more or less dissociated into simpler molecules. If the molecular weight of a substance, as determined by observations of freezing points, apparently decreases as dilution increases, it is likely that the substance is dissociated in the solution, and that the amount of dissociation increases as the quantity of solvent is increased. Substances may undergo dissociation in one solvent and not in another (for several carefully worked out examples, *v* Beckmann, *Z P C* 2, 715). Those substances, solutions of which show osmotic pressures agreeing with those calculated by van't Hoff's law from observations of the lowering of freezing-points of the solutions, are generally, if not always, non electrolytes. The apparent exceptions to the law of van't Hoff occur chiefly, if not wholly, among electrolytes. The dissociation-hypothesis of Arrhenius regards such electrolytes as more or less dissociated into their ions when they are dissolved in water. A great deal of work has been done in developing and applying the hypothesis of electrolytic dissociation, an account of this work, and of the chief results, will be found in the article *PHYSICAL METHODS*, section *Electrical methods*.

Raoult has found that in many cases the lowerings of vapour pressure produced by dissolving a comparatively non volatile substance in a considerably more volatile liquid is related to the number of molecules of the dissolved body in 100 molecules of the solvent, provided the solution be very dilute (*Z P C* 2, 353). Arrhenius has shown that this generalisation made by Raoult can be deduced from van't Hoff's law of osmotic pressures (*Z P C* 3, 115). The generalisation has been placed on a thermodynamical basis by van't Hoff (*Z P C* 1, 493) and Planck (*Z P C* 1, 577). The law may be put in the following form *At any specified temperature the ratio of lowering of vapour-pressure of a solvent, produced by dissolving a non-volatile body in it, to the vapour-pressure of the solvent, is equal to the ratio of the number of molecules of the dissolved body to the total number of molecules in the solution*. Let p = vapour pressure of solvent, $p-p'$ = observed lowering of vapour pressure, W = weight of dissolved body, W' = weight of solvent, m = molecular weight of dissolved body, and m' = molecular weight of solvent; then

$$\frac{p-p'}{p} = \frac{W}{m} \cdot \frac{W'}{m'}.$$

If W , W' , p , p' , and m' are known, m can be found. Suppose a grams of the substance are dissolved in 100 g solvent, then,

$$m = \frac{m' a}{100 p - p'}$$

Among the solvents which have been used in applying this law to the determination of molecular weights are ether, alcohol, CS_2 , and Hg. For descriptions of apparatus, and some of the data obtained, *v* Raoult (*Z P C* 2, 353), Walker (*Z P C* 2, 602), Beckmann (*Z P C* 4, 532), Ramsay (who determined mol w of several metals by using Hg as solvent) (*C J* 55, 521).

Raoult and others have found that the rise

in the boiling point of a liquid caused by dissolving a non-volatile substance therein bears a simple relation to the molecular weight of the dissolved substance. There is a constant which must be determined for each solvent which expresses the rise of b.p. caused by solution of 1 gram molecule of substance in 100 grams of solvent, for ether this constant is 21° (Beckmann, *Z P C* 3, 803). It is necessary then to find the weight of substance which, dissolved in 100 g ether, raises the b.p. 1° , the product of this weight multiplied by 21 gives, approximately, the molecular weight of the dissolved substance. Thus Beckmann (*l.c.*) found that 2.153 g aniline dissolved in 100 g ether raised the b.p. of the ether 484° , therefore $4.45 \text{ g aniline would raise the b.p. } 1^\circ$, but $4.45 \times 21 = 93.4$, the mol w of aniline is 93. Arrhenius contributes a note to Beckmann's paper (*Z P C* 4, 550) in which he shows, by thermodynamical reasoning, that the rise of boiling point (dT) of a solvent, caused by dissolving n gram molecules of another substance in 100 g of the solvent, is directly proportional to the quantity dissolved (n) and the square of the b.p., and is indirectly proportional to the heat of vaporisation of 1 g of the liquid, W . Put into an equation this state-

ment reads thus $-dT = \frac{92T^2}{W} n$. This equation

is precisely similar to that found by van't Hoff (*v* p 419) for the molecular lowering of the freezing point of a solvent, only in the present case the quantities T and W depend upon the boiling point of the solvent. A description of apparatus suited for applying the law of molecular raising of boiling point to molecular weight determinations will be found in Beckmann's paper, *Z P C* 4, 543.

MOLYBDATES Salts of molybdic acid v.

MOLYBDENUM, ACIDS OF, p 422

MOLYBDENUM Mo At. w 95.9 Mol w unknown SG 8.56 (Long, *Am. S* [2] 45, 131), 8.49 to 8.64 (Bucholz, *Nicholson's J* 20, 121) Does not melt in O-H flame at temp at which Pt melts (Debray, *A* 103, 250) SH 5°–15° 0659 (De la Rive a Marcet, *A Ch* [2] 75, 113) Emission spectrum (obtained by using electric spark) shows only a few lines, the most prominent in the blue and violet (v Thalen, *A Ch* [4] 18, 242) SVS c 113

Occurrence — Never uncombined The sulphide (molybdenite, or molybdenum glance), oxide (molybdenum ochre), molybdate of lead (wulfenite), and molybdate of cobalt (paterite), occur in small quantities in certain localities Many iron ores contain small quantities of Mo compounds (Braun, *Fr* 6, 86, Wohler, *Mineral analyse* [Göttingen, 1861]) The residues from the copper smelting ovens at the Mansfeld works sometimes contain as much as 28 p c Mo (Heine, *J pr* 9, 176, cf Stromeyer, *P* 28, 551, Steinberg, *J pr* 18, 379, Genth *J pr* 37, 193, Steinacker, *Ueber einige Molybdunverbindungen* [Göttingen, 1861] 22) An alloy of Mo and Pb, in plates 30 mm long, was found in Utah by Silliman (*Am S* [3] 6, 128) According to Lookyer (*Pr* 27, 279), Mo occurs in the sun

Scheele in 1778 (*Opusc* 1, 200) distinguished native Mo sulphide from galena In 1782, Hjehn obtained the metal from the sulphide (v *Crell Ann* for 1790, 1791, 1792, and 1794) For an historical account of this metal v Svanberg a Struve, *J pr* 44, 257 The name molybdenum was given from *μολύβδαινα*, or *molybdæna*, used by Dioscorides and Pliny to designate galena and other lead compounds

Formation — 1 By reducing MoO₃ by H, K or Na, C, or KCN — 2 By reducing Mo chlorides by H at a high temperature — 3 By reducing acid K molybdate by C — 4 By electrolysing molten MoO₃, or (NH₄)₂MoO₄ in solution

Preparation — The starting-point is pure MoO₃ (v *infra*) — 1 MoO₃ is heated in a crucible in a stream of pure H (which must be passed over a long layer of red-hot Cu), the mass is transferred to a tube of unglazed porcelain, and very strongly heated in the H stream, finally the last traces of oxide are removed by gently

warming in a stream of dry HCl as long as a white wool like sublimate (MoO₃, 2HCl) is formed (Liechti a Kempe, *A* 169, 344) The metal in contact with the porcelain tube is not pure (Debray, *C R* 56, 732, cf Wohler a von Uslar, *A* 94, 256, Rammelsberg, *P* 127, 284) — 2 MoO₃ is mixed with C and heated in a graphite-crucible, in the O-H flame, the product always contains a few per cents of C (Debray, *C R* 46, 1098) — 3 An intimate mixture of 1 pt MoO₃ and 1½ pts KCN is placed in a crucible, the cover is luted on, the crucible is placed in another which is filled with C, and the whole is kept at white heat for 12 hours By this method Loughlin (*Am S* [2] 45, 131) obtained metal with 98.7 p c Mo

There are many methods for preparing MoO₃ from Mo ores Finely powdered molybdenite (MoS₂) is roasted in an open porcelain vessel, with frequent stirring, until SO₂ ceases to be evolved, Brunner (*D P J* 150, 672) recommends to mix the ore with its own weight of fine quartz-sand, previously washed with HClAq, and to heat in a flat Pt dish, to incipient redness, till the residue is citron yellow when hot, and white when cold The roasted ore is treated with NH₄Aq, to the solution are added a few drops of NH₄ sulphide, the ppd CuS is removed, the filtrate is evaporated to dryness, the residue is dissolved in NH₄Aq, and the solution is evaporated to the crystallisation point (Wohler) Svanberg a Struve (*J pr* 44, 264) add excess of K₂CO₃ to the ammoniacal solution of the roasted ore, separate ppd Al₂O₃, evaporate to dryness, and strongly heat the residue in a Pt crucible, they treat with water, filter from CuO and Al₂O₃, evaporate to dryness, add S equal to double the weight of the residue, heat in a glass vessel on a sand bath to full redness till excess of S is burnt off, wash with warm water (the last washings containing a little K₂CO₃) as long as the washings are coloured, and until the MoS₂ is perfectly black, and then roast the pure MoS₂ thus obtained, or oxidise it to MoO₃ by HNO₃Aq Delifs (*A* 106, 376) decomposes molybdenite by HNO₃Aq Wittstein forms soluble sulpho-molybdates by roasting with S, and decomposes by H SO₄Aq, finally roasting the sulphide to MoO₃ (*R P* [2] 73, 155, cf Wicke, *A* 45, 373, Wohler, *ibid* p 374) Molybdenite may also be decomposed by calcining with alkali carbonates (v Christl, *D P J* 124, 398, Elbers, *A* 83, 219), or by the use of H₂SO₄ (Elbers, *lc*)

Properties — As prepared by reducing the chloride in H, Mo appears as dull silver-coloured, somewhat malleable, plates (Wohler a von Uslar, *A* 94, 256) The metal obtained by reducing MoO₃ by H at very high temperatures is lustrous, if the reduction is effected at lower temperatures, an ashen grey powder is obtained which becomes metal-like when rubbed The metal obtained by Debray, which contained 4–5 p c C, was silver white, and harder than topaz The SG of Mo is given by Loughlin (*Am S* [2] 45, 131) as 8.56, this metal contained 98.7 p c Mo Debray (*C R* 46, 1098) gives SG 8.6 for the metal obtained by reducing MoO₃ by C, and containing 4–5 p c C

Mo, whether in powder or in pieces, is unchanged in ordinary air, when heated it becomes brown, then blue, then white, on the surface,

and at high temperatures it is burnt to MoO_3 . It is oxidised by fusion with KNO_3 , or slowly by KOH , also by HNO_3 , or Cl water, it burns when heated in steam, evolving H_2 . Mo is insol in HClAq , dilute $\text{H}_2\text{SO}_4\text{Aq}$, and HFAq , it is not acted on by KOHAq . Mo combines directly with O , Cl , and Br , but not with I . The metal is infusible at white heat (Debray, *A* 108, 250).

The atomic weight of Mo has been determined (1) by analysing, and determining $V D$ of MoCl_3 (Liechti & Kempe, *A* 169, 344, Debray, *C R* 66, 732), (2) by determining $S H$ of Mo (De la Rive & Marcet, *A Ch* [2] 75, 113), (3) by determining Cl in MoO_3Cl_2 (H Rose, *P* 40, 400, Svanberg & Struve, *A* 68, 209), (4) by synthesis of Ag_2MoO_4 (Debray, *C R* 66, 732), (5) by analyses of MoCl_3 and MoCl_4 (L & K, *A* 169, 344, cf L Meyer, *ibid* p 360), (6) by reducing MoO_3 in H (*S* & *S*, *J pr* 44, 301, Dumas, *A Ch* [3] 55, 143, Debray, *C R* 66, 732, Rammelsberg, *B* 10, 1776), (7) by oxidising MoS_2 to MoO_3 (*S* & *S*, *A* 68, 209), (8) by conversion of MoCl_3 and MoCl_4 to MoS_2 (L & K, *A* 169, 344, cf Meyer, *ibid* p 360). The atom of Mo is pentavalent in the gaseous molecule MoCl_5 .

Mo is probably both metallic and non-metallic in its chemical relations. Few, if any, definite salts are known obtained by replacing the H of acids by Mo , but Mo_2O_3 and MoO_2 seem to dissolve in acids without evolution of O . The oxide MoO_3 is an anhydride, molybdic acid, H_2MoO_4 , and molybdates, besides tri tetra n molybdates, are known. MoO_3 also combines with some other anhydrides to form complex bodies which react as acids, *e g* P_2O_5 , 20MoO_3 , $38\text{H}_2\text{O}$, SiO_2 , 12MoO_3 , $26\text{H}_2\text{O}$. MoS_2 reacts as an acidic sulphide, forming sulphosalts M^+MoS_4 . Several haloid compounds, and many oxyhaloid compounds, of Mo are known. Mo is closely related to Cr , W , and U , and is less closely related to S , Se , and Te . Mo occurs in Group VI series 6, the following table exhibits the position of Mo relatively to the other members of the group

Even series—				
2	4	6	8	10
$\text{O} = 16$	$\text{Cr} = 52$	$\text{Mo} = 96$	—	$\text{W} = 184$

Odd series—				
3	5	7	9	11
$\text{S} = 32$	$\text{Se} = 79$	$\text{Te} = 125$	—	—

(*v* CHROMIUM GROUP OF ELEMENTS, vol 11 p 168, cf CLASSIFICATION, vol 11 p 207)

Reactions—1 Heated in air or oxygen, Mo is burnt to oxide, if the temperature is sufficiently high, MoO_3 is formed—2 Oxidised, to MoO_3 , by molten nitre, and slowly by molten potash—3 Heated in steam, blue oxide ($?\text{Mo}_2\text{O}_3$), and then MoO_3 , is formed—4 Pulverulent Mo is oxidised by rubbing with silver oxide, or mercuric oxide—5 Oxidised by nitric acid, conc hot sulphuric acid, or chlorine water—6 Mo does not dissolve in hydrochloric, hydrofluoric, nor dilute sulphuric acid, nor does it react with potash solution.

Combinations—1 Mo combines with chlorine to form MoCl_3 , and with bromine to form MoBr_3 , it does not combine directly with I —2 Heated in oxygen, Mo forms oxides, MoO_3 being the final product of the combination.

Detection and Estimation—The greater

number of the Mo compounds, including most of the molybdates of the alkaline earths and heavy metals, are insol in water. Lower oxides, and also the sulphides, produce MoO_3 when heated in air, MoO_3 readily dissolves in alkali solutions. Insol molybdates are brought into soluble forms by fusion with alkali carbonates. All Mo compounds may be changed to soluble alkali sulphomolybdates by fusion with Na_2CO_3 , and S . Phosphomolybdates are readily soluble in NH_4Aq . Mo compounds impart a yellow colour to the borax bead when heated in the oxidising flame, the colour disappears on cooling, in the reducing flame, they give a dark brown colour, the bead is opaque if excess of Mo compound is present. They give a clear green microcosmic salt bead in the reducing flame, and in the oxidising flame a bead which is greenish when hot and colourless when cold. In solution, Mo compounds give a brown black pp with H_2S , soluble in NH_4 sulphide, solutions of molybdates give blue coloured compounds by the action of reducing agents. When MoO_3 or a molybdate is evaporated with conc H_2SO_4 , and then allowed to cool, the acid becomes deep blue in colour, this reaction distinguishes molybdates from tungstates, the blue colour does not appear if antimonious or stannous salts are present, unless the substance has been wetted with a few drops of phosphoric acid, and evaporated to dryness, before addition of H_2SO_4 (Schönn, *Fr* 8, 379, Maschke, *Fr* 12, 383). If Zn is put into solution of a molybdate, a few drops of conc KCNSAq are added, and then enough HClAq or $\text{H}_2\text{SO}_4\text{Aq}$ to cause slow evolution of H_2 , a carmine red colour is produced, even with $\frac{1}{50000}$ part MoO_3 , ether removes the coloured compound (Braun, *Fr* 2, 36).

Liquids containing molybdates yield deep red solutions (sulphomolybdates) by boiling with yellow NH_4 sulphide (Braun, *Fr* 6, 86).

Mo is estimated (1) as metal by reducing in H (Rammelsberg, *P* 127, 281), (2) as MoO_3 by oxidising in air or by HNO_3Aq (v d Pfordten, *B* 15, 1927), (3) as PbMoO_4 (Chatard, *B* 4, 280, v also Ullik, *A* 144, 217), (4) by reduction with Zn and titration by means of standard KMnO_4Aq (Wernecke, *Fr* 14, 1, v d Pfordten, *B* 15, 1927), (5) by the reaction of MoO_3 with an acidified solution of KI , whereby I is set free and is determined by standard $\text{Na}_2\text{S}_2\text{O}_4\text{Aq}$ (Mauro & Danesi, *Fr* 20, 507).

Molybdenum, Acids of, and their salts. The oxide MoO_3 is slightly sol in water, c 500 parts cold water dissolve 1 part MoO_3 . The solution reddens litmus. Several hydrates of MoO_3 have been isolated. $\text{MoO}_3 \cdot \text{H}_2\text{O} = \text{H}_2\text{MoO}_4$, was obtained by Ullik, and also by Vivier (*v infra*), the hydrates $\text{MoO}_3 \cdot 2\text{H}_2\text{O}$, $2\text{MoO}_3 \cdot \text{H}_2\text{O}$, $4\text{MoO}_3 \cdot \text{H}_2\text{O}$, $5\text{MoO}_3 \cdot \text{H}_2\text{O}$, and $8\text{MoO}_3 \cdot \text{H}_2\text{O}$, have also been prepared, some of these are soluble, and some are insoluble, in water. Several series of salts are known, these salts may be represented as derived from hydrates of MoO_3 , in some cases the hypothetical hydrates have been isolated, and in other cases they have not been isolated. Besides reacting as the anhydride of more than one acid, MoO_3 reacts with some oxides more acidic than itself to form compounds, *e g* $\text{MoO}_3 \cdot \text{SO}_3$, it also combines with

certain acids—*e.g.* with HCl , H_3PO_4 , H_2AsO_4 —the compounds thus formed have acidic reactions and yield salts (*v* ANTIMONO MOLYBDATES, ARSENO MOLYBDATES, PHOSPHO MOLYBDATES, p 425, *v* also MOLYBDENUM TRIOXIDE, p 432)

MOLYBDIC ACIDS 1 H_2MoO_4 . The normal hydrate $\text{MoO}_3 \cdot \text{H}_2\text{O}$, or hydroxide $\text{MoO}_3(\text{OH})_2$, was obtained by Ullik, but only once, by mixing MgMoO_4 with an equivalent of HNO_3 aq and allowing to stand (*A* 153, 374) Vivier (*C R* 106, 601) obtained this compound by allowing a solution of NH_4 molybdate in HNO_3 aq to stand for some time, also by heating ordinary NH_4 molybdate solution with its own volume of water to 50° – 60° for some days H_2MoO_4 forms a mass of minute needles, it is quite insol water

2 $\text{H}_2\text{Mo}_2\text{O}_{11}$. The hydrate $2\text{MoO}_3 \cdot \text{H}_2\text{O}$ ($=\text{MoO}_3(\text{OH})_2 \cdot \text{MoO}_3$) was obtained by Ullik (*A* 144, 329) by the action of excess of H_2SO_4 aq on the Ba salt formed by adding BaCl_2 aq to ordinary NH_4 molybdate solution, filtering, placing over H_2SO_4 and drying the gum like residue over H_2SO_4 for some months, or at 100° (Ullik, *A* 153, 373) $\text{H}_2\text{Mo}_2\text{O}_{11}$ is a gum like amorphous solid, *e sol* water

3 $\text{H}_4\text{Mo}_3\text{O}_{15}$, and $\text{H}_4\text{Mo}_4\text{O}_{16}$. The hydrates $4\text{MoO}_3 \cdot \text{H}_2\text{O}$ ($=\text{MoO}_3(\text{OH})_2 \cdot 3\text{MoO}_3$), and $8\text{MoO}_3 \cdot \text{H}_2\text{O}$ ($=\text{MoO}_3(\text{OH})_2 \cdot 7\text{MoO}_3$) are formed similarly to $2\text{MoO}_3 \cdot \text{H}_2\text{O}$, the drying being conducted at 120° , and 160° – 170° , respectively (*U*, *l c*) These compounds are amorphous solids, *e sol* water Sabanejeff (*J R* 1889 [1] 515, abstract in *B* 23 (*Ref*) 87) obtained a colloidal form of $\text{H}_4\text{Mo}_3\text{O}_{15}$, *sl sol* water, by drying for some weeks over H_2SO_4 , the formula was determined by applying Raoult's law (*cf* MOLECULAR WEIGHTS, p 417) For other hydrates of MoO_3 , viz $\text{MoO}_3 \cdot 2\text{H}_2\text{O}$ and $5\text{MoO}_3 \cdot \text{H}_2\text{O}$, *v* HYDRATES OF MOLYBDENUM TRIOXIDE, p 432

Graham (*C J* 1864) obtained a soluble colloidal form of molybdic acid (he does not give the composition) by dialysing an aqueous solution of Na molybdate, to which excess of HCl aq had been added, until the liquid in the dialyser was free from NaCl and HCl Graham describes the solution of molybdic acid as 'yellow, astringent to the taste, acid to test paper, and possessed of much stability', it decomposed Na_2CO_3 with evolution of CO_2 , and became in *sol* when heated for some time with a strong acid

Chloromolybdic acid $\text{H}_2\text{MoO}_4\text{Cl}_2$ ($=\text{MoO}_3(\text{OH})_2\text{Cl}_2$) (*Molybdenum hydroxychloride*) This compound is obtained by passing HCl over MoO_3 at 150° – 200° (Debray, *C R* 46, 1101) It forms a loose, white, crystalline, mass, *e sol* water, sublimed unchanged in HCl

Thiomolybdic acid and thiomolybdates, *v* MOLYBDENUM, THIOACIDS OR, AND THEIR SALTS, p 434

MOLYBDATES A great many molybdates are known, they are more or less closely related to the chromates The following classification is that given by Ullik (*W A B* 60 [2] 295), and now generally adopted $\text{R} = \text{divalent metal}$

Monomolybdates, RMO_4 , or RO MoO_4 ,
Dimolybdates, $\text{R}_2\text{Mo}_2\text{O}_{11}$, or $\text{R}_2\text{O } 2\text{MoO}_3$,
Trimolybdates, $\text{R}_3\text{Mo}_3\text{O}_{15}$, or $\text{R}_3\text{O } 3\text{MoO}_3$,
Tetramolybdates, $\text{R}_4\text{Mo}_4\text{O}_{19}$, or $\text{R}_4\text{O } 4\text{MoO}_3$,
Octomolybdates, $\text{R}_8\text{Mo}_8\text{O}_{27}$, or $\text{R}_8\text{O } 8\text{MoO}_3$,
Decamolybdates, $\text{R}_{10}\text{Mo}_{10}\text{O}_{31}$, or $\text{R}_{10}\text{O } 10\text{MoO}_3$,
Tribasic heptamolybdates, $\text{R}_3\text{Mo}_7\text{O}_{24}$, or $3\text{R}_2\text{O } 7\text{MoO}_3$,

There are a few molybdates which do not belong to any of these classes, *e.g.* $5\text{Al}_2\text{O}_3 \cdot 2\text{MoO}_3$, and $2\text{BaO } 5\text{MoO}_3$

The alkali *monomolybdates* are produced by dissolving MoO_3 , xH_2O , or MoO_3 , in equivalent quantities of alkali, in solution or molten, they are easily *sol* in water The other salts of this series are generally *insol* in water, they are produced by *ppn* from the alkali salts, or, in crystals by fusing Na_2MoO_4 with NaCl and metallic chlorides (Schultze, *A* 126, 55) The alkali *dimolybdates* are formed by fusing MoO_3 and alkali carbonates in the proper proportion, or by the action of MoO_3 on molten alkali nitrates (Ullik, *A* 144, 214) The *trimolybdates* are formed by boiling metallic carbonates with considerable excess of MoO_3 and water, filtering, and allowing to evaporate in the air These salts are generally easily *sol* in hot water, but only slightly *sol* in cold water, many of them exist both in crystalline and amorphous forms, the amorphous varieties are readily *sol* in cold water (Ullik, *A* 144, 227, 153, 376) The *tetramolybdates* may be obtained by rapidly evaporating very small quantities of the solutions which yield *trimolybdates* when allowed to evaporate slowly They form amorphous, brittle, masses, which slowly decompose with formation of *trimolybdates* (Ullik, *A* 144, 321) Crystallisable acid *tetramolybdates* are sometimes obtained by adding a fair excess of acid to solutions of mono or *dimolybdates*, addition of a little acid to such solutions generally throws down *trimolybdates* Very few *octo-* or *decamolybdates* have been prepared

The following table presents the composition of the chief molybdates The small figures after the formulæ refer to the list of memoirs given after this table —

MOLYBDATES

<i>Monomolybdates</i> , RMO_4 , or RO MoO_4	
$(\text{NH}_4)_2\text{MoO}_4$ (also <i>infra</i> , Mg salts) (23, 27)	
$5(\text{NH}_4)_2\text{MoO}_4 \cdot \text{Mn}_2\text{Mo}_2\text{O}_{21}$ 12aq (22)	
BaMoO_4 (1, 23)	
$\text{BeMoO}_4 \cdot \text{BeO} \cdot \text{H}_2$ 6aq (24)	
CaMoO_4 (7)	
CoMoO_4 (1, 89)	
$\text{CoMoO}_4 \cdot 2\text{NH}_3$ aq (33)	
$3\text{CuMoO}_4 \cdot \text{CuO} \cdot \text{H}_2$ 4aq (11)	
$\text{Fe}_2(\text{MoO}_4)_3 \cdot \text{MoO}_3$ 7aq (34, 1)	
$\text{Fe}_2(\text{MoO}_4)_3 \cdot 2\text{MoO}_3$ 16aq (20)	
$5\text{Li}_2\text{MoO}_4$ 2aq (17, 26)	
MgMoO_4 5aq (12, 21, 26)	
$\text{MgMoO}_4 \cdot (\text{NH}_4)_2\text{MoO}_4$ 2aq (12)	
$\text{MgMoO}_4 \cdot \text{K}_2\text{MoO}_4$ 2aq (12)	
MnMoO_4 (<i>v supra</i> , NH_4 salts, and <i>infra</i> , K salts) (1, 22, 39)	
Hg_2MoO_4 (29)	
$\text{NiMoO}_4 \cdot 2\text{NH}_3$ aq (1, 33)	
K_2MoO_4 (also <i>supra</i> , Mg salts) (23, 26, 34)	
$2\text{K}_2\text{MoO}_4 \cdot \text{Mn}_2\text{Mo}_2\text{O}_{21}$ 12aq (22)	
$\text{K}_2\text{MoO}_4 \cdot 2\text{Na}_2\text{MoO}_4$ 14aq (16, 26)	
$3\text{Rb}_2\text{MoO}_4 \cdot 4\text{MoO}_3$ 4aq (26, 31)	
Ag_2MoO_4 (33)

 $8\text{Ti}_2\text{MoO}_7 \cdot 5\text{MoO}_3$ (37)
 $8\text{Ti}_2\text{MoO}_7 \cdot 3\text{MoO}_3$ (37)
 ZnMoO_4 (1, 39)

Dimolybdates, $\text{R}_2\text{Mo}_2\text{O}_7$, or $\text{RO } 2\text{MoO}_3$, or $\text{R}_2\text{MoO}_4 \cdot \text{MoO}_3$

$\text{Al}_2(\text{MoO}_4)_3 \cdot 3(\text{NH}_4)_2\text{Mo}_2\text{O}_7 \cdot 20\text{aq}$ (18)
 $\text{Al}_2(\text{MoO}_4)_3 \cdot 3\text{K}_2\text{Mo}_2\text{O}_7 \cdot 20\text{aq}$ (28)
 $\text{Al}_2(\text{MoO}_4)_3 \cdot 3\text{Na}_2\text{Mo}_2\text{O}_7 \cdot 22\text{aq}$ (28)
 $(\text{NH}_4)_2\text{Mo}_2\text{O}_7$ (also *supra*, Al salts, and *infra* Cr salts) (28)
 $\text{Cr}_2(\text{MoO}_4)_3 \cdot 3(\text{NH}_4)_2\text{Mo}_2\text{O}_7 \cdot 20\text{aq}$ (19)
 $\text{Cr}_2(\text{MoO}_4)_3 \cdot 3\text{K}_2\text{Mo}_2\text{O}_7 \cdot 20\text{aq}$ (19)
 $\text{Cr}_2(\text{MoO}_4)_3 \cdot 3\text{Na}_2\text{Mo}_2\text{O}_7 \cdot 21\text{aq}$ (19)
 $\text{Hg}_2\text{Mo}_2\text{O}_7$ (29)
 $\text{Na}_2\text{Mo}_2\text{O}_7$ (2)

Trimolybdates, $\text{R}_3\text{Mo}_3\text{O}_{10}$, or $\text{RO } 3\text{MoO}_3$, or $\text{R}_3\text{MoO}_4 \cdot 2\text{MoO}_3$

$(\text{NH}_4)_3\text{Mo}_3\text{O}_{10} \cdot \text{aq}$ (25, 32)
 $(\text{NH}_4)_3\text{Na}_3\text{Mo}_3\text{O}_{10} \cdot \text{aq}$ (38)
 $\text{BaMo}_3\text{O}_{10} \cdot 8\text{aq}$ (23)
 $\text{CaMo}_3\text{O}_{10} \cdot 6\text{aq}$ (7)
 $\text{CoMo}_3\text{O}_{10} \cdot 10\text{aq}$ (11)
 $2\text{CuMo}_3\text{O}_{10} \cdot 9\text{aq}$ (11)
 $\text{MgMo}_3\text{O}_{10} \cdot 10\text{aq}$ (12)
 $\text{K}_3\text{Mo}_3\text{O}_{10} \cdot 8\text{aq}$ (8, 23)
 $\text{Na}_3\text{Mo}_3\text{O}_{10} \cdot 4\text{aq}$, and 7aq (5, 28)
 $(\text{NaNH}_4)_3\text{Mo}_3\text{O}_{10} \cdot \text{aq}$ (38)
 $\text{ZnMo}_3\text{O}_{10} \cdot 10\text{aq}$ (11)

Tetramolybdates, $\text{R}_4\text{Mo}_4\text{O}_{13}$, or $\text{RO } 4\text{MoO}_3$, or $\text{R}_4\text{MoO}_4 \cdot 3\text{MoO}_3$

$(\text{NH}_4)_4\text{Mo}_4\text{O}_{13} \cdot \text{aq}$ (25)
 $\text{BaH}_4(\text{Mo}_4\text{O}_{13}) \cdot 17\text{aq}$ (6)
 $\text{CaMo}_4\text{O}_{13} \cdot 9\text{aq}$ (7)
 $\text{CaH}_4(\text{Mo}_4\text{O}_{13}) \cdot 17\text{aq}$ (7)
 $\text{MgH}_4(\text{Mo}_4\text{O}_{13}) \cdot 19\text{aq}$ (12)
 $\text{KHM}_4\text{O}_{13} \cdot 6\text{aq}$ (10)
 $\text{NaHM}_4\text{O}_{13} \cdot 8\text{aq}$ (14)
 $\text{Na}_4\text{Mo}_4\text{O}_{13} \cdot 6\text{aq}$ (3)
 $\text{ZnMo}_4\text{O}_{13} \cdot 8\text{aq}$ (11)

Octomolybdates, $\text{R}_8\text{Mo}_8\text{O}_{23}$, or $\text{RO } 8\text{MoO}_3$, or $\text{R}_8\text{MoO}_4 \cdot 7\text{MoO}_3$

$\text{Na}_8\text{Mo}_8\text{O}_{23} \cdot 4\text{aq}$ (1*, 6)
 $\text{NaHM}_8\text{O}_{23} \cdot 4\text{aq}$ (1*, 6)

Decamolybdates, $\text{R}_{10}\text{Mo}_{10}\text{O}_{29}$, or $\text{RO } 10\text{MoO}_3$, or $\text{R}_{10}\text{MoO}_4 \cdot 9\text{MoO}_3$

$\text{Na}_{10}\text{Mo}_{10}\text{O}_{29} \cdot 12\text{aq}$ (1*, 6)

Tribasic heptamolybdates (sometimes called *seven thirds molybdates*), $\text{R}_3\text{Mo}_3\text{O}_{24}$, or $3\text{RO } 7\text{MoO}_3$, or $\text{R}_3\text{MoO}_4 \cdot 2\text{RO } 6\text{MoO}_3$

$(\text{NH}_4)_3\text{Mo}_3\text{O}_{24} \cdot 4\text{aq}$ (ordinary ammonium molybdate) (16, 28, 26, 27)
 $\text{Ba}_3\text{Mo}_3\text{O}_{24} \cdot 9\text{aq}$ (28, 31)
 $\text{Mg}_3\text{Mo}_3\text{O}_{24} \cdot 20\text{aq}$ (12)
 $\text{K}_3\text{Mo}_3\text{O}_{24} \cdot 4\text{aq}$ (28, 26)
 $\text{Na}_3\text{Mo}_3\text{O}_{24} \cdot 22\text{aq}$ (18, 26, 36)

Molybdates not included in foregoing classes

$5\text{Al}_2\text{O}_3 \cdot 2\text{MoO}_3$ (18, 28)
 $4(\text{NH}_4)_3\text{O} \cdot 5\text{MoO}_3 \cdot \text{aq}$ (30)

$2\text{BaO } 5\text{MoO}_3 \cdot 6\text{aq}$ (28)
 $\text{CuO } 2(\text{NH}_4)_2\text{O } 5\text{MoO}_3 \cdot 9\text{aq}$ (21)
 $7(\text{NH}_4)_2\text{O } 2\text{Na}_2\text{O } 21\text{MoO}_3 \cdot 15\text{aq}$ (26)
 $7(\text{NH}_4)_2\text{O } 3\text{Na}_2\text{O } 25\text{MoO}_3 \cdot 30\text{aq}$ (26)

For some other complex molybdates, v Bärwald, *C C* 1885 424 (Abstract in *C J* 50, 17)

Molybdates of Cd (1), Di (Frerichs & Smith, *A* 191, 355), La (F & F, *lc* p 365), Pb (28), and Manross, *A* 82, 358), and Sm (Clève, *Bl* [2] 43, 170), have also been prepared

To indicate the methods of preparation and properties of the molybdates, short descriptions are given of the NH_4 and Na salts, for the others, reference must be made to the original memoirs

Ammonium molybdates (1) *Monomolybdate*, $(\text{NH}_4)_2\text{MoO}_4$. Prepared by dissolving MoO_3 in excess of very conc NH_4Aq , and ppg by alcohol, obtained in small monoclinic crystals by spontaneous evaporation of the trimolybdate in conc NH_4Aq . Effloresces in air, with loss of NH_3 , with water, forms an acid salt. Forms double salts with MgMoO_4 and MnMoO_4 . (2) *Dimolybdate*, $(\text{NH}_4)_4\text{Mo}_2\text{O}_7$. Prepared by evaporating the mother liquor from which the monomolybdate has separated, a white crystalline powder. Forms double salts with $\text{Al}_2(\text{MoO}_4)_3$ and $\text{Cr}_2(\text{MoO}_4)_3$. (3) *Trimolybdate*, $(\text{NH}_4)_6\text{Mo}_3\text{O}_{10}$. Prepared by slow decomposition of ordinary NH_4 molybdate solutions, at temperatures below 10° . Lustrous needles, easily sol hot water, sl sol cold water. Forms a double salt with $\text{Na}_2\text{Mo}_4\text{O}_{10}$. (4) *Tetramolybdate*, $(\text{NH}_4)_8\text{Mo}_4\text{O}_{13}$. Prepared by slowly decomposing solution of ordinary NH_4 molybdate by HClAq or HNO_3Aq , the solution eventually becomes filled with crystals of the tetra-salt, and the liquid is free from Mo. (5) *Tribasic heptamolybdate*, $(\text{NH}_4)_3\text{Mo}_3\text{O}_{24} \cdot 4\text{aq}$ (= $3(\text{NH}_4)_3\text{O} \cdot 7\text{MoO}_3 \cdot 4\text{aq}$). This is the *ordinary*

ammonium molybdate used as a reagent for phosphoric acid, &c. Crystallises from solution of MoO_3 in NH_4Aq in large monoclinic prisms, unchanged in air. The same salt crystallises with 12aq from the mother liquor.

Treatment of ammonium molybdate residues. Venator (*Ar Ph* [3] 23, 713) recommends to add enough FeCl_3Aq to give a brownish colour to the solution, to ppt phosphoric acid by NH_4Aq , to filter, and add BaCl_2Aq whereby Ba molybdate and BaSO_4 are ppt. The pp is thoroughly washed with hot water, and boiled for a long time with $(\text{NH}_4)_2\text{SO}_4\text{Aq}$, $\text{NH}_4\text{molybdate}$ separates from the filtrate on evaporation.

Sodium molybdates. (1) **Monomolybdate**, $\text{Na}_2\text{MoO}_4\cdot 2\text{aq}$. Prepared by fusing together equivalent quantities MoO_3 and Na_2CO_3 , dissolving in water, and evaporating, also by dissolving MoO_3 in $\text{Na}_2\text{CO}_3\text{Aq}$, also by neutralising the solution of any of the other Na salts by Na_2CO_3 . Small lustrous tablets, sol water, solution has an alkaline reaction. Solutions evaporated under 6° give a salt with 10aq, these crystals effloresce to the salt with 2aq. Forms a double salt with K MoO_4 . (2) **Dimolybdate**, $\text{Na}_2\text{Mo}_2\text{O}_7$. Prepared by fusing together MoO_3 and Na_2CO_3 in the proper proportion, and treating with a little cold water, also by adding MoO_3 to the equivalent quantity of molten NaNO_3 (only half of this is decomposed), and treating with cold water. Small lustrous needles, sol with difficulty in water, hot or cold. Melts at incipient redness, and crystallises on cooling. An aqueous solution of this salt evaporated to a syrup yields crystals of $\text{Na MoO}_4\text{aq}$, easily sol water. (3) **Trimolybdate**, $\text{Na}_2\text{Mo}_3\text{O}_{10}\cdot 7\text{aq}$. Prepared by saturating warm $\text{Na}_2\text{CO}_3\text{Aq}$ with MoO_3 , filtering, and allowing to evaporate spontaneously, also by adding excess of HNO_3Aq to a conc solution of MoO_3 in $\text{Na}_2\text{CO}_3\text{Aq}$, also by adding acetic acid to solution of $\text{Na}_2\text{MoO}_4\cdot 2\text{aq}$, also by spontaneous evaporation of solution of $\text{NaHMoO}_4\cdot 8\text{aq}$ after addition of 1 or 2 formula weights of Na_2CO_3 . A voluminous pp consisting of fine needles. Small quantities of a hot conc solution of this salt give $\text{Na}_2\text{Mo}_3\text{O}_{10}\cdot 4\text{aq}$ on rapid evaporation, amorphous mass, easily sol water. Forms a double salt with $(\text{NH}_4)_2\text{Mo}_3\text{O}_{10}$. (4) **Tetramolybdates**, (a) **Normal salt**, $\text{Na}_2\text{Mo}_4\text{O}_{23}$. Prepared by adding the proper quantity of HClAq to $\text{Na}_2\text{MoO}_4\text{Aq}$, and evaporating, also by spontaneous evaporation of solution of $\text{NaHMoO}_4\cdot 8\text{aq}$, to which a little NaCl has been added. Easily sol hot water, sl sol cold water. (b) **Acid salt**, $\text{NaHMo}_4\text{O}_{23}\cdot 8\text{aq}$. Prepared by adding the proper quantity of HClAq to $\text{Na MoO}_4\text{Aq}$. Large monoclinic crystals, sol water, hot or cold. Melts below redness. (5) **Octomolybdates**, (a) **Normal salt**, $\text{Na}_2\text{Mo}_8\text{O}_{52}\cdot 4\text{aq}$. Prepared by digesting the acid salt with 1 formula weight Na_2CO_3 in water. A white insol powder. (b) **Acid salt**, $\text{NaHMo}_8\text{O}_{52}\cdot 4\text{aq}$. Prepared by adding excess of conc HNO_3Aq to boiling $\text{Na}_2\text{MoO}_4\text{Aq}$. A white pp. (6) **Decamolybdate**, $\text{Na}_2\text{Mo}_{10}\text{O}_{60}\cdot 12\text{aq}$. Prepared by adding 2 HClAq to $\text{Na MoO}_4\text{Aq}$, and evaporating on the steam bath. Separates as a white, almost insol, crystalline powder. (7) **Tri-basic heptamolybdate**, $\text{Na}_3\text{Mo}_7\text{O}_{42}\cdot 22\text{aq}$ ($= 3\text{Na}_2\text{O}\cdot 7\text{MoO}_3\cdot 22\text{aq}$). Prepared by dissolving MoO_3 in the calculated quantity of Na_2CO_3 in water, also by mixing equivalent quantities of

$\text{Na}_2\text{Mo}_2\text{O}_7$ and Na_2CO_3 in solution, and evaporating, also from a solution of MoO_3 in NaOH Aq or $\text{Na}_2\text{CO}_3\text{Aq}$, by adding HNO_3Aq as long as the pp of trimolybdate redissolves and until the liquid acquires an acid reaction. Large, lustrous, monoclinic prisms, easily sol water, solution reacts acid. Melts when warmed, and crystallises on cooling, the molten salt is insol water. There are also several complex double sodium molybdates.

ANTIMONO-, ARSENO-, FLUO-, PHOSPHO-, SILICO-, VANADO-, MOLYBDATE.

Antimonoso-molybdates. These salts are most simply regarded as compounds of Sb_2O_3 with MoO_3 , and basic oxides, they are obtained by boiling SbOCl with an acid molybdate solution (Gibbs, *P Am A* 21, 93).

Antimono molybdates. Some of these salts, compounds of Sb_2O_3 with MoO_3 , and basic oxides, are described by Gibbs (*P Am A* 21, 105).

Arsenoso molybdates. Described by Gibbs (*lc* 21, 81). The former salts are obtained by boiling As_2O_3 with conc solutions of acid molybdates, the latter by oxidising the former in alkaline solution. (For composition of foregoing complex salts v abstracts of Gibbs' papers in *C J Abstracts*, 1886 426, 511, 1887 113, v also *Pufahl, B* 17, 217, *Debray, C R* 78, 1408, *Struve, J pr* 58, 493.)

Arseno molybdic acids. Compounds of H_2AsO_4 with MoO_3 , v *Severth, B* 6, 391, *Debray, C R* 78, 1408, *Struve, J pr* 58, 493.

Regarding the relations of the antimono and arseno molybdates to the phospho molybdates, v *Phosphomolybdates*, p 426.

Fluo molybdates. A number of salts are obtained by dissolving molybdates in HFAq and evaporating, others are formed by dissolving metallic oxides along with MoO_3 in HFAq and evaporating, other salts are produced by dissolving hydrated MoO_3 along with metallic oxides in HFAq and evaporating, others by dissolving MoCl_3 in alkali fluorides. These salts may be regarded as *fluomolybdates*, most of them belong to one of the series $\text{M}^i\text{Mo}_i\text{O}_i\text{F}_i$, $\text{M}^i\text{Mo}_i\text{O}_i\text{F}_i$, or $\text{M}^i\text{Mo}_i\text{OF}_i$, the first may be looked on as salts of the hypothetical acid $\text{H}_i\text{MoO}_i\text{F}_i$, derived from H_iMoO_i , the second may be looked on as salts of the hypothetical acid HMoO_iF_i , derived from H_iMoO_i , and the third as salts of the hypothetical acid H_iMoOF_i , derived from the hypothetical H_iMoO_i . The foregoing, and other, fluomolybdates may also be regarded as compounds of metallic fluorides with MoO_3F_2 and MoOF_3 , respectively.

Fluomonomolybdates, $\text{M}^i\text{Mo}_i\text{O}_i\text{F}_i$. These salts, which may also be represented as $2\text{MF MoO}_3\text{F}_i$, are generally obtained by dissolving monomolybdates in HFAq , most of them are sol water, and crystallise well. When carefully heated in air, many form molybdates, others give residues of metallic oxides (Delafontaine, *J* 1867 233). The chief fluomonomolybdates are the following $(\text{NH}_4)_2\text{MoO}_4\text{F}_i\cdot \text{H}_2\text{O}$, trichlorides, by adding slight excess of HFAq to a strongly ammoniacal solution of ordinary $\text{NH}_4\text{molybdate}$, and evaporating, when heated, H_2O and HF are evolved and blue oxide of Mo remains $(\text{NH}_4)_2\text{MoO}_4\text{F}_i$, rhombic plates (Mauro, *Mem R Acad des Lincei* [4] 4, 481). $\text{CoMoO}_3\text{F}_i\cdot 6\text{H}_2\text{O}$, dark red efflorescent crystals,

obtained by dissolving equivalent weights of CoO and MoO₃ in HFAq, and evaporating K₂MoO₄F₂H₂O, lustrous, triclinic crystals, obtained by dissolving K₂MoO₄ in HFAq, also by adding KF to MoO₃ dissolved in HFAq. Other

ever, exceed 6, in one case $n=14$ when $R=Ag$, (Gibbs). R = basic metal usually Na, K, or NH₄, x is generally large, varying from 8 to 46. The chief sub classes of these phospho molybdates are the following (Gibbs) —

10MoO ₃ ·2P ₂ O ₅ ·5R ₂ O xaq,	$R=NH_4$, and K , $x=7$ and 20
10MoO ₃ ·2P ₂ O ₅ ·6R ₂ O xaq,	$R=NH_4$, K , Ag , $x=14$, $R=Na$, $x=23$.
32MoO ₃ ·2P ₂ O ₅ ·6R ₂ O xaq,	$R=NH_4$, $x=28$
36MoO ₃ ·2P ₂ O ₅ ·2R ₂ O xaq,	$R=Na$, x undetermined, >10
36MoO ₃ ·2P ₂ O ₅ ·4R ₂ O xaq,	$R=Na$, x >8
44MoO ₃ ·2P ₂ O ₅ ·5R ₂ O xaq,	$R=K$, $x=22$ "
44MoO ₃ ·2P ₂ O ₅ ·6R ₂ O	$R=NH_4$
44MoO ₃ ·2P ₂ O ₅ ·6R ₂ O xaq,	$R=NH_4$, $x=18$ and 24
44MoO ₃ ·2P ₂ O ₅ ·6R ₂ O xaq,	$R=K$, $x=24$
44MoO ₃ ·2P ₂ O ₅ ·14R ₂ O xaq,	$R=Ag$, $x=23$
48MoO ₃ ·2P ₂ O ₅ ·2R ₂ O xaq,	$R=\frac{1}{2}Co(NH_3)_4(NO_3)_3O$, $x=46$
48MoO ₃ ·2P ₂ O ₅ ·4R ₂ O xaq,	$R=K$, $x=8$

salts of this series are CdMoO₄F₂, NiMoO₄F₂·6H₂O, Rb₂MoO₄F₂·H₂O, 2Na₂MoO₄F₂·H₂O, Ti₂MoO₄F₂·H₂O, ZnMoO₄F₂·6H₂O.

Fluomolybdates, M₁Mo₂O₇F₂ or M₂MoO₄F₂ (Delafontaine, *J* 1867 233). These salts may also be represented as MF MoO₄F₂, they are obtained by dissolving dimolybdates in HFAq, or by treating the salts M₂MoO₄F₂ with HFAq. The chief salts of this series are NH₄MoO₄F₂·H₂O, and KMoO₄F₂·H₂O.

Fluomolybdates other than the foregoing. The salts (NH₄)₂MoO₇F₂ (or MoO₄F₂·3NH₄F) and (NH₄)₂MoO₇F₂ (NH₄)₂MoO₄ (or MoO₄F₂·4NH₄F) (NH₄)₂MoO₄ are described by Mauro (*Mem R Acad der Lincei* [4] 4, 481). The same chemist (*G* 19, 179, *v* also *B* 15, 2509) describes the following salts — K₂MoO₇F₂·H₂O (or MoO₄F₂·2KF·H₂O), obtained by dissolving MoCl₅ or MoO₃·xH₂O in conc hot KFAq, and crystallising K₂Mo₂O₇F₂·H₂O (or 3MoO₄F₂·5KF·H₂O), by dissolving the preceding salt in HFAq and evaporating (NH₄)₂MoO₇F₂ (or MoO₄F₂·2NH₄F), by dissolving MoO₃·xH₂O in HFAq, adding NH₄Aq till the green liquid becomes reddish, then adding HFAq till a green colour is produced again, and evaporating considerably at a moderate temperature (NH₄)₂MoO₇F₂·H₂O (or 3MoO₄F₂·5NH₄F·H₂O), by dissolving the preceding salt in warm HFAq and evaporating.

Phospho-molybdates. The phospho molybdates have been examined by Berzelius, Svanberg a Struve (*J* pr 44, 299), Debray (*B* [2] 5, 404), Rammelsberg (*B* 10, 1776), Finkener (*B* 11, 1638), and especially by Wolcott Gibbs (*P Am A* 17, 62, 18, 232, 21, 50). These salts are produced when phosphoric acid or a soluble phosphate is added to solution of a molybdate, with or without the presence of a free acid, also by fusing together phosphates and molybdates, by dissolving molybdates in soluble in water in phosphoric acid, by digesting MoO₃ with an alkaline phosphate, and by treating mixtures of insoluble phosphates and molybdates with a dilute acid. The phospho-molybdates of the fixed alkaline bases may be dehydrated by careful heating, but MoO₃ is generally partially volatilised. Solutions of these salts in NH₄Aq are decomposed by H₂S with formation of thio-molybdates.

The phospho molybdates belong to the general form $mMoO_3 \cdot 2P_2O_5 \cdot nR_2O$ xaq, m is always an even number varying from 10 to 48, n varies from 2 to 6, and is generally = 6, n may, how-

The only *phospho molybdic acid* which has been isolated is 48MoO₃·2P₂O₅·6H₂O xaq, three hydrates are known in which $x=54$, 92, and 100 (Gibbs).

The salts with 6R₂O are regarded by Gibbs as normal salts, those with less than 6R₂O generally have acid reactions. To the *ordinary ammonium phospho-molybdate* — obtained by adding excess of a mineral acid to a solution containing MoO₃, P₂O₅, and an NH₄ salt — Gibbs assigns the composition 48MoO₃·2P₂O₅·5(NH₄)₂O·16aq (cf Svanberg a Struve, *J* pr 44, 291, Nutting, *Pharmaceut Vierteljahresschrift*, 4, 549, Sonnenschein, *J* pr 53, 342, Lupowitz, *P* 109, 135, Seligsohn, *J* pr 67, 470, Hundeshagen, *Fr* 23, 141, 172, who says that when dried above 130° the salt is 12MoO₃·(NH₄)₂PO₄).

Gibbs (*lc*) describes four other series of phospho molybdates —

Metaphospho molybdates,
 $mMoO_3 \cdot nH_2PO_4 \cdot pR_2O$ xaq

Hypophospho molybdates,
 $mMoO_3 \cdot nH_2PO_2 \cdot pR_2O$ xaq

Phosphoroso molybdates,
 $mMoO_3 \cdot nH_2PO_3 \cdot pR_2O$ xaq

Phosphoroso phospho molybdates,
 $mMoO_3 \cdot nP_2O_5 \cdot nH_2PO_3 \cdot pR_2O$ xaq

Metaphospho molybdates, represented by 10MoO₃·4NH₄PO₃·3(NH₄)₂O 9aq and

14MoO₃·3Ba(PO₃)₂·BaO 55aq are converted by acids into oithophospho molybdates (Gibbs, *P Am A* 21, 116).

Hypophospho molybdates are represented by 8MoO₃·2H₂P₂O₄·2(NH₄)₂O 2aq, this salt was obtained by mixing NaH₂PO₄Aq with solution of (NH₄)₂Mo₂O₇, and adding HClAq (*G*, *P Am A* 18, 232).

Phosphoroso-molybdates are represented by 24MoO₃·4H₂PO₃·4(NH₄)₂O xaq, in which $x=17$ and 25, obtained by adding H₂PO₃Aq (produced by adding water to PCl₅) to solution of (NH₄)₂Mo₂O₇ (*G*, *P Am A* 18, 237, 21, 89).

Phosphoroso phospho molybdates are represented by 72MoO₃·3P₂O₅·2H₂PO₃·9(NH₄)₂O 38aq, obtained by adding the product of the decomposition of PCl₅ by H₂O to solution of 10MoO₃·2P₂O₅·6(NH₄)₂O 14aq (*G*, *lc* 21, 96).

Note — *Pyrophospho-tungstates* have been isolated, of the form 22WO₃·9P₂O₅·pR₂O, $p=13$, 18, and 20, an *ortho-metaphospho tungstate* has also been prepared,

22WO₃·3(P₂O₅·3K₂O) 6NaPO₃·2K₂O 2Na₂O 42aq.

Corresponding molybdates have not yet been isolated

Besides the foregoing phospho molybdates, representatives of phosphovanado- and phosphostanno- molybdates have been prepared by Wolcott Gibbs

Phosphovanado molybdates are represented by $28\text{MoO}_3 \cdot 2\text{P}_2\text{O}_5 \cdot 16\text{V}_2\text{O}_5 \cdot 16(\text{NH}_4)_2\text{O}$ 100aq, and $48\text{MoO}_3 \cdot 2\text{P}_2\text{O}_5 \cdot \text{V}_2\text{O}_5 \cdot 7(\text{NH}_4)_2\text{O}$ 30aq. These salts are obtained by digesting MoO_3 with solution of phosphovanadates, $\text{mP}_2\text{O}_5 \cdot \text{nV}_2\text{O}_5 \cdot \text{pR}_2\text{O}_5$, by heating solutions of vanado molybdates, $\text{mMoO}_3 \cdot \text{nV}_2\text{O}_5 \cdot \text{pR}_2\text{O}_5$, with alkaline phosphates in the presence of acid, and by heating V_2O_5 with solution of an alkaline phospho molybdate (Gibbs, *l.c.* 18, 253)

Phosphostanno molybdates, the salt $16\text{MoO}_3 \cdot 3\text{P}_2\text{O}_5 \cdot 4\text{SnO}_2 \cdot 3(\text{NH}_4)_2\text{O}$ 28aq is obtained by pouring solution of $\text{SnCl}_2 \cdot 2\text{NH}_4\text{Cl}$ into a hot solution of the acid NH_4 phospho molybdate $10\text{MoO}_3 \cdot 2\text{P}_2\text{O}_5 \cdot 5(\text{NH}_4)_2\text{O}$ 7aq (Gibbs, *l.c.* 21, 120)

The arseno- molybdates already referred to (p 425) belong to the series $\text{mMoO}_3 \cdot \text{nAs}_2\text{O}_5 \cdot \text{pR}_2\text{O}_5$ (arsenoso- compounds) where $m=6, 8$, and 12 , $n=3, 2$, and 5 , $p=2$ and 3 ($\text{R}=\text{NH}_4, \frac{1}{2}\text{Mn}, \frac{1}{2}\text{Ba}$), and $x=6, 13$, and 24 (Gibbs, *P Am A* 21, 81). The antimo- molybdates (*v* p 425) belong to the series $17\text{MoO}_3 \cdot 3\text{Sb}_2\text{O}_5 \cdot 6(\text{NH}_4)_2\text{O}$ 21aq (antimonoso- compounds), and the series $7\text{MoO}_3 \cdot 4\text{Sb}_2\text{O}_5 \cdot 5(\text{NH}_4)_2\text{O}$ 12aq (antimono compounds) (Gibbs, *P Am A* 21, 93 a 105)

Silico-molybdates Alkali molybdate solutions produce yellow pps when added to solutions of alkali silicates in presence of HNO_3 (Knop, *C C* 1857 691, 861, Richter, *D P J* 199, 183). According to Paumentier (*C R* 92 1231) these pps have the composition $13\text{MoO}_3 \cdot \text{M}_2\text{SiO}_5 \cdot x\text{H}_2\text{O}$. P obtained the acid $12\text{MoO}_3 \cdot \text{H}_2\text{SiO}_3 \cdot 24\text{H}_2\text{O}$ from the mercurous salt (*C R* 94, 213). This acid forms large yellow regular octahedra, melting at 45° and decomposing below 100° , easily soluble in water and dilute acids, decomposed by excess of NH_4Aq or alkali carbonates with separation of silica

Vanado molybdates These salts belong to two series (Gibbs, *P Am A* 18, 240 a 264)

Vanadio molybdates These salts are represented by $6\text{MoO}_3 \cdot \text{V}_2\text{O}_5 \cdot 2(\text{NH}_4)_2\text{O}$ 5aq, $16\text{MoO}_3 \cdot 2\text{V}_2\text{O}_5 \cdot 5\text{BaO}$ 29aq, and $18\text{MoO}_3 \cdot \text{V}_2\text{O}_5 \cdot 8(\text{NH}_4)_2\text{O}$ 15aq, they are obtained by digesting V_2O_5 (free from VO) with solutions of alkaline molybdates, by heating together solutions of alkaline vanadates and molybdates especially in presence of acid, by boiling solutions of alkaline vanadates or meta vanadates (*e.g.* NH_4VO_3) with MoO_3 , and by the decomposition of phosphovanadomolybdates (*v supra*)

Vanadio-vanadico molybdates The representatives of this series which have been isolated are $28\text{MoO}_3 \cdot \text{VO}_2 \cdot 4\text{V}_2\text{O}_5 \cdot 11(\text{NH}_4)_2\text{O}$ 20aq and $80\text{MoO}_3 \cdot 3\text{VO}_2 \cdot 2\text{V}_2\text{O}_5 \cdot 14\text{BaO}$ 48aq. They are obtained by boiling VO_2 and V_2O_5 with an acid molybdate, by the partial reduction of vanadio molybdates, and by digesting solutions of acid molybdates with solutions containing VO_2 and V_2O_5

Alumino-, chromico-, ferrico-, and manganomolybdates have been obtained by Struve (*Petersburg Acad Bull* 12, 142) and Paumentier (*C. R.* 98, 389). These salts are

classified by Gibbs (*P Am A* 21, 121) as belonging to the forms $10\text{MoO}_3 \cdot \text{M}_2\text{O}_3 \cdot 2\text{K}_2\text{O}$ 15aq, where $\text{M}=\text{Al}, \text{Cr}, \text{Fe}$, $12\text{MoO}_3 \cdot \text{M}_2\text{O}_3 \cdot 6\text{R}_2\text{O} \cdot x\text{H}_2\text{O}$, where $\text{M}=\text{Al}, \text{Cr}, \text{Fe}$, $\text{R}=\text{NH}_4, \text{K}$, or Na , and x is generally $=20$ to 22 , and $16\text{MoO}_3 \cdot \text{Mn}_2\text{O}_5 \cdot 5\text{R}_2\text{O}$ 12aq where $\text{R}=\text{NH}_4$, and K

Molybdenum, alloys of Mo alloys with several metals. With aluminum, a crystalline powder consisting of microscopic rhombic prisms, approximating in composition to MoAl_3 , is obtained by melting together 1 pt MoO_3 dissolved in HFAq and evaporated to dryness, 2 pts cryolite, 2 pts KCl NaCl , and 1 pt Al , and dissolving excess of Al from the regulus by NaOHAq (Wohler a Michel, *A* 115, 102). With iron, grey, hard, brittle, alloys are obtained by directly fusing the metals together, by reducing $\text{Fe}_2\text{O}_3 \cdot 4\text{MoO}_3$ in H at full red heat, an alloy of the composition Mo_3Fe is obtained (Stenacker, *Ueber einige Molybdänverbindungen* [Göttingen, 1861]). Alloys with Cu, Au, Pt, and Ag have been described. An alloy of Mo with lead was found in plates in Utah (Silliman, *Am S* [3] 6, 128)

Molybdenum, bromides of Mo combines directly with Br to form three bromides MoBr_3 , MoBr_2 , and MoBr , no MoBr_4 corresponding with MoCl_4 has been isolated. When Br is passed over strongly heated Mo, an oxybromide is formed, then a greenish grey sublimate of MoBr , near the heated part of the tube, the metal becomes yellow red and is eventually converted into MoBr_2 , between the MoBr_2 and MoBr_3 , isolated lustrous black needles of MoBr are formed. The only halogen compound of Mo which has been gasified, and the mol w of which is known in the gaseous state, is MoCl_4

MOLYBDENUM DIBROMIDE, MoBr_2 ($\text{Mo}_2\text{Br}_4, \text{Br}$) (*Molybdous bromide*)

Preparation —1. By passing Br vapour, much diluted by CO_2 , over strongly heated Mo (Atterberg, *J* 1872 260) —2. By passing Br vapour over Mo at a moderate temperature, or over a heated mixture of MoO_3 and C, strongly heating the MoBr_2 thus produced, and treating the residue with water whereby unchanged Mo may be washed away (Blomstrand, *J pr* 82, 433)

Properties and Reactions —A golden yellow powder, unchanged by heat, insoluble in water and in all acids. Concentrated alkali solutions produce alkali bromide and $\text{MoO}_3 \cdot x\text{H}_2\text{O}$ (Blomstrand, *J pr* 77, 91). Dilute alkali solutions produce alkali bromide, and yellow solutions from which CO_2 ppts $\text{Mo}_2\text{Br}_4(\text{OH})_2 \cdot 8\text{H}_2\text{O}$. This compound, known as *molybdenum bromohydroxide*, is prepared by slowly adding CO_2 to the solution of MoBr in KOHaq , or by adding acetic acid and then passing in CO , or by decomposing the solution when hot by NH_4Cl (*v Molybdenum bromohydroxide*). The reaction of MoBr_2 with KOHaq points to the formula $\text{Mo}_2\text{Br}_4 \cdot \text{Br}$, for the dibromide, the radicle Mo_2Br_4 combines with acid radicles to form salts, *v Molybdenum bromohydroxide*, p 428

MOLYBDENUM TRIBROMIDE, MoBr_3 (*Molybdic bromide*) Obtained by passing Br vapour over gently heated Mo, or by heating a mixture of MoO_3 and C in Br vapour, any MoBr_2 and $\text{MoO}_3 \cdot \text{Br}$ formed are removed by heating in the stream of Br, as these compounds are more volatile than MoBr_3 (Blomstrand, *J pr* 82, 433).

Forms a blackish green mass of small interlaced needles. Sublimes with difficulty, at bright red heat gives MoBr_2 and Br. Unchanged by water, insoluble in conc HClAq and cold dilute HNO_3Aq . Slowly acted on by dilute alkali solutions, decomposed by boiling alkali solution with ppn of black $\text{Mo}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$ (Blomstrand, *l c*).

MOLYBDENUM TETRABROMIDE, MoBr_4 (Molybdic bromide) Formed in small quantity by heating Mo in Br, appears as single, black, lustrous, needles. Easily decomposed by heat to MoBr_2 and Br, the temperatures at which it is formed and decomposed being not very different. Fusible and volatile, forming brown vapours. Deliquescent, soluble in water, forming a brown-yellow solution from which alkalis ppt rusty brown $\text{MoO}_3 \cdot x\text{H}_2\text{O}$ (Blomstrand, *J pr* 82, 433).

Molybdenum, bromochlorides of

$\text{Mo}_2\text{Br}_2\text{Cl}_2 \cdot 3\text{H}_2\text{O}$ and $\text{Mo}_2\text{Cl}_2\text{Br}_2 \cdot 3\text{H}_2\text{O}$ Produced by adding HClAq to a solution of MoBr_2 in KOHAc , and by adding HBrAq to MoCl_2 in KOHAc respectively, cf *Molybdenum bromohydroxide, infra*, and *Molybdenum chlorohydroxide, p 430*.

Molybdenum, bromochlorohydroxide of
 $\text{Mo}_2\text{Cl}_2\text{Br}_2\text{OH} \cdot x\text{H}_2\text{O}$, obtained by adding water to an alcoholic solution of $\text{Mo}_2\text{Cl}_2\text{Br}_2 \cdot 3\text{H}_2\text{O}$, cf *Molybdenum chlorohydroxide de*.

Molybdenum, bromofluoride of

$\text{Mo}_2\text{Br}_2\text{F}_2 \cdot 3\text{H}_2\text{O}$ Produced by adding HFAq to solution of MoBr_2 in KOHAc , cf *Molybdenum bromohydroxide*.

Molybdenum, bromohydroxide of

$\text{Mo}_2\text{Br}_2(\text{OH})_2$ Prepared by dissolving MoBr_2 in KOHAc , and passing in CO_2 or adding acetic acid, or by adding NH_4Cl to a hot solution of MoBr_2 in KOHAc (Blomstrand, *J pr* 82, 433, cf Atterberg, *J* 1872 260). The yellow crystalline pp, consisting of $\text{Mo}_2\text{Br}_2(\text{OH})_2 \cdot 8\text{H}_2\text{O}$, is dried at 100° or *in vacuo* over H_2SO_4 , by placing the pp. over H_2SO_4 , the dihydrate $\text{Mo}_2\text{Br}_2(\text{OH})_2 \cdot 2\text{H}_2\text{O}$ is produced.

$\text{Mo}_2\text{Br}_2(\text{OH})_2$ is a red powder, sol in KOHAc , this solution probably contains $\text{Mo}_2\text{Br}_2\text{OK}$. Addition of acids to this solution generally ppts a compound of the acid radicle with the group Mo_2Br_2 , thus HClAq ppts $\text{Mo}_2\text{Br}_2\text{Cl}_2 \cdot 3\text{H}_2\text{O}$, HBrAq ppts $\text{Mo}_2\text{Br}_2\text{Br}_2 \cdot 3\text{H}_2\text{O}$, HFAq ppts $\text{Mo}_2\text{Br}_2\text{F}_2 \cdot 3\text{H}_2\text{O}$, and HIAq ppts the double compound $(\text{Mo}_2\text{Br}_2\text{I}_2) \cdot \text{Mo}_2\text{Br}_2(\text{OH})_2 \cdot 8\text{H}_2\text{O}$. $\text{H}_2\text{SO}_4\text{Aq}$ ppts $\text{Mo}_2\text{Br}_2\text{SO}_4 \cdot 3\text{H}_2\text{O}$. $\text{K}_2\text{Cr}_2\text{O}_7\text{Aq}$ ppts black $\text{Mo}_2\text{Br}_2\text{CrO}_4 \cdot 2\text{H}_2\text{O}$. Addition of NH_3 , molybdate and acetic acid ppts the molybdate $\text{Mo}_2\text{Br}_2\text{MoO}_4 \cdot 2\text{H}_2\text{O}$, $\text{H}_3\text{PO}_4\text{Aq}$, $\text{H}_2\text{C}_2\text{O}_4\text{Aq}$, and HNO_3Aq also yield pps, that by HNO_3Aq dissolves in excess of the acid. Acetic acid and CO_2 reppt the hydroxide from its solutions in alkalis. The haloid compounds of the radicle Mo_2Br_2 are yellow solids insol in excess of the haloid acids, they are decomposed by boiling water giving $\text{Mo}_2\text{Br}_2(\text{OH})_2 \cdot x\text{H}_2\text{O}$. The sulphate is yellow, and is sol in excess of $\text{H}_2\text{SO}_4\text{Aq}$, this solution gives no pp with AgNO_3Aq , addition of HClAq ppts $\text{Mo}_2\text{Br}_2\text{Cl}_2 \cdot 3\text{H}_2\text{O}$.

The compound $\text{Mo}_2\text{Br}_2(\text{OH})_2 \cdot 8\text{H}_2\text{O}$ might be represented as an oxybromide of Mo, viz as $\text{Mo}_2\text{OBr}_2 \cdot 9\text{H}_2\text{O}$, but the production of $\text{Mo}_2\text{Br}_2(\text{OH})_2$, by drying the hydrate, and the reactions of this compound with acids, are better expressed by representing the compound as a compound of the radicle Mo_2Br_2 , than as an

oxybromide. A corresponding chlorohydroxide, $\text{Mo}_2\text{Cl}_2(\text{OH})_2$, exists (*v p 430*).

Molybdenum, bromo-iodide of, $\text{Mo}_2\text{Br}_2\text{I}_2$ This compound is only known in combination with $\text{Mo}_2\text{Br}_2(\text{OH})_2$, the compound has the composition $(\text{Mo}_2\text{Br}_2\text{I}_2) \cdot \text{Mo}_2\text{Br}_2(\text{OH})_2 \cdot 8\text{H}_2\text{O}$, and is produced by adding HIAq to a solution of $\text{Mo}_2\text{Br}_2(\text{OH})_2$ in KOHAc , cf *Molybdenum bromohydroxide, supra*.

Molybdenum, chlorides of MoCl_3 is formed when Mo is heated in Cl free from O , by heating MoCl_3 in H_2 , MoCl_3 is produced, and MoCl_3 produces MoCl_2 , and MoCl_3 when heated in CO_2 . The formula MoCl_3 represents the molecular composition of the gaseous pentachloride, the mol wt of none of the other chlorides in the gaseous state has been determined.

MOLYBDENUM DICHLORIDE MoCl_2 (? $\text{Mo}_2\text{Cl}_2\text{Cl}_2$) (Molybdous chloride)

Formation—1 By heating MoCl_3 in an in different gas (Blomstrand, *J pr* 77, 95, Liechti a Kempe, *A* 169, 344)—2 By heating Mo with HgCl_2 —3 By carefully heating Mo in Cl largely diluted with CO_2 .

Preparation— MoCl_3 , as pure as possible, is placed in several porcelain boats, which are heated to dull redness in a glass tube, while a slow stream of perfectly dry CO_2 , free from an, is passed through the tube, the contents of the first boat are not quite pure MoCl_2 , but may be purified by gently warming with very dilute HNO_3Aq (Liechti a Kempf, *A* 169, 344).

Properties and Reactions—An amorphous dull yellow powder, unchanged in air, but when heated forms Mo_2O_3 , and then MoO_3 , volatilised with difficulty, insoluble in alcohol, dissolves in alcohol and ether (*L a K, l c*). Dissolves in HClAq and crystallises from this solution as $\text{MoCl}_2 \cdot \text{H}_2\text{O}$, $\text{MoCl}_2 \cdot 2\text{H}_2\text{O}$, or $2\text{MoCl}_2 \cdot 3\text{H}_2\text{O}$ (Blomstrand, *J pr* 77, 95, *v infra*, *Combinations*, No 1). Very slightly sol in HNO_3Aq , dissolved by $\text{H}_2\text{SO}_4\text{Aq}$, soluble in NH_4Aq , on boiling a brown powder containing N is ppd. Decomposed by hot conc alkali solutions with ppn of $\text{MoO}_3 \cdot x\text{H}_2\text{O}$. Dissolved by dilute alkali solutions to form a yellow liquid from which CO_2 or dilute acetic acid ppts $\text{Mo}_2\text{Cl}_2(\text{OH})_2 \cdot x\text{H}_2\text{O}$, *v infra* *Molybdenum chlorohydroxide*. This reaction suggests the formula $\text{Mo}_2\text{Cl}_2\text{Cl}_2$ for the dichloride (cf *Combinations*, No 2), the radicle Mo_2Cl_2 combines with acid radicles to form salts, *v Molybdenum chlorohydroxide*.

Combinations—1 With water to form the hydrates $\text{MoCl}_2 \cdot \text{H}_2\text{O}$, $\text{MoCl}_2 \cdot 2\text{H}_2\text{O}$, and $2\text{MoCl}_2 \cdot 3\text{H}_2\text{O}$ (or $\text{Mo}_2\text{Cl}_2\text{Cl}_2 \cdot 3\text{H}_2\text{O}$, $\text{Mo}_2\text{Cl}_2\text{Cl}_2 \cdot 6\text{H}_2\text{O}$, and $(\text{Mo}_2\text{Cl}_2\text{Cl}_2) \cdot 9\text{H}_2\text{O}$). The first of these hydrates is formed by dissolving MoCl_2 in rather dilute HClAq and allowing to stand, it forms thin yellow plates, insol water. The second hydrate is formed by warming a solution of MoCl_2 in HClAq on a water bath, or by slowly diluting a conc solution, it forms long thin prisms, sol water, alcohol, and ether. Dilute solutions of this hydrate deposit $\text{Mo}_2\text{Cl}_2(\text{OH})_2 \cdot 2\text{H}_2\text{O}$. The third hydrate is formed by dissolving MoCl_2 in hot HClAq and allowing to cool, it forms lustrous needles, insol water, decomposed by hot water, decomposed by heat with loss of H_2O , Cl, and HCl (Blomstrand, *J pr* 77, 95)—2 With the alkali haloid salts to form compounds of the type $2\text{MX} \cdot \text{Mo}_2\text{Cl}_2 \cdot x\text{H}_2\text{O}$

where $M = NH_4$ or K , and $X = Cl, Br$, or I (Blomstrand, *lc*) Obtained by adding excess of haloid acid, HX , to solutions of $MoCl_3$ in KOH or NH_4OH , and evaporating These compounds are decomposed by water, with solution of KX , or NH_4X , and ppt of $Mo_2Cl_4 \cdot x \cdot 3H_2O$ From solutions of these compounds $AgNO_3$ Ag ppts only half of the halogen present, thus 4Br is pptd from $Mo_2Cl_4 \cdot Br_2 \cdot 2KBr$, and 4Cl from $Mo_2Cl_4 \cdot Cl_2 \cdot 2KCl$ These compounds are not decomposed by H_2S in presence of acids, nor by K_2FeCy_4

MOLYBDENUM TRICHLORIDE, $MoCl_3$ (Molybdo-molybdic chloride)

Formation—1 By passing vapour of $MoCl_3$ over heated Mo (Berzelius)—2 By heating $MoCl_3$ by means of an ordinary spirit lamp, in a stream of H (Blomstrand, *J pr* 71, 449)—3 By passing CO_2 charged with $MoCl_3$ through a tube heated in one spot, $MoCl_3$ remains behind the heated place as a thick crystalline crust (Blomstrand, *lc*)

Preparation— $MoCl_3$ is prepared in a hard glass tube, narrowed at intervals so as to form 3 or 4 divisions (*v* *Molybdenum pentachloride, Preparation*), the greater part of the $MoCl_3$ is in the second division, while a little is in the first division Pure dry H is passed through the tube for some time, the second division of the tube is then heated until the $MoCl_3$ begins to sublime into the third division, the temperature of the third division is kept at 250° , at which temperature reduction to $MoCl_2$ proceeds When reduction is complete (known by the change of colour of black $MoCl_3$ into red $MoCl_2$), the H is replaced by a stream of dry CO_2 , and the small quantity of $MoCl_3$ in the first division of the tube is sublimed over the $MoCl_2$, which is not yet quite pure (Liechti & Kempe, *A* 169, 344)

Properties and Reactions—A dark brownish red solid, resembling amorphous P Unchanged in air Heated in a tube drawn to a fine opening, $MoCl_3$ forms as a red crystalline sublimate, heated in air, gives a white woolly sublimate, then brownish red, and finally dark blue, vapours, while impure $MoCl_3$ remains (*L a K, lc*) Decomposes at red heat into $MoCl_2$ and $MoCl$, Insol water and HCl Aq, sol in hot HNO_3 Aq, also in conc H_2SO_4 , forming a deep blue liquid (*L a K, lc*) Decomposed by boiling water, also by KOH Aq or $NaOH$ Aq, with pptn of $Mo_2O_3 \cdot 3H_2O$, warm NH_3 Aq produces a brown powder which contains N A compound of KCl with $MoCl_3$ was obtained by Berzelius by the action of K -amalgam on MoO_3 dissolved in HCl Aq

MOLYBDENUM TETRACHLORIDE, $MoCl_4$ (Molybdo-chloride)

Preparation— $MoCl_4$ is placed in a porcelain boat and heated to dull redness, in a long tube of hard glass, in a very slow stream of pure, air-free, CO_2 , $MoCl_4$ remains in the boat, and $MoCl_3$ sublimes, and is carried forward some distance by the CO_2 (Liechti & Kempe, *A* 169, 344)

Properties—A brown semi-crystalline solid, the vapour is intensely yellow Deliquescent, dissolves in water with hissing sound, the solution shows the reactions of salts of MoO_3 . Somewhat sol in alcohol and ether, dissolved by H_2SO_4 Aq with evolution of HCl , sol in conc HNO_3 Aq

Reactions—1 Kept in contact with air, oxy chlorides are produced—2 Heated in air, $MoO_3 \cdot Cl_2$ and $MoO_3 \cdot 2HCl$ are formed—3 Heated in carbon dioxide, forms $MoCl_3$ and $MoCl_2$, at a higher temperature the $MoCl_3$ is decomposed to $MoCl_2$ and $MoCl$

Combinations—1 With phosphorus pentachloride to form $MoCl_2 \cdot 2PCl_5$, a bluish amorphous solid, obtained by the reaction of PCl_5 with $MoCl_3$ or $MoO_3 \cdot Cl_2$ When this compound is heated, $MoCl_3$, PCl_5 is produced, a metal like lustrous solid, soluble in water to form a black liquid (Cronander, *Bl* [2] 19, 500)—2 With ammonium chloride to form $3MoCl_3 \cdot 2NH_4Cl \cdot 6H_2O$, obtained by saturating NH_4Cl Aq with $MoCl_3$, filtering from NH_4Cl which separates, and allowing to crystallise forms green, deliquescent octahedra (Blomstrand, *J pr* 71, 449)

MOLYBDENUM PENTACHLORIDE, $MoCl_5$ Mol wt 272.75 V.D. at $350^\circ = 137$ This chloride was supposed by Berzelius, also by Blomstrand, to be tetrachloride, its composition was determined by Debray (*C R* 66, 732)

Formation—1 By gently heating Mo or MoS_2 in Cl —2 By strongly heating in Cl a mixture of MoO_3 and C

Preparation—A tube of hard glass is narrowed at intervals so that 4 or 5 divisions are formed, a porcelain boat containing Mo is placed in the tube, and the Mo is heated in a stream of dry HCl so long as any white woolly sublimate of $MoO_3 \cdot 2HCl$ is formed, this sublimate is driven out of the tube by warming in the stream of HCl After cooling, dry air free Cl is passed through the tube for at least an hour, to ensure the removal of every trace of air, and the Mo is then gently heated in the stream of Cl $MoCl_5$ is formed and deposited immediately in front of the porcelain boat, by careful heating while the stream of Cl passes, the $MoCl_5$ can be sublimed into the different divisions of the tube, each of which is then sealed off (Liechti & Kempe, *A* 169, 344)

Properties—A black, crystalline, lustrous mass, a shade of greenish colour indicates presence of oxychloride (*L a K, lc*) Melts at 194° , and boils at 268° (Debray, *C R* 66, 732) The vapour is dark red V.D. at $350^\circ = 137$ (Debray, *lc*, Rieth, *B* 3, 668) May be sublimed unchanged in Cl or CO_2 Decomposed by heating in air with production of $MoO_3 \cdot Cl_2$ Fumes in air, and deliquesces to a brown liquid Dissolves in water with decomposition, solution in a little water is brown, but becomes colourless on dilution Sol in alcohol and ether, forming green liquids Sol in H_2SO_4 Aq and HNO_3 Aq

Reactions—1 Heated in air forms $MoO_3 \cdot Cl_2$, same change results by exposure to air—2 Reacts towards some organic compounds as a carrier of chlorine, e.g. CCl_4 and S_2Cl_2 are produced by passing Cl into CS_2 mixed with $MoCl_3$ (Aronheim, *B* 9, 1788)—3 Heated with ammonia or ammonium chloride produces compounds of Mo with N and H (*v* *Molybdenum, nitride of*, p 430)

Combinations—With phosphoryl chloride, to form $MoCl_3 \cdot POCl_3$, large dark green crystals, melting at 125° – 127° , and boiling at 170° with separation into its constituents (Pirutti, *B* 12, 1326) This compound is formed by heating PCl_5 with MoO_3 , in the ratio $3PCl_5 : MoO_3$, to 170° in a sealed tube, pouring off the brown liquid

from the crystals, washing the latter with CS_2 and drying them in a stream of CO_2 .

Molybdenum, chlorobromides of
 $\text{Mo}_2\text{Br}_2\text{Cl}_2 \cdot 3\text{H}_2\text{O}$ and $\text{Mo}_2\text{Cl}_2\text{Br}_2 \cdot 3\text{H}_2\text{O}$ Produced by adding HClAq to a solution of MoBr_2 in KOHAg , and by adding HBrAq to a solution of MoCl_2 in KOHAg respectively* (cf. *Molybdenum bromohydroxide*, p 428, and *Molybdenum chlorohydroxide*, *infra*)

Molybdenum, chlorobromohydroxide of
 $\text{Mo}_2\text{Cl}_2\text{Br}_2\text{OH} \cdot 2\text{H}_2\text{O}$, obtained by adding water to an alcoholic solution of $\text{Mo}_2\text{Cl}_2\text{Br}_2 \cdot 2\text{H}_2\text{O}$ (v next article)

Molybdenum, chlorohydroxide of
 $\text{Mo}_2\text{Cl}_2(\text{OH})_2 \cdot 2\text{H}_2\text{O}$ Prepared by dissolving MoCl_2 in KOHAg , and neutralising by acetic acid, the octohydrate $\text{Mo}_2\text{Cl}_2(\text{OH})_2 \cdot 8\text{H}_2\text{O}$ is obtained by adding CO_2 or NH_4Cl in place of acetic acid. The dihydrate a light yellow amorphous powder, insol water and alcohol, when freshly pptd and washed with cold water it dissolves readily in acids, but on boiling the solution in HNO_3Aq or $\text{H}_2\text{SO}_4\text{Aq}$ the hydrate is reprecipitated, and is now quite insoluble in acids. The octohydrate forms yellow lustrous crystals (Blomstrand, *J pr* 77, 95)

By adding HBrAq or HIAq to MoCl_2 , or $\text{Mo}_2\text{Cl}_2(\text{OH})_2 \cdot 2\text{H}_2\text{O}$, warming, and allowing to cool, the compounds $\text{Mo}_2\text{Cl}_2\text{Br}_2 \cdot 3\text{H}_2\text{O}$ and $\text{Mo}_2\text{Cl}_2\text{I}_2 \cdot 3\text{H}_2\text{O}$ are obtained, and by evaporating the mother liquor from the second of these, on the water bath, the compound $\text{Mo}_2\text{Cl}_2\text{I}_2 \cdot 6\text{H}_2\text{O}$ is produced. These haloid compounds of the radicle Mo_2Cl_2 are yellowish red crystals, soluble in alcohol, crystallisable from dilute HBrAq and HIAq respectively. Addition of water to the alcoholic solution of $\text{Mo}_2\text{Cl}_2\text{Br}_2 \cdot 3\text{H}_2\text{O}$ ppts $\text{Mo}_2\text{Cl}_2\text{Br}_2\text{OH} \cdot 2\text{H}_2\text{O}$ (Blomstrand, *lc*)

The compounds $\text{Mo}_2\text{Cl}_2(\text{OH})_2 \cdot 2\text{H}_2\text{O}$ and $\text{Mo}_2\text{Cl}_2(\text{OH})_2 \cdot 8\text{H}_2\text{O}$ might be represented as oxybromides of Mo, viz as $\text{Mo}_2\text{OCl}_2 \cdot 3\text{H}_2\text{O}$ and $\text{Mo}_2\text{OCl}_2 \cdot 9\text{H}_2\text{O}$, but the reactions of these compounds with HBrAq and HIAq , and the composition and properties of the salts $2\text{KX Mo}_2\text{Cl}_2\text{X}_2 \cdot x\text{H}_2\text{O}$ (v *Molybdenum dichloride*), are better expressed by representing them as hydrated hydroxides of the radicle Mo_2Cl_2 , than as hydrated oxybromides. A corresponding bromohydroxide, $\text{Mo}_2\text{Br}_2(\text{OH})_2$, exists (v p 428)

Molybdenum, chloro-iodides of
 $\text{Mo}_2\text{Cl}_2\text{I}_2 \cdot x\text{H}_2\text{O}$, $x=3$ and 6. Obtained by adding HIAq to MoCl_2 or to $\text{Mo}_2\text{Cl}_2(\text{OH})_2 \cdot 2\text{H}_2\text{O}$ (cf preceding article)

Molybdenum, fluorides of No fluoride of Mo has been isolated. Solutions of $\text{Mo}_2\text{O}_3 \cdot x\text{H}_2\text{O}$, $\text{MoO}_3 \cdot x\text{H}_2\text{O}$, and $\text{MoO}_2 \cdot x\text{H}_2\text{O}$, in HFAq may contain the corresponding fluorides (Berzelius). The first of these solutions is purple, on evaporation a purple coloured varnish is obtained, addition of KF , NH_4F , or NaF , to this solution, and evaporation, ppts rose coloured powders which may be double compounds of alkali fluoride and MoF_5 . Solution of $\text{MoO}_2 \cdot x\text{H}_2\text{O}$ in HFAq is rose red, but goes colourless on addition of much HFAq , on evaporation it yields a crystalline solid which dissolves in water, KF ppts a reddish-brown solid. Solution of MoO_3 in HFAq is colourless, on evaporation it yields a yellow syrup, addition of KF produces

$2\text{KF MoO}_2\text{F}_2 \cdot \text{H}_2\text{O}$ ($=\text{K}_2\text{MoO}_2\text{F}_2 \cdot \text{H}_2\text{O}$), (cf. *Fluomolybdates* under *Molybdates*, p 425)

Molybdenum, fluobromide of

$\text{Mo}_2\text{Br}_2\text{F}_2 \cdot 3\text{H}_2\text{O}$, prepared by adding HFAq to solution of $\text{Mo}_2\text{Br}_2(\text{OH})_2$ or MoBr_2 in KOHAg cf *Molybdenum, bromohydroxide of*, p 428

Molybdenum, haloid compounds of The haloid compounds of Mo which have been isolated are MoBr_2 , MoBr_3 , MoBr_4 , MoCl_2 , MoCl_3 , MoCl_4 , and MoCl_5 , the three bromides are reformed by the direct union of Mo and Br, MoCl_2 is produced by heating Mo in Cl, MoCl_3 is obtained by partial reduction (by H) of MoCl_5 , and MoCl_2 and MoCl_3 are the products of the decomposition by heat of MoCl_5 . The only one of these compounds whose molecular weight is known in the gaseous state is MoCl_5 . The reactions of the dibromide and dichloride leave little doubt that the molecular formulae of these compounds are not less than Mo_2X_4 , these compounds react as $\text{Mo}_2\text{X}_4\text{X}_2$, the radicles Mo_2X_4 combine with acid radicles to form salts such as $\text{Mo}_2\text{Br}_2\text{SO}_4$ and $\text{Mo}_2\text{Cl}_2\text{Br}_2$. These radicles Mo_2X_4 also combine with alkali haloid compounds to form $2\text{MY Mo}_2\text{X}_4\text{Y}_2 \cdot x\text{H}_2\text{O}$ where M = alkali metal and Y = halogen

No fluoride or iodide of Mo has been isolated with certainty

Molybdenum, hydroxides or hydrated oxides of, v *Molybdenum, oxides of*, p 431, also *Molybdic acids*, p 423

Molybdenum, hydroxychlorides of, $\text{Mo}(\text{OH})_2\text{Cl}$, v *Chloromolybdic acid*, p 423, $\text{Mo}_2\text{Cl}_2(\text{OH})_2$, v *Molybdenum, chlorohydroxide of*, *supra*

Molybdenum, hydroxybromide of, $\text{Mo}_2\text{Br}_2(\text{OH})_2$, v *Molybdenum, bromohydroxide of*, p 428

Molybdenum, iodides of None has been isolated with certainty. A solution of $\text{MoO}_2 \cdot x\text{H}_2\text{O}$ in HIAq gives a crystalline solid on evaporation, this solid is sol water, on heating it gives MoO_2 and HI (Berzelius)

Molybdenum, iodobromide of $\text{Mo}_2\text{Br}_2\text{I}_2$ Known only in combination with $\text{Mo}_2\text{Br}_2(\text{OH})_2$, as $(\text{Mo}_2\text{Br}_2\text{I}_2)_2 \cdot \text{Mo}_2\text{Br}_2(\text{OH})_2 \cdot 8\text{H}_2\text{O}$, which is produced by adding HIAq to a solution of $\text{Mo}_2\text{Br}_2(\text{OH})_2$ in KOHAg , cf *Molybdenum, bromohydroxide of*, p 428

Molybdenum, iodochloride of
 $\text{Mo}_2\text{Cl}_2\text{I}_2 \cdot x\text{H}_2\text{O}$, $x=3$ and 6. Obtained by adding HIAq to MoCl_2 or $\text{Mo}_2\text{Cl}_2(\text{OH})_2 \cdot 2\text{H}_2\text{O}$, cf *Molybdenum, chlorohydroxide of*, *supra*

Molybdenum, nitride of Mo_2N_2 , or (?) Mo_2N , A greyish black powder, obtained by passing dry NH_3 over MoCl_5 heated to full redness (Uhrlaub, P 101, 605). Heated to whiteness in NH_3 , Mo is produced

COMPOUNDS OF MOLYBDENUM WITH NITROGEN AND HYDROGEN These compounds are produced by heating MoCl_5 or MoO_3 in NH_3 , also by heating NH_4Cl with MoCl_5 . MoCl_5 melts when heated in dry NH_3 , NH_4Cl volatilises, and on continued warming a blackish mass remains, which when powdered, quickly washed with water, and dried over H_2SO_4 , has the composition $\text{Mo}_2\text{N}_2\text{H}_4$ (Uhrlaub, P 101, 605). Wöhler (A 108, 258) regarded this compound as 4MoN , $\text{Mo}(\text{NH}_2)_2$. By heating to incipient redness, a body of the composition $\text{Mo}_2\text{N}_2\text{H}_4$ is produced (Uhrlaub, *lc*). Both these compounds are black powders, heated in air they burn to MoO_3 , and give off NH_3 , with molten KOH they evolve NH_3 , and with NaClOAg

they evolve N (Uhrlaub, *lc*) By heating to a temperature slightly above that at which NH_4Cl is sublimed, Tuttle obtained Mo_3N_4 (*A* 101, 285) These compounds are all reduced to Mo by very strongly heating in NH_3 According to Tuttle (*lc*), purple coloured to black crystals are obtained by heating MoO_3 to redness in NH_3 , and these crystals consist of MoO_3 , Mo nitride, and Mo amide

Molybdenum, oxides and hydrated oxides of The three oxides MoO , Mo_2O_3 , and MoO_3 have been isolated, there also exist one or more oxides with more O than Mo O, and less than MoO_3 , a hydrate of the monoxide (MoO) was obtained by Blomstrand, but little is known concerning it The oxides Mo_2O_3 and MoO_3 are basic, they dissolve in acids to form salts, but little is known with certainty regarding these salts MoO_3 is acidic, it is the anhydride of molybdic acid HMoO_4 , and several other acidic hydrates of MoO_3 are known, *v* **Molybdenum, acids of**, p 423 MoO_3 also combines with some acids, *eg* HCl , and acidic radicles, *eg* SO_3 The mol wt of none of the oxides is known with certainty, as none has been gassed

HYDRATED MOLYBDOS OXIDE, $\text{MoO} \cdot x\text{H}_2\text{O}$ By treating MoBr_3 with conc KOH aq, Blomstrand obtained a black hydrate of MoO (*J pr* 77, 91) This compound has been examined only slightly

MOLYBDENUM SESQUIOXIDE, Mo_2O_3 (*Molybdomolybdic oxide*) This oxide was regarded by Berzelius as the protoxide, its composition was determined correctly by Blomstrand (*J pr* 71, 454, *cf* Svanberg a Struve, *J pr* 44, 257)

Formation—1 By heating MoO_3 to redness for some time in a stream of H (*S a S, lc*) — 2 By long continued digestion of MoO_3 with Zn and HCl aq, the product oxidises readily in air (Berzelius) — 3 By decomposing MoCl_5 by KOH aq, washing the pp of $\text{Mo}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$ with cold water, pressing between paper, drying over H_2SO_4 and heating *in vacuo* (Blomstrand, *J pr* 71, 455)

Preparation— $\text{MoO}_3 \cdot 3\text{H}_2\text{O}$ is obtained by one of the following methods it is dried over H_2SO_4 , and heated to a moderate temperature, *in vacuo*, or out of contact with air (if heated in air it is oxidised to MoO) To obtain $\text{Mo}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$, HCl aq is added to a conc solution of a molybdate till the pp which forms is redissolved, this solution is digested with Zn until the colour changes from blue to red brown and finally to black (Blomstrand, *J pr* 71, 455, Rammelsberg, *P* 127, 284, Weincke, *Fr* 14, 1, Pisani, *Fr* 4, 420, Macagno, *B* 8, 258, *cf* O von der Ploiden, *B* 15, 1925) Addition of NH_4 aq to this black solution ppts $\text{Mn}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$, care should be taken to ppt as little $\text{ZnO} \cdot \text{H}_2\text{O}$ as possible along with the $\text{Mo}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$ (the $\text{ZnO} \cdot \text{H}_2\text{O}$ begins to come down when most of the $\text{Mo}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$ is pptd) The pp is washed with water containing a little HCl , to remove $\text{ZnO} \cdot \text{H}_2\text{O}$, then with pure cold water (Blomstrand, *lc*), and is then pressed between paper $\text{Mo}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$ is also obtained by reducing the HCl solution of a molybdate by K amalgam containing very little K, and then ppg by NH_4 aq (Berzelius), also by adding NH_4 aq to the solution obtained by boiling HCl aq and Cu with PbMoO_4 (von Kobell, *J pr* 41, 158, *cf* Hirzel, *J* 1850 309), or with MoO_3 aq (Rammelsberg, *P* 127, 281)

Properties and Reactions—A black solid. As obtained by reducing MoO_3 with Zn and HCl aq (*v* **Formation** No 2), Mo_2O_3 is brass-yellow and shows the same crystalline form as the MoO_3 from which it is prepared, this variety of Mo_2O_3 oxidises in air more rapidly than the black variety obtained by heating the hydrate Heated in air, burns to MoO_3 Insol acids

HYDRATE OF MOLYBDENUM SESQUIOXIDE, $\text{Mo}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$ A black solid obtained as described under **Molybdenum sesquioxide**, **Preparation** The moist hydrate oxidises by exposure to air Dissolves slowly in acids to form purple solutions, which are opaque but become transparent and greyish brown when much diluted By evaporation, dark grey or black, non crystallisable, salts are obtained, these salts have not been examined at all satisfactorily, a phosphate, nitrate, borate, and several sulphates were obtained by Berzelius (*P* 6, 331, 369)

MOLYBDENUM DIOXIDE, MoO_2 (*Molybdic oxide*) By strongly heating NH_4 molybdate, in a closed crucible, Bucholz obtained a dark metallic mass which he regarded as Mo dioxide (*Scher J* 9, 485), but Uhrlaub (*P* 101, 605) and Tuttle (*A* 101, 285) showed that this substance contains N and H

Formation—1 By reducing MoO_3 or $\text{Hg} \cdot \text{MoO}_3$ (*H Rose, P* 75, 319) by heating in H (Svanberg a Struve, *J pr* 44, 257, Rammelsberg, *P* 127, 281) — 2 By melting $\text{Na}_2\text{Mo}_2\text{O}_7$ with $\frac{1}{3}$ its weight of Zn, added in small pieces, and repeatedly washing the cold mass first with warm conc KOH aq and then with warm HCl aq, the product usually contains a little MoO_3 (Ullrich, *A* 144, 227) — 3 By strongly heating $\text{Na}_2\text{Mo}_2\text{O}_7$ in H and removing Na MoO_4 produced by very dilute KOH aq (*S a S, lc*) ($? \text{Na}_2\text{Mo}_2\text{O}_7 + 2\text{H}_2 = \text{Na MoO}_4 + 2\text{H}_2\text{O} + 2\text{MoO}_2$)

Preparation—A mixture of 1 part MoO_3 , 1 part K CO_3 , and $\frac{1}{2}$ part H_2BO_3 , is very strongly heated in a Pt crucible, the crystals of MoO found in the mass on cooling are washed with H_2O , then with dilute NH_4 aq, and then with dilute HCl aq (Mauro a Panebianco, *G* 11, 501, *cf* Muthmann, *A* 238, 108)

Properties and Reactions—A dark brown powder, appearing somewhat purple in direct sunlight Obtained by fusing MoO_3 with K_2CO_3 and H_2BO_3 (*v* **Preparation**), MoO_2 forms copper red to greyish, metallic, very lustrous prisms, *SG* 6.44 at 10° (*M a P, lc*) Unacted on by alkali solution, HCl aq or HFA aq, oxidised to MoO_3 by HNO_3 aq, or by heating in air, heated in Cl_2 forms MoO_2Cl_2 Slightly soluble in conc. H_2SO_4 , and cream of tartar solution

HYDRATE OF MOLYBDENUM DIOXIDE, $\text{MoO}_2 \cdot x\text{H}_2\text{O}$ Obtained by adding NH_4 aq to solution of MoCl_5 , washing the pp with NH_4Cl aq, then with alcohol, pressing between paper, and drying *in vacuo* over H_2SO_4 The solution of MoCl_5 may be prepared by digesting a conc solution of MoO_3 in HCl aq with powdered Mo or with Cu (in absence of air) till all is dissolved (Rammelsberg, *P* 127, 281, *cf* Hirzel, *J* 1850 309)

$\text{MoO}_2 \cdot x\text{H}_2\text{O}$ is reddish-brown to nearly black, it closely resembles $\text{Fe}_2\text{O}_3 \cdot 8\text{H}_2\text{O}$ Slightly soluble in water, forming a reddish yellow liquid, which reddens litmus, and from which salts (*eg* NH_4Cl) reppt the hydrate This solution gela-

latimises after long standing, and dries to a brown black, insoluble, hydrate (Berzelius, *Lehrbuch*) Moist $\text{MoO}_3 \cdot x\text{H}_2\text{O}$ oxidises superficially in air, forming the blue oxide Heated *in vacuo* MoO_3 is produced $\text{MoO}_3 \cdot x\text{H}_2\text{O}$ is insoluble in caustic alkali solution, but dissolves in alkaline carbonates and bicarbonates, these solutions reprecipitate the hydrate on boiling, by standing in air molybdates are formed (Berzelius)

$\text{MoO}_3 \cdot x\text{H}_2\text{O}$ dissolves in acids to form salts These salts are generally purple red to black, only a few are crystallisable, their solutions oxidise in air, alkalis precipitate $\text{MoO}_3 \cdot x\text{H}_2\text{O}$ from these solutions The same salts may be prepared by digesting MoO_3 and Mo with acids till the colour is reddish-brown Berzelius (*P* 4, 153, 6, 331, 369, 7, 261) prepared some of the salts of MoO_3 , but they have not been examined satisfactorily By mixing MoO_3 in HClAq with NH_3 , molybdate, Rammelsberg obtained a crystalline salt $(\text{NH}_4)_2\text{O} \cdot 2\text{MoO}_3 \cdot 4\text{MoO}_3 \cdot 9\text{H}_2\text{O}$ (*P* 127, 281)

MOLYBDENUM TRIOXIDE, MoO_3 (Molybdic anhydride) This oxide was obtained by Scheele in 1778 soon after he had distinguished native Mo sulphide from galena

Occurrence—As molybdenum ochre in small quantities in a few localities

Formation—1 By heating Mo, or any of the lower oxides, for some time in air—2 By prolonged heating of the lower oxides in steam (Regnault, *A Ch* 62, 356)—3 By roasting MoS_2 in air, or oxidising it by HNO_3Aq (*v* Molybdenum, Preparation, p 421)—4 From NH_3 , molybdate, by evaporating with excess of HNO_3 and washing the residue with water (Brunner, *D P J* 150, 372), also by heating in thin layers spread out in a flat porcelain dish (Wilke, *A* 144, 205)

Preparation—Impure MoO_3 is dissolved in NH_3Aq , H_3PO_4 is removed by ppt with MgCl_2Aq , the filtrate is evaporated, the crystals of NH_4 molybdate which separate are heated with excess of HNO_3Aq and the residual MoO_3 is washed with water (For details as to preparation of MoO_3 from Mo ores *v* MOLYBDENUM, Preparation, p 421)

Properties—A white, light, porous, solid, when thrown into water it separates into small, thin, lustrous, scales S G 4.39 at 21° (Schafarik, *J pr* 90, 12) Strongly heated in an open vessel, sublimes in colourless, transparent, rhombic needles (Nordenskjöld, *P* 112, 160) Melts at red heat Soluble in 500 parts cold water (Bucholz, *Scher J* 9, 485), in 960 parts hot water (Hatchett, *T* 1795 323) The solution reddens litmus, tastes metallic (Wittstein, *J* 1860 159, Muller, *J pr* 80, 119) Soluble in acids, but scarcely soluble after being strongly heated Dissolves in alkali, alkaline carbonate, and cream of tartar solutions

Reactions—1 By heating in hydrogen MoO_3 is reduced to MoO_2 , Mo_2O_3 , or Mo, according to the temperature employed—2 Reduced to Mo by treating with potassium or sodium—3 Reduced to Mo_2O_3 by digesting with hydrochloric acid and zinc or copper, &c., also by potassium-amalgam—4 Reduced to the blue oxide (*v* p 433) by a little hydrogen sulphide (excess of H_2S produces black Mo sulphide), also by solution of sulphur dioxide, hydrogen iodide solution, boiling hydrochloric acid, nitric oxide, or stannous

chloride—5 Heated with ammonia, compounds of Mo with N, and with N and H, are produced (*v* Molybdenum, nitride of, p 430)—6 Heated with sulphur, MoS_2 is produced—7 Oxy chlorides, along with molybdates, oxybromides, or oxyfluorides are formed by heating MoO_3 with metallic chlorides, bromides, or fluorides (Schulze, *J pr* [2] 21, 440)—8 Various reduction products result by heating with potassium iodide (Schulze, *l c*)—9 Hydrogen chloride produces $\text{MoO}_3 \cdot 2\text{HCl}$ ($=\text{MoO}(\text{OH})\text{Cl}_2$, *v* Chloromolybdic acid, p 423)—10 Hydrofluoric acid probably produces MoO_2F_2 (*v* Molybdenum, oxyfluoride of, p 423)—11 Dissolves in fairly conc sulphuric acid, on evaporation, crystals of $\text{MoO}_3 \cdot \text{SO}_3$ separate (*v* infra, Combinations, No 3) Hot dilute $\text{H}_2\text{SO}_4\text{Aq}$, saturated with MoO_3 , gelatinises on cooling—12 Reacts with alkalis to form molybdates, $\text{R} \cdot \text{MoO}_4$, &c. (*v* p 423)—13 Oxy chloride, MoO_2Cl_2 , is formed by heating in chlorine (H Rose, *P* 75, 319)—14 Oxychlorides are produced by heating with phosphorus tri- or penta chloride (Michaelis, *J* 1871 249, Schiff, *A* 102, 116)

Combinations—1 With water to form various acidic hydrates (*v* Molybdic acids, p 423, also infra, Hydrates of molybdenum trioxide)—2 With hydrogen chloride to form $\text{MoO}_3 \cdot 2\text{HCl}$ This compound is produced as a white, loose, sublimate, by heating MoO_3 in HCl to 150° – 200° , it is easily soluble in water, and can be sublimed unchanged in HCl (Debray, *C R* 46, 1101) This compound may be regarded as an acid and called chloromolybdic acid, $\text{MoO}(\text{OH})\text{Cl}$ (*v* p 423)—3 With sulphur trioxide to form $\text{MoO}_3 \cdot \text{SO}_3$, and with SO_2 and H_2O to form $\text{MoO}_3 \cdot \text{SO}_3 \cdot 2\text{H}_2\text{O}$ $\text{MoO}_3 \cdot \text{SO}_3$ was obtained by Schultz Sellac (*B* 4, 14) by evaporating a solution of MoO_3 in fairly conc H_2SO_4 , it forms lustrous, transparent, deliquescent crystals, which lose SO_3 when heated $\text{MoO}_3 \cdot \text{SO}_3 \cdot 2\text{H}_2\text{O}$ was obtained by Anderson (*J B* 22, 161) by adding excess of $\text{H}_2\text{SO}_4\text{Aq}$ to BaMoO_4 , filtering, and evaporating—4 Combines with the oxides of phosphorus, arsenic, antimony, vanadium, and silicon, in presence of basic oxides, to form salts of complex acids, *v* Anti-mono, &c., molybdates, pp 425 et seq—5 With ammonium fluoride to form $\text{MoO}_3 \cdot 2\text{NH}_4\text{F}$ (? NH_4 salt of $\text{MoO}(\text{OH})\text{F}_2$), obtained in lustrous, light yellow, octahedral crystals, by adding NH_3Aq to an aqueous solution of $\text{MoO}_3 \cdot \text{F}_2 \cdot 3\text{NH}_4\text{F}$ (this salt is obtained by evaporating a solution of NH_4 molybdate in excess of NH_4FAq acidified by HFAq) (Mauro, *Mem R Acad dei Lincei*, [4] 4, 481)

HYDRATES OF MOLYBDENUM TRIOXIDE Six compounds $x\text{MoO}_3 \cdot y\text{H}_2\text{O}$ have been isolated Four of these have been described under Molybdic acids (p 423), the remaining two are described here

Monomolybdic dihydrate, $\text{MoO}_3 \cdot 2\text{H}_2\text{O}$ A yellow, crystalline, solid Slowly separates from a solution of 15 grs ordinary NH_3 molybdate in 1000 cc water mixed with 1000 cc HNO_3Aq S G 1.16, may be washed with cold water, sol in water and acids, solution reddens litmus and turns turmeric brown, conc HNO_3Aq separates MoO_3 (Millingk, *Gm -K* 2 [2], 170)

Ootomolybdic monohydrate, $8\text{MoO}_3 \cdot \text{H}_2\text{O}$ Obtained by ppg solution of or

dinary NH_4 molybdate by BaCl_2 Aq. decomposing the Ba salt by exactly the equivalent quantity of dilute boiling H_2SO_4 Aq. filtering, evaporating over H_2SO_4 , and drying at $160^\circ\text{--}170^\circ$ (Ullik, *A* 144, 329, 153, 373) Soluble in water

OXIDES OF MOLYBDENUM OTHER THAN THE DI-, SESQUI- AND TRI- OXIDE Several oxides appear to exist intermediate between MoO_3 and MoO_2 , their compositions are not yet settled Some of them form hydrates of which some are soluble and some insoluble in water The substance known as 'blue oxide of molybdenum,' formed by the action of reducing agents on acid solutions of MoO_3 , is probably Mo_2O_5

References— Mo_2O_5 , by heating lower oxides in air (Berzelius, *P* 6, 331, 369) Mo_2O_5 , by heating $(\text{NH}_4)_2\text{O} \cdot 2\text{MoO}_3 \cdot 4\text{MoO}_3 \cdot 9\text{H}_2\text{O}$ (Rammelsberg, *P* 127, 281) Mo_2O_5 , by heating NH_4 molybdate with MoO_3 (Berlin, *J pr* 49, 447, Uhrlaub, *P* 101, 605), also by electrolysis of molten MoO_3 (Wöhler a Bañ, *A* 110, 275) Mo_2O_5 , by heating MoO_3 with KI (Schulze, *J pr* [2] 21, 440) $\text{Mo}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$, by adding NH_4 molybdate or MoO_3 to MoO in HCl Aq (Berzelius, Rammelsberg, *lc*) Regarding properties of the blue products obtained by reducing acid solutions of MoO_3 , v Schiff, *A* 120, 47, Maschke, *Fr* 12, 384, Berzelius, *Gm K* 2 [2], 164, O von der Pfordten, *B* 15, 1925 Fairley (*C J* 31, 142) obtained indications of an oxide of Mo with more O than MoO_3 , by adding H_2O Aq to MoO_3 dissolved in excess of alkali solution

Molybdenum, oxybromide of $\text{MoO} \cdot \text{Br}_2$ Obtained by passing Br vapour over heated MoO_3 , by melting MoO_3 with H_3BO_3 , powdering, and then heating with KBr, by the reaction of MoO_3 on many metallic bromides (Schulze, *J pr* [2] 21, 442) Yellow crystals, may be sublimed, deliquescent and soluble in water The compound $\text{Mo}_2\text{Br}(\text{OH}) \cdot 8\text{H}_2\text{O}$ may be represented as an oxybromide $\text{Mo}_2\text{OBr} \cdot 9\text{H}_2\text{O}$, but is better regarded as hydrated bromohydroxide (*q v*, p 428)

Molybdenum, oxychlorides of Many oxychlorides of Mo exist They are produced by the reaction of Mo oxides with Cl, Mo chlorides with O, and PCl_5 and metallic chlorides with MoO_3

I Green oxychloride $\text{Mo}_2\text{O}_5\text{Cl}_2$, more probably MoOCl_2 (Blomstrand, *J pr* 71, 459, Putzbach, *A* 201, 123) By heating a mixture of Mo and MoO_3 in air free Cl, and in many other ways Melts and sublims below 100° Soluble in water Reduced by H at high temperatures, Putzbach (*lc*) describes $\text{Mo}_2\text{O}_5\text{Cl}_2$ as a product of this reduction

II Yellow white oxychloride MoO_2Cl_2 By passing Cl over heated MoO_3 or MoO (H Rose, *P* 75, 319), by heating Mo chlorides in presence of O (Blomstrand, *lc*), and in many other ways (*v* Schulze, *J pr* [2] 21, 441, Michaelis, *J* 1871 249, Schiff, *A* 102 216, Putzbach, *lc*) Melts at a high temperature when heated under pressure, at ordinary pressure sublims without melting, soluble in water and alcohol

III Violet oxychloride $\text{Mo}_2\text{O}_5\text{Cl}_4$, perhaps MoOCl_3 (Blomstrand, *lc*) Produced along with the green oxychloride, than which it is much less easily volatilised Dark violet-red crystals, deliquescent

VOL. III

IV Brown oxychloride, $\text{Mo}_2\text{O}_5\text{Cl}_3$ (Blomstrand, *lc*) Produced, along with $\text{Mo}_2\text{O}_5\text{Cl}_2$, by heating Mo_2O_5 in dry Cl, purified by sublimation in H Forms large dark brown crystals, melts easily, deliquescent and soluble in water Putzbach (*lc*) describes a brown oxychloride, $\text{Mo}_2\text{O}_5\text{Cl}_4$, obtained in the preparation of MoOCl_3 , also a red oxychloride, $\text{Mo}_2\text{O}_5\text{Cl}_3$, obtained by heating the violet compound in CO_2

The compound $\text{Mo}_2\text{Cl}_4(\text{OH}) \cdot 2\text{H}_2\text{O}$ may be represented as an oxychloride, $\text{Mo}_2\text{OCl}_3 \cdot 3\text{H}_2\text{O}$, but its reactions are more those of chlorohydroxide (*q v*) $\text{MoO} \cdot 2\text{HCl}$, which might be represented as $\text{MoO}_2\text{Cl}_2 \cdot \text{H}_2\text{O}$, is described as chloromolybdic acid (*q v*)

Molybdenum, oxyfluoride of MoO_2F_2 Produced by heating MoO_3 with metallic fluorides, as a blue-white amorphous sublimate (Schulze, *J pr* [2] 21, 442) A number of compounds are known which may be regarded as double compounds of MoO_2F_2 with alkali fluorides, others may be regarded as double compounds of MoOF_3 with alkali fluorides, these are described as fluo molybdates (*p* 425)

Molybdenum, phosphide of Mo_2P_2 A grey crystalline powder, SG 6 17, oxidised by heating in air, with conc HNO_3 Aq forms H_3PO_4 and MoO_3 , heated in Cl forms MoCl_3 and PCl_5 , reduces Cu solutions with ppn of Cu Produced by heating a mixture of 1 pt MoO_3 with 2 pts glacial phosphoric acid to a high temperature for some time, and washing with HCl Aq and then with NaOH Aq (Wöhler a Rautenberg, *A* 109 374)

Molybdenum, salts of Little is known with certainty of the salts obtained by replacing H of oxyacids by Mo MoO_2 and Mo_2O_3 dissolve in acids to form salts, but accurate analyses and description of those salts are lacking (*v* Molybdenum dioxide and sesquioxide, p 431) MoO_3 combines with SO_2 to form MoSO_3 , and with HCl to form $\text{MoO} \cdot 2\text{HCl}$, but those compounds are probably rather acids than salts (*v* Molybdenum trioxide, p 432) The radicles Mo_2Br , and Mo_2Cl , combine with certain acidic radicles to form salts (*v* Molybdenum bromohydroxide, and chlorohydroxide, pp 428, 430)

Molybdenum, selenide of MoSe_2 Obtained, but not free from a greyish blue substance which is produced along with it, by saturating acid NH_4 molybdate with H Se gas (Uelsmann, *A* 116, 125)

Molybdenum, sulphides of Three are known, MoS_2 , MoS , and MoS_3 As none has been gasified the molecular weight of none is known with certainty MoS and MoS_3 , and probably also MoS_2 , are all acidic towards the alkali sulphides

MOLYBDENUM DISULPHIDE, MoS_2 Occurs native, as molybdenite, SG 4 138 to 4 569 Prepared by heating to redness a mixture of 1 pt MoO_3 and 2 pts S, in a crucible, till excess of S is burnt off, and washing the residue with warm water as long as the washings are coloured (Svanberg a Struve, *J pr* 44, 264) According to Carnot (*Bl* [2] 32, 164) compounds of Mo generally yield MoS , when heated in a stream of dry H_2S A black, lustrous powder, insol water, sol conc H_2SO_4 , with evolution of SO_2 , and production of a blue liquid Forms MoO_3 , when roasted in air, or heated with conc.

F F

HNO_3Aq , readily attacked by Cl , more slowly by Br , not acted on by aqueous alkali but after fusion with alkali dissolves in water (? with formation of a thio-salt) Slowly reacts with steam at high temperatures (Regnault, *A. Ch.* 62, 385) Reduced to Mo by strongly heating in H (O von der Pfordten, *B* 17, 731)

MOLYBDENUM TRISULPHIDE, MoS_3 (Thiomolybdic anhydride) Obtained by passing H_2S into solution of a molybdate until decomposition is complete, i.e. till all molybdate is changed to a thiomolybdate, adding dilute HClAq in slight excess, warming gently (Atterberg, *J* 1873 258), washing, and drying at a moderate temperature A black powder, red-brown when moist Goes to MoS_2 when heated E sol alkali sulphide solutions, slowly dissolved by alkali or alkali hydrosulphide solution, the solutions thus obtained contain *thiomolybdates*, M_2MoS_3 (*v* THIOMOLYBDIC ACIDS AND THEIR SALTS, *infra*) MoS_3 is reduced to Mo by heating in H (O von der Pfordten, *B* 17, 731)

MOLYBDENUM TETRASULPHIDE, MoS_4 Prepared by fusing a mixture of 2 pts MoO_3 and 1 pt K_2CO_3 , powdering, boiling with water, filtering, diluting, saturating with H_2S , washing the pp with cold and then with hot water, then treating with HClAq , and heating the chocolate brown powder thus obtained to 140° in a stream of H_2S (Kruss, *B* 16, 2044) Also obtained by heating MoS_3 to 100° in H_2S (K, *lc*) Also by boiling MoS_3 with $\text{K}_2\text{MoS}_4\text{Aq}$, washing the pp of MoS_3 and K_2MoS_4 with cold water, dissolving in boiling water, and adding acid to this solution (Berzelius) MoS_4 is a cinnamon-brown powder, partially oxidised in moist air With basic sulphides forms *perthiomolybdates* M_2MoS_5 (*v* THIOMOLYBDIC ACIDS AND THEIR SALTS, *infra*)

Molybdenum, sulpho-acids of, *v* Molybdenum, thio acids of, and their salts

Molybdenum, thio-acids of, and their salts A number of molybdates are known in which O is partly or wholly replaced by S These salts may be divided into two classes, those containing both O and S , these may be called *oxy-thiomolybdates*, and those containing only S , these may be called *thiomolybdates* The latter salts are classed as thiomolybdates, derived from MoS_3 , and perthiomolybdates, derived from MoS_4 The only thio acid of Mo which has been isolated with certainty is H_2MoS_3

PERTHIOMOLYBDIC ACID, H_2MoS_4 A red pp obtained by adding a weak acid to K_2MoS_4 (which separates during the preparation of MoS_3), washing with cold water, and drying over H_2SO_4 (Kruss, *A* 225, 1) Insol water, alcohol, and ether Sol warm NaOHAq , not acted on by NH_4Aq , evolves H_2S slowly when boiled with conc HClAq

OXY-MONOTHIOMOLYBDATES, $\text{M}_2\text{MoO}_3\text{S}$ The Na salt is prepared by melting pure MoO_3 with dry Na_2CO_3 , till CO_2 is all expelled, powdering the $\text{Na}_2\text{Mo}_2\text{O}_7$, thus obtained, dissolving in freshly-prepared NaHSaQ , withdrawing the reddish heavy oil which separates, washing the crystals which are formed by allowing this oil to stand, with alcohol, ether, CS_2 , and then again with alcohol and ether, and drying over H_2SO_4

(Krüss, *A* 225, 1). A hygroscopic salt, sol water

OXY-DITHIOMOLYBDATES, $\text{M}_2\text{MoO}_2\text{S}_2$ The NH_4 salt is prepared, as golden-yellow needles, by passing H_2S into NH_4 molybdate dissolved in NH_4Aq , at c 6° (Krüss, *lc*) The K salt is also described by Krüss (*lc*)

OXY-PYRODITHIOMOLYBDATES, $\text{M}_2\text{Mo}_2\text{O}_2\text{S}_2$ ($= 2\text{M}_2\text{MoO}_2\text{S}_2 - \text{M}_2\text{S}$) The salts of this series at present known are acid salts The NH_4 salt, $\text{NH}_4\text{HMo}_2\text{O}_2\text{S}_2$, is prepared, as a reddish-yellow pp, by adding NH_4HS drop by drop to NH_4 molybdate at c 90° , filtering after addition of NH_4Cl , washing with alcohol, and drying over H_2SO_4 Corresponding K and Na salts are described by Krüss (*lc*)

TETRA-BASIC DIOXY DITHIOMOLYBDATES The salt $\text{K}_2\text{O} \cdot 3\text{K}_2\text{S} \cdot 2\text{MoO}_3 \cdot 2\text{MoS}_3$ ($= \text{K}_4\text{Mo}_2\text{S}_8\text{O}_{10}$) was obtained by Krüss (*lc*) by adding alcohol to a solution of $\text{K}_2\text{Mo}_2\text{O}_7$, repeatedly shaking the oil which forms with alcohol, separating the black flaky crystals from the yellow crystals and the brownish red powder, all of which are produced on standing, washing and drying

THIOMOLYBDATES, M_2MoS_3 These salts are derived from the hypothetical thiomolybdic acid H MoS_3 , of which acid MoS_3 is the anhydride The soluble thiomolybdates are obtained by directly combining MoS_3 with basic sulphides, also by passing H_2S into conc solutions of the corresponding molybdates, the insoluble thio molybdates are obtained by ppg salt solutions by soluble thiomolybdates The soluble thiomolybdates may generally be crystallised, the crystals show fluorescence, green in reflected, red in transmitted, light Solutions of these salts are red The thiomolybdates as a class are decomposed by heat, giving a mixture of sulphide of the basic metal and MoS_2 , the K salt is only partly decomposed at white heat Conc solutions are stable in presence of excess of MoS_3 , when diluted, and especially in presence of free alkali, the solutions become turbid with formation of thiosulphates and thiomolybdates richer in S than the original salts Boiled in absence of air, the solutions evolve H_2S and form MoS_2 and perthiomolybdates, M_2MoS_5 (Berzelius, *P* 7, 261, Krüss, *A* 225, 1, cf Bodenstein, *J* pr 78, 186)

Potassium thiomolybdate, K_2MoS_3 Prepared by gradually heating, finally to a high temperature, a mixture of equal parts K_2CO_3 and S , with a little C , and a large excess of MoS_3 , dissolving in water, filtering, and crystallising (Hirzel, *J* 1850 319) Krüss (*lc*) obtained this salt by dissolving 5 g K_2MoO_4 in 16 cc water, adding 50 cc KOHAc , S 1 46, and saturating with H_2S Red, rhombic, crystals, with greenish fluorescence Sol water, acetic acid ppts $\text{K}_2\text{Mo}_2\text{S}_5$

The other thiomolybdates which have been examined, more or less fully, are the salts of NH_4 , Ba , Cd , Ca , Ce , Cr , Co , Cu , Au , Fe , Li , Mg , Mn , Hg , Ag , Na , Sr , Sn , U , and Zn

PERTHIOMOLYBDATES, M_2MoS_5 The soluble salts of this class are formed by boiling thiomolybdates M_2MoS_3 with MoS_3 , the insoluble salts by ppg salt solutions by soluble perthiomolybdates The perthiomolybdates are generally dark red, solutions of the alkali salts give

a pp of MoS_3 on addition of acids (Berzelius, *P* 7, 261)

Potassium perthiomolybdate, K_2MoS_6 . Prepared by saturating an acid K molybdate solution with H_2S (a mixture of K_2MoS_4 and MoS_3 is thus produced), boiling for some hours in a retort, cooling, collecting the pp of K_2MoS_6 mixed with MoS_3 , washing with water till the washings give a flocculent dark red pp on addition of HClAq , extracting with boiling water, and evaporating the solution. Also by heating dilute $\text{K}_2\text{MoS}_4\text{aq}$ with excess of MoS_3 , nearly to 100° till the liquid is nearly dry. Also by reacting on MoS_3 with KHSAq . A red mass, resembling an extract, on one occasion Berzelius obtained ruby-red crystalline granules. Insol cold water, sol hot water. Scarcely acted on by cold HClAq or KOHaq .

The other perthiomolybdates examined, more or less fully, are the salts of NH_4 , Ba, Bi, Ca, Au, Fe, Hg, Ag, Na, Sr, and Sn.

TRIANGULAR DITHIOMOLYBDATES Krüss (*A* 225, 1) obtained the salt $\text{K}_2\text{Mo}_2\text{S}_6$ ($=3\text{K}_2\text{S} \cdot 2\text{MoS}_3$) = $\text{K}_2\text{MoS}_3 \cdot \text{MoS}_3 \cdot 2\text{K}_2\text{S}$ by passing H_2S into $\text{K}_2\text{MoO}_4\text{aq}$ containing KOHaq , $\text{SG} > 1.46$ (*cf* Potassium thiomolybdate, *supra*). Small redish orange rhombic crystals, sol water, insol alcohol and ether. Decomposes slowly in air, giving K_2MoS_3 . M M P M.

MONARDA OIL The essential oil of *Monarda punctata*, which smells like thyme, contains thymol $\text{C}_{10}\text{H}_{14}\text{O}$ [48°] and a terpene (Arrpe, *A* 58, 41).

MONO This prefix is very seldom used in this dictionary. Compounds whose names begin with mono are described under the name to which mono has been prefixed.

MORIN or MORIC ACID $\text{C}_{15}\text{H}_8\text{O}_4\text{aq}$ (B a H), $\text{C}_{15}\text{H}_{10}\text{O}_4\text{aq}$ (from alcohol), $\text{C}_{15}\text{H}_{10}\text{O}_4 \cdot 2\text{aq}$ (from water) (L). S 0.25 at 20° , 0.94 at 100° . Occurs in old fustic (*Morus tinctoria*) to which it imparts its dyeing properties (Wagner, *J pr* 51, 82, Hlasiwetz a Pfandler, *J pr* 90, 445, 94, 65, *A* 127, 352, Löwe, *Z* 1875, 117, *Fr* 14, 119, Benedikt a Hazura, *M* 5, 165, 667).

Preparation—1 Deposited as calcium salt from an infusion of the wood on cooling. This deposit is extracted with alcohol, water is added to the alcoholic extract when calcium morate is ppd while maclurin remains in solution. The calcium salt is then decomposed by oxalic acid (Wagner)—2 The deposit is washed, heated with very dilute HClAq , freed from CaCl_2 by washing, and repeatedly dissolved in alcohol and ppd by water (H a P, B a H).

Properties—Needles, v sl sol water, v sol alcohol, m sol ether, insol CS_2 . The solutions are deep yellow. Blackens at 300° . Conc H_2SO_4 dissolves it, without change, forming a brownish yellow solution. Its alkaline solutions are deep yellow. Its solution does not ppt gelatin. It stains the skin yellow. FeCl_3 colours the alcoholic solution deep olive green. It reduces Fehling's solution on warming and ammoniacal AgNO_3 in the cold. Its alcoholic solution exhibits green fluorescence on the addition of an aluminium salt (Goppelsröder, *J pr* 101, 406, 104, 10, *Z* [2] 4, 154, 607). Morin yields resorcin on dry distillation.

Reactions—1 Sodium-amalgam turns the alkaline solution indigo blue and finally yellow,

the solution then containing phloroglucin—2. Potash-fuson yields phloroglucin and resorcin. 3 Nitric acid in HOAc oxidises it to (4, 2, 1)-di-oxy-benzoic acid.—4 Bromine added to its alcoholic solution forms ethyl-tetra-bromomorn $\text{C}_{15}\text{H}_2\text{EtBr}_4\text{O}$, 4aq which is ppd on adding water and melts at 135° . Tin and HCl convert this ether into tetra-bromo-morn $\text{C}_{15}\text{H}_2\text{Br}_4\text{O}$, 2aq which becomes anhydrous at 110° and then melts at 258° . It dyes silk and wool yellow without a mordant.

Salts— $\text{KC}_2\text{H}_3\text{O}_4$, yellow needles (from $\text{K}_2\text{CO}_3\text{aq}$)— $\text{Ca}(\text{C}_2\text{H}_3\text{O}_4)_2$, yellow precipitate $\text{Ba}(\text{C}_2\text{H}_3\text{O}_4)_2$, red-brown powder— $\text{Zn}(\text{C}_2\text{H}_3\text{O}_4)_2$, lemon-yellow needles, insol water, sol alkalis— $\text{PbC}_2\text{H}_3\text{O}_4$, egg yellow pp— $\text{Pb}_2\text{C}_2\text{H}_3\text{O}_4$ (L).

Morin sulphonic acid $\text{C}_{15}\text{H}_8\text{O}_4 \cdot \text{SO}_3\text{H}$, 2aq. Formed by heating morin with conc H_2SO_4 . Golden brown powder, sl sol. cold, v sol hot, water— $\text{K}_2\text{C}_2\text{H}_3\text{SO}_4$, 1aq golden needles— $\text{BaC}_2\text{H}_3\text{SO}_4$, Golden flocculent pp, converted by nitric acid into tri-nitro phloroglucin.

Isomorn Formed by adding sodium-amalgam to an alcoholic solution of morin containing HCl until the solution is deep-purple, and then evaporating (H a P). Purple-red prisms. When heated alone or in alcoholic solution, or more quickly by treatment with alkalis, it is reconverted into ordinary morin. Its solution mixed with dilute alum is dichroic.

Paramorn $\text{C}_{15}\text{H}_8\text{O}_4$. Obtained, together with a larger quantity of resorcin, by distilling morin mixed with sand (Benedikt, *B* 8, 606). Yellowish, woolly needles (from ether). Tasteless. May be sublimed. Reduces Fehling's solution. V sol hot water and ether (unlike morin). It dissolves unchanged in conc H_2SO_4 . Alkalis form a yellow solution. Unlike morin, its alcoholic solution is not ppd by $\text{Pb}(\text{OAc})_2$.

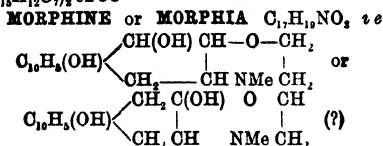

MORINDIN $\text{C}_{22}\text{H}_{16}\text{O}_{15}$ (A) [245°] (Stein). Extracted by alcohol from the root of various species of *morinda* used as a dye ('Suranyi') in India (Anderson, *Tr E* 16 [6], 435, *A* 71, 216). Slender lustrous orange needles, when heated it gives off orange vapours which condense to red needles of morindone. It is insol ether, v sl sol cold water and alcohol, sol aqueous KOH and conc H_2SO_4 , forming reddish violet solutions. Gives a red lake with alum, and a cobalt blue pp with baryta water. Morindin resembles ruberythric acid $\text{C}_{22}\text{H}_{16}\text{O}_{14}$ (Roehlede, *Sitz B* 7, 806, Stenhouse, *C* 17, 333) but differs from it in being insoluble in ether and in the behaviour of the red alkaline solution on boiling, for this becomes deep purple in the case of ruberythric acid, but does not change in that of morindin (Stein, *J pr* 97, 234, Thorpe a. Greenall, *C* 51, 52, 53, 171).

Morindone $\text{C}_{15}\text{H}_{10}\text{O}_4$. Tri-oxy methyl-anthraquinone (?). Formed together with glucose by boiling morindin with dilute mineral acids. Red needles, resembling alizarin. Insol water, v sol alcohol and ether. Its solution in potash is reddish-purple, but fades on standing (unlike alizarin). Conc H_2SO_4 gives a dark-blue solution (alizarin gives an orange solution). FeCl_3 gives a green colour. On distillation with zinc-dust it yields methyl anthracene.

MORINGIC ACID An acid supposed by Walter to exist as a glyceride in oil of ben (from

Moringa aptera) but shown by Zaleski (*B* 7, 1013) to be oleic acid

MORITANNIC ACID $C_{15}H_{12}O_7$ (?) If, after the aqueous extract of fustic has deposited morin, the filtrate be shaken with $EtOAc$, the acetic ether evaporated, and the residue dissolved in cold water and pptd by $NaCl$, brown amorphous moritannic acid separates first, followed by maclurin (Löwe, *Fr* 14, 127) V sol water. The solution is pptd by albumen, gelatin, and alkaloids $FeCl_3$ gives a brownish-black pp. Alcoholic lead acetate gives a pp ($C_{15}H_{12}O_7$), 5PbO

(Knorr, *B* 22, 1117) Mol w 285 [230°] (Hesse, *Ph* [3] 18, 801) S G 1.32 (Schröder, *B* 13, 1074) S 01 at 10°, 04 at 40°, 22 at 100° (Chastaing, *Bl* [2] 37, 477) S (absolute alcohol) 1.132 at 10.6°, 8.623 at 78° S (alcohol of 90 p.c.) 3.77 at 10.6°, 2.991 at 78° S (amyl alcohol) 2.68 at 11°, 2.247 at 78° (Florio, *G* 13, 496) S (ether) 0.23 at 10° (F) S (chloroform) 0.4 at 9.4°, 1.235 at 56° (F) S (amyl alcohol) 2.61 in the cold (Kubly, *J* 1866, 823) The solubility of crystallised morphine in boiling liquids is given by Prescott (*Ph* [3] 6, 404) as follows S (ether) 0.163, S (chloroform) 0.23, S (amyl alcohol) 1.1, S (benzene) 0.112 The solubility of amorphous morphine in boiling liquids is given by Prescott as S (ether) 0.473, S (chloroform) 0.506 The solubility of freshly pptd morphine in boiling solutions is given by Prescott as S (ether) 0.94, S (chloroform) 1.16, S (amyl alcohol) 1.1, S (benzene) 0.5 According to Burg (*Fr* 19, 222), the solubility of morphine in pure chloroform is 0.1, and in a mixture of 9 pts chloroform and 1 pt alcohol it is 9 [a]_D (in a 2 p.c. solution containing 2 mols $NaOH$) = -70.23° (Hesse, *A* 176, 190) [a]_D (in a solution of the hydrochloride) = -100.67° - 1.14*p*, where *p* = percentage of salt present (Hesse, Grimbert, *J* *Ph* [5] 16, 295)

Occurs in opium, being known in an impure state as *Magisterium opii* in the seventeenth century, and was first isolated in 1816 by Sertürner (*Gül. Ann* 55, 61, 57, 192, 59, 50) Dott (*Pr E* 12, 189) found in a sample of opium that half the morphine was present as meconate and half as sulphate It also occurs in *Eschscholtzia californica* (Baudet & Adrian, *C. C* 1889, 197), and in hops

Preparation—1 Opium is macerated with water at 38°, the extract evaporated with $CaCO_3$ to a small bulk, and then mixed with $CaCl_2$. The liquid is filtered from pptd calcium meconate and evaporated. It first deposits calcium meconate, and afterwards a mixture of the hydrochlorides of morphine and codeine. These crystals are dissolved in water and treated with ammonia, which ppt morphine, leaving codeine in solution (Robiquet & Gregory, *A* 5, 87, 7, 261)—2 The aqueous extract of opium is boiled with lime, and the filtrate boiled with NH_4Cl , which ppt morphine (Mohr, *A* 35, 120)

Properties—Small trimetric prisms (containing aq), v sl sol water, alcohol, and ether. It has a very bitter taste, and is a powerful narcotic poison. It dissolves readily to the extent of one equivalent in aqueous KOH , lime, baryta, and $NaOH$, but scarcely at all in ammonia and alkaline carbonates. It readily dissolves in acids. It is levorotatory. It loses its water of crystallisation at 100° (Dott, *Ph* [3] 18, 701), and begins to sublime at 150° in dots (Blyth)

Reactions—1 Very readily oxidised, thus 0.14 p.c. of the base is sufficient to liberate iodine from iodic acid (Serullas, *B J* 11, 238) Morphine is oxidised by alkaline K_2FeO_4 to pseudomorphine $C_{17}H_{17}N_2O_6$ (Hesse, *A* 235, 229), and the same substance is formed by the action of nitrous acid on morphine (Schutzenberger, *A* 108, 346, *Bl* 4, 176), and by allowing morphine to stand in aqueous NH_3 exposed to the air (Polstorff, *B* 13, 86) Morphine slowly reduces silver nitrate in the cold—2 On oxidation with alkaline $KMnO_4$, it yields an acid, apparently pyridine tricarboxylic acid (Barth & Weidel, *M* 4, 700)—3 Potash fusion yields protocatechuic acid (B & M) and methylamine (Wertheim, *A* 73, 208) Alcoholic potash at 180° forms methyl ethyl amine (Skraup & Wiegmann, *M* 10, 110)—4 Nitrous acid forms nitroso morphine, pseudomorphine, and a base $C_{17}H_{19}NO_3$ —5 Nitric acid, diluted with ($\frac{1}{2}$ mols of) water, forms at 100° an acid $C_{16}H_{15}NO_3$, which can be converted by conc HNO_3 into picric acid, and which yields methylamine when heated with KOH (Chastaing, *C R* 94, 44, *J Ph* [5] 4, 338)—6 Converted into codeine by heating with $NaOEt$ and MeI the yield being small owing to the formation of morphine methylo iodide (Grimaux, *A Ch* [5] 27, 273, Dott, *Ph* [3] 12, 1009)—7 On distillation with zinc dust it yields pyridine, NH_3 , pyrrole, and a base which may be quinoline, as chief products, together with 4 p.c. of phenanthrene and $\frac{1}{2}$ p.c. of phenanthraquinoline (Gerichten & Schrotter, *A* 210, 396)—8 When evaporated with dilute H_2SO_4 , till white fumes appear, morphine yields a residue turned brown by alkalis. Morphine (1 pt), heated with H_2SO_4 ($\frac{1}{2}$ pts) and oxalic acid (2 pts), at 120° forms a product which, on diluting with water, leaves a yellowish white amorphous body undissolved. This substance, $C_{17}H_{19}NO_3$, is soluble in hot water and in alkalis. It turns green in air, and its alkaline solution turns red in air. The redened alkaline solution gives with HCl a blue pp, 'morphine blue', $C_{17}H_{19}NO_3$, which can be crystallised from ether. Malonic and succinic acids behave like oxalic acids, forming the compounds $C_{17}H_{19}NO_5$ and $C_{17}H_{19}NO_6$. All these formulae should perhaps be doubled (Chastaing & Barillot, *C R* 105, 941, 1012)—9 Heating with oxalic acid forms trimorphine—10 Heating with conc HCl yields apomorphine (Matthiessen & Wright, *Pr* 17, 455, 460), and the bases $C_{17}H_{17}ClN_2O_6$, $C_{17}H_{17}ClN_2O_7$, $C_{17}H_{17}ClN_2O_8$, and $C_{17}H_{17}Cl_2N_2O_8$ —11 With $ClCH_2OAc$ and H_2SO_4 it gives an intense violet colour, and after dilution with water and addition of NH_3 , an amorphous yellow base, possibly $CH_3(C_{17}H_{17}NO_3)_2$, which gives a violet colour with H_2SO_4 (Grimaux, *C R* 93, 271)—12 Aqueous *alloxan* and SO_2 form $C_{17}H_{17}N_2O_7$, $C_{17}H_{17}NO_8$, H_2SO_4 (Pelizzari, *A* 248, 161)—13 Bleaching-powder, acting on a solution

of morphine hydrochloride, forms $C_{17}H_{19}ClNO_3$, a crystalline body (Mayer, *B* 4, 121)

Colour tests—1 Liberates iodine from iodic acid solution The brown colour is increased by adding ammonia (Lefert, *J Ph* [3] 40, 97). If a layer of very dilute ammonia be poured upon a very dilute solution of morphine containing iodic acid and starch, a brown ring below a blue ring will appear at the junction of the liquids (Dupré, *C N* 8, 267)—2 *Chloride of gold* colours the solution blue, being reduced to gold—3 $KMnO_4$ is reduced, becoming green—4 *Ferric salts* give a blue colour, destroyed by acids, by heat, and by alcohol (Robinet a Pelletier, *A* 5, 172)—5 $FeCl_3$, added to a previously heated solution of morphia in H_2SO_4 , gives a deep red colour, changing to dirty green (Husemann, *A* 128, 305) According to Lindo (*C N* 37, 158), morphine, gently warmed with H_2SO_4 and $FeCl_3$, gives an indigo blue colour—6 A solution of *molybdic acid* in conc H_2SO_4 gives, with solid morphine, a violet colour, changing through blue to dirty green (Frohde, *Fr* 5, 214)—7 A solution obtained by adding ammonia to cupric sulphate till the pp cupric hydrate is just re dissolved is coloured green by salts of morphine (Nadler, *Fr* 13, 235, Lindo, *Fr* 19, 359)—8 Nitric acid gives an orange red colour, gradually changing to yellow—9 H_2SO_4 , containing a little nitric acid, gives a violet red solution (Erdmann, *A* 120, 188, Husemann, *A* 128, 305)—10 When morphine is boiled with aqueous phosphorous or hypophosphorous acid, and conc H_2SO_4 is added, the liquid becomes reddish violet On now adding a little nitric acid the solution becomes yellowish, and on warming with copper it assumes a splendid blue colour (Dragendorff, *J* 1864, 727)—11 $KClO_4$ (free from chlorate), added to morphine mixed with H_2SO_4 , gives a dark brown colour (Grove, *Fr* 13, 324, Siebold, *ibid*)—12 Conc H_2SO_4 , followed by water and some oxidising agent (iodic acid, K_2FeCy_4 , K_2CrO_4 , KNO_3 , MnO_2 , or PbO), best in the solid state, gives a deep red colour on gentle warming (Lindo, *C N* 36, 228, Dott, *C N* 36, 255)—13 A mixture of K_2FeCy_4 , ferric chloride, and HCl is coloured blue This reagent may be used to detect morphine in quinine salts (Kieffer, *A* 103, 271, Hager, *Fr* 12, 220, Armitage, *Ph* 18, 761) According to Hesse (*Ph* 18, 801), the blue colour is due to pseudomorphine, not to Prussian blue—14 Chlorine water and ammonia give a red colour in a 1 p.c solution (Flückiger, *Ar Ph* [3] 1, 117)—15 Aqueous $K_2Cr_2O_7$ gives a dirty brown pp (Plugge, *Ar Ph* [3] 25, 793)—16 Conc H_2SO_4 , containing a little K_2AsO_4 , gives on warming a blue violet colour, changing to dark brown red Water turns this green, and chloroform on shaking with it becomes violet, while ether becomes violet red, the liquid below it being brown (Tattersall, *C N* 41, 63, Donath, *J pr* [2] 33, 563)—17 H_2SO_4 and a little $KClO_4$ gives in the cold a grass green colour, the edge of the liquid being pale rose colour (Vitali, *B* 14, 1583)—18 A mixture of morphine (1 pt) and powdered sugar (7 pts) turns purple on addition of a drop of H_2SO_4 , the mass gradually changing in colour through bluish green to yellow (Schneider, *J* 1872, 747)—19 If morphine is heated with H_2SO_4 at 200° , and the

mass poured into water, the liquid becomes blue If chloroform be shaken with this liquid it acquires a blue colour, while if ether be used the ethereal layer becomes purple (Jorisson, *Fr* 20, 422)—20 On warming morphine with H_2SO_4 and sodium phosphate a violet colour appears (Vulpus, *Ar Ph* [3] 25, 256)

Estimation in Opium—Opium (200 pts) is exhausted with warm water and the extract evaporated to a thin syrup, mixed with alcohol (40 pts of S G 82), ether (380 pts), and ammonia (45 pts of S G 935) The mixture is occasionally shaken, and after 18 hours it is filtered and washed with alcohol-ether The pp is dried, digested with benzene, dried, and weighed After weighing the base may be titrated with standard HCl (Teschemacher a Smith, *C N* 57, 93, 103, 244, Flückiger, *J* 1885, 1962, *Ar Ph* [3] 27, 721, Venturini, *G* 16, 239, Stillwell, *Am* 8, 307, R Williams, *C N* 57, 134)

Another method consists in exhausting 7 g of opium with 110 c.c of water and 4 g of slaked lime 50 c.c of the filtrate are mixed with 5 c.c of 95 p.c alcohol, 25 c.c of ether, and 3 g of NH_4Cl After standing for 12 hours the ether is filtered off, and another 10 c.c of ether added The entire liquid is then filtered and the morphine collected on the filter determined by direct weighing or by titration (Goebel, *Chem Zeit* 11, 508) The morphine may also be extracted from the opium by baryta water and ppd by CO_2 (Von Perger, *J pr* [2] 29, 97) Indeed, a great many processes for estimating morphine in opium have, from time to time, been proposed (Guillemont, *J Ph* [3] 16, 17, [4] 6, 102, Riegel, *Jahrb pr Pharm* 23, 202, Gumbourt, *J Ph* [3] 41, 97, 177, F Mayer, *Am J Pharm*, 35, 28, Arnoldi, *Russ Zeit Pharm* 1873, 641, Lynn, *Amer J Pharm* [4] 6, 358, *C J* 34, 612, Flewry, *J Ph* [4] 6, 99, Schachtrupp, *Fr* 7, 284, 509, Merck, *A* 18, 79, 21, 202, 24, 46, Steen, *Ar Ph* [2] 148, 150, *C J* 25, 180, J T Miller, *Ph* [3] 2, 465, *C J* 25, 181, Bevel, *Monit Scient* 13, 812, *J* 1871, 821, Kremel, *C C* 1887, 1529, Adrian a Gallois, *J Ph* [5] 15, 193, Schlikum, *Ar Ph* [3] 25, 13, Dott, *Ph* [3] 18, 82, Plugge, *Ar Ph* [3] 25, 343)

Methods for separating morphine from other alkaloids have been given by Dragendorff (*Ph*, [3] 7, 24), Hager (*C C* 1872, 727), Neubauer (*Fr* 9, 134), and others

Salts— $B'HCl$ 3aq S 5 in the cold, 100 at 100° (Regnault, *A Ch* [2] 68, 131, *A* 26, 24), 4 at 15° (Hesse, *A* 179, 190) $[a]_D = -94^\circ$ in a 2 p.c solution containing excess (10 mols) of HCl Silky fibres (from water)— $B'HCl$ S (MeOH) 2 at 15° Minute prisms (from MeOH) The salt $B'HCl$ 3aq is partially rendered anhydrous by solution in alcohol (Hesse, *A* 203, 151)— $B'H_2PtCl_4$, yellow curdy pp, m sol water (Liebig, *A* 26, 46) Decomposed by boiling water (O de Coninck, *Bl* [2] 45, 131)— $B'H_2PtCl_4$ 6aq (Hesse)— $B'HCl(HgCl_2)$ Crystalline pp (Hinterberger, *A* 77, 201)— $B'ZnCl_2$ 2aq— $B'ZnCl_2$ 7aq (Graffinghoff, *Z* 1866, 600)— $B'HEr$ 2aq needles (Schmidt, *B* 10, 194)— $B'HI$ 2aq long silky needles grouped in rosettes, sl sol cold water (Schmidt, *B* 10, 194)— $B'HI$ 3aq (Bauer, *Ar Ph* [3] 5, 289)— $B'HI$ 3aq hair like needles (Kunz, *Ar Ph* [3]

26, 807) — B_2I_2 , crystalline mass (B) — BHI , obtained by ppg a salt of morphine with iodine dissolved in $HIAq$ Brown pp, sol $KIAq$, from which it crystallises in nearly black prisms, sol alcohol and boiling ether (Bauer, Jørgensen, *J pr* [2] 2, 487, *Z* [2] 5, 673) — $BHHgI_2$, crystalline pp, m sol alcohol (Groves, *C J* 11, 97) — $B_2H_2SO_4$, 5aq [a] = -100.47 - 96p in a p p c solution at 22.5° (Hesse) *S* 4 in the cold (Dott) — $BHClO_2$, 2aq needles (Bödeker, *A* 71, 88) — $BHVO$, (Ditte, *A Ch* [6] 13, 237) — $BHCyS$ 4aq [100°] Needles (Dollfus, *A* 65, 214) — $B_2H_2PtO_2$, groups of minute needles (Schwarzenbach, *C C* 1860, 304) — $BHOAc$ *S* 50 in the cold (Dott) Tufts of needles, v sol water, m sol alcohol (Merck, *A* 24, 48) — $B'CHCl$, CO_2H (Florio, *J* 1833, 1343) — $B'CHCl$, CO_2H 4aq — $B'CCl$, CO_2H 14aq — Butyrate $B'C_4H_7O_2$ *S* 14 at 12° (Decharme, *J* 1863, 444) — Valerate $B'C_5H_9O_2$, Large trimetric crystals (Pasteur, *A Ch* [3] 58, 455) *S* 28 in the cold (Dott) — Lactate $B'C_3H_5O_2$, monoclinic crystals *S* 10 at 13° (Decharme) — Trichloro-lactate $B'CCl_3H_5O_2$, 5aq (F) — Oxalate $B'_2C_2H_2O_4$, aq prisms *S* 48 at 12° (D) — Tartrates — $B'_2C_2H_2O_4$, 3aq Nodular groups of needles, efflorescent at 20° (Arppe, *J pr* 3, 332) *S* 11 in the cold (Dott) — $B'_2C_2H_2O_4$, 3aq Tufts of long rectangular flattened prisms (A) — Mellitate $B'_2C_2H_2O_4$, minute needles (Karmrod, *A* 81, 171) — Phenyl acetate $B'CH_2Ph$, CO_2H [92°] — Nitroprusside (Davy, *Ph* [3] 11, 756)

Metallic derivatives $C_17H_{15}KNO_2$, 24aq Obtained in a crystalline state by evaporating a solution of morphine in $KOHAq$ in a desiccator over H_2SO_4 (Chastaing, *J Ph* [5] 4, 19) — $(C_17H_{15}KNO_2)_2K_2CO_3$, 2aq — $Ba(C_17H_{15}NO_2)_2$, 3aq white crystalline solid — $Ca(C_17H_{15}NO_2)_2$, 5aq — $Ca(C_17H_{15}NO_2)_2$, 2aq

(a) **Acetyl derivative** $C_17H_{15}AcNO_2$ Obtained, together with the (8) modification, by boiling morphine (1 pt) with $HOAc$ (2 pts) for several hours (Wright, *C J* 27, 1033, Beckett a Wright, *C J* 28, 315) Crystallises from ether, either with aq or in the anhydrous state Gives no colour with $FeCl_3$ — $B'HCl$ 3aq crystals, sl sol cold water — $B_2H_2PtCl_4$ amorphous — $B'EtI$ 4aq crystals (from 85 p c alcohol)

(8) **Acetyl derivative** $C_17H_{15}AcNO_2$ The chief product obtained by heating morphine (1 mol) with acetic anhydride (1 mol) at 100° When less acetic anhydride is used a compound $(C_17H_{15}AcNO_2)(C_17H_{15}NO_2)$ is obtained (Wright) Amorphous — $B'HCl$ amorphous, v sol water Readily converted into morphine by boiling water, and hence usually gives a blue colour with $FeCl_3$ — $B'EtI$ amorphous

(7) **Acetyl derivative** $C_17H_{15}AcNO_2$ Accompanies the (8)-isomeride to the extent of 25 p c Anhydrous crystals (from ether) — $B'HCl$ crystallises with difficulty, v sol water — $B'EtI$ 4aq crystals (from 85 p c alcohol)

Di-acetyl derivative $C_{17}H_{15}Ac_2NO_2$ [169°] Formed by heating morphine with excess of Ac_2O at 85° (Wright, Hesse, *A* 222, 205) The product is treated with water and dilute NH_4aq , and extracted with ether Colourless prisms (from ether), v sol cold alcohol, m sol ether Gives no colour with $FeCl_3$ Converted by boiling water first into the (a) acetyl deriva-

tive, and then into morphine — $B'HCl$ crystals, extremely sol water — $B_2H_2PtCl_4$ — $B'MeCl$ Formed by heating morphine methylchloride with Ac_2O at 85° (Hesse) Needles, v e sol water — $B'MeI$ Heated with $AgOAs$ it yields the crystalline di-acetyl derivative of a compound $C_{17}H_{15}O_2$ [143°] (Fischer, *B* 19, 792) — $B'EtI$ 4aq Crystals (B a W)

Di-propionyl derivative

$C_{17}H_{15}(C_2H_3O)_2NO_2$ Formed by heating morphine with propionic anhydride at 85° (Hesse, *A* 222, 207) White amorphous powder, v e sol ether, alcohol, and chloroform, sl sol water $FeCl_3$ gives no colouration — $B'HCl$ — $B_2H_2PtCl_4$

(a) **Butyryl derivative** $C_{17}H_{15}(C_4H_7O)_2NO_2$ Formed by boiling morphine (1 pt) with butyric acid (2 pts) for 6 hours (Beckett a Wright, *C J* 28, 16) Crystals (from ether) Gives no colour with $FeCl_3$ — $B'HCl$ more soluble and less readily crystallisable than the hydrochloride of the (a) acetyl derivative — $B_2H_2PtCl_4$ — $B'EtI$ amorphous

(8) Butyryl derivative

$C_{17}H_{15}(C_4H_7O)_2NO_2$ An amorphous base, accompanying the preceding isomeride Gives a blue colour with $FeCl_3$

Di butyryl derivative $C_{17}H_{15}NO_2$, *ie* $C_{17}H_{15}(C_4H_7O)_2NO_2$ Formed by heating morphine (1 pt) with butyric anhydride (2 pts) for 3 hours at 140° (B a W) Amorphous Resolved by boiling water or boiling dilute alcohol into butyric acid and butyryl morphine — $B'HCl$ amorphous Gives no blue colour with $FeCl_3$ — $B'EtI$ amorphous By boiling morphine with a mixture of acetic and butyric acids, Beckett and Wright obtained a product which formed a crystalline double salt with the formula $(C_{17}H_{15}AcNO_2)(C_{17}H_{15}(C_4H_7O)_2NO_2)H_2Cl_2$, 8aq, resolved into its components by boiling water

Benzoyl derivative $C_{17}H_{15}BzNO_2$ Formed by heating morphine with benzoic acid at 160° (B a W), and by boiling the di benzoyl derivative with dilute alcohol Amorphous — $B'HCl$ crystalline, v sl sol water Not coloured by $FeCl_3$

Di benzoyl derivative $C_{17}H_{15}Bz_2NO_2$ [188°-191° cor] Formed from morphine and Bz_2O at 130° (B a W) or $BzCl$ at 105° (Wright a Rennie, *C J* 37, 609, Dott a Stockman, *Ph* [3] 18, 231, cf Brookmann a Polstorff, *B* 13, 96) Prisms, insol water, sol hot alcohol Gives no colour with $FeCl_3$ — $B'HCl$ amorphous — $B_2H_2PtCl_4$ — $B'EtI$ 4aq crystals

Acetyl benzoyl derivative

$C_{17}H_{15}AcBzNO_2$ Formed from the (a) acetyl derivative and Bz_2O at 130° (B a W) Crystalline — $B'HCl$ amorphous, v sol water — $B_2H_2PtCl_4$ — $B'EtI$ 4aq crystals (from alcohol).

Succinozoyl derivative

$(C_{17}H_{15}NO_2)CO C_2H_5CO_2H$ Formed by heating morphine (1 pt) with succinic acid (2 pts) at 180° (Beckett a Wright, *C J* 28, 689) Separates from alcohol in crystals (containing 4aq), insol water and ether — $B_2H_2PtCl_4$

Methylo-chloride $C_{17}H_{15}NO_2MeI$ 4aq Formed by warming morphine with MeI and alcohol (How, *C J* 6, 125, *A* 88, 338) If $NaOEt$ is also present the product is codeine (Grimaux, *A Ch* [5] 27, 273, *C R* 92, 1140)

Methylo-chloride $C_{17}H_{15}NO_2MeCl$ 2aq.

Formed from the methylo-iodide and AgCl (Hesse, A 222, 207) Long needles Its aqueous solution is coloured blue by FeCl_3 , Ac_2O forms $\text{C}_1\text{H}_7\text{I}_2\text{Ac}_2\text{NO}_2\text{MeCl} - (\text{C}_1\text{H}_7\text{NO}_2\text{MeCl})_2\text{PtCl}_4\text{aq}$

Methylo-hydroxide $\text{C}_1\text{H}_7\text{NO}_2\text{MeOH} \cdot 5\text{aq}$ Formed from the sulphate and baryta (Broockmann a Polstorff, B 13, 96) Colourless needles Reduces Ag_2O

Ethylo-iodide $\text{C}_1\text{H}_7\text{NO}_2\text{EtI} \cdot 3\text{aq}$ Formed by heating morphine with EtI and alcohol at 100° (How) Needles (from water).

Methyl-morphine v CODEINE

Di-methyl-morphine $\text{C}_1\text{H}_7\text{Me}_2\text{NO}$, *Methylmorphumethine* [118°] $[\alpha]_D^{20} = -208.6^\circ$ in a 4 pc solution in 97 pc alcohol at 16° Formed by heating codeine methylo-iodide (1 mol.) with aqueous KOH (1 mol), adding benzene, and shaking with acetic acid The acid liquid is saturated with NaCl, and the hydrochloride of di methyl morphine then crystallises out The free base is obtained by adding NaOH and extracting with ether (Hesse, A 222, 220) Prisms, in sol ether, v sol water and alcohol Conc H_2SO_4 gives a bluish violet colour Conc HNO_3 forms a yellow solution

Salts — $\text{B}^+\text{HCl} \cdot 2\text{aq}$ S 92 at 18° — $\text{B}_2\text{H}_2\text{PtCl}_6\text{aq}$

Methylo - hydroxide

$\text{C}_1\text{H}_7\text{Me}_2\text{NO}_2\text{MeOH}$ Formed from the iodide and moist Ag_2O (Knarr, B 22, 181) Thick syrup Split up at 160° into NMe, and the phenanthrene derivative $\text{C}_1\text{H}_7\text{EtO}_2$, Ac_2O at 160° – 200° forms acetyl methyl dioxypheanthrene $\text{C}_1\text{H}_7(\text{OMe})(\text{OAc})$, dimethylamine, and di methyl oxyethyl amine NMe $\text{CH}_2\text{CH}_2\text{OH}$ (Fischer a Von Gerichten, B 19, 794)

(a) *Methylo iodide* $\text{C}_1\text{H}_7\text{Me}_2\text{NO}_2\text{MeI} \cdot 3\text{aq}$ Formed from di methyl morphine and MeI dissolved in alcohol (Hesse, A 222, 225) Prisms v sol hot water

(b) *Methylo - iodide* $\text{C}_1\text{H}_7\text{Me}_2\text{NO}_2\text{MeI}$ Obtained by adding KOH to a solution of the (a) isomeride, allowing the oily pp to crystallise, and adding KI to the mother liquor (Hesse, A 222, 227) Crystals

(a)-*Methylo chloride*

$\text{C}_1\text{H}_7\text{Me}_2\text{NO}_2\text{MeCl} \cdot 3\text{aq}$ Obtained from the (a) methylo iodide by treatment with AgCl With Ac_2O it forms $\text{C}_1\text{H}_7\text{AcMe}_2\text{NO}_2 \cdot 2\text{aq}$ crystallising in needles v sol hot water and alcohol — $(\text{B}^+\text{MeCl})_2\text{PtCl}_4\text{aq}$

(b) *Methylo chloride* $\text{C}_1\text{H}_7\text{Me}_2\text{NO}_2\text{MeCl}$ Formed from the (b) methylo iodide and AgCl Forms a neutral sulphate and a platinumchloride

Acetyl derivative $\text{C}_1\text{H}_7\text{AcMe}_2\text{NO}_2$

[66°] Formed from di methyl morphine and Ac_2O at 85° (Hesse, A 222, 223) V sol alcohol and ether, m sol water, insol KOH aq Gives a blue colour with conc H_2SO_4 — $\text{B}^+\text{HCl} \cdot 3\text{aq}$ — $\text{B}^+\text{H}_2\text{PtCl}_6\text{aq}$ — $\text{B}^+\text{HNO}_3\text{aq}$ — $\text{B}^+\text{H}_2\text{SO}_4\text{aq}$

Ethyl-morphine $\text{C}_1\text{H}_7\text{EtNO}_2$, *Codeithine* [83°] S $2\frac{1}{2}$ at 100° Formed by heating morphine (1 mol.) with NaOEt (1 mol.), alcohol, and EtI (Grimaux, C R 92, 1140, 1228, A Ch. [5] 27, 278) Hard brilliant laminae (containing aq), v sol alcohol and ether, m sol water Ppd from solutions of its salts by KOH and Na_2CO_3 , but not by NH_4aq Gives a blue colour with H_2SO_4 containing FeCl_3 — B^+HCl groups of slender needles — $(\text{C}_1\text{H}_7\text{EtNO}_2)_2\text{MeI}$ Hard

bulky crystals, converted by moist Ag_2O into a tertiary base [132°]

Di-ethyl-morphine $\text{C}_1\text{H}_7\text{Et}_2\text{NO}_2$ The iodide of this base appears to be formed by heating morphine with NaOH (1 mol.) and EtI (2 mols.) It is crystalline, and is converted by successive treatment with Ag_2O and MeI into $\text{C}_1\text{H}_7\text{Et}_2\text{NO}_2\text{MeI}$, which crystallises from alcohol, and is converted by Ag_2O into an hydroxide which is split up on distillation into NMeEtPr and a derivative of phenanthraquinone $\text{C}_1\text{H}_7\text{EtO}_2$, (Gerichten a Schrötter, B 15, 2182)

Ethylene di-morphine $\text{C}_1\text{H}_7(\text{C}_1\text{H}_7\text{NO}_2)_2$, *Di-codethine* *Dicodethylene* Prepared by boiling morphine with alcoholic soda and ethylene bromide (Grimaux, C R. 93, 67, A Ch. [5] 27, 281) White needles (from alcohol), insol ether, v sol alcohol Blackens when heated, and decomposes above 200° With H_2SO_4 and FeCl_3 it gives a blue colouration — $\text{B}^+\text{H}_2\text{Cl}_2$ Hard prisms

Morphinyl-sulphuric acid

$\text{C}_1\text{H}_7(\text{OSO}_3\text{H})\text{NO}_2 \cdot 2\text{aq}$ *Morphine sulphonic acid* Formed by shaking morphine (20 g) with KOH (8 g), water (25 cc), and $\text{K}_2\text{S}_2\text{O}_8$ (15 g) (Stolnikoff, H 8, 242) Silvery needles (from water), not decomposed at 160° v sl sol cold water, alcohol, and ether Hot dilute HCl aq hydrolyses it to morphine and H_2SO_4 Does not give a blue colour with FeCl_3 Hot conc H_2SO_4 gives a rose colour, changing to violet Less poisonous than morphine, producing tetanus

Nitroso-morphine $\text{C}_1\text{H}_7(\text{NO})\text{NO}_2 \cdot \text{aq}$ Formed by passing nitrous acid gas into morphine suspended in water (E L Mayer, B 4, 121) Reddish yellow powder, turned black by FeCl_3

Trimorphine $(\text{C}_1\text{H}_7\text{NO}_2)_3$ Formed by heating morphine (30 g) with H_2SO_4 (30 cc) and water (30 cc) at 100° (Wright, C J 26, 220) Formed also by heating morphine (1 pt) with dry oxalic acid (3 pts) at 145° (Beckett a Wright, C J 28, 698) Amorphous, sol ether Gives a purple colour with FeCl_3 — $\text{B}^+\text{H}_2\text{Cl}_2$ Amorphous Converted by conc hydrochloric acid at 100° into $\text{C}_{10}\text{H}_{11}\text{Cl N}_3\text{O}_6\text{HCl}$, a brittle gum

Tetramorphine $(\text{C}_1\text{H}_7\text{NO}_2)_4$ Formed, together with trimorphine, by heating morphine with dilute H_2SO_4 at 100° – 140° (Wright, C J 26, 220) Amorphous On heating with HCl aq it forms the salt $(\text{C}_1\text{H}_7\text{NO}_2)_4(\text{HCl})_4$ (?) On adding HCl to an aqueous solution of tetra morphine a flocculent pp of $(\text{C}_1\text{H}_7\text{NO}_2\text{HCl})_4$ is got — $(\text{C}_1\text{H}_7\text{NO}_2)_2\text{H}_2\text{SO}_4$, *Sulphomorphine*. Obtained by heating morphine with dilute H_2SO_4 at 160° (Arppe, A 55, 96, Matthiessen a Wright, Pr 17, 455, Wright, C J 26, 220)

Apomorphine $\text{C}_1\text{H}_7\text{NO}_2$ Formed by heating morphine or codeine with HCl aq at 145° for 2 or 3 hours (Matthiessen a Wright, Pr 17, 455) Formed also by heating morphine with aqueous phosphoric acid till the temperature reaches 185° (Wright, C J 25, 652) It is also one of the products when morphine is heated with aqueous ZnCl_2 for 20 minutes at 125° (Mayer a Wright, C J 26, 211) Amorphous mass, which turns green in moist air Sl sol water, especially if it contains CO_2 , sol alcohol, ether, and chloroform Emetic, 0.2 g of the hydrochloride being sufficient to produce vomiting. A solution of apomorphine hydrochloride gives with caustic alkalis a white pp, quickly becoming black, with Na_2CO_3 a white pp, turning green, with

HNO_3 , a blood-red colour, with FeCl_3 an amethyst colour, with $\text{K}_2\text{Cr}_2\text{O}_7$ an orange pp, with KI an amorphous pp, quickly becoming green, and with platinum chloride a yellow pp, decomposing on warming. It reduces AgNO_3 . AcCl yields a mono acetyl derivative (Danckworth, *Ar Ph* 228, 572) — B^+HCl crystals, sl sol cold water

Polymeride of apomorphine $\text{C}_{138}\text{H}_{138}\text{N}_6\text{O}_{18}$ (?) Formed, together with apomorphine and several bases, which form the hydrochlorides $\text{C}_{138}\text{H}_{138}\text{ClN}_6\text{O}_{18}$, $\text{C}_{138}\text{H}_{138}\text{N}_6\text{O}_{18}\text{H}_2\text{Cl}_2$ (?), and $\text{C}_{138}\text{H}_{138}\text{Cl}_2\text{N}_6\text{O}_{18}\text{H}_2\text{Cl}_2$ (?) by heating morphine with aqueous ZnCl_2 . It forms a hydrochloride $\text{B}^+\text{H}_2\text{HCl}$, insol alcohol (Mayer & Wright)

Diapotetramorphine $\text{C}_{12}\text{H}_{12}\text{N}_2\text{O}_2$ Formed, together with apomorphine, by heating morphine with aqueous phosphoric acid (Wright) Amorphous, rapidly darkening in air. Evaporation with conc hydrochloric acid converts it into $\text{C}_{12}\text{H}_{12}\text{Cl}_2\text{N}_2\text{O}_2 \cdot 8\text{HCl}$. Evaporation with HIAq and phosphorus yields the corresponding $\text{C}_{12}\text{H}_{12}\text{N}_2\text{O}_2 \cdot 8\text{HI}$ (Wright)

Pseudomorphine $\text{C}_8\text{H}_8\text{N}_2\text{O}_2$ $1\frac{1}{2}$ aq or $\text{C}_8\text{H}_8\text{N}_2\text{O}_2 \cdot 8\text{aq}$ (Hesse, *A* 235, 229) **Dehydromorphine Oxymorphine Oxymorphine Dymorphine** Discovered by Pelletier (1832) in Levant opium. Occurs in morphine hydrochloride made by Gregory's method (Hesse, *A* 141, 87)

Formation — 1 By heating a solution of morphine hydrochloride with AgNO_3 at 60° (Schutzenberger, *Bl* [2] 4, 176) — 2 By oxidising morphine with KMnO_4 , potassium nitrite, or K_2FeCy_6 , or by exposing its ammoniacal solution to the air (Polstorff, *B* 13, 86, cf Pelletier, *A* 16, 49)

Properties — White, microcrystalline powder (from NH_4Aq), insol water, alcohol, ether, and chloroform, sol KOH aq and NH_4aq , v e sol alcoholic NH_3 . Lævrotatory (Hesse, *A* 176, 195). Decomposed by heat without melting. It is not affected by reducing agents. It is tasteless and not poisonous

Colour tests — 1 When evaporated with dilute H_2SO_4 until fumes of H_2SO_4 appear it becomes bluish green, and, on adding water, rose-red, if HNO_3 , or dilute NaNO_2 , be now added the colour changes to deep violet. Under similar circumstances morphia gives a rose red colour, turned brownish red by water, and raspberry red by HNO_3 (Donath, *J pr* [2] 33, 560) — 2 Resembles morphia in its reaction with FeCl_3 , with molybdic acid in H_2SO_4 (Froehde's reagent), with HNO_3 , and with HIO_3 . For the reaction with iodic acid HCl must be absent. NH_4Cl interferes with these tests — 3 Conc H_2SO_4 forms an olive green colour — 4 Conc HNO_3 gives an intense orange red colour, changing to yellow — 5 A mixture of equal parts of cane sugar and pseudomorphine is coloured by H_2SO_4 blue, changing to dark green (Hesse, *A* 234, 255)

Salts — $\text{B}^+\text{HCl aq}$ Minute needles $\text{S } 14$ at 20° [α_D] = $-103^\circ 13'$. — $\text{B}^+\text{HCl} 2\text{aq}$ — $\text{B}^+\text{HCl} 3\text{aq}$ — $\text{B}^+\text{HCl} 4\text{aq}$ — $\text{B}^+\text{HCl} 6\text{aq}$ — $\text{B}^+\text{HCl} 8\text{aq}$ — $\text{B}^+\text{H}_2\text{PtCl}_6\text{aq}$ — B^+HIAq — $\text{B}^+\text{H}_2\text{SO}_4\text{aq}$ small colourless needles, sl sol cold water (Polstorff) — $\text{B}^+\text{H}_2\text{SO}_4\text{aq}$ laminae $\text{S } 287$ at 20° . — $\text{B}^+\text{H}_2\text{Cr}_2\text{O}_7\text{aq}$ crystalline pp $\text{S } 1$ at 18° . — $\text{B}^+\text{H}_2\text{C}_2\text{O}_4\text{aq}$ $\text{S } 05$ at 20° . — $\text{B}^+\text{H}_2\text{C}_2\text{O}_4\text{aq}$ — Tartrate $\text{B}^+\text{C}_2\text{H}_3\text{O}_4\text{aq}$ needles — $\text{B}^+\text{C}_2\text{H}_3\text{O}_4\text{aq}$. $\text{S } 24$ at 18° .

Acetyl derivative $\text{C}_{17}\text{H}_{15}\text{Ac}_2\text{NO}_2$ [276°]

Formed by heating pseudomorphine (1 pt) with Ac_2O (2 pts) at 120° (Hesse, *A* 222, 235, 234, 255) Crystallises from ether in prisms (containing 4 aq) V e sol alcohol, m sol ether and chloroform. When mixed with cane sugar and dissolved in conc H_2SO_4 , it gives a dark green colour. If the H_2SO_4 contain $\text{Fe}_2(\text{SO}_4)_3$, the colour is at first blue — $\text{B}^+\text{H}_2\text{PtCl}_6\text{aq}$

Methylo-iodide $\text{C}_{17}\text{H}_{15}\text{NO}_2\text{MeI}$ 2 aq Formed by the action of HI on the crystalline body $(\text{C}_{17}\text{H}_{15}\text{NO}_2)_2\text{Me}(\text{OH})\text{MeI}$, which is prepared by oxidising morphine methylo iodide with alkaline K_2FeCy_6 (Polstorff, *B* 13, 93) Small prisms

Methylo-hydroxide

$\text{C}_{17}\text{H}_{15}\text{NO}_2\text{Me}(\text{OH})$ 8½ aq Prepared by the action of moist Ag_2O on the iodide or of baryta on the sulphate Crystalline, v sol water, insol alcohol

Methylo sulphate

$(\text{C}_{17}\text{H}_{15}\text{NO}_2)_2\text{Me}_2\text{SO}$ 4 aq Obtained by ppg a solution of the oxyiodide with Ag_2SO_4 . Leaflets, v sol hot water

MORPHOTHEBAINE v THEBAINE

MORPHOTROPY This term is applied to the relations between the crystalline form and the composition of those bodies which are chemically similar, and which are derived from the same parent body, v this vol p 89

MORRHUIC ACID $\text{C}_{18}\text{H}_{31}\text{NO}_2$, 1 e

$\text{CH} \begin{array}{c} \text{CH}(\text{OH}) \\ \text{CH}_2 \text{NH} \end{array} \text{C}_8\text{H}_7\text{CO}_2\text{H}$ (?) **Oxypropyl pyridine dihydride carboxylic acid** Occurs in cod-liver oil in a combination with glycerin and phosphoric acid, from which it is readily set free by acids and alkalis. Obtained by extracting the oil with dilute (85 pc) alcohol containing 5 pc of HCl (Gautier & Mourgues, *C R* 107, 740) Square flattened prisms or large lanceolate plates, insol cold, sol hot, water, v sol alcohol, ether, and alkalis. The solutions have a disagreeable aromatic odour (Gautier, *Bl* [3] 2, 233) Morrhucic acid decomposes carbonates. A solution of the potassium salt gives pps with lead acetate and AgNO_3 , but not with cupric acetate. The silver salt is readily reduced, even in the cold. Morrhucic acid forms a crystalline platinumchloride, an amorphous aurochloride, and a hydrochloride which is decomposed by boiling water. On distilling with lime it yields a basic oil which forms a crystalline methylo iodide. Potassium morrhuate is oxidised by KMnO_4 to an acid which ppts cupric acetate, and appears to be a pyridine derivative

MORRHUINE $\text{C}_{18}\text{H}_{31}\text{N}$, An alkaloid occurring together with aselline $\text{C}_{18}\text{H}_{31}\text{N}$, in cod-liver oil (Gautier & Mourgues, *Bl* [3] 2, 228, *C R* 107, 626) Thick oil, smelling like *syrringa*, v sl sol water, v sol alcohol and ether. Lighter than water. Ppts copper salts. Strongly alkaline. It forms a very deliquescent hydrochloride crystallising in groups of needles, a crystalline platinumchloride and a yellow aurochloride. Morrhucine constitutes one third of the total bases in the oil, and is a diaphoretic and diuretic

MORTARS v CEMENTS, in DICTIONARY OF APPLIED CHEMISTRY

MOSAIC GOLD An alloy of Cu and Zn in equal parts, v COPPER ALLOYS OF, vol 11 p 254, v also DICTIONARY OF APPLIED CHEMISTRY.

MUCEDIN v PROTEIDS.

MUCIC ACID $C_6H_8O_7$, *tc*

$CO_2H \cdot CH(OH) \cdot CH(OH) \cdot CH(OH) \cdot CH(OH) \cdot CO_2H$
 Mol w 210 [206°–216°] (K & T) S 33 at 14°, 17 at 100° Formed by the oxidation of milk sugar, galactose, melitose, dulcitol, gum arabic, gum tragacanth, and plant mucus with dilute nitric acid (Scheele, *Opuscul* 2, 111, Laugier, *A Ch* 41, 79, Berzelius, *A Ch* 92, 141, 94, 5, 95, 31, Malaguti, *A Ch* [2] 60, 195, 63, 86, Liebig & Pelouze, *A* 19, 258, Liebig, *A* 9, 24, 26, 160, Hagen, *P* 71, 531, *A* 64, 347, Johnson, *A* 94, 225, Schwanert, *A* 116, 257, Tollens, *A* 249, 220)

Preparation —1 Milk sugar (1 pt) is heated with HNO_3 (2 pts of S G 1 4) and water (2 pts) until red fumes appear. The flame is then removed until the reaction has abated. The liquid is then evaporated, a further quantity (4 pt) of HNO_3 being added during the evaporation. The product is washed with water and dried (Klinkhardt, *J pr* [2] 25, 43). The yield is 35 p.c., cf Guckelberger, *A* 74, 348 —2 Coarsely powdered milk sugar (100 g) is heated with HNO_3 (1200 c.c. of S G 1 15) in a basin on a water bath until the volume is greatly reduced (to 150 or 200 c.c.) After cooling, water (200 c.c.) is added, and after some days the mucic acid is filtered off and washed with water (500 c.c.) The yield is good (40 g). When galactose is treated in the same way the yield is 77 p.c. (Kent & Tollens, *A* 227, 221)

Properties —Colourless tables, sl sol cold water, insol alcohol. It does not reduce Fehling's solution.

Reactions —1 When boiled with water it changes to the isomeric paramucic acid —2 When heated with water at 180° it yields pyromucic acid —3 On dry distillation it yields CO_2 , pyromucic acid and some diphenylene oxide. When cautiously heated at 280° it forms a small quantity of dehydro mucic acid $C_6H_4O(CO_2H)_2$, which condenses on the neck of the retort as small crystals —4 Boiling nitric acid oxidises it to oxalic and racemic acids —5 On oxidation with H_2SO_4 and MnO formic acid is given off —6 Potash fusion yields acetic and oxalic acids —7 $HIAg$ and phosphorus at 140° forms some adipic acid (Crum Brown, *A* 125, 19), and diphenylene oxide (Heinzelmann, *A* 193, 186) —8 PCl_5 forms di chloro muconic chloride $C_6H_4Cl_2O$ (Lièbs Bodart, *A* 100, 325, Bode & Wichelhaus, *A* 132, 95) —9 When allowed to ferment for 9 months it yields alcohol and acetic, butyric, and traces of lactic acids (Béchamp, *Bl* [3] 3, 770) —10 Ba.S at 205° forms thiophene (8)-carboxylic acid —11 Fuming $HClAq$ (or $HBrAq$) at 100°–150° forms dehydro mucic acid.

Salts — $(NH_4)_2A$ flat four sided prisms (from water), sl sol cold, v sol hot, water. Decomposed at 220°–240° into pyrrole, pyrrole carboxylic amide, NH_3 , and CO_2 — NH_4HA aq needles or thin prisms. More soluble in water than the normal salt — Na_2A 4½aq transparent triethinic crystals — Na_3A ½aq white powder — $NaHA$ 3½aq prisms — K_2A ½aq granules S 125 Insol alcohol — K_2A 2½aq (Schmidt & Cöbenzl, *B* 17, 601) — KHA aq decomposes at 150°–180° into CO_2 and pyromucate — BaA 1½aq (dried at 100°) — CaA 1½aq — MgA 2½aq (at 100°) — PbA aq white pp — $Pb_2C_6H_4O_7$: ob-

tained by ppg ammonium mucate with basic lead acetate — CuA aq (dried at 100°) bluish-white pp — FeA 2½aq (dried at 100°) yellow powder — $K(SbO)A$ — $Na(SbO)A$ (dried at 100°) Obtained by dissolving Sb_2O_3 in $NaHA$ Amorphous (Klein, *C R* 97, 1437) — AgA (dried at 100°) white pp —Methylamine salt Decomposed by distillation into methyl pyrrole and methyl pyrrole carboxylic methylamide —Ethylamine salt Decomposed by distillation into ethyl pyrrole, ethyl pyrrole dicarboxylic diethylamide, and ethyl pyrrole carboxylic ethylamide (Bell, *B* 10, 1866) —Diethylamine salt Decomposed by heat giving off NH_3 —Aniline salt $(C_6H_5N)_2HA$ Insol boiling alcohol, sol boiling water (Kottnitz, *J pr* [2] 6, 138) Decomposed on distillation into phenyl pyrrole, CO_2 , aniline, and H_2O On heating with water it forms mucic anilide.

Methyl ether Me_2A Laminæ or flattened six sided prisms (from water), v sol hot water, v sl sol hot alcohol. Decomposes at 165°

Mono-ethyl ether $EtHA$ Formed by boiling Et_2A with alcohol (Lumprecht, *A* 165, 255). Crystals (containing 3aq), sol water and alcohol. Melts below 100° — NH_4EtA

Di-ethyl ether Et_2A [158°] S 23 at 20° S (alcohol of S G 814) 64 at 15° Formed by heating mucic acid (1 pt) with H_2SO_4 (4 pts) till it turns black, leaving it to cool, and adding alcohol (4 pts) (Malaguti, *A Ch* [2] 63, 86) Crystals (from boiling alcohol) Lumprecht was not able to obtain this ether by the action of alcohol and HCl on mucic acid. Mucic ether is reduced by sodium amalgam to an acid which strongly reduces Fehling's solution, and which may be readily re-oxidised to mucic acid (E Fischer, *B* 23, 937)

Isoamyl ether $(C_4H_9)_2A$ Needles

Amide $C_6H_8O_6(NH_2)_2$ Mucamide S G 155 1589 Formed from the normal ether and ammonia (Malaguti, *C R* 22, 854) Formed also by the action of ammonia on tetra acetyl mucic amide (Ruhemann, *B* 20, 3366) Minute crystals (from water), v sl sol boiling water, insol alcohol and ether. Converted by water at 140° into ammonium mucate. On dry distillation it yields pyrrole carboxylic amide, paracyanogen, and a little pyromucic acid.

Anilide $C_6H_4O_6(NHPh)_2$ Formed by heating the aniline salt at 120°, or the ether with excess of aniline (Kottnitz) Plates, insol water, alcohol, and dilute acids

o-Toluide $C_6H_3O_6(NHC_6H_4)_2$ Formed like the preceding (K) Plates

Tetra-acetyl derivative $C_6H_4(OAc)_4(CO_2H)_2$ [266° cor] Formed by boiling mucic acid with Ac_2O and $ZnCl_2$ (Maquenne, *Bl* [2] 48, 720) Efflorescent needles (containing 2aq), sl sol water, v sol alcohol

Ethyl ether of the tetra acetyl derivative $C_6H_4(OAc)_4(CO_2Et)_2$ [177°] S (95 p.c. alcohol) 4 at 17° Formed by heating mucic ether with $AcCl$ at 100° (Werigo, *A* 129, 195) Needles, sl sol ether, v sol boiling alcohol, v sl sol boiling water

Di-phenylhydrazide $C_6H_4(OH)_2(CO N_2H_5Ph)_2$ [240°] Formed by heating mucic acid with phenyl hydrazine hydrochloride and $NaOAc$ on the water-bath (Bulow, *A* 236, 196, Maquenne, *Bl* [2] 48,

722) Pale yellow plates (from phenyl-hydrazine), v sl sol. water, alcohol, and ether Crystallises unaltered from alcoholic potash

Paramucic acid S 136 in the cold, 58 at 100° Formed by evaporating an aqueous solution of mucic acid to dryness, dissolving the residue in alcohol, and allowing the alcoholic solution to evaporate in the air (Malaguti, *A* 15, 179) Crystalline, more soluble in water than mucic acid On recrystallisation from hot water it changes into mucic acid Paramucates, with the exception of the normal ammonium salt, are more soluble than the corresponding mucates, but their boiling solutions deposit mucates

Dehydromucic acid $C_6H_6O_5$

Formation—1 By heating mucic acid in sealed tubes with $HBrAq$ (saturated at 0°) at 100° for two days The product may be crystallised from water and separated from unaltered mucic acid by crystallisation of the Ba salt (Heinzelmann, *A* 193, 184)—2 By heating mucic acid with fuming $HClAq$ at 145° (Seelg, *B* 12, 1033)—3 In small quantity by heating mucic acid at 180° (Klinkhardt)—4 By heating hydrogen potassium saccharate with conc $HClAq$ at 150° (Sohst a Tollens, *A* 245, 19)

Preparation—Mucic acid (1 pt), conc HCl (1 pt), and conc HBr (1 pt) are heated 8 hours at 150° in sealed tubes The solid contents of the tubes are collected and distilled with steam If this steam be condensed it is found to contain di-phenylene oxide The residue is neutralised by ammonia, filtered, and mixed with HCl The dehydro mucic acid is then ppd Yield 20 p c (Klinkhardt, *J pr* 133, 44)

Properties—Plates (from alcohol) or needles (from hot water) Does not melt at 320° V sl sol cold water, alcohol, and ether May be sublimed

Reactions—1 $FeCl_3$ produces, especially on warming, in a solution of dehydro-mucic acid, a transparent gelatinous pp This result is prevented by the presence of other acids—2 **Bromine water** converts it into fumaric acid, the reaction being $C_6H_6O_5(CO_2H)_2 + 3Br_2 + 3H_2O = C_4H_4(CO_2H)_2 + 2CO_2 + 6HBr$ —3 A mixture of HNO_3 and H_2SO_4 converts it into nitropyromucic acid (*q v*)—4 **Sodium amalgam** reduces it to two acids of the formula $C_6H_6O_5$, melting at 146° and 173° (Graebe a Bungener, *B* 12, 1079) The (α) acid [146°] crystallises in thin plates and forms the crystalline salts $CaA'' 3\frac{1}{2}aq$, $BaA'' 4\frac{1}{2}aq$, and $AgA'' \frac{1}{2}aq$ The (β)-acid [173°] forms large crystals (containing *aq*) and the salts $CaA'' 1\frac{1}{2}aq$ (amorphous), $BaA'' 1\frac{1}{2}aq$ (needles) and AgA'' —5 On **dry distillation** it splits up into CO_2 and pyromucic acid (*q v*)

Salts— $BaA'' 2\frac{1}{2}aq$ — $BaA'' 6aq$ Sol water— $CaA'' 8aq$ — AgA'' white pp, decomposed by boiling water

Ethylether EtA'' [47°]

Chloride $C_6H_6O_5(COCl)_2$ [80°] (α 245°) From PCl_5 on the acid (Klinkhardt, *J pr* 133, 46) Smells like $POCl_3$ Sol ether, alcohol, and $CHCl_3$ At 100° it sublimes forming flat needles Boiling water reconverts it into dehydro-mucic acid

Amide $C_6H_6O_5(CONH_2)_2$ Formed by the action of NH_3 on an ethereal solution of the chloride. Slender needles (from water) Nearly

insol cold water, alcohol, and ether Does not melt below 240°

MUCILAGE The gum of plants from which it is obtained by steeping these in hot water, which on cooling forms a jelly When linseed mucilage is strained through linen, and the filtrate mixed with alcohol and $HClAq$, a pp is obtained which after washing with alcohol and ether has the composition $C_6H_{10}O_5$ (Schmidt, *A* 51, 50, Frank, *J pr* 95, 484, Nageli a Cramer, *Pharm Cent* 1855, 426, Kirchner a Tollens, *A* 175, 215) Brittle gum, resembling bassorin (*q v*), sol cold water, insol alcohol Dextrogyrate Insoluble in ammoniacal cupric oxide Boiling dilute H_2SO_4 partially converts it into glucose

Quince mucilage is coloured blue by iodine, and gives no mucic acid on oxidation with nitric acid Boiling dilute H_2SO_4 yields a mixture of cellulose, gum, and sugar The mucilage from salep (*Orchis mascula*), from *Tamarindus indica*, and from some other plants, is also turned blue by iodine (*v* STARCH) Quince mucilage yields furfuraldehyde on distillation with dilute H_2SO_4 , indicating the presence of arabinose or xylose It contains neither glucose nor galactose, since neither saccharic nor mucic acid is formed on oxidation

Salep mucilage yields no furfuraldehyde on distillation with dilute H_2SO_4 , but on oxidation it yields saccharic (but not mucic) acid It contains glucose and mannose, but no galactose or arabinose (Gans a Tollens, *A* 249, 245)

MUCIN *v* PROTEIDS, Appendix C

MUCOBROMIC ACID $C_6H_6BrO_5$

CHO CBr CBr CO H Semi-aldehyde of di bromo-maleic acid [121°] Formed by adding bromine to pyromucic acid covered with a little water without cooling The product is boiled and evaporated, the yield being 70 p c of the theoretical (Schmelz a Beilstein, *A Suppl* 3, 276, Jackson a Hill, *B* 11, 1671 *Am* 3, 41) Formed also from (β)-di bromo pyromucic acid and hot dilute HNO_3 (Hill a Sanger, *A* 232, 89) and by oxidation of di bromo maleic aldehyde

Properties—White plates, v sol alcohol, ether, and hot water, v sl sol cold water Red dens litmus and decomposes carbonates, but its salts are very unstable

Reactions—1 When heated it partially sublimes, and the rest decomposes into HBr , di bromo maleic acid, and CO_2 (Hill, *Am* 3, 105)—2 Boiling baryta-water forms CO_2 , bromo-acetylene, malonic acid, and formic acid (Jackson a Hill, *B* 11, 289) Cold baryta water forms HBr and bromo maleic acid A cold paste of baryta and water forms bromo propionic acid and β di bromo acrylic acid Baryta water at 0° forms mucoxybromic acid (*q v*)—3 **Bromine water** forms di bromo maleic acid (Hill, *B* 13, 734) By heating with water and bromine (3 mols) in sealed tubes at 125° it is converted into penta and hexa bromo ethane, di bromo maleic acid, and tetra bromo butyric acid (Lumprecht, *A* 165, 293) Bromine (1 at) at 145° forms di-bromo maleic acid, mucobromyl bromide, and a little dibromo succinic acid—4 PBr_3 forms the bromide (*v infra*)—5 **Phenol** (25 g) dissolved in water (80 g) containing KOH (17.5 g) converts mucobromic acid (20 g) into 'phenoxy-mucobromic' acid $C_6H_5BrO_5$, which crystallises from water in prisms [105°] Phenoxy mucic

bromic acid forms the crystalline salts KA' and BaA' , 3aq, and is converted by Ag_2O in hot water into phenoxyl-bromo-maleic acid $\text{C}_6\text{H}_4\text{BrO}_2$, which crystallises in slender needles [104°], and forms a crystalline silver salt $\text{Ag}_2\text{A}'$ (Hill & Stevens, *Am* 6, 188) — 6 Moist Ag_2O oxidises it to di-bromo-maleic acid. Nitric acid acts in like manner — 7 Alcoholic potassium nitrite forms a pp of $\text{K}_2\text{C}_4\text{H}_4\text{N}_2\text{O}_6$, v sol cold water, converted by hot water into CO_2 , HCy , HNO_2 , and $\text{KC}_4\text{H}_4\text{NO}_6$. Bromine in CS_2 converts the salt $\text{K}_2\text{C}_4\text{H}_4\text{N}_2\text{O}_6$ into $\text{C}_4\text{HBr}_2\text{N}_2\text{O}_6$ (Hill & Sanger, *B* 15, 1906) — 8 KNO_2 at 50° forms the acid $\text{C}_4\text{H}_4\text{NO}_6$, which forms the crystalline salts NaA' aq, KA' aq, CaA' 4aq, BaA' 5aq, PbA' 4aq, CuA' , and AgA' .

Salts — BaA' white plates, sol cold water and alcohol — AgA' felted needles, insol water

Ethyl ether EtA' [51°] (255°–260°) Formed from the acid, alcohol, and H_2SO_4 . Large monoclinic crystals with aromatic odour. KNO_2 converts it into crystalline $\text{C}_4\text{H}_4\text{KNO}_6$.

Mucobromic acetic anhydride $\text{C}_4\text{HBr}_2\text{O}_6$ [54°] Formed by heating mucobromic acid with AcCl at 120°. Long needles, v e sol alcohol, ether, and chloroform.

Bromide $\text{C}_4\text{HBr}_2\text{O}_6$ [56°] Obtained by heating mucobromic acid (1 pt) with PBr_3 (4 pts) at 115°. Small slender prisms (from alcohol), sol alcohol, ether, benzene, chloroform, and CS_2 . Boiling water slowly reconverts it into mucobromic acid.

MUCOCHLORIC ACID $\text{C}_4\text{H}_2\text{Cl}_2\text{O}_6$, \pm e $\text{CHO Cl Cl CO}_2\text{H}$ or $\text{CHO Cl Cl C CO}_2\text{H}$ *Semi aldehyde of di-chloro-maleic acid* [125°] Formed by passing chlorine into a solution of pyromucic acid (1 pt) in water (10 pts) at 0° in presence of iodine, the yield being 40 p c of the theoretical (Beilstein & Schmelz, *A Suppl* 3, 276, Bennett & Hill, *B* 12, 655). Plates, v sol hot water, alcohol, and ether, insol ligroin and CS_2 . Split up by alkalis, even in the cold, into di-chloro-acrylic acid and formic acid.

MUCONIC ACID (of Limpricht) $\text{C}_4\text{H}_4\text{O}_6$, \pm e $\text{CO}_2\text{H CH}_2\text{C} \begin{smallmatrix} \text{CH CH}_2 \\ \text{O CO} \end{smallmatrix}$ [100°–125°] Formed

by adding silver oxide to a hot solution of di-bromo-adipic acid [175°–190°] (formed by adding bromine to a warm solution of hydromucic acid in HOAc), and decomposing the resulting silver salt with HCl or H_2S (Limpricht, *A* 165, 274). Large crystals, v sol water, alcohol, and ether. Boiling baryta water decomposes it into CO_2 , acetic acid, succinic acid, and another acid. Salts — BaA' 4aq nodules, v sol water.

Muconic acid $\text{CO}_2\text{H CH CH CH CO}_2\text{H}$ [above 260°] S 02 at 15°. Formed by the action of alcoholic potash on β -di-bromo-adipic acid (Rupe, *A* 256, 22, Ruhemann & Blackman, *C J* 57, 373). Branching white needles, sl sol. hot water, m sol hot alcohol and HOAc . Completely decomposed by KMnO_4 in presence of Na_2CO_3 . Combines with bromine forming the acid $\text{CO}_2\text{H CHBr CHBr CHBr CO}_2\text{H}$ [c 250°]. Sodium amalgam reduces it to hydro-mucic acid [195°].

Salts — KA' transparent plates, v sol water, insol alcohol. — BaA' — PbA' — $\text{Ag}_2\text{A}'$ curdy white pp. The cupric salt is a bluish green heavy amorphous pp.

Methyl ether $\text{Me}_2\text{A}'$ [154°] Fan shaped groups of needles.

Ethyl ether EtA' [64°] Plates (from dilute alcohol).

Di-chloro-mucic acid $\text{C}_6\text{H}_2\text{Cl}_2\text{O}_6$, \pm e $\text{CO}_2\text{H CH Cl Cl CH CO}_2\text{H}$ S 10 at 100°. Obtained by heating mucic acid or saccharic acid with PCl_5 and decomposing the resulting chloride with water (Liés Bodart, *A* 100, 325, Boëde, *A* 132, 95, Bell, *B* 12, 1272, Limpricht, *A* 165, 253, Rupe, *A* 256, 6). Long needles (containing 2aq); v sl sol cold water, v sol alcohol, m sol. ether. Not decomposed by boiling aqueous alkalis.

Reactions — 1 Reduced by sodium amalgam to two acids of the formula $\text{C}_4\text{H}_4\text{O}_6$, one of which melts at 195°, and yields malonic acid on oxidation, the other melts at 169°, and yields succinic acid on oxidation. Boiling with sodium amalgam reduces it to adipic acid [148°] — 2 Alcoholic potash at 190°–200° forms oxalic and acetic acids.

Salts — The Ba and Ca salts are m sol. water — $\text{Ag}_2\text{A}'$ insoluble pp.

Methyl ether $\text{Me}_2\text{A}'$ [156°] Pearly plates, v sol ether, hot alcohol, and HOAc .

Ethyl ether EtA' [96°] From the chloride and alcohol (Wichelhaus, *A* 135, 251, Bell, *B* 12, 1273). Prisms.

Chloride $\text{C}_6\text{H}_2\text{Cl}_2\text{O}_6$. Formed by the action of PCl_5 (6 mols) on mucic acid (1 mol). Large crystals (from CS_2), decomposed by moist air.

Hydromucic acid $\text{C}_4\text{H}_4\text{O}_6$, \pm e $\text{CO}_2\text{H CH}_2\text{CH CH CH}_2\text{CO}_2\text{H}$ [195°] S 58 at 15°. Formed by reducing di-chloro-mucic acid with sodium amalgam or with zinc dust and acetic acid. White needles or prisms. Converted by boiling NaOHAq into the isomeric acid [169°]. Oxidised by KMnO_4 to oxalic and acetic acids. Its Ba and Ca salts are less soluble in hot than in cold water. Bromine added to its aqueous solution forms bromohydromucic acid $\text{CO}_2\text{H CH}_2\text{CBr CH}_2\text{CO}_2\text{H}$ [183°], which yields an ether melting at 80°. Bromine without water forms unstable dibromoadipic acid of the formula $\text{CO}_2\text{H CH}_2\text{CHBr CHBr CH}_2\text{CO}_2\text{H}$.

Ethyl ether $\text{Et}_2\text{A}'$ (163° at 35 mm) Oil.

Amide $\text{C}_4\text{H}_4\text{O}_6(\text{NH}_2)_2$ [210°] (Ruhemann & Blackman, *C J* 57, 371).

Hydromucic acid $\text{C}_4\text{H}_4\text{O}_6$, \pm e $\text{CO}_2\text{H CH CH}_2\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$ [169°] S 11 9 Formed by boiling the isomeric acid with aqueous NaOH (Rupe, *A* 256, 13). Nodular aggregates of plates, v sol hot, insol cold water, v sl sol ether. Yields oxalic and succinic acids on oxidation with KMnO_4 . Bromine forms a mono-bromo-derivative [160°] crystallising in branching needles, but no di-bromo-adipic acid.

Methyl ether Oil. Forms with bromine $\text{CO}_2\text{Me CH}_2\text{CH}_2\text{CHBr CHBr CO}_2\text{Me}$ [85°].

MUCOXYBROMIC ACID $\text{C}_4\text{H}_2\text{BrO}_6$, \pm e $\text{CO}_2\text{H C(OH)CBr CHO}$ [112°] Formed by the action of baryta water at 0° upon mucobromic acid (Hill & Palmer, *Am* 9, 148). Thick prisms, with bevelled ends, v sol water, alcohol, and ether, v sl sol chloroform, benzene, ligroin, and CS_2 . FeCl_3 gives an intense garnet red colour. AgNO_3 forms a white crystalline pp. On heating with baryta-water it yields oxalate and formate. Bromine water converts it into bromalhydrate.

CBr, CH(OH)₂ and oxalic acid. Aniline yields C₆H₅BrO₂(NPh)

Salts—K₂A'' aq plates, v sol cold water, decomposed on warming—BaA'' 2aq needles, sl sol cold water, decomposed on boiling—PbA'' yellow pp—Ag₂A'' crystalline pp, explodes on heating or on moistening with HNO₃

Methyl ether Me₂A'' Sticky liquid

Mono-ethyl ether EtHA'' [89°] Prisms, sol alcohol and ether

Di-ethyl ether Et₂A'' Viscous liquid

'Anilmucoxybromic' acid

CO₂H C(OH) CBr CH NPh [132°] Formed by the action of aniline hydrochloride on a dilute solution of mucoxybromic acid (Hill a Palmer, *Am* 9, 156) Pale yellow needles (containing aq), sl sol cold water, v sol alcohol, and ether FeCl₃ gives a brown pp Hot acids and alkalis set free aniline Phenyl hydrazine ppts the phenyl hydrazine salt (C₆H₅N)₂C₁₀H₇BrNO₃ aq

Salts—K₂A''—BaA'' 1aq bright yellow crystalline pp—Ag₂A'' bright orange yellow pp

MUCOXYCHLORIC ACID C₆H₅ClO₃ 1c

CO₂H C(OH) CCl CHO [115°] Formed from mucochloric acid by treatment with a very slight excess of baryta, added slowly at a low temperature (Hill a Palmer, *Am* 9, 159) The yield is 73 p.c. of the theoretical Stout prisms, v sol water, alcohol, and ether, v sl sol chloroform and benzene With FeCl₃ it gives a deep garnet red colour On heating with excess of baryta it yields oxalate and formate Bromine water forms oxalic acid and CClBr₂CHO Phenyl hydrazine yields an unstable condensation product Aniline produces anilmucoxychloric acid

Salts—K₂A'' small tables—BaA'' 2aq crystalline pp, sl sol cold water, v sl sol dilute alcohol—BaA'' aq—Ag₂A''

Mono-ethyl ether EtHA'' [95°] Prisms, which may be sublimed, sol water, alcohol, and ether, v sol boiling benzene

Di-ethyl ether Et₂A'' Viscous liquid

Anilmucoxychloric acid C₆H₅ClNO₃ 1c CO₂H C(OH) CCl CH NPh [147°] Formed from mucoxychloric acid and aniline Pale yellow needles (containing aq), becoming brilliant yellow when anhydrous, sl sol cold water, v sol alcohol and ether When it is heated with acids or alkalis aniline is split off FeCl₃ gives a deep brown pp

Salts—K₂A''—BaH₂A'' 1aq brightly yellow needles—Ag₂A'' bright orange pp—Phenylhydrazine salt PhN₂H₂H₂A'' aq white crystalline mass, sl sol cold water, v sol alcohol

MUCUS OF PLANTS v MUCILAGE

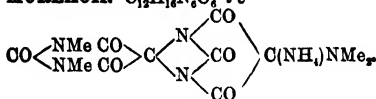

MUNJEET The root of *Rubia munjista*, used in India as a dye stuff If ground munjeet is boiled with a solution of aluminic sulphate, and the red liquid filtered and acidified with HCl, a yellow pp is formed If the pp be boiled with alcohol, pectic acid remains undissolved, and the alcohol contains purpurin and munjinstin They are separated by boiling dilute acetic acid, which dissolves munjinstin

Munjinstin is identical with purpuroxanthic acid, C₁₆H₁₂(CO₂H)₄ [231°] v Di oxy ANTHRA QUINONE CARBOXYLIC ACID (E Schunck a H Roemer, *O* J 33, 422, cf Stenhouse, *Pr* 12, 683, 13, 86, 145)

MUNTZ'S METAL An alloy of Cu and Zn, v. DICTIONARY OF APPLIED CHEMISTRY

MUREXIDE The ammonium hydrogen salt of PURPURIC ACID (q v)

MUREXOIN C₁₂H₈N₄O₂ 2c

Formed by converting caffeine into di methyl alloxan (Fischer, *B* 14, 1912), and reducing this by H₂S to tetra methyl alloxantin, which is then subjected to the action of air and ammonia (Brunn, *B* 21, 514, cf Rochleder, *J* pr 51, 405) Red prisms, sl sol water and alcohol Its aqueous solution is purple, resembling that of KMnO₄ Sublimes at about 230° Decolourised by potash (difference from murexide) Dilute HCl decomposes it, forming di methyl parabanic acid

MURIATIC ACID Synonymous with CHLORHYDRIC ACID, q v vol ii p 5

MURRAYIN C₁₈H₂₂O₁₀ [170°] A glucoside obtained from the flowers of *Murraya eratica* by extracting with water (Blas, *Z* 1869, 316, De Vrij, *Z* 1876, 850, Hoffmann, *Ar Ph* [3] 14, 139) White powder, composed of small needles, sl sol cold water, v sol boiling water and alcohol, insol ether Tastes bitter, but is not poisonous Its solutions in alkalis and in Na₂CO₃ exhibit a greenish blue fluorescence and turn brown on heating The aqueous solution is not pptd by salts of Cu or Hg FeCl₃ colours its solution blue Lead subacetate gives a pp It reduces ammoniacal AgNO₃, and Fehling's solution on warming Dilute acids split it up into glucose and murrayetin

Murrayetin C₁₂H₁₆O₈ [c 110°] Formed by boiling murrayin with dilute H₂SO₄ Prisms (containing 1/2 aq), sl sol cold, m sol boiling water, v sol alcohol, m sol ether Tasteless Its solutions exhibit strong greenish blue fluorescence, which is increased by KOH and by Na₂CO₃ FeCl₃ gives a bluish green colour Lead acetate gives, after a time, a yellow pp

MUSCARINE C₇H₁₁NO 1c CH(OH)₂ CH₂ NMe, OH An alkaloid occurring, together with neurine, in the fly agaric (*Agaricus muscarius*) (Schmiedeberg a Koppe, *J* 1870, 875, Ruckert, *N Rep Pharm* 21, 193), in the fungus *Amnaria Pantherina* (Giacosa, *J* 1883, 1488), and in putrefying flesh (Gautier, *Bl* [2] 48, 13, cf Brieger, *B* 17, 2741) Formed by oxidising neurine CH(OH)₂ CH₂ NMe, OH with conc HNO₃ (Schmiedeberg a Harnack, *C. C.* 1876, 554) Deliquescent tasteless crystals, v a. sol water and alcohol, insol ether Its solution is strongly alkaline, ppts ferric and cupric hydrates from solutions of their salts, and acts as a narcotic poison antagonistic to atropine Not affected by boiling dilute acids or alkalis Gives amorphous pps with mercury potassium iodide and bismuth-potassium iodide

Salts—(CH(OH)₂ CH₂ NMe, Cl), PtCl, 2aq—CH(OH)₂ CH₂ NMe, AuCl

Di-ethyl ether (HO)Me₂N CH₂ CH(OEt)₂ Formed by heating chloro-acetal CH₂Cl CH(OEt)₂ (from di-chloro-ether) with tri-methyl amine (Berlinerblau, *B* 17, 1139) By heating the compound C₆H₅NBr CH₂ CH(OEt)₂, formed by the action of bromo-acetal upon pyridine, with moist Ag₂O at 80° there is formed syrupy C₆H₅N(OH) CH₂ CH(OEt)₂, which is inappro

privately termed by Lochert (*Bl* [8] 8, 859) diethyl muscarine pyridine

MUSCLE Muscular tissue consists of fibres bound together into fasciculi by connective tissue. The fibres may be transversely striated (voluntary and cardiac muscle) or not (other in voluntary muscle). The plain or unstriated fibres are elongated cells with oval nuclei, and inclosed by a delicate envelope, they are singly refracting. The cardiac fibres have no sheath. The voluntary muscular fibres have a well marked sheath or sarcolemma, under which are situated numerous nuclei, the contents of the sarcolemma (muscle plasma) have a semi liquid consistency during life. Kuhne, and later Eberth, observed a nematode worm (*Myogryctes Weissmanni*) crawling up the interior of a muscular fibre (*Zeit f wiss Zool* 12, 530), the contents of the sarcolemma are not, however, homogeneous, this is denoted by the transverse striping, which is probably an optical effect produced by the presence of certain more solid structures which are described as rods, membranes, tubules, and networks of fibres by different observers, these solid bodies are isotropous and are suspended in an anisotropous (doubly refracting) viscous fluid. (For the various theories of the histological structure of striated muscle during rest and on contraction, v Quain, *Anat* 9th edit, London, 1882, p 118 *et seq*, also O Nasse, *Zur Anat u Physiol d quergestreiften Muskelsubstanz*, Leipzig, 1882, v Schafer, *Pr* 1891)

The sarcolemma is homogeneous and elastic, it is composed of an elastin like substance (Ewald, *Zeit Biol* 26, 1)

The muscle plasma, fluid during life, coagulates after death, producing the stiffening called *rigor mortis*. As blood plasma separates into a solid substance, fibrin, and a liquid residuum, serum, after it is shed, so the muscle plasma separates into a clot composed of myosin and a liquid residue muscle serum. Like the coagulation of the blood this can be hindered by cold, and by squeezing the frozen muscles of the frog Kuhne obtained a liquid muscle plasma, which set into a clot which expressed serum subsequently when it contracted. This occurred most readily at about 30°-40°C. This can also be demonstrated in the muscles of warm blooded animals, but as *rigor* occurs there more rapidly, great expedition in manipulation is required. *Rigor mortis* is also accompanied by the formation of sarcocollactic acid.

Admixture of muscle plasma with solutions of neutral salts prevents the coagulation of the latter. Dilution of such salted muscle plasma brings about coagulation, this occurs most readily at 37°-40°C. Saline extracts of rigid muscle differ from salted muscle plasma in being acid, but resemble it very closely in the way in which myosin can be made to separate from it, myosin in fact undergoes a re-coagulation. This is not a simple precipitation, it is first a jelling through the liquid, the clot subsequently contracts, squeezing out a colourless fluid or salted muscle serum. This does not take place at 0°C, it occurs most readily at the temperature of the body, and is hastened by the addition of a ferment prepared from muscle in the same way as Schmidt's ferment is prepared from blood. The ferment is not identical with

fibrin ferment, as it does not hasten the coagulation of salted blood plasma, nor does the fibrin ferment hasten the coagulation of muscle plasma. The re-coagulation of myosin is also accompanied by the formation of lactic acid.

The proteids of muscle plasma are—

1 Paramyosinogen, which is coagulated by heat at 47°C

2 Myosinogen, which is coagulated at 56°C. It is on the presence of this proteid that the power of fresh muscle juice to hasten the coagulation of blood plasma depends

3 Myoglobulin, which differs chiefly from serum globulin in its coagulation temperature (63°C)

4 Albumin, which is apparently identical with serum albumin α , coagulating at 73°C

5 Myoalbumose, this has the properties of deutoalbumose, and is identical with, or closely connected to, the myosin ferment

The first two proteids in the above list go to form the clot of myosin, paramyosinogen (called muscubin by Hammarsten) is, however, not essential for coagulation, the three last remain in the muscle serum

Paramyosinogen, myosinogen, and myoglobulin are proteids of the globulin class. They are all completely precipitated by saturation with magnesium sulphate, or sodium chloride, or by dialysing out the salts from their solutions. They can be separated by fractional heat coagulation, or by fractional saturation with neutral salts

When muscle turns acid, as it does during *rigor mortis* the pep-in which it contains is enabled to act, and at a suitable temperature (35°-40°C) albumoses and peptones are formed by a process of self digestion. It is possible that the passing off of *rigor mortis*, which is apparently due to the reconversion of myosin into myosinogen, may be the first stage in the self digestion of muscle. The usual theory with regard to the cause of the disappearance of *rigor* is that it is due to putrefaction setting in. Cossar Ewart (*Proc R Soc* 1887) has shown that the disappearance of *rigor* and the appearance of bacteria in the muscle are simultaneous. C Schipilloff's theory is that the lactic acid which is formed from the glycogen in muscle (Otto) produces *rigor* by precipitating the myosin, and the disappearance of *rigor* is due to more acid being formed, which redissolves the precipitate. R Bohm has, however, shown that lactic acid is not derived from glycogen, but from a proteid source, and Latham has been able to deduce a formula which represents the formation of the acid from a combination of cyan hydrins such as he supposes a proteid to be

For the properties of myosin v PROTEIDS

For fuller details respecting muscle plasma and the proteids of muscle consult Kuhne, *Protoplasma*, Leipzig, 1864, E Grubert, *Maly's Jahrsber* 18, p 307, J Klemptner, *ibid* p 310, E Kugler, *ibid* p 311, Demant, *Zeit physiol Chem* 3, 241, 4, 386, Halliburton, *J Physiol* 8, 133. Concerning the formation of acid during coagulation, v Kuhne, *lc*, Nasse, *lc*, Weyl, A. Seidler, *Zeit physiol Chem* 557 (W & S suppose that the acidity is partially due to the formation of acid potassium phosphate, the phos-

phoric anhydride being derived from the lecithin and nuclei of the muscle), Berzelius (*Lehrbuch*, 9, 569), Du Bois Reymond (*Gesammelte Abhandl. zur allgem. Muskel und Nervenphysik*, Leipzig, 1877, 2, p. 3), Heidenhain (*Mechanische Leistung*, p. 143), R. Böhm (*Pf* 23, 44), Hoppe-Seyler (*H* 666), Latham (*Brit Med Journal*, vol. 1, 1886, p. 680), C Schiploff (*Centralbl f d med Wissen*, 1882, 291), Chittenden (*Studies from Lab Physiol Chem Yale*, 3, 116). Concerning the digestion of myosin, see Kühne and Chittenden (*Zeit Biol* 25, 358).

Pigments of muscle—Hæmoglobin is present in small quantities in nearly all muscles, it is contained in the muscle plasma, and it is especially abundant in the slowly contracting red muscles which occur in rodents, and occasionally also in other animals. In the gastropods, *Limæna* and *Paludina*, the muscles contain hæmoglobin, but there is none in the blood (Lankester, v also HÆMOGLOBIN).

Myohæmatin is one of a group of colouring matters called histohæmatins, i.e. pigments occurring in the tissues. These substances are probably respiratory in function, they have not been definitely separated from the tissues, but are probably proteid in nature and contain iron, myohæmatin can be recognised most easily, after soaking the muscle in glycerine, by the spectroscopic, myohæmatin is contained in the muscle plasma. Myohæmatin exhibits four absorption bands—one just below δ , two between δ and ϵ , and one just below ϵ . By soaking the muscle in ether, as a result of osmotic phenomena, the liquid separates out two layers, the lower of which is watery, yellowish-red in colour, and contains myohæmatin which presents a slightly different spectrum from that just described, viz. one band between δ and ϵ and one between ϵ and δ . In both cases the bands are very feeble when the pigment is oxygenated, but become well marked on the addition of reducing agents (MacMunn, *Phil Trans* 1, 1886, p. 267, *J Physiol* 8, 51). Hoppe-Seyler believes myohæmatin is altered hæmoglobin (*Zeit physiol Chem* 13). This, however, has been shown by MacMunn to be untenable (*ibid*).

Constituents of Muscle—Muscle contains on the average 75 p.c. of water, this percentage is higher in young animals and in cold-blooded animals, of the 25 p.c. of solids, 21 p.c. consists of the proteids already described, and the remaining 4 p.c. of extractives and salts (*cf* Hofmann, *Lehrbuch der Zoochemie*, 104). The extractives are divided into (1) *nitrogenous*, viz. creatine the most abundant (0.2 to 0.3 p.c. Voit, *Z B* 4, 77, increased by starvation, Demant, *Zeit physiol Chem* 8, 387), creatinine, xanthine, hypoxanthine, and carmine, (2) *non nitrogenous* viz. fats, glycogen (C. Bernard, *C R* 48, 678, Nasse, *Pf* 2, 97, Brücke, *Sitz W* 63, 214, Abels, *Med Jahrbücher*, 1877, 551, Kulz, *Z B* 22, 161), inosite (Scherer, *Annal d Chem u Pharm* 78, 322, Gauret, a Villiers, *C R* 86, 486), sarcosolactic acid and lactic acid. In addition to the ferments already described (pepsin and myosin-ferment), muscle also contains an amolytic ferment (Nasse, *lc*). Fresh muscle yields on ignition 1 to 1.5 p.c. of mineral matters, of which the most important constituents are potas-

sum and phosphoric acid (*cf* Hofmann, *lc.*, and Bunge, *Zeit physiol Chem* 9, 60).

Contraction of muscle—The processes that occur in resting muscle are twofold—one a change of matter, this chemical tonus, as it may be called, is lessened by curare poisoning, by which the influence of the nervous system over the muscular is shut off and the other set of changes is a change of the potential energy of chemical affinity into actual energy evidenced by the production of heat. On the contraction of a muscle, there is a sudden acceleration of both these changes, viz. an increase in chemical decomposition, and in the conversion of potential into actual energy which is evidenced as heat, electrical inequality, and mechanical motion. It is with the former of these, the chemical changes, that we have here specially to deal. They may be briefly summarised as follows—

1 **Change in reaction**—The muscle ordinarily alkaline becomes acid, as it does during *rigor mortis*, and the acid produced is lactic acid. The acidity can be easily demonstrated by litmus paper (Kühne). It is the accumulation of this and other waste products, including alkaloidal substances (Mosso), in the muscle which produces fatigue—2 There is a relative increase of water (Ranke, *Tetanus*, cap. 2, p. 63). 3 The extractives soluble in water decrease, those soluble in alcohol increase (Helmholtz, *Arch f Anat u Phys* 1845 72, Ranke, *lc* 141, Heidenhain, *Pf* 3, 574)—4 Glycogen diminishes and sugar increases in amount (Ranke, Nasse, *Pf* 2, 97)—5 Creatine diminishes and creatinine increases in amount (Sarokin, *Virchow's Archiv*, 28, Voit, *Z B* 4, 77)—6 Tanned muscle is not able to oxidise pyrogallie acid as resting muscle is (Grützner, *Pf* 7, 255)—7 Nitrates are converted into nitrites (Geschleiden, *ibid* 8, 506)—8 **Gaseous changes**. The amount of oxygen used and of carbonic acid given out increases, the amount of carbonic acid exhaled is never equal in amount to that of the oxygen absorbed, and during tetanus, i.e. continuous contractions, the quotient $\frac{\text{CO}_2 \text{ exhaled}}{\text{O absorbed}}$ increases. The following

numbers from Ludwig and Schmidt illustrate the differences in the gases of the blood leaving muscle during rest and activity

Venous blood.	Oxygen less than arterial blood.	CO ₂ more than arterial blood
Muscle at rest	9 p.c.	6.71 p.c.
„ during activity	12.26 „	10.79 „

(For analyses of the gases of muscle v. Hermann, *Stoffwechsel der Muskeln*, Ludwig, Sezelkow u. A. Schmidt, *Sitz W* 45, *Sitzungsber math phys Classe der k. s. Gesellsch der Wissensch* 20, 12, *Arbeiten aus d physiol Anstalt zu Leipzig*, 1869. Full references of the literature on the effect of muscular exercise on respiration are given by Gamgee, *Physiol Chem* p. 382).

No trustworthy results exist which show that the proteids of muscle undergo any change during activity, and the effect of muscular exercise on the nitrogenous excreta is very small, the increase of urea being quite out of proportion to the amount of work done. (For experiments on dogs v. Voit, *Untersuchungen über den Einfluss*

der Kochsalzes des Kaffees und der Muskelbewegungen auf den Stoffwechsel, München, 1860 For experiments on man, v Fick u Wislizenus, *Vierteljahrsschrift d nat Gesellsch in Zurich*, 10, Parkes, *Pr* 15, 389, 16, 44, E Smith, *Phil Trans* 1862, 747, A Flint, *Journ of Anat and Physiol* 12, 91, F W Pavy, *Lancet*, 1876, North, *Journ of Physiol* 1, 171, *Pr* 39, 443)

Hermann's theory of muscular contraction.—No oxygen is obtainable from muscle *in vacuo* Hermann considers that the formation of carbonic acid is not simply the result of oxidation, but due to the splitting of a complex substance *inogen* into carbonic acid, lactic acid, and a gelatinous proteid myosin, the same occurs, but to a greater extent, in *rigor mortis*, the process of clotting especially going further Each contraction is thus the partial death of the muscle This is supported by the fact that the electrical conditions, like the chemical, are similar in dead and contracted muscle There is, however, no evidence to prove that a clot of myosin is formed at each contraction Bernstein has more recently formulated a theory in which he seeks to show that changes in form, in composition, and in electrical potential are all parts of the same mechanism (*Untersuch a d physiol Inst Halle*, 1888) See also Burdon Sanderson (*Re ports Brit Ass* 1889) W D H

MUSTARD OILS The seeds of black mustard (*Sinapis nigra*) contain potassium myronate, which, in presence of water, is decomposed by the ferment myrosin (also present in the seeds) into KHSO_4 , glucose, and allyl thiocarbimide or oil of mustard Small quantities of crotonitrile and free sulphur are formed in the hydrolysis (Forster, *L V* 1888, 209) Black mustard seed also contains a fixed oil which yields stearic and erucic acids on saponification (Darby, *A* 69, 1) The allyl thiocarbimide amounts to about 5 p c of the weight of the seeds White mustard seed (*Sinapis alba*) yields on pressure 36 p c of a fixed oil containing glyceryl erucate The seeds also contain a glucoside, sinabin $\text{C}_{20}\text{H}_{31}\text{N}_2\text{S}_2\text{O}_{16}$ which is decomposed by myrosin into sinapin sulphate $\text{C}_{16}\text{H}_{19}\text{NO}_2\text{H}_2\text{SO}_4$, glucose, and an oil $\text{C}_{17}\text{H}_{33}\text{NSO}$ (Will, *Z* [2] 7, 89, *A* 199, 150) The term 'mustard oil' has been applied not only to the fixed and volatile oils from mustard seed, but also to all compounds of the form RNCS where R denotes a hydrocarbon radicle In this dictionary these compounds are described as thiocarbimides Thus the essential oil of black mustard is described as allyl thiocarbimide

MYCOMELIC ACID $\text{C}_{17}\text{H}_{33}\text{N}_2\text{O}_4 \cdot \frac{1}{2}\text{aq}$ When alloxan is gently warmed with aqueous NH_3 , it forms a yellow solution which deposits on cooling a transparent jelly of ammonium mycomelate, from the hot aqueous solution of which salt H_2SO_4 ppts mycomelic acid (Liebig & Wöhler, *A* 26, 304) Mycomelic acid is also produced by boiling azulonic acid with water (Emmerling & Jacobsen, *B* 4, 951) and by heating uric acid with water at 180° (Wöhler, *A* 103, 118, Hlawetz, *A* 103, 211) Gelatinous pp, drying up to a loose yellow powder Reddens litmus Almost insol cold water, m sol hot water and alkalis, m sol alcohol and ether — $\text{AgC}_7\text{H}_{11}\text{N}_2\text{O}_2$.

MYCOSE v TREHALOSE and SUGARS.

MYCOTONINE $\text{C}_{27}\text{H}_{51}\text{N}_3\text{O}_5 \cdot 5\text{aq}$. [144°] Oc-

curs, together with lycaconitine, in *Aconitum lycoctonum* (Dragendorff & Salomonovitch, *C O* 1886, 861) V sol chloroform and benzene, nearly insol ether (difference from lycaconitine) Poisonous, 01 g killing a frog Produces paralysis of the extremities of the motor nerves.

MYO-HÆMATIN v MUSCLE

MYOSIN v PROTEIDS and MUSCLE

MYRICIN $\text{C}_{26}\text{H}_{40}\text{O}_2$. [72°] The portion of bees'-wax insoluble in alcohol It is myricyl palmitate (Brodie, *A* 71, 144) Light feathery crystals (from ether), readily saponified by alcoholic potash According to Nafziger (*A* 224, 251) myricin also contains an ether of oleic acid

MYRICYL ALCOHOL $\text{C}_{26}\text{H}_{42}\text{O}$ $\pm e$ $\text{C}_{26}\text{H}_{42}\text{O}$, CH_3OH [85.5°] Obtained by saponifying carnauba wax, in which it occurs both free and combined (Maskelyne, *C J* 22, 87, Von Pieverling, *A* 183, 344, Sturcke, *A* 223, 294) According to Brodie (*A* 71, 147) myricyl alcohol is obtained by saponifying the myricin of bees'-wax, but Schwallb (*A* 235, 106) considers that the myricyl alcohol so obtained has the homologous formula $\text{C}_{25}\text{H}_{40}\text{O}$

Properties — Small white needles (from ether), almost insol cold alcohol, ether, and benzene, but readily soluble in these liquids when hot On heating with soda lime at 200° it forms melissic acid $\text{C}_{25}\text{H}_{40}\text{O}_2$, CO_2H [90°]

DI MYRICYL-AMINE $\text{C}_{52}\text{H}_{84}\text{N}_2$ $\pm e$ $\text{NH}(\text{C}_{26}\text{H}_{41})_2$. [78°] Formed by passing NH_3 for 24 hours over myricyl iodide at 120° (Von Pieverling, *A* 183, 351) Crystalline, nearly insol boiling alcohol and ether, v sol boiling benzene

MYRICYL CHLORIDE $\text{C}_{26}\text{H}_{41}\text{Cl}$ [64.5°] Formed from myricyl alcohol and PCl_5 (Von Pieverling, *A* 183, 348) Waxy mass (from ether), sol alcohol, benzene, and ligroin

MYRICYL CYANIDE $\text{C}_{26}\text{H}_{39}\text{CN}$ [75°] Amorphous (Von Pieverling, *A* 183, 357)

MYRICYL IODIDE $\text{C}_{26}\text{H}_{39}\text{I}$ [70°] Formed by adding phosphorus and iodine in successive small portions to myricyl alcohol heated to 120° (Von Pieverling, *A* 183, 347) Plates (from ligroin), v sol hot alcohol and ether When heated with finely divided potassium it yields $\text{C}_{26}\text{H}_{42}$. [102°] (Hell & Hagele, *B* 22, 502)

MYRICYL MERCAPTAN $\text{C}_{26}\text{H}_{41}\text{SH}$ [94.5°] An amorphous yellow powder, formed by the action of alcoholic KSH on myricyl chloride (Von Pieverling, *A* 183, 349) Sl sol boiling ether, ligroin, and alcohol

MYRISTIC ACID $\text{C}_{14}\text{H}_{27}\text{O}_2 \pm e$ $\text{C}_{13}\text{H}_{25}\text{O}_2$, CO_2H Mol w 228 [54°] (250.5° v at 100 mm) Kraft, *B* 12, 1668, 15, 1724, 16, 1719) S G \pm 8622 H F 107,000 (Von Rechenberg) H C 2,061,712 (Lougumne, *A Ch* [6] 11, 222) Occurs as glyceryl ether (myristin) in nutmeg-butter (from *Myristica moschata*) (Playfair, *P M* [3] 18, 202, *A* 37, 153, Fluckiger, *N Rep Pharm* 24, 213), in Otoba-wax or otobite (from *Myristica otoba*) (Uricoechea, *A* 91, 369), in dika bread (prepared from the fruit of *Mangifera Gabonensis*) (Oudemans, *J pr* 81, 356) amounting to more than one half of the fatty acids contained therein, in the oil of *Cyperus esculentus* (Hell & Twerdomehoff, *B* 22, 1742), in small quantity in cocoa nut oil (Gorgey, *A* 66, 314), in common butter (Heintz, *P* 87, 267, 90, 187, 92, 429, 588, *J pr* 66, 1), in croton oil

(Schlippe, *A* 105, 1), and in Bicuhyba wax (from *Myristica Bicuhyba*). It occurs in combination with ethal in spermaceti (Heintz, *A* 92, 291). It also occurs in the seeds of *Nigella sativa* (Greenish, *Ph* [3] 11, 909, 1013) and in lycopodium spores (from *Lycopodium clavatum*) (Langer, *Ar Ph* [3] 27, 241, 289). Myristic acid is formed by fusing stearic acid with potash (Marasse, *B* 2, 361).

Preparation—By saponifying nutmeg butter or myristin and distilling the acid obtained under reduced pressure.

Properties—Shining laminae (from alcohol), insol water, v sol hot alcohol and ether. A mixture of 30 pts myristic acid and 70 pts lauric acid melts at 35°. Nitric acid (S G 1.5) readily oxidises it, forming various products (Uverdlinger, *B* 19, 1893). The dry distillation of the calcium salt yields myristone. Distillation with MeOH *in vacuo* yields tridecane (Mai, *B* 22, 2133).

Salts—KA' crystalline soap, v sol water and alcohol, insol ether (Playfair)—NaA'—BaA', minnelaminæ, v sl sol water and alcohol—MgA', Baq minute needles (Heintz)—CuA', minute bluish green needles—PbA', amorphous mass—(PbA')₂, Pb(OAc)₂, insoluble powder—AgA' amorphous powder.

Ethyl ether EtA' [11°] (Lutz, *B* 19, 1433) (295°) S G (liquid) 864 (Playfair). Formed from the acid, alcohol, and HCl. Crystals, al sol alcohol and ether, m sol ligroin.

Glyceryl ether C₁₁H₂₁O₂ or **C₁₂H₂₂O₂**, *Myristin Trimyristin* [55°] and [49°] H G 6,601,895 (Lougumine). Occurs in the cases mentioned above, and also in large quantity in the fat of the oil nut (*Myristica surinamensis*) (Reimer a Will, *B* 18, 2011), and to the extent of 1.5 or 2 p c in cochineal (Liebermann, *B* 18, 1975). It is best obtained by extracting powdered nutmeg with ether (Masino, *G* 10, 72). Brilliant leaflets, v sol warm alcohol, ether, benzene, and CHCl₃, nearly insol cold alcohol. It forms two varieties, melting at 55° and at 49°, which are interchangeable by heating 1° above the melting-point for half a minute (R a W, I).

Phenyl ether A'C₆H₅ [36°], (230° at 15 mm).

p-Tolyl ether A'C₆H₄ [39°], (240° at 15 mm) (Krafft a Burger, *B* 17, 1379).

Chloride C₁₁H₂₁COCl [−1°] (168° at 15 mm). Colourless liquid (Krafft a Burger).

Amide C₁₁H₂₁CONH₂ [102°] Formed by heating the glyceryl ether with alcoholic NH₃ at 100° (Masino, *A* 202, 173) or the ethyl ether with aqueous NH₃ at 250°. Formed also by heating the ammonium salt at 230° in a sealed tube (Reimer a Will, *B* 18, 2016), and by the action of NH₃ on the chloride (Krafft a Stauffer, *B* 15, 1730). Plates (from alcohol), v sol benzene, alcohol, and chloroform, sl sol ether, insol water. Bromine and NaOHAq forms C₁₁H₂₁NH CO NH CO C₁₁H₂₁ [103°].

Anilide C₁₁H₂₁CONHPh [84°] Prepared by boiling the acid with aniline for some days (Masino, *G* 10, 75). Silky needles, sol ether, benzene, and chloroform.

Nitrile C₁₁H₂₁CN [19°] (226.5° at 100 mm) S G $\frac{1}{2}$ 6981, $\frac{1}{2}$ 7724. Formed from the amide by distilling with P₂O₅ (Krafft a Stauffer, *B* 15, 1730).

Myristic-benzoic-anhydride

C₁₁H₂₁COOCO C₆H₅ [38°] Formed from BzCl and potassium myristate (Chiozza a Malerba, *A* 91, 102). Silky laminae, m sol ether.

Bromo-myristic acid C₁₁H₂₁BrO₂ [31°] Formed from myristic acid, amorphous P and Br (Hell a Twerdomedoff, *B* 22, 1745). Needles, insol water, sol alcohol and ether.

Tetra bromo-myristic acid C₁₁H₂₁Br₄O₄ Formed from myristic acid and Br (Masino).

Amido-myristic acid C₁₁H₂₁(NH₂)O₂ [253°] Formed from bromo myristic acid and alcoholic NH₃ (H a T). Needles, insol alcohol.

Phenyl-amido-myristic acid

C₁₁H₂₁(NHPh)O₂ [143°] Formed from bromo myristic acid and aniline (H a T). White mass, insol water, sl sol benzene, v sol alcohol. Gives a dark green pp, with cupric acetate in hot alcoholic solution.

Oxy-myristic acid C₁₁H₂₁(OH)O₂ [51.5°] Formed by boiling bromo myristic acid with excess of aqueous NaOH (H a T). Crystalline, insol hot water, v sol alcohol and benzene—BaA', flocculent pp, sl sol cold water, v sl sol hot water—AgA' white pp.

MYRISTIC ALDEHYDE C₁₁H₂₁CHO [53°] (169° at 22 mm). Crystalline solid. Prepared by dry distillation of a mixture of calcium myristate and formate (Krafft, *B* 13, 1415).

Isomeride—TETRADECIC ALDEHYDE

MYRISTICIN C₁₂H₂₁O₂ [30°] (c 145° at 10 mm) S G $\frac{25}{4}$ 1501. Occurs in oil of mace (Semmler, *B* 23, 1803). Yields benzene when distilled with zinc dust. Bromine forms C₁₂H₂₁Br₂O₂ [105°].

MYRISTICOL C₁₁H₂₁O (212°–218°). The chief constituent of the volatile oil of nutmeg (Gladstone, *C J* 25, 11, Wright, *C J* 26, 549, 686). Resinified by heat. P₂S₅ converts it into cymene. PCl₅ yields a chloride, C₁₁H₂₁Cl [100°], slowly split up on boiling into HCl and cymene.

MYRISTIN v *Glyceryl ether of MYRISTIC ACID*.

MYRISTOLIC ACID C₁₁H₂₁O₂ [12°] Formed by passing chlorine into myristic acid heated to 100°, and decomposing the product with alcoholic potash (Masino, *A* 202, 175). Oil. Not solidified by nitrous fumes. Gives Pettenkofer's reaction with sugar and H₂SO₄.

MYRISTONE C₆H₁₁CO [76°] S G $\frac{80}{4}$ = 801, $\frac{100}{4}$ = 792. Silvery plates. Formed by distilling calcium or barium myristate with lime (Overbeck, *P* 86, 591, *A* 84, 290, Krafft, *B* 15, 1713). Does not combine with NaHSO₄.

Oxim C₂₀H₃₃N [51°] Amorphous, sl sol alkalis (Spiegler, *B* 17, 1575, *M* 5, 242).

MYRISTONITRILE v *Nitrile of MYRISTIC ACID*.

MYRONIC ACID C₁₁H₂₁NSO₃ (from *μύρον*, a fragrant ointment). Occurs as potassium salt in the seeds of black mustard (Bassy, *J Ph* 16, 39, Ludwig a Lange, *Z* 1860, 430, 577, Will a Körner, *A* 125, 257), in horse radish (Winckler, *J* 1849, 436), in rape seed (*Brassica rapa*), and in turnip seed (*Brassica napus*) (Ritthausen, *J pr* [2] 24, 273). This salt may be obtained by boiling mustard seeds (1 pt) with alcohol (6 pts), macerating the residue with cold water, and evaporating the aqueous extract after addition of a little BaCO₃. The free acid may be

obtained by adding tartaric acid to a solution of the potassium salt, evaporating, and extracting with alcohol Syrup, readily decomposed by heat Its aqueous solution gives off H_2S on boiling An aqueous solution of myrosin splits it up into glucose, allyl thiocarbimide, and H_2SO_4 Boiling baryta water forms a pp of $BaSO_4$, with evolution of allyl thiocarbimide Caustic potash solution acts vigorously, yielding allyl cyanide, NH_3 , glucose, and allyl thiocarbimide Conc HCl sets free H_2SO_4 , boiling dilute H_2SO_4 yields H_2S , glucose, H_2SO_4 , and NH_3 Zinc and $HClAq$ give off H_2S

Salts— KA' Groups of silky needles (from alcohol) or glassy prisms (from water), v e sol water, nearly insol alcohol, insol ether Tastes bitter Its solution is hydrolysed by myrosin

$KC_{10}H_7NS_2O_{10} = C_6H_5O_6 + C_4H_5NCS + KHSO_4$ The hydrolysis is not brought about by emulsion, yeast, or saliva Water at 115° yields allyl cyanide, H_2S , and sulphur Silver nitrate solution gives a pp $C_6H_5NSAg_2SO_4$. — BaA'_2 (at 100°) plates, v sol water

MYEOSIN A proteid ferment contained in the seeds of black and white mustard and of many other cruciferous plants It may be obtained by exhausting white mustard with cold water, evaporating below 40° to a syrup, and ppg by alcohol (Bussy, *J Ph* 26, 44, Winckler, *Jahrb pr Pharm* 3, 93) Its aqueous solution is coagulated by heat and by alcohol, when it loses its hydrolytic power, but it recovers this after a day's immersion in water It does not hydrolyse amygdalin

MYROXOCARPIN $C_{18}H_{19}O_6$ [115°] Deposited in crystals from an alcoholic solution of

white balsam of Peru (Stenhouse, *A* 77, 306) Trimetric crystals, $a b c = 1.936 : 755$ Insol water, v sol hot alcohol and ether Does not dissolve in acids or alkalis

MYRRH A gum resin which exudes from *Balsamodendron myrrha*, a shrub growing in Arabia and Abyssinia The resin yields proto catechuic acid and pyrocatechin on potash-fusion (Hlasiwetz & Barth, *J* 1866, 630) Besides resin and gum (Buckner, *N Rep Pharm* 16, 76), myrrh contains a small quantity of an essential oil, boiling about 266° , $S G$ 15° 1.0189, μ_A 1.5196 at 75° , μ_D 1.5278, μ_H 1.5472 (Gladstone, *C J* 17, 11) The oil quickly resinifies when exposed to atmospheric oxidation It contains $C_{10}H_{16}O$ (263°) (Flückiger, *B* 9, 471) According to Kohler (*Ar Ph* 228, 291) myrrh contains a gum $C_6H_9O_3$, a resin $C_{20}H_{31}O_2(OH)$, two dibasic acids $C_{12}H_{19}O_8$ and $C_{18}H_{27}O_8$, and 7 p c of an essential oil $C_{10}H_{16}O$

MYRTLE OIL A volatile oil obtained from the berries and leaves of the myrtle (*Myrtus communis*) (Riegel, *Pharm Centr* 1850, 319) It contains a terpene $C_{10}H_{16}$ (160° – 170°), $S G$ 15° 891, μ_A 1.462 at 18° , μ_D 1.468, μ_H 1.488 (Gladstone, *J* 1863, 548) Jahns (*Ar Ph* [3] 27, 174) found in Spanish oil of myrtle pinene $C_{10}H_{16}$ (169°) [α]_D = 36.8 , and cineol (170°)

MYTILOTOXINE $C_6H_7NO_2$ Occurs in mussels (*Mytilus edulis*) and in putrid flesh (Brieger, *Die Ptomaine*, Gautier, *Bl* [2] 48, 13) Its hydrochloride crystallises in tetrahedra, and is very poisonous, but gradually decomposes, losing its poisonous properties — $B'HAuCl$, [182°] Minute cubes

N

NANDININE $C_{15}H_{17}NO$ Occurs in the root bark of *Nandina domestica* of Japan (Eijkman, *R T C* 3, 197) White amorphous powder, insol water, v sol alcohol, ether, benzene, and chloroform Poisonous Gives the alkaloidal reactions H_2SO_4 forms a reddish-violet colour, changed by a drop of HNO_3 to an intense blue Nitric acid gives a green colour changing to brown — $B'H_2PtCl_6$ turned blue by H_2SO_4

NAPHTHA v **PETROLEUM**

(β)-**NAPHTH-ACRIDINE** $C_{21}H_{15}N_3$ v e

$C_{10}H_7 \begin{array}{c} \text{CH} \\ \diagup \quad \diagdown \\ \text{N} \end{array} C_{10}H_7$ [216°] Formed by the action

of methylal, and HCl upon (β) naphthyl amine (Beed, *J pr* [2] 34, 160, 35, 317) Long, straw-yellow, needles, v sol alcohol, v al sol ether The alcoholic solution fluoresces dark blue

Nitrate $B'HNO_3$ small needles

Picrate $B'O_2C_6H_4(NO_2)_3$ amorphous

Derivative v **PHENYL-NAPHTHAACRIDINE**

NAPHTHALDEHYDE v **NAPHTHOIC ALDEHYDE**

NAPHTHALENE $C_{10}H_8$ *Naphthalin* Mol w 128 [80.2°] (Reissert, *B* 23, 2243), [80°] (Landolt, *Z P O* 4, 849), [79.5°] (Vohl), [79°] (Lössen & Zander, *A* 225, 111), [80.06°] (Mills, *P M* [5] 14, 27) (218°) at 760 mm (Vohl, *J*

Vol III

pr 102, 29, Crafts, *Bl* [2] 39, 282), (217°) at 740 mm $S G$ 15° 1.152 (V), μ_A 1.145 (Schroder, *B* 12, 1613) $S G$ (liquid) 18° 978 (Kopp, *A* 95, 329), 7° 982 (L & Z) $H C v$ 1,232,400 $H C p$ 1,233,600 (Stohmann), 1,245,000 (Berthelot & Vieille, *Bl* [2] 47, 863), 1,242,000 (Berthelot, *A Ch* [6] 13, 302, 326) $H F$ — 17,600 (Stohmann, Kleber, & Langbein, *J pr* [2] 40, 90), — 29,000 (Berthelot & Vieille, *A Ch* [6] 10, 442), — 42,000 (von Rechenberg) $S V$ 149.2 (L & Z), 148 (Lössen, *A* 254, 53), 145.46 (Ramsay), $S V S$ 130.61 (Schiff) R_p 74.12 in a 6.66 p c alcoholic solution (Kanonnikoff), 71.78 (Nasim & Bernheimer, *G* 14, 153, 15, 93) S (toluene) 32 at 16.5° , S (alcohol) 5.29 at 15° (Bech, *B* 12, 1978) Its absorption in the ultra violet spectrum has been studied by Hartley (*C J* 39, 161)

Occurrence—In petroleum from Rangoon (Warren & Storer, *Mem Amer Acad* 9, 208) In coal tar, from which it may be obtained by shaking the fraction 180° – 220° with aqueous $NaOH$ and then with dilute H_2SO_4 , and distilling the residue alone or with steam (Garden, *Thomson's Annals*, 16, 74, Faraday, *Tr* 1826, Kidd, *B. J.* 2, 186, Reichenbach, *S* 61, 175, 68, 233).

Formation.—1 A product of the passage through a red hot tube of the vapour of the following

G G

lowing substances — petroleum, alcohol (Reichenbach, *B* 12, 307), ether, acetic acid, essential oils, toluene (Ferko, *B* 20, 660), xylene, ψ -cumene, a mixture of ethylene with benzene, with styrene, with anthracene or with chrysene (Berthelot, *Bl* [2] 6, 272, 279), ethylene alone, acetylene, a mixture of benzene and acetylene (Berthelot, *Bl* [2] 7, 218, 278, 306), oil of turpentine (Schulz, *B* 9, 648), wood-tar (Letney & Atherberg, *B* 11, 1210, 1222) — 2 By passing over red hot quicklime the vapour of the bromide of phenyl butylene derived from benzyl bromide, allyl iodide and sodium (Aronheim, *B* 6, 67, *A* 171, 233) — 3 By passing the vapour of isobutyl benzene over heated lead oxide (Wreden & Znatovitch, *B* 9, 1606) — 4 By distilling colophony and gum benzoin with zinc dust (Ciamician, *B* 11, 269) — 5 By heating dimethyl aniline (1 pt) with bromine (1 pt) at 115° (Brunner & Brandenburg, *B* 11, 697) — 6 By oxidising pyrene acid and distilling the resulting naphthalene tetra-carboxylic acid with slaked lime (Bamberger & Philip, *B* 19, 1999) — 7 By hydrolysis of its sulphonic acids this takes place when superheated steam is passed through a solution of naphthalene (β) sulphonic acid in dilute H_2SO_4 at 135° (Armstrong & Miller, *C* 46, 148)

Synthesis — By dry distillation of the silver salt of tetra hydro naphthalene di carboxylic acid $C_{10}H_6$ $\begin{matrix} \text{CH}_2\text{CH}(\text{CO}_2\text{H}) \\ \text{CH}_2\text{CH}(\text{CO}_2\text{H}) \end{matrix}$ which acid is formed

by the action of *o* xylene bromide C_8H_6 $\begin{matrix} \text{CH}_3 \\ \text{CH}_3 \end{matrix}$ Br on di-sodio ethane tetra carboxylic ether $C_2Na_2(\text{CO}_2\text{Et})_4$, and boiling the product with alcoholic KOH Naphthalene is also formed by passing the tetra hydro naphthalene di carboxylic acid through a red hot tube (Baeyer & Perkin, *B* 17, 448) (*v* NAPHTHOL and NAPHTHALENE DERIVATIVES, Constitution of)

Purification — Commercial naphthalene may be purified by sublimation. It may also be purified by repeatedly heating with a little H_2SO_4 (best with MnO_2) at 180° and distilling with steam (Stenhouse & Groves, *B* 9, 683)

Properties — Monoclinic tables, insol cold, almost insol hot, water, *v* sol alcohol, ether, fatty and essential oils, and HOAc. Volatile with steam, 1 pt distilling over with about 570 pts of water (Naumann, *B* 4, 646, 10, 2014, 2100, 11, 33). Burns with smoky flame. Boiling naphthalene dissolves S, P, and the sulphides of As, Sb, and Sn, it also dissolves indigo, iodine, $HgCl_2$, HgI_2 , and As_2O_3 .

Reactions — 1 *Chlorine* forms derivatives by substitution and by addition (Laurent, *A* 49, 218, 52, 275, 69, 214) — 2 *Bromine* forms derivatives by substitution — 3 *Nitric acid* forms nitro and di nitro naphthalene — 4 The vapour of *aqua regia* in the cold forms $C_{10}H_6Cl_4$ and $C_{10}H_6Cl_2$ (Bunge, *B* 4, 289) — 5 *Phosgene* has no action (Berthelot, *Bl* [2] 13, 301) — 6 The vapour passed through a red hot tube yields carbon, methane (Kletzensky, *J* 1865, 561), and dinaphthyl (Ferko, *B* 20, 662). When passed through a red-hot tube together with hydrogen it is mainly unaltered, but yields some acetylene and benzene (Berthelot, *Bl* [2] 6, 281). When passed together with acetylene through a red-hot tube it yields much anthracene. At a white

heat it reacts with benzene forming anthracene (Berthelot). When passed through a red-hot tube containing charcoal it yields some dinaphthyl. When passed with ethylene through a red-hot tube it yields acenaphthene, phenanthrene, and dinaphthyl (Ferko, *B* 20, 662) — 7 Saturated HIAq at 280° yields the dihydride $C_{10}H_{12}$, and finally ethyl and di ethyl benzene and decane (Berthelot, *J* 1867, 709). When heated with conc HIAq and red phosphorus the products are naphthalene hexahydride, and only $C_{10}H_{18}$ (173°–180°) and $C_{10}H_{22}$ (153°–158°) (Wreden, *A* 187, 164) — 8 Boiling aqueous $KMnO_4$ oxidises it to phthalic acid. Aqueous $K_2Cr_2O_7$ and H_2SO_4 yield phthalic acid and dinaphthyl (Lossen, *A* 144, 71). Dilute HNO_3 at 130° also yields phthalic acid (Beilstein & Kurbatow, *A* 202, 215). A mixture of CrO_3 and HOAc oxidises it to naphthoquinone. Oxidation with MnO_2 and H_2SO_4 yields dinaphthyl and a resinous acid $C_{10}H_8O_4$, which forms the amorphous salts Pb_2A''' , $PbHA'''$, and Ag_2HA''' (Lossen) — 9 $KClO_4$ and H_2SO_4 form phthalic acid, di chloro-naphthalenes, and syrupy chloroxy naphthalic acid $C_{10}H_6ClO_4$ (Hermann, *A* 151, 79) — 10 CrO_3Cl_2 yields di chloro naphthoquinone — 11 Aqueous hypochlorous acid forms $C_{10}H_6(\text{HOCl})_2$, crystallising in prisms, *sl* sol water, converted by alcoholic potash into $C_{10}H_6(\text{OH})_2$, which crystallises in prisms, almost insol water, *v* sol alcohol, and forms an insoluble lead compound $Pb_2C_{10}H_6O_4$ (dried at 100°) and a sulphonic acid which yields a crystalline calcium salt $CaC_{10}H_6S_2O_{10}$ (Neuhoff, *A* 136, 342) — 12 When heated with excess of $AlCl_3$ it forms benzene and hydrides of Naphthalene. At 160° iso dinaphthyl is formed (Friedel & Crafts, *Bl* [2] 39, 195, *C* 100, 692) — 13 *Methyl chloride* in presence of $AlCl_3$ forms $C_{10}H_{12}$ [181°] crystallising in plates, *v* sol hot ether, *sl* sol cold alcohol (Bischoff, *B* 23, 1905, *C* Liebermann, *A* 163, 122, Furth, *B* 16, 2171) — 14 *Iodine* at 250° appears to form a compound $C_{10}H_8I$ (Bleunard & Vrau, *C* 94, 534) — 15 On passing a mixture of cyanogen and naphthalene vapour through a red hot tube there is formed the nitrile of (α) naphthoic acid — 16 Heating with *chloride of sulphur* yields di chloro naphthalene (Laurent, *A* 76, 298) — 17 *Nitric peroxide* forms nitro and di nitro naphthalene and, at 100°, the compounds $C_{10}H_6O_4$ [225°] and $C_{10}H_6O_2$ [131°] (Leeds, *Am* 2, 283) — 18 When heated with *potassium* it forms a black powder $C_{10}H_6K_2$, which is decomposed by water, yielding KOH and $C_{10}H_6$ (Berthelot, *Bl* [2] 7, 110) — 19 Naphthalene (2 pts) fused with *antimonious chloride* (8 pts) yields on cooling deliquescent crystals of $(C_{10}H_6)_2Sb_2Cl_4$ (W Smith, *C* 41, 411) — 20 Naphthalene taken internally appears in the urine as (β) naphthol and (β) naphthoquinone (Edlefsen, *C* 1888, 1007)

Combinations with nitro compounds — $C_{10}H_6C_6H_5(NO_2)_2$ [18] [53°] Prisms (Hepp, *A* 215, 379) — $C_{10}H_6C_6H_5(NO_2)_2$ [14] [119°] White needles, *v* *sl* sol alcohol, separated into its components by distillation with steam — $C_{10}H_6C_6H_4Cl(NO_2)_2$ [124] [78°] Long white needles (from alcohol), decomposed by heating with potash or aniline, naphthalene being set free (Willgerodt, *B* 11, 603) — $C_{10}H_6C_6H_5(NO_2)_2$ [162°] White needles, deposited from a mixture

of the alcoholic solutions of naphthalene and tri nitro benzene (Hepp, *A* 215, 377) — $C_{10}H_7Cl(NO_2)_3$ [96°] Flat canary-yellow needles (Liebemann a Palm, *B* 8, 378) — $C_{10}H_7C_2H_4Me(NO_2)_2$ [61°] Formed by mixing naphthalene and di-nitro-toluene dissolved in benzene (Hepp) — $C_{10}H_7C_2H_4Me(NO_2)_3$ [98°] Formed from (a) tri nitro toluene and naphthalene in alcoholic solution (Hepp) Needles — $C_{10}H_7C_2H_4Me(NO_2)_2$ [100°] Formed from (8)-tri nitro toluene and naphthalene Yellowish needles (from alcohol) — $C_{10}H_7C_2H_4Me(NO_2)_3$ [89°] Formed from (7) tri-nitro-toluene (H) — $C_{10}H_7C_2H_4(NO_2)_3NH_2$ [169°] Orange prisms $C_{10}H_7C_2H_4(NO_2)_3OH$ Yellow needles (Gruner, *Z* 1868, 218) — $C_{10}H_7C_2H_4(NO_2)_3OH$ [73°] Formed from (8)-tri nitro phenol and naphthalene (Henriques, *A* 215, 332) *V* e s o l alcohol — $C_{10}H_7C_2H_4(NO_2)_3OH$ [100°] Formed from naphthalene and (7) tri nitro phenol (Henriques) Golden needles (from alcohol), s l s o l alcohol — $C_{10}H_7C_2H_4Me(NO_2)_3OH$ [106°] From naphthalene and tri nitro *m*-cresol (Nöling a Collin, *B* 17, 271) Yellowish needles (from acetone) — $C_{10}H_7C_2H_4Me(NO_2)_3OH$ [127°] From naphthalene and tri nitro *m*-cresol (Nöling a Sals, *B* 15, 1862) — $C_{10}H_7C_2H_4(NO_2)_3S$ [50°] Yellow needles (from benzene) Formed from naphthalene and di nitro thiophene (Rosenberg, *B* 17, 1778)

Picric acid compound

$C_{10}H_7C_2H(NO_2)_3OH$ [149°] Golden yellow monoclinic needles, s o l alcohol, ether, and benzene Slowly separated into its components by boiling water

Naphthalene dichloride $C_{10}H_7Cl_2$ Formed by passing chlorine over naphthalene $KClO_3$ and HCl may also be used (E Fischer, *B* 11, 735, 1411) Oil, miscible with ether, m s o l alcohol Begins slowly to decompose at 40°–50° into HCl and chloro naphthalene Alcoholic potash also converts it into chloro naphthalene Sodium or sodium amalgam at 150° converts it into naphthalene

Naphthalene tetrachloride $C_{10}H_4Cl_4$ Mol w 270 [182°] R_D 105 35 in a 2 39 p c chloroform solution (kanonnikoff) Formed by passing a rapid current of chlorine over naphthalene until the product, after having become liquid, thickens again, when it is washed with ether and crystallised from benzene Formed also by treating naphthalene with a saturated solution of chlorine in $CHCl_3$ (Grimaux, *B* 5, 222, Schwarzer, *B* 10, 379), by chlorinating naphthalene in direct sunlight (Leeds a Everhart, *A* *C* *J* 2, 203), and by the action of $KClO_3$ and HCl on naphthalene (Fischer, *B* 11, 735) Large monoclinic prisms, insol water, s l s o l alcohol, m s o l ether, v s o l benzene and petroleum Sublimes at 225°–230° Decomposed on distillation into HCl and (a) and (8) di chloro naphthalenes (Krafft a Becker, *B* 9, 1088) Alcoholic potash forms (a) and some (i) di-chloro naphthalene reconverted into naphthalene on digesting with iron (Zinn, *B* 4, 288) Boiling dilute $AgNO_3$ slowly converts it into $C_{10}H_7(ClO)$ [196°] When boiled with water it yields $C_{10}H_7Cl(OH)$, which crystallises in prisms (from ether) [156°], S 3 3 at 100°, and is decomposed on distillation with HCl into water, HCl , and chloro-naphthol Zn and H_2SO_4 re-

duce it to (a) naphthol It gives rise to $C_{10}H_7Cl_2(OAc)$, [131°] and $C_{10}H_7Cl_2(OBz)$, [150°]

The existence of an isomeric naphthalene tetra-chloride [118°] has been denied by Atterberg (*B* 11, 1223, cf Fischer, *B* 11, 735)

Naphthalene tri chloro bromide $C_{10}H_4Cl_3Br$ Formed from the tetrachloride and bromine; after 48 hours the product is washed with warm alcohol and crystallised from ether Prisms

Naphthalene dihydride $C_{10}H_8$ [15 5°] (212°) VD 4 7 (calc 4 56) Occurs in heavy coal tar oil (Berthelot, *B* [2] 9, 288) Formed by heating naphthalene with conc $HIAq$ for a short time at 280° (Berthelot), and by reducing naphthalene dissolved in isoamyl alcohol with sodium (Bamberger a Lodter, *B* 20, 3073) Naphthalene dihydride is formed by distilling the bromide of naphthalene tetra hydride, or by heating it with alcoholic KOH (Graebe a Guye, *B* 16, 3032) It is likewise obtained by the action of sodium on an alcoholic solution of the nitrile of naphthoic acid (Bamberger a Lodter, *B* 20, 1704) and, as a by product, when (8) naphthylamine dissolved in isoamyl alcohol is reduced with sodium (Bamberger a Muller, *B* 21, 859)

Properties —Tables Does not combine with picric acid By treatment with bromine dissolved in chloroform it is converted into the dibromide $C_{10}H_6Br_2$, which crystallises in thick colourless prisms, v s o l alcohol and ether, and gives off HBr on heating (*B* a *L*)

Naphthalene dihydride $C_{10}H_8$ (200°) Formed by distilling the dihydride of naphthoic acid with soda lime (von Pechmann, *B* 16, 517) Liquid

Naphthalene tetrahydride $C_{10}H_{12}$ *see* $C_6H_5 \begin{matrix} < CH_2 & CH_2 \\ & CH & CH \end{matrix}$ (205°) at 716 mm SG 1 2

978 Formed by heating naphthalene with $HIAq$ at 280° (Berthelot), with PH_4I at 180° (Baeyer, *A* 155, 276), or by adding sodium to its solution in isoamyl alcohol (Bamberger a Kitschelt, *B* 23, 1561) Formed also by suspending the tetrahydride of (a) naphthyl hydrazine (1 pt) in boiling water and allowing a solution of cupric sulphate (2 pts) to drop in slowly, nitrogen is evolved, and the naphthalene tetrahydride may be separated from ppd cuprous oxide by steam distillation (Bamberger a Bordt, *B* 22, 631) Prepared by heating naphthalene (10 pts) with HI (9 pts) and amorphous phosphorus (3 pts) for 8 hours at 220°–225°, the yield is good (8 pts) (Graebe a Guye, *B* 16, 3028, cf Graebe, *B* 5, 678)

Properties —Oil, slowly turning brown in air Smells like naphthalene Its solution in chloroform absorbs bromine, giving off HBr It immediately decolorises an acid solution of $KMnO_4$, and is oxidised to $C_{10}H_7(CO_2H)CH_2CH_2CO_2H$ (Bamberger) The compound obtained by Baeyer and by Graebe yielded phthalic acid on oxidation by $KMnO_4$, and may perhaps not be identical with Bamberger's tetrahydride When passed through a red hot tube it is resolved into naphthalene and hydrogen

Naphthalene hexahydride $C_{10}H_{14}$ *Hexahydronaphthalene* (200°) (*G* a *G*), (205° at 764 mm) (*A*) SG 9 419 CE (0°–26 3°) 000817 (Lossen a Zander, *A* 225, 112) R_D 71 15 (Nasini a Bernheimer, *G* 15, 93) S V.

1712 (Lossen, *A* 254, 53) Formed by heating naphthalene with conc HIAq and phosphorus (Wieden a Znatovitch, *B* 9, 278, 1606, *A* 187, 164) Prepared by heating naphthalene (67 pts) with HI (100 pts) and amorphous phosphorus (30 pts) for 10 hours at 240°–250° (Graebe a Guye, *B* 16, 3031), or by heating naphthalene (10 g), amorphous phosphorus (3 g), and HIAq (9 g, boiling at 127°) at 235° for 7½ hours (Agrestini, *G* 12, 495) Liquid, which absorbs oxygen from the air Does not combine with picric acid Reacts with bromine, giving off HBr, and forming a product which is converted by alcoholic potash into $C_{10}H_7Br$ (270°)

Naphthalene octohydrate $C_{10}H_8 \cdot 8H_2O$ (185°–190°) SG $\frac{1}{2}$ 910, $\frac{1}{2}$ 892 Formed by heating naphthalene (5 g) with HIAq (9 g of SG 17) and red phosphorus for 15 hours at 260° (Guye, *Bn* 2, 138) Liquid, smelling like oil of turpentine Absorbs oxygen from the air

Naphthalene Peri-dicarboxylic acid $C_{10}H_6O_4$, *ie* $C_{10}H_4(CO_2H)_2$ [11] *Naphthalic acid* Mol w 216 [266°]

Formation—1 By oxidising acenaphthene with $K_2Cr_2O_7$ and H_2SO_4 or HOAc (Behr a Dorp, *B* 6, 862, *A* 172, 266, Anselm, *B* 22, 869) —2 By oxidising pyrene ketone with $KMnO_4$ (Bamberger a Philip, *B* 19, 3040) —3 By saponification of its semi nitrile $C_{10}H_5Cy CO_2H$ which is formed by the action of cuprous cyanide upon diazotised *peri* amido naphthoic acid (Bamberger a Philip, *B* 20, 248) —4 By oxidising di-*exo*-oxy-acenaphthene with alkaline $KMnO_4$ (Ewan a Cohen, *C J* 55, 580)

Properties—Long silky hair like needles (from alcohol), almost insol water, sl sol ether Split up into water and its anhydride by heating alone at 145°, by boiling with HOAc, or even by exposure over H_2SO_4 (Blumenthal, *B* 7, 1092) Distillation with lime yields naphthalene Yields a fluorescein on heating with resorcin

Salts— $(NH_4)A \cdot EtOH$ Plates (from slcohol)— Na_2A — $K_2A \cdot EtOH$ Plates— BaA aq sparingly soluble white silvery plates— CaA aq— Al_2A aq

Di-methyl ether Me_2A [103°]

Anhydride $C_{10}H_4 \cdot \begin{smallmatrix} CO \\ \diagup \diagdown \\ O \end{smallmatrix}$ [266°]

Needles (from alcohol), sl sol alcohol and benzene Not attacked by boiling HNO_3

Imide $C_{10}H_4 \cdot \begin{smallmatrix} CO \\ \diagup \diagdown \\ CO \end{smallmatrix} NH$ [above 280°]

Formed by boiling the acid or its anhydride with aqueous ammonia White needles Sol warm KOHAq When $AgNO_3$ is added to its solution in alcoholic NH_3 , there is formed a crystalline pp $Ag_2C_{10}H_4N_3O_4$

Naphthalene dicarboxylic acid $C_{10}H_6(CO_2H)_2$ [255°] Formed by reducing di-oxy naphthalene dicarboxylic acid [162°] with HIAq and amorphous phosphorus (Claus a Meixner, *J pr* [2] 37, 8) Flocculent pp, insol water and ether, sol alcohol Yields naphthalene on distillation with lime— PbA greyish white pp

Naphthalene 'a' dicarboxylic acid $C_{10}H_6(CO_2H)_2$ [22] Obtained by digesting its nitrile with $HClAq$ at 200° (Ebert a Merz, *B* 9, 606) Long needles (from alcohol) Melts far above 300° V sl sol boiling benzene, toluene, and HOAc, m sol boiling alcohol Yields naphthalene on distillation with lime— CaA 44q minute needles, sl sol water— Ag_2A

Nitrile $C_{10}H_4(CN)_2$ [268°] Formed by distilling naphthalene (a) disulphonic acid with potassium cyanide White needles (by sublimation), m sol boiling alcohol

Naphthalene 'β' dicarboxylic acid $C_{10}H_6(CO_2H)_2$ [23] Obtained in the same way as the 'a' isomeride, from naphthalene 'β' disulphonic acid (E a M) Short needles (from alcohol) Melts far above 300° Almost insol boiling benzene, toluene, and HOAc, m sol boiling alcohol— K_2A 44q tufts of needles, v e sol water— CaA 3½q minute needles, almost insol water— Ag_2A

Nitrile $C_{10}H_4(CN)_2$ [297°] Long needles (from HOAc) Almost insol boiling ether, alcohol, and benzene

Naphthalene (γ) dicarboxylic acid $C_{10}H_6(CO_2H)_2$ Obtained from its nitrile, which is formed by distilling with KCy potassium bromo naphthalene sulphonate (obtained by sulphonating (a) bromo naphthalene) (Darmstadter a Wichelhaus, *A* 152, 809, *Z* [2] 5, 571) Small needles, v sol alcohol, insol boiling water— BaA 24q crystalline grains

Nitrile $C_{10}H_4(CN)_2$ [204°] Thin needles, sl sol alcohol and ether

Naphthalene (δ) dicarboxylic acid **Nitrile** $C_{10}H_6(CN)_2$ [236°] Obtained by distilling potassium bromo naphthalene (a) sulphonate with KCy (D a W) Needles, v sol alcohol

Naphthalene (ε) dicarboxylic acid **Nitrile** $C_{10}H_6(CN)_2$ [170°] Obtained by distilling potassium bromo-naphthalene (β) sulphonate with KCy (D a W) Small needles, v sol alcohol

Naphthalene tri-carboxylic acid $C_{10}H_5(CO_2H)_3$ Obtained by quickly heating the tetra carboxylic acid to 200°–250° (Bamberger a Philip, *B* 19, 3037)

Naphthalene tetra carboxylic acid $C_{10}H_4O_8$, *ie* $C_{10}H_4(CO_2H)_4$ [11' 44'] Formed by oxidising pyrene acid with dilute $KMnO_4$ (Bamberger a Philip, *B* 19, 1998, 20, 368, *A* 240, 182) Colourless glistening plates or needles, m sol hot HOAc and water, v sl sol alcohol and benzene Not attacked by HNO_3 , even at 160° Yields naphthalene on distillation with lime— Ba_2A (dried at 130°)— Ag_2A

Anhydride $C_{10}H_4 \cdot \begin{smallmatrix} CO \\ \diagup \diagdown \\ CO \end{smallmatrix} O$ Formed by heating the acid at 150°–170° (Bamberger a Philip, *B* 19, 3037) Needles (from HOAc)

Sublimes above 300° Gives a fluorescein when heated with resorcin

Imide $C_{10}H_6(\text{CO})_2\text{NH}$ Formed by treating the anhydride with NH_4Aq Needles and prisms Sublimes in needles above 270° V sol alcohol, ether, and benzene Aqueous NaOH colours it yellow (forming the Na salt), without dissolving it, on adding acids it turns white again

Naphthalene dihydride dicarboxylic acid $C_{10}H_8(\text{CO}_2\text{H})_2$ *Dihydronaphthalic acid* Formed by reducing naphthalic acid with sodium amalgam (Anselm, B 22, 859) Colourless crystalline solid, v sol warm alcohol, sl sol ether and water Reduces alkaline KMnO_4 It turns yellow at 150°–160°, froths at 199°, and changes to the anhydride, but is not melted at 275°

Naphthalene tetrahydride dicarboxylic acid $C_{10}H_8(\text{CH}_2\text{CH}(\text{CO}_2\text{H}))_2$ [199°] When an alcoholic solution of ethane tetra carboxylic ether $C_8H_4(\text{CO}_2\text{Et})_4$ (1 mol) and NaOEt (2 mols) is heated at 130° with di ω bromo α xylene $C_8H_4(\text{CH}_2\text{Br})_2$ (1 mol) there is formed naphthalene tetrahydride tetracarboxylic ether $C_{10}H_8(\text{CH}_2\text{C}(\text{CO}_2\text{Et}))_2$, and when this is saponified with alcoholic potash it loses CO_2 (2 mols) yielding the dicarboxylic acid The yield is 70 p c of the theoretical (Breyer & Perkin, B 17, 448, C J 53, 11) Minute tables, sl sol cold, m sol hot, water, v sol chloroform, alcoh, ether, and acetone Splits up at its melting point into H_2O and its anhydride On passing through a red-hot tube it yields naphthalene— $\text{Ag}_2\text{A}''$ white crystalline pp which yields the anhydride and naphthalene on dry distillation

Anhydride $C_{10}H_6(\text{CH}(\text{CH}_2\text{CO}))_2\text{O}$ [184°]

Four sided prisms (from ether) or needles (by sublimation), sl sol ether, m sol alcohol and chloroform, insol cold water Slowly reconverted into the acid by hot water

Naphthalene tetra hydride tetra carboxylic acid $C_{10}H_8(\text{CH}_2\text{C}(\text{CO}_2\text{H}))_2$ *Tetrahydro naphthalene tetracarboxylic acid* The ether is formed by heating an alcoholic solution of sodium chloro malonic ether $\text{CNaCl}(\text{CO}_2\text{Et})_2$ (2 mols) with α xylene bromide (1 mol), reducing the resulting $C_8H_4(\text{CH}_2\text{CCl}(\text{CO}_2\text{Et}))_2$ by means of zinc dust and HOAc to α xylene di malonic ether $C_8H_4(\text{CH}_2\text{CH}(\text{CO}_2\text{Et}))_2$, and treating the sodium derivative $C_8H_4(\text{CH}_2\text{CNa}(\text{CO}_2\text{Et}))_2$ with an ethereal solution of iodine (Baeyer & Perkin, jun, B 17, 448) The ether may also be obtained from $C_8H_4(\text{CH}_2\text{Br})_2$, sodium ethylate and $C_2H_5(\text{CO}_2\text{Et})_2$ (*v supra*) The free acid, which may be obtained by careful saponification of the ether with alcoholic potash, is a syrup which splits up at 185° into CO_2 and the dicarboxylic acid described above

NAPHTHALENE DI-OXIM v *Di-oxim* of NAPHTHOQUINONE.

NAPHTHALENE - DIPHENYL AZAMMONIUM HYDRATE v AZAMMONIUM COMPOUNDS

NAPHTHALENE PHOSPHINIC ACID $C_{10}H_7\text{P}(\text{OH})_2$ *Naphthyl phosphorous acid* [126°] SG 1377 (Schroder, B 12, 564) Formed by the action of water on its chloride Aggregates of small needles, sl sol cold water, almost insol HClAq Melts under water Reduces silver solution It is accompanied by an acid $(C_{10}H_7)_2\text{PO OH}$ [204°] which is insol water.

Chloride $C_{10}H_7\text{PCl}_2$ (above 360°) Formed by heating mercuric dinaphthyl $\text{Hg}(\text{C}_{10}\text{H}_7)_2$ with PCl_3 at 190° for several hours (Kelbe, B 9, 1051, 11, 1499) Liquid Combines with chlorine forming $C_{10}H_7\text{PCl}_4$

NAPHTHALENE PHOSPHONIC ACID $C_{10}H_7\text{PO}(\text{OH})_2$ [190°] SG 1440 Formed by the action of water on its tetrachloride (Kelbe) Long needles, v sol hot, sl sol cold, water When strongly heated it decomposes, with separation of carbon, into naphthalene and metaphosphoric acid— $\text{Ag}_2\text{A}''$ white pp

Chloride $C_{10}H_7\text{PCl}_4$ Formed from the compound $C_{10}H_7\text{PCl}_2$ and chlorine

NAPHTHALENE-STYRENE v NAPHTHYL ETHYLNE

NAPHTHALENE (a) SULPHINIC ACID $C_{10}H_7\text{SOH}$ Formed by digesting a solution of the chloride of naphthalene (a) sulphonic acid in ether with sodium amalgam (Gessner, B 9, 1500, cf Otto & Moraes, B 6, 860) White scales, v sol water, sl sol HClAq , m sol alcohol, sl sol ether Decomposed by HClAq at 180° into naphthalene and SO_2

Salts— KA' aq glistening scales — BA' 1' aq Slender needles S 5 at 14°, 2 at 100° — PBA' aq long branched needles — AGA' Soluble plates, not decomposed at 200°

Naphthalene (b)-sulphinic acid $C_{10}H_7\text{SO}_2\text{H}$ [105°] Formed in the same way as the preceding isomeride from naphthalene (b) sulphonic acid, and ppd by adding HCl to a solution of the Na salt as a white crystalline powder, m sol alcohol, ether, and water, almost insol HClAq Readily decomposed by HClAq at 150° into naphthalene and SO

Salts— KA' aq scales — BA' , glistening needles S 47 at 15°, 625 at 100° — CAa' 3aq white crystalline solid, v sol water and alcohol — MgA' 6aq scale, more sol alcohol than water

References—BROMO and CHLORO NAPHTHALENE SULPHONIC ACID

NAPHTHALENE (a) SULPHONIC ACID $C_{10}H_7\text{SO}_3\text{H}$ Formed, together with the (b)-isomeride, by dissolving naphthalene in H_2SO_4 At 160°–170° the chief product is the (b) acid, but at 80°–100° the product consists mainly of the (a) acid (Merz & Weith, B 3, 195, cf Faraday, P 7, 104, Berzelius, P 44, 377, Liebig & Wohler, P 24, 169, A 37, 197) Naphthalene is converted by $\text{Cl SO}_3\text{H}$ (1 mol) into a mixture of the (a) and (b) sulphonic acids (Armstrong, C J 24, 173) It may be separated from the (b) isomeride by means of the calcium or lead salts Crystalline and deliquescent, v e sol water, sol alcohol, sl sol ether Partially converted into the (b) isomeride by heating with H_2SO_4 at 100°, more completely at higher temperatures Decomposed into naphthalene and H_2SO_4 by heating with HClAq at 200° Oxidised by KMnO_4 in acid solution to phthalic acid (Beil-

stein & Kurbatoff, *C C* 1881, 359, *A* 202, 216) Alkaline KMnO_4 yields $\text{C}_6\text{H}_4(\text{CO}_2\text{H})\text{CO}_2\text{H}$ (Henriques, *B* 31, 1607) and phthalic acid. Bromine forms dibromo naphthalene and bromonaphthalene sulphonic acid

Salts— $\text{KA}'_2\text{aq}$ Plates (from alcohol) *S* 77 at 11° — $\text{CaA}'_2\text{aq}$ Plates (slowly decomposed at 80°) *S* 6 at 11° — $\text{BaA}'_2\text{aq}$ Plates *S* 115 at 10° (*M*), 113 at 15° , 476 at 100° (Regnault, *J pr* 12, 99)— $\text{PbA}'_2\text{aq}$ Plates *S* 37 at 10° — $\text{Pb}_2\text{OA}'_2$ — AgA' *S* 103 at 10°

Ethyl ether EtA' Formed by boiling the chloride (1 mol) with alcohol (2 mols) (Kimberly, *A* 114, 133) Viscid liquid, which slowly solidifies Insol water, miscible with alcohol and ether Decomposed on distillation, giving off SO_2 and naphthalene Aqueous or alcoholic potash merely saponifies it Water at 150° resolves it into alcohol, naphthalene, and H_2SO_4 Converted by PCl_5 at 160° into (a) chloro naphthalene and SOCl_2 (Carius, *A* 114, 145)

Chloride $\text{C}_{10}\text{H}_7\text{SO}_2\text{Cl}$ [66°] Glistening plates (from ether), v sol ether, CS_2 , and benzene (Maikopar, *Z* 1869, 710, Kimberly, *A* 114, 129) On passing chlorine into a solution in CS_2 , there is formed the tetrachloride $\text{C}_{10}\text{H}_6\text{Cl}_4\text{SO}_2\text{Cl}$, a thick liquid, sol CS_2 , chloroform, benzene, and ether, and converted by alcoholic potash into di chloro naphthalene sulphonic chloride (Widmann, *B* 12, 2228)

Amide $\text{C}_{10}\text{H}_7\text{SO}_2\text{NH}_2$ [150°] Prepared by warming the chloride with conc NH_4Aq Sol water, v sol alcohol and ether Its alcoholic solution gives with AgNO_3 a crystalline pp $\text{C}_{10}\text{H}_7\text{SO}_2\text{NHAg}$, v sol alcohol and ether, quickly blackening in light

Benzoyl derivative of the amide $\text{C}_{10}\text{H}_7\text{SO}_2\text{NHBz}$ [195°] Formed by heating the amide with BzCl (Kimberly) Minute four sided prisms (from alcohol) (Wolkoff, *Z* 1871, 422, *B* 5, 142) Insol water, m sol alcohol and ether Decomposed by boiling KOHaq into benzoic acid, NH_3 , and naphthalene sulphonic acid PCl_5 converts it into $\text{C}_{10}\text{H}_6\text{SO}_2\text{NCOClC}_6\text{H}_5$, which crystallises from ether in large four sided plates [94°] and is re converted by boiling water or alcohol into $\text{C}_{10}\text{H}_7\text{SO}_2\text{NHCOC}_6\text{H}_5$, and by ammonium carbonate into crystalline $\text{C}_{10}\text{H}_7\text{SO}_2\text{NC}(\text{NH}_2)_2\text{C}_6\text{H}_5$ Behaves like an acid, decomposing carbonates, and forming the salts— $\text{C}_{10}\text{H}_7\text{SO}_2\text{NKBz}$ prisms, v sol water and alcohol— $\text{CaA}'_2\text{aq}$ needles— BaA'_2 slender needles, sl sol water— AgA' minute needles

Anilide $\text{C}_{10}\text{H}_7\text{SO}_2\text{NHPH}$ [112°] Needles (Carleson, *Bl* [2] 27, 360)

(a) *Naphthalene* $\text{C}_{10}\text{H}_7\text{SO}_2\text{NHC}_6\text{H}_5$, [82°] Small needles (*C*)

Naphthalene (β)-sulphonic acid $\text{C}_{10}\text{H}_7\text{SO}_3\text{H}$ Produced by the action of H_2SO_4 upon phenyl (a) naphthyl ketone, the isomeric change resulting from the heat evolved in the reaction (Elbs & Steinike, *B* 19, 1966) Prepared by heating naphthalene (500 g) with H_2SO_4 (400 g) for 8 hours at 160° and purifying the acid by means of the Ca salt (Merz & Weith, *B* 3, 196) Non-deliquescent crystals Not decomposed by dilute HClAq at 200° Split up into naphthalene and H_2SO_4 by distilling with dilute H_2SO_4 at 135° in a current of superheated steam (Armstrong & Miller, *C J* 45, 148) Oxidised by alkaline KMnO_4 to $\text{C}_6\text{H}_4(\text{CO}_2\text{H})\text{CO}_2\text{H}$

(Henriques, *B* 21, 1607) KMnO_4 in neutral or acid solution yields phthalic acid (Beilstein & Kurbatoff, *C C* 1881, 359, *A* 202, 216) CrO_3 and dilute H_2SO_4 yield naphthoquinone sulphonic acid (*B* & *K*) The Ca salt yields phthalic acid on oxidation by CrO_3 Bromine water forms bromo naphthalene sulphonic acid

Salts— $\text{KA}'_2\text{aq}$ Plates (from water) or needles (from dilute alcohol) *S* 66 at 10° *S* (85 p.c. alcohol) 9— CaA'_2 Plates *S* 13 at 10° — $\text{BaA}'_2\text{aq}$ Plates *S* 345 at 10° — $\text{PbA}'_2\text{aq}$ Scales *S* 9 at 10°

Chloride $\text{C}_{10}\text{H}_7\text{SO}_3\text{Cl}$ [76°] Plates, less soluble in ether than the (a) isomeride (Maikopar) Reduced by HI to (β) di naphthyl disulphide [139°] (Cleve, *B* 21, 1100) Combines with chlorine (dissolved in CS_2) forming a tetrachloride $\text{C}_{10}\text{H}_6\text{Cl}_4\text{SO}_3\text{Cl}$, which separates from chloroform in colourless cubes [131°], v sol chloroform, CS_2 , and hot HOAc , insol water (Widmann, *B* 12, 959) The tetrachloride is converted by boiling alcoholic KOH into di chloro naphthalene (β) sulphonic acid

Amide $\text{C}_{10}\text{H}_7\text{SO}_3\text{NH}_2$ [212°] (Cleve, *Bl* [2] 25, 258) Small thin plates (from alcohol), sl sol water and ether

Ethylamide $\text{C}_{10}\text{H}_7\text{SO}_3\text{NHEt}$ [82.5°] (Carleson, *Bl* [2] 27, 360)

Anilide $\text{C}_{10}\text{H}_7\text{SO}_3\text{NHPH}$ [132°] Needles (a) *Naphthalene* $\text{C}_{10}\text{H}_7\text{SO}_3\text{NHC}_6\text{H}_5$ [177.5°] Needles

Naphthalene tetrahydride sulphonic acid $\text{C}_{10}\text{H}_8\text{SO}_3\text{H}$ Formed by heating naphthalene tetrahydride with H_2SO_4 for 3 hours at 40° (Graebe & Guye, *B* 16, 3030, Bamberger & Kirschelt, *B* 23, 1565) Crystals, v sol water and alcohol Decomposed by distillation with dilute H_2SO_4 and a current of superheated steam at 175° , or by dilute H_3PO_4 at 130° (Friedel & Crafts, *Bl* [2] 42, 66, *C R* 109, 95)— $\text{NaA}'_2\text{aq}$ Tables, v sol water— $\text{BaA}'_2\text{aq}$ Tables, sol hot alcohol, sl sol cold water

Naphthalene 'a'-disulphonic acid

$\text{C}_{10}\text{H}_6(\text{SO}_3\text{H})_2$ [22] Formed, together with about an equal quantity of the (β) isomeride and some of the (δ) isomeride, by heating naphthalene (1 pt) with H_2SO_4 (5 pts) for 4 hours at 160° (Ebert & Merz, *B* 9, 592, Armstrong, *B* 15, 204, cf Berzelius, *A Ch* [2] 65, 290, Laurent, *Compt Chim* 1849, 390) The acids may be partially separated by their Ca salts, that of the (β) acid crystallising out first, while that of the (a) acid is the most soluble The potassium salt of the (a) acid is more soluble than that of the (β) acid, and less soluble than that of the (δ) acid Long, very deliquescent needles, sl sol conc HClAq Gives di oxy naphthalene [186°] on fusion with KOH (cf Gress, *B* 13, 1959, Dusat, *C R* 64, 859, Darmstadter & Wichelhaus, *A* 152, 306) Water at 200° splits it up into naphthalene and H_2SO_4 Fusion with NaOH forms (β) naphthol (δ) sulphonic acid $\text{C}_{10}\text{H}_6(\text{OH})\text{SO}_3\text{H}$ (Weniger, *B* 20, 2906) PBr_3 forms (β)-di-bromo naphthalene Yields di-chloro-naphthalene [114°]

Salts— $\text{KA}'_2\text{aq}$ Transparent needles (from hot saturated solutions). *S* (of KA') 71 at 18° — $\text{NaA}'_2\text{aq}$ Glistening needles *S* (of NaA') 45.5 at 18° — $\text{CaA}'_2\text{aq}$ *S* 16 at 18° — $\text{CaA}'_2\text{aq}$ (from a rapidly-cooled hot saturated

solution) —BaA''2aq Long, broad needles S 12 at 19° —PbA''2aq Long needles, sol water

Chloride $C_{10}H_7(SO_2Cl)_2$ [158°] (E a M), [162°] (A) Obtained by heating the K salt with PCl_5 at 140° Plates (from benzene), or needles (from ether) S (benzene) 18.3 at 14°

Amide $C_{10}H_7(SO_2NH_2)_2$ [243°] Needles, m sol hot NH_4Aq and alcohol

Naphthalene β' -disulphonic acid

$C_{10}H_6(SO_3H)_2$ [231°] Almost the sole product obtained by heating a mixture of naphthalene (1 pt) and H_2SO_4 (5 pts) for 24 hours at 180° (Ebert a Merz) Formed also from its 'a'-isomeride by prolonged heating with H_2SO_4 at 180° Somewhat deliquescent plates Gives (β) naphthol 'β'-sulphonic acid and (β) di-oxy-naphthalene on fusion with potash Yields $C_{10}H_7Cl$ [135°]

Salts —NaA''aq aggregates of minute prisms S (of NaA'') 12 at 19° —K₂A'' Bushy groups of needles S 5.2 at 18° —CaA''aq S 6.2 at 18° When once dry this salt dissolves in water with great difficulty —BaA''aq —PbA''aq

Chloride $C_{10}H_6(SO_2Cl)_2$ [226°] S (benzene) 45 at 14° Tufts of small needles or thin plates, v sl sol $HOAc$ (difference from the (α)-isomeride), v sol benzene

Amide $C_{10}H_6(SO_2NH_2)_2$ Small needles, v sl sol NH_4Aq , almost insol alcohol, ether, benzene, and toluene Not melted at 305°

Naphthalene (γ) disulphonic acid

$C_{10}H_6(SO_3H)_2$ [14°] Formed by treating naphthalene (1 mol) with $ClSO_3H$ (2 mols) below 100° and also by sulphonating naphthalene with SO_3 (Armstrong, B 15, 204, Armstrong a Wynne, C J Proc 2, 230, 3, 42) Its Pb, Ca, and Ba salts resemble those of the (β) acid, dissolving very sluggishly in water On fusion with potash it yields di oxy naphthalene [260°] —NaA''2aq —K₂A''2aq plates, less soluble than the corresponding salt of the 'α' acid

Chloride $C_{10}H_6(SO_2Cl)_2$ [184°] Prisms (from benzene) Yields (γ) di chloro naphthalene [107°] on treatment with PCl_5

Naphthalene (δ) disulphonic acid

$C_{10}H_6(SO_3H)_2$ [13°] Also called (γ) Occurs in small quantity in the product of sulphonation of naphthalene by H_2SO_4 at 160° (Armstrong, B 15, 204) Formed by treating potassium naphthalene (β) sulphonate with $ClSO_3H$ (Armstrong a Wynne, C J Proc 2, 230) —BaA''4aq —NaA''7aq Formed also by heating naphthalene (β) sulphonic acid with fuming H_2SO_4 at 100° (Ewer a Pick, G P 45,229 [1887], Armstrong, C J Proc 4, 10) Long needles Gives dioxy naphthalene [135.5°] on fusion with potash Yields $C_{10}H_7Cl_2$ [49°] The potassium salt is more soluble than that of the (α) or (β) acid —K₂A''aq —Na₂A''4aq —BaA''4aq —CaA''4aq —PbA''3aq

Chloride $C_{10}H_6(SO_2Cl)_2$ [125°] Small prisms (from benzene) On treatment with PCl_5 it yields di chloro naphthalene [59°]

Naphthalene (1,2') disulphonic acid Formed from (α) naphthylamine disulphonic acid (Armstrong a Wynne, C J Proc 5, 136) Yields $C_{10}H_7Cl_2$ [62.5°] —K₂A''aq

Chloride [122.5°]

Naphthalene (1, 3) disulphonic acid Obtained from (1', 1, 3) or (2', 4') naphthylamine disulphonic acid by eliminating NH_2 (Armstrong

a Wynne, C J Proc 5, 18, 129) Yields $C_{10}H_7Cl_2$ [61°] —K₂A''2aq —BaA''4aq

Chloride [137°]

Naphthalene hexahydride (α)-di-sulphonic acid $C_{10}H_{12}(SO_3H)_2$ Formed by heating naphthalene hexahydride with H_2SO_4 and SO_3 , and separated from the (β)-isomeride by means of the K salt (Agrestini, G 12, 495) —K₂A'' (dried at 105°) Nodules, sol alcohol

Naphthalene hexahydride (β)-sulphonic acid $C_{10}H_{12}(SO_3H)_2$ Formed as above —K₂A'' 13aq Insol alcohol

Naphthalene trisulphonic acid $C_{10}H_5(SO_3H)_3$ [242°] Formed from naphthalene and $ClSO_3H$ (Wynne, C J Proc 3, 146) Yields $C_{10}H_7Cl_2$ [194°] —Na₂A''6aq

Naphthalene tetra-sulphonic acid

$C_{10}H_4(SO_3H)_4$ Formed by heating naphthalene with H_2SO_4 and P O, for three or four hours at 260° (Stenhofer, B 8, 1486, M 3, 111) Two isomeric acids are formed in the process, and when a solution of their Ba salts is slowly evaporated at 30° to 35° the salt of the acid here described crystallises out in striated prisms Prisms (containing 4aq), v e sol water, sl sol alcohol, insol ether Decomposes above 170°

Salts —K₂A''2aq non deliquescent needles —Na₂A''2aq (at 100°) —Na₂A''10aq very deliquescent prisms —Ba₂A''2aq prisms —Pb₂A''6aq crystalline pp —Cu₂A''12aq blue prisms —Ag₂A''24aq very soluble needles

References —Bromo, Chloro, Iodo- and Nitro NAPHTHALENE SULPHONIC ACIDS

NAPHTHAL-FLUORESCIN $C_{20}H_{14}O_8$..

$O < \begin{matrix} C_6H_4(OH) \\ C_6H_4(OH) \end{matrix} > C < \begin{matrix} O \\ O \end{matrix} > CO$ [308°] Formed by heating naphthalic anhydride and resorcin at 250° (Terrisse, A 227, 136) Yellow rhombic prisms Its alkaline solution is red, with splendid green fluorescence

Acetyl derivative $C_{20}H_{14}AcO_8$ [191°]

$C_{20}H_{14}AcO_8$ [120°] Needles (from acetone) Insol alkalis, but saponified slowly By treatment with PCl_5 it is converted into the chloride $C_{20}H_{14}O_8Cl_2$, which crystallises in scales, sol chloroform, acetone, or glacial acetic acid, hardly sol benzene, ether, or alcohol

Naphthal eosin $C_{20}H_{14}Br_2O_8$ [above 310°]

Formed by adding bromine to an alcoholic solution of naphthal fluorescein Its alkaline solutions are orange, with yellow fluorescence, and dye silk scarlet

NAPHTHALIN v NAPHTHALENE

(β) **NAPHTHAMIDINE** $C_{10}H_9N$, C(NH) NH_2

White crystalline mass, obtained from its hydrochloride, which is prepared by the action of alcoholic NH_3 at 50° to 60° upon (β) naphthamido ether $C_{10}H_9N$, C(NH) OEt (Pinner a Klein, B 11, 1486) —B' HCl [226°] Needles

(α) **NAPHTHAMIDOXIM** $C_{11}H_{10}N_2O$.. $C_{10}H_9N$, C(NOH) NH_2 [149°] Obtained by mixing the nitrile of (α) naphthosic acid with hydroxylamine hydrochloride, Na_2CO_3 , and alcohol (Ekstrand, B 20, 223) Plates (from dilute alcohol), v sol alcohol, insol ligroin On boil-

The following are the physical properties of some of the members examined

	S.C. $\frac{16-18}{4}$	μ_a	μ_p	μ_v	μ_D	R _z
Decanaphthene .	7808	1 43066	1 43863	1 4427	1 433	77 2
Endecanaphthene .	8019	1 43883	1 4466	1 45156	1 441	84 2
Dodecanaphthene .	812	1 4438	1 45173	1 45646	1 44606	91 8
Tetradecanaphthene .	8215	1 44913	1 45706	1 4619	1 4514	107 1
Pentadecanaphthene .	8290	1 4544	1 46136	1 4661	1 4544	114 7

The naphthenes are obtained from the following fractions of Caucasian petroleum

	Boiling point
Octonaphthene $C_{18}H_{18}$	116–120°
Nonaphthene $C_{19}H_{18}$	135°–140°
Decanaphthene $C_{20}H_{18}$	152°–167°
Endecanaphthene $C_{21}H_{18}$	180°–185°
Dodecanaphthene $C_{22}H_{18}$	196°–197°
Tetradecanaphthene $C_{24}H_{18}$	240–241°
Pentadecanaphthene $C_{25}H_{18}$	246°–248°

(Markownikoff & Oglobine, *A Ch* [6] 2, 446)

Some of these hydrocarbons (e.g. octonaphthene and nonaphthene) occur in two isomeric forms. Octonaphthene on treatment with H_2SO_4 and HNO_3 yields tri nitro *m* xylene, and it is therefore probably *m* xylene hexahydride (Markownikoff & Spady, *B* 20, 1851). Nonaphthene (136°), S.G. 0.7667 is identical with pseudo cumene hexahydride, for it yields some tri nitro ψ cumene on nitration and ψ cumene sulphonic acid with excess of H_2SO_4 (Kononoff, *C C* 1887, 1133, *J R* 22, 4, 118). Heptanaphthene $C_{17}H_{14}$, also occurs in Caucasian petroleum and boils at 101° (Milkovskiy, *Bl* [2] 45, 182).

Hexanaphthene carboxylic acid $C_{16}H_{14}CO_2H$ *Hexahydro benzoic acid?* (216°) S.G. 1.84/1.84. 9503. Obtained from the oils of Baku by extracting with caustic soda, and purified by fractional distillation of its methyl ether (A-chau, *B* 23, 867). Thick colourless oil, smelling like valeric acid. Not solid at -10° . Not attacked by bromine in the cold. HNO_3 and $KMnO_4$ act slowly upon it. It slowly expels HCl from $CaCl_2$. Conc. H_2SO_4 dissolves it, and, on warming, decomposes it. Phosphoric acid decomposes it gradually in the cold.

Salts— KA . Very hygroscopic soap like mass, gradually becoming crystalline, v sol water and alcohol— NaA' . Flat hygroscopic prisms— CaA' 4aq. long pointed needles. A saturated solution becomes milky on heating and clear again on cooling— BaA' . Large thin plates, v sol alcohol, m sol water— BaA' , 2aq. Amorphous— CdA' . Pearly plates, sl sol cold water— AgA' . Curdy pp.

Methyl ether MeA' (167°) S.G. 1.84/1.84. 9055. Colourless liquid with sickly odour. **Chloride** $C_{16}H_{13}COCl$ (168°). Slowly decomposed by water.

Amide $C_{16}H_{13}CONH_2$ [123.5°]. Melts under water. Extremely thin pearly plates, m sol water, v sol other solvents.

Anilide $C_{16}H_{13}CONHPh$ [94°]. Long elastic needles.

NAPHTHENYL-AMIDINE v **NAPHTHANIDINE**

NAPHTHIDINE v **DIAMIDO DINAPHTHYL**
NAPHTHIL BENZOIN v **BENZOIN**

(β) NAPHTH IMIDO-ACETATE $C_{12}H_9NO_2$, $\pm C_{10}H_7C(NH)(OAc)$ [152°]. Prepared by boiling naphth imido isobutyl ether with Ac_2O (Pinner & Klein, *B* 11, 1487). White needles.

(β) NAPHTH-IMIDO-ISOBUTYL ETHER $C_{11}H_9NO_2$ $\pm C_{10}H_7C(NH)OC_2H_5$ [38°]. Prepared by the action of gaseous HCl on a solution of (β) naphthonitrile $C_{10}H_7CN$ in isobutyl alcohol (Pinner & Klein, *B* 11, 1487). Long white needles— $BHCl$. Decomposed by heat into isobutyl chloride and the amide of (β) naphthoic acid.

(β)-NAPHTHIMIDO ETHYL ETHER $C_{10}H_7C(NH)OEt$. Hydrochloride $BHCl$. Prepared by leading HCl into an alcoholic solution of the nitrile of (β) naphthoic acid (Pinner & Klein, *B* 11, 1485). Decomposed by heat into $EtCl$ and the amide of (β) naphthoic acid.

(α) NAPHTHINDOLE $C_{12}H_7N$ $\pm C_{10}H_5$ $\begin{smallmatrix} CH \\ \diagup \\ NH \end{smallmatrix} CH$ [175°]. Obtained by distilling its carboxylic acid (Schlieper, *A* 239, 229). Plates (from ligroin), v sol alcohol, ether, and benzene, sl sol hot water. Colours pine wood, in presence of HCl , bluish violet. Its solution in acetic acid gives a red colour with conc. HNO_3 , and a bluish green pp. on boiling with hydrogen peroxide. Its picrate crystallises in needles— $B'HCl$. Colourless pp., got by adding HCl to the solution in $HOAc$.

On boiling an alcoholic solution of (α) naphthindole with zinc dust and HCl there is formed a hydride which yields an oxalate melting at 166°.

(β) Naphthindole $C_{10}H_7$ $\begin{smallmatrix} CH \\ \diagup \\ NH \end{smallmatrix} CH$ (above 360°) at 760 mm, (222° V at 18 mm).

Formation—1. By heating ethylidene (β) naphthyl hydrazine with $ZnCl_2$, the yield being small—2. By heating the (β) naphthyl hydrazide of pyruvic ether with $ZnCl_2$ at 195°, the intermediate body being (β) naphthindole carboxylic acid (Schlieper, *A* 236, 178).

Properties—Yellow oil, v sol alcohol, ether, benzene, and $HOAc$, sl sol ligroin. Yields a picrate, crystallising in dark red needles, and a nitrosamine. Conc. HCl aq. solidifies the oil. It colours pine wood, in presence of HCl , violet. Oxidising agents yield a solid product.

(α) NAPHTHINDOLE CARBOXYLIC ACID $C_{12}H_7NO_2$, $\pm C_{10}H_5$ $\begin{smallmatrix} CH \\ \diagup \\ NH \end{smallmatrix} CO_2H$ [202°].

Formed by the action of boiling alcoholic potash upon its ether, which is obtained by heating the (α) naphthyl hydrazide of pyruvic ether with $ZnCl_2$ (Schlieper, *A* 239, 232). Silvery laminae (from water), v sl sol hot water, v sol alcohol and ether. Decomposes above 210° into CO_2 and (α)-naphthindole.

Ethyl ether EtA' [170°]

(β)-Naphthindole-carboxylic acid $C_{10}H_7NO_2$,
 $C_{10}H_6 < \begin{smallmatrix} CH \\ NH \end{smallmatrix} > CO_2H$ [226°] Obtained by

saponifying its ether, which is formed when the (β)-naphthyl hydrazide of pyruvic ether is heated with $ZnCl_2$ (Sohlhoyer, *A* 236, 181) Colourless plates, insol water, sl sol ether, v sol hot HOAc and alcohol Does not colour pine-wood Bromine gives a yellow pp

(α)-NAPHTHINDOLE SULPHONIC ACID

$C_{10}H_6 < \begin{smallmatrix} NH \\ CH \end{smallmatrix} > CSO_3H$ (?) The sodium salt of

this acid, formed by the action of (α) naphthylamine on the compound of glyoxal with $NaHSO_3$, is converted by mineral acids into (α)-naphthoxindole (Hinsberg, *B* 21, 116)

β -Naphthindole sulphonic acid

$C_{10}H_6 < \begin{smallmatrix} CH \\ NH \end{smallmatrix} > CSO_3H$ or $C_{10}H_6 < \begin{smallmatrix} N \\ CH_2 \end{smallmatrix} > CSO_3H$

The sodium salt of this acid is obtained by the action of (β)-naphthylamine on the compound of glyoxal and $NaHSO_3$ (Hinsberg, *B* 21, 113) it is stable towards alkalis, but converted by mineral acids into (β) naphthoxindole

NAPHTHIONIC ACID *v* (1, 4) NAPHTHYLAMINE SULPHONIC ACID.

NAPHTHISATIN *v* ISATIN

NAPHTHOACRIDINE *v* NAPHTHACRIDINE

NAPHTHOBENZALDOXIM so called, *v* Oxim of NAPHTHOALDEHYDE

NAPHTHOBENZYL ALCOHOL *v* NAPHTHYL AERINOL

NAPHTHOBENZYLAMINE *v* NAPHTHYL AERINYL AMINE

NAPHTHO-CINNAMIC ACID so called, *v* NAPHTHYL ACRYLIC ACID

NAPHTHOCUMARIC ACID *v* Oxy NAPHTHYL-ACRYLIC ACID

NAPHTHOCUMARIN *v* Anhydride of Oxy-NAPHTHYL ACRYLIC ACID

NAPHTHOXYAMIC ACID $C_{10}H_7N_2O_5$ The potassium salt of this acid is prepared by boiling di nitro naphthalene with alcoholic KCy (Muhlhauser, *A* 141, 214) The free acid is a brownish black mass, insol ether, nearly insol water, m sol alcohol —KA' aq Dark mass, with coppery lustre, forming a fine blue solution in hot water and hot alcohol The barium salt is a dark blue pp, and explodes when heated The silver salt is insol water, has a bronze lustre, and explodes violently when heated

NAPHTHO-HYDROQUINONE *v* HYDRO-NAPHTHOQUINONE

(α) NAPHTHOIC ACID $C_{10}H_7O_2$ *vs* $C_{10}H_6CO_2H$ Naphthalene (α) carboxylic acid Mol w 172 [162°] H C *v* 1,232,000 H C p 1,232,600 H F 77,400 (Stohmann, Kleber, a Langbein, *J pr* [2] 40, 137)

Formation —1 By saponifying its nitrile by boiling alcoholic potash (Merz, *Z* [2] 4, 34, 5, 396) or conc HClAq (Hofmann, *B* 1, 89) —2 By heating a mixture of bromo-naphthalene and $Cl CO_2Et$ with sodium amalgam at 110° for several hours, and saponifying the resulting ether with alcoholic potash (Egish, *C R* 69, 360) —3 By fusing potassium naphthalene (α)-sulphonate with sodium formate (V Meyer, *A* 156, 274) —4 By boiling with potash its amide which is formed by the action of $ClCO NH_2$ on

naphthalene in presence of $AlCl_3$ (Gattermann, *A* 244, 56)

Preparation —A mixture of 3 pts of sodium naphthalene (α) sulphonate and 2 pts of potassium ferrocyanide (both quite dry) is distilled from an iron tube, the nitrile is rectified and saponified by heating it with an equal volume of HCl to 200°, the yield is 25 p c of the sulphonate (Boessneck, *B* 16, 639)

Properties —Needles (from dilute alcohol), v sl sol water, m sol hot alcohol Yields naphthalene on distillation with lime, and phthalic acid on oxidation by CrO_3 in HOAc

Salts —BA', 4aq Needles, sl sol water —CaA', 2aq S 1.08 at 15° —AgA'

Ethyl ether EtA' (309° cor)

Chloride $C_{10}H_6COCl$ (297.5°) From the acid (4 pts) and PCl_5 (5 pts) Hydroxylamine converts it into $C_{10}H_6CO NH OH$ [187°] and ($C_{10}H_6CO$), NOH [150°] (Ekstrand, *B* 20, 1358) Reacts with potassium (β) naphthoate, forming ($\alpha\beta$) naphthoic anhydride $C_{10}H_6COOCO C_{10}H_6$ (Hausmann, *B* 9, 1515)

Amide $C_{10}H_6CONH_2$ [202°] Formed from the chloride and NH_3 , or from the nitrile and alcoholic soda (Hofmann, Ekstrand, *J pr* [2] 38, 146) Prepared by passing dry gaseous cyanic acid and HCl into a solution of naphthalene in CS, containing $AlCl_3$ heated on the water bath (Gattermann a Rossolymo, *B* 23, 1197) Colourless monoclinic tables (from alcohol) (Bamberger a Philip, *B* 20, 241)

Anilide $C_{10}H_6CONHPh$ [160°] White silky crystals

(α) Naphthalide $C_{10}H_6CONHC_6H_5$ [244°]

Anhydride ($C_{10}H_6CO$) O [145°] Obtained by distilling calcium naphthoate with naphthyl chloride (Hofmann) Prisms (from boiling benzene)

Nitrile $C_{10}H_6CN$ (α) Cyano naphthalene Mol w 153 [37°] (298° cor) *Formation* —1 By distilling naphthylamine with oxalic acid and heating the resulting formyl derivative of naphthylamine with HClAq (Hofmann, *A* 142 121, *B* 1, 39) —2 By distilling potassium naphthalene (α) sulphonate with KCy (Merz, *Bl* [2] 9, 335, 10, 47) or K_2FeCy_6 (Boessneck, *B* 16, 639, Hausmann, *B* 9, 1514) —3 By passing a mixture of cyanogen and naphthalene through a red hot tube (Merz a Weith, *B* 10, 746) —4 By heating di naphthylthiourea with copper powder (Weith, *B* 6, 967) —5 By heating tri (α) naphthyl phosphate with KCy, the yield being 20 p c of the theoretical (Heim, *B* 16, 1779) —6 By boiling the formyl derivative of (α)-naphthylamine with zinc dust in a current of hydrogen, the yield being 11 p c (Gasiorowski a Merz, *B* 18, 1006) —7 By the action of cuprous cyanide on (α) diazo naphthalene salts (Bamberger a Philip, *B* 20, 257)

Properties —Needles Reduced in alcoholic solution by sodium to the tetrahydride of naphthyl carbonylamine $C_{10}H_{11}CH_2NH_2$ On heating with hydroxylamine it yields $C_{10}H_{11}CONH_2$ and naphthamidoxim [149°]

(β)-Naphthoic acid $C_{10}H_7CO_2H$ *Isonaphthoic acid* [185° cor] (above 300°) H C *v* 1,227,800 H C p 1,228,400 H F 81,600 (Stohmann, Kleber, a Langbein, *J pr* [2] 40, 137)

Formation —1 By saponification of its

nitrile, which is formed by heating potassium naphthalene (β) sulphonate with KCl (Merz a Muhlhauser, *Z* [2] 5, 70) — 2 By boiling (β)-naphthyl naphthalene with conc HNO_3 (Giamocian, *B* 11, 272) — 3 By oxidising (β) naphthoic aldehyde with KMnO_4 (Schulze, *B* 17, 1530)

Properties — Long white needles (from hot water), sl sol hot water, v sol alcohol and ether Yields naphthalene on distillation with baryta Oxidised to phthalic acid by CrO_3 in HOAc

Salts — $\text{NaA}' \frac{1}{2}\text{aq}$ (Vieth, *A* 180, 314) Small tables, v e sol water — $\text{KA}' \frac{1}{2}\text{aq}$ — $\text{BaA}' 4\text{aq}$ — Needles (from hot water) *S* 07 at 15° — $\text{CaA}' 3\text{aq}$ *S* 055 at 15° — $\text{MgA}' 5\text{aq}$ — AgA'

Methyl ether MeA' [77°] (290°) *H.F.* 70,600 (Stohmann, *J pr* [2] 40, 353)

Ethyl ether EtA' (309°)

Chloride $\text{C}_{10}\text{H}_7\text{COCl}$ [43°] (305°) Formed from the acid and PCl_5 (Vieth, cf Grucarevic a Merz, *B* 6, 1242) Hydroxylamine solution at 100° attacks it, forming the compounds $\text{C}_{10}\text{H}_7\text{CO NH OH}$ [168°], and $(\text{C}_{10}\text{H}_7\text{CO})_2\text{NOH}$ [171°] (Ekstrand, *B* 20, 1359) The (β) naphthyl hydroxylamine reacts with (α) naphthoyl chloride forming ($\alpha\beta$) di naphthoyl hydroxylamine [160°] With urea it forms di naphthyl-urea [215°]

Anhydride $(\text{C}_{10}\text{H}_7\text{CO})_2\text{O}$ [134°] Plates composed of needles (Hausmann, *B* 9, 1515)

Amide $\text{C}_{10}\text{H}_7\text{CONH}_2$ [192°] Formed by warming the chloride with powdered ammonium carbonate Formed also by heating the nitrile with alcoholic potash (Leone, *G* 14, 120) Plates

Anilide $\text{C}_{10}\text{H}_7\text{CONHPh}$ [170°] Small plates (from benzene)

***p* Toluide** $\text{C}_{10}\text{H}_7\text{CO NHC}_6\text{H}_5$ [191°] Silky needles

(α) **Naphthalide** $\text{C}_{10}\text{H}_7\text{CO NH C}_{10}\text{H}_7$ [157°] Very small needles, sl sol ether

Nitrile $\text{C}_{10}\text{H}_7\text{CN}$ [66.5°] (305° col) Formed by reactions like those used for preparing its (α) isomeride (*v supra*) White mass, nearly insol water, v sol alcohol and ether When its alcoholic solution is saturated with HCl there is formed the hydrochloride of naphthimido ethyl ether (*q v*) (Pinner a Lohmann, *B* 11, 1485) By exhaustive chlorination with SbCl_5 it yields per chloro-benzene (Merz a Weith, *B* 16, 2887)

References — AMIDO-, BROMO, BROMO NITRO, CHLORO, CHLORO NITRO-, NITRO-, OXY, and GHIU, NAPHTHOIC ACIDS, and AMIDO-, and BROMO-AMIDO NAPHTHOIC ANHYDRIDE

(α) **NAPHTHOIC ACID TETRAHYDRIDE** $\text{C}_{10}\text{H}_{11}\text{CO}_2\text{H}$ [128°] Formed, together with the amide, by heating its nitrile with alcoholic pot ash for 5 or 6 hours at 165° (Bamberger a Bordt, *B* 23, 629) Slender dendritic prisms, v sol alcohol, sl sol cold water — CuA'_2 bluish green pp — PbA'_2 needles grouped in stars — AgA' flaky pp

Amide $\text{C}_{10}\text{H}_{11}\text{CONH}_2$ [162°] Flat needles, v sol boiling water

Nitrile $\text{C}_{10}\text{H}_{11}\text{CN}$ (278°) at 721 mm Formed from (α)-naphthylamine tetrahydride by Sandmeyer's reaction, and purified by steam-distillation

(α) **NAPHTHOIC ALDEHYDE** $\text{C}_{10}\text{H}_7\text{CHO}$ • *Naphthobenzaldehyde* Mol w 156 (292° cor)

Formed from naphthyl carbinol by oxidation with chromic acid mixture (Bamberger a Loder, *B* 21, 258) Pale yellow viscid liquid, with faint aromatic odour Conc HNO_3 at -5° yields a nitro-derivative [136°] It forms with NaHSO_3 a compound crystallising in glistering leaflets The phenyl hydrazide [185°] forms yellow leaflets, which turn red on exposure to light Aniline forms $\text{C}_{10}\text{H}_7\text{CH NPh}$ [71°], *o* toluidine yields $\text{C}_{10}\text{H}_7\text{CH NC}_6\text{H}_3$ [59°], *p* toluidine produces $\text{C}_{10}\text{H}_7\text{CH NC}_6\text{H}_4$ [93°], and (α)-naphthylamine $\text{C}_{10}\text{H}_7\text{CH NC}_6\text{H}_4$ [117°]

Oxim $\text{C}_{10}\text{H}_7\text{CH NOH}$ • *Naphthobenzald-oxim* [98°] Colourless needles (from alcohol), sl sol water (Brandes, *B* 22, 2151)

(β)-**Naphthoic aldehyde** $\text{C}_{10}\text{H}_6\text{CHO}$ [61°] Formed by distilling a mixture of calcium (β) naphthoate and calcium formate at a high temperature (Battershall, *Z* [2] 7, 292, 673, *A* 168, 116) Formed also by heating ω chloro (β) methyl-naphthalene ($\text{C}_{10}\text{H}_7\text{CH}_2\text{Cl}$) with lead nitrate (Schulze, *B* 17, 1530), and by oxidising (β)-naphthyl carbinol (Bamberger a Brekmann, *B* 20, 1118) Silvery plates, volatile with steam Reduces ammoniacal AgNO_3 , Alcoholic NH_3 converts it into the hydramide ($\text{C}_{10}\text{H}_7\text{CH}_2\text{N}_2$) [146°–150°]

(α)-**NAPHTHOL** $\text{C}_{10}\text{H}_7\text{OH}$ Mol w 144, [94°] (279°) *SG* 4 1224 (Schroder, *B* 12, 1613) *R₂₀* 76 97 in an 86 p c alcoholic solution (Kanonnikoff, *J pr* [2] 31 348), 75 25 (Nasini a Bernheimer, *G* 14, 153) Occurs in anthracene oil obtained from coal tar (K E Schulze, *A* 227, 150)

Formation — 1 By the action of nitrous acid on (α) naphthylamine (Griess, *J* 1866, 460) 2 From naphthalene (α) sulphonic acid by pot ash fusion (Eller, *A* 152, 275) — 3 By heating γ phenyl isocrotic acid $\text{CHPh CH CH}_2\text{CO}_2\text{H}$ at its boiling point for 5 or 10 minutes, water being eliminated (Fittig a Erdmann, *B* 16, 43, *A* 227, 242)

Preparation — By heating naphthalene (1 pt) with H_2SO_4 (2 pts) at 60° to 70° , and fusing the sodium salt of the (α) sulphonic acid formed with three times its weight of NaOH

Properties — Short trimetric prisms (Léger, *C R* 111, 110), sl sol hot water, v sol alcohol, ether, and benzene Volatile with steam Pine wood, moistened with an aqueous solution of (α) naphthol, and then with HClAq , turns green in sunlight, and finally reddish brown Bleaching powder gives, in a solution of (α)-naphthol, a dark violet colour, and ultimately violet flakes, which are turned brown by heating, but are decolourised by ammonia FeCl_3 gives a milky pp, soon becoming violet flakes of (α)-dinaphthol (α) Naphthol is a powerful antiseptic, more powerful in this respect than (β)-naphthol, although less poisonous (Maximovitch, *C R* 106, 366)

Reactions — 1 On boiling in the air, or on heating in sealed tubes at 350° – 400° , it yields dinaphthylene oxide ($\text{C}_{10}\text{H}_6\text{O}$) (Merz a Weith, *B* 14, 196) — 2 Heated to 270° for 8 hours with four times its weight of ammoniacal CaCl_2 (damp) at yields about 74 p c of (α) naphthylamine If ammoniacal ZnCl_2 is used instead of CaCl_2 , the product is 60 p c of ($\alpha\alpha$) dinaphthylamine (Benz, *B* 16, 14, cf Merz a Weith, *B* 14, 2844). — 3 Aniline and CaCl_2 yield, on heat-

ing, a little phenyl naphthyl-amine (M a W) — 4 *Ammonium acetate* at 270° yields the acetyl derivative of (a)-naphthylamine (Calm, B 15, 615) — 5 *Ammonium formate* at 250° yields CO and (a) naphthylamine — 6 When (a) naphthol (2 pts) is heated with anhydrous oxalic acid (1 pt) and conc H_2SO_4 (1 pt) at 130°, there is formed a compound $\text{C}_{10}\text{H}_8\text{O}_2$, crystallising from chloroform in pale rose coloured leaflets, insol alcohol and ether, converted by potash fusion into the acid $\text{C}_{10}\text{H}_6\text{O}_4$ (crystallising in golden green tables), and yielding the halogen derivatives $\text{C}_{10}\text{H}_5\text{Cl}_2\text{O}$ and $\text{C}_{10}\text{H}_4\text{Br}_2\text{O}$, both of which crystallise in the monoclinic system (Hong, M 1 251) — 7 Boiling with KClO_4 and HCl yields di chloro naphthoquinone (Wichelhaus, A 152, 801) — 8 *Chlorine*, acting on (a) naphthol dissolved in HOAc , forms $\text{C}_{10}\text{H}_7\text{Cl}_2\text{OH}$ [108°] and $\text{C}_6\text{H}_5\text{C}(\text{CO CCl})\text{CH}$ [121°] When the liquid is

kept cold the product is $\text{C}_6\text{H}_5\text{C}(\text{CO CCl})\text{CH}$ [157°] (Zincke a Kegel, B 21, 1030, 1044) — 8 PCl_5 at 100° forms di naphthyl phosphate At 150° it yields (a) chloronaphthalene (Oehler, B 15, 312) — 9 Conc HClAq at 200° yields di naphthyl oxide — 10 *Aluminium* and *iodine* yield aluminium (a)-naphthol (Gladstone a Tribe, G 41, 16) On distillation of this body there is formed a dinaphthyl [189°] — 11 *Iodine* and *potash* yield a dark-violet compound (Messinger a Fortmann, B 22, 2322) — 12 Somewhat more readily oxidised by KMnO_4 than (b) naphthol (Dreyfus, C R 105, 523) — 13 H_2SO_4 yields mono and di-sulphonic acids In presence of HOAc it also forms oxy naphthyl methyl ketone 14 HCl , acting on a mixture of (a) naphthol and aldehyde below 0° forms $\text{CH}_3\text{CH}(\text{C}_{10}\text{H}_7\text{OH})_2$ (Claus a Trauer, B 19, 3004) — 15 *Di-chloro ether* $\text{C}_6\text{H}_5\text{Cl}_2\text{OEt}$ yields amorphous $\text{C}_{10}\text{H}_8\text{O}_2$ or $\text{C}_6\text{H}_5(\text{C}_{10}\text{H}_7\text{OH})_2$ (Wischneus, A 243, 165) — 16 *Benzoic aldehyde* yields $\text{C}_6\text{H}_5\text{CH}(\text{C}_{10}\text{H}_7\text{OH})_2$ which turns brown in air (Claisen, B 19, 3316) 17 When boiled with *phthalic anhydride* it yields naphthol phthalate $\text{C}_{10}\text{H}_7\text{O}_4$ (Grabowski, B 4, 661, 725, 6, 1065) — 18 *Pyromellitic anhydride* (1 mol), heated with (a)-naphthol (4 mols), at 300° yields the compounds $\text{C}_{10}\text{H}_8\text{O}_6$ and $\text{C}_{10}\text{H}_6\text{O}_8$ [265°] When the two bodies are heated together in other proportions at 250° there are formed the compounds $\text{C}_{10}\text{H}_8\text{O}_6$, $\text{C}_{10}\text{H}_{12}\text{O}_7$, and $\text{C}_{10}\text{H}_{16}\text{O}_8$ (Grabowski) — 19 *Maleic anhydride* and ZnCl_2 at 160° forms $\text{C}_{10}\text{H}_8\text{O}_4$ and an acid $\text{CO}_2\text{HCHCHCO}_2\text{H}$, $\text{C}_{10}\text{H}_7\text{OH}$ [90°] (Burekhardt, B 18, 2868) — 20 *Benzotrifluoride* at 100° forms $\{\text{C}_6\text{H}_5\text{C}(\text{C}_{10}\text{H}_7\text{OH})_2\}_2\text{O}$, a reddish-brown powder, insol water, sol alcohol and ether (Doebner, A 257, 58)

Picric acid compound
 $\text{C}_{10}\text{H}_7\text{OC}_6\text{H}_2(\text{NO}_2)_3\text{OH}$ [190°] Orange needles (Marchetti, G 12, 503)

Compound with camphor
 $\text{C}_{10}\text{H}_7\text{OC}_6\text{H}_{10}\text{O}$ SG Δ 1 0327 $[\alpha]_D = -10.5^\circ$ Syrupy liquid, not solid at -16° Not sensibly decomposed by water (Léger, C R 111, 110)

Acetyl derivative $\text{C}_{10}\text{H}_7\text{OAc}$ [49°] Formed by heating (a) naphthol with AcCl (Schaeffer, B 2, 131) Formed also by heating (a) naphthol with HOAc at 200° (Graebe, A 209, 151), or with Ac_2O and NaOAc (Tassinari, G 10, 471) Large crystals, sol alcohol and ether

Split up into (a) naphthol and acetic acid by distillation with steam On oxidation with CrO_3 in cold HOAc it yields *c oxy phthalic acid*, and three compounds melting at 114°, 119°, and 121° respectively (Miller, B 14, 1601)

Benzoyl derivative $\text{C}_{10}\text{H}_7\text{OBz}$ [56°] Crystals, v sol ether (Maikopar, Z 1869, 216)

Methyl ether $\text{C}_{10}\text{H}_7\text{OMe}$ (270°) (V), (258°) (S), (266°) (M), (265°) (H), (269°) (V) (N a B) SG Δ 1 0974 (S), Δ 1 0964 (Nasim, G 15, 84) Prepared by the action of MeCl on sodium (a) naphthol (Vincent, Bl [2] 40, 106) or of MeI (60 g), KOH (25 g), and MeOH on (a) naphthol (60 g) (Staedel, A 217, 42) Formed also by heating (a) naphthylamine with methyl alcohol and ZnCl_2 at 200° (Hantzsch, B 13, 1347), and by heating MeOH with (a) naphthol and HCl (Manchetti, G 9, 545) Prepared by boiling (a) naphthol for several hours with MeOH and ZnCl_2 (Green, *priv com*) Liquid, smelling like orange blossom, sol alcohol, ether, and benzene With HNO_3 it gives a tri-nitro derivative [128°] With picric acid it forms a compound crystallising in red needles, decomposed by alcohol

Ethyl ether $\text{C}_{10}\text{H}_7\text{OEt}$ (281° cor) Formed from (a) naphthol, KOH , and EtI in alcoholic solution (Schaeffer, A 152, 286), or from (a) naphthol (25 g), MeOH (25 g), and H_2SO_4 (10 g) at 125° (Gattermann, A 244, 72) Heavy oil Converted by HNO_3 into a tri nitro derivative $\text{C}_{10}\text{H}_4(\text{NO}_2)_3\text{OEt}$ [148°] (Strädel, B 14, 899)

Propyl ether $\text{C}_{10}\text{H}_7\text{OC}_3\text{H}_7$ (299° cor) SG Δ 1 0447 (Nasim a Bernheimer, G 15, 84)

Ethylene ether $(\text{C}_{10}\text{H}_7\text{O})\text{CH}_2$ [126°] Plates (from alcohol) (Koelle, B 13, 190b)

(a) *Naphthyl ether v Di naphthyl oxide*
Nitroso derivatives v Oxim of (a) and (b) naphthoquinone

(b) *Naphthol* $\text{C}_{10}\text{H}_7\text{OH}$ Mol w 144 [123°] (286°) SG Δ 1 217 (Schroder, B 12, 161) n_D^{20} 76.43 in an 11.18 p.c alcoholic solution (Kanonnikoff, J pr [2] 31, 348) S 02, S (20 p.c alcohol) 2 (Bouchard, C R 105, 702) Occurs in coal tar (K Schulze, A 227, 150). Formed by the action of nitrous acid on (b)-naphthylamine (Liebermann, A 183, 268) Prepared by fusing sodium naphthalene (b) sulphinate (1 pt) with NaOH (2 pts) at 300° (Schaeffer, A 152, 282)

Properties — Plates or tables, sol hot water, v sol alcohol, ether, chloroform, and benzene Readily sublimates May be distilled by superheated steam Powerfully antiseptic (Bouchard, Maximovitch, C R 106, 1441) Pine wood dipped in an aqueous solution of (b) naphthol and then in HClAq becomes green on exposure to daylight Bleaching powder colours a solution of (b)-naphthol slightly yellow, but the colour is destroyed by excess of bleaching powder, on adding ammonia and warming, yellowish flakes separate FeCl_3 colours its solution slightly green, and, after a time, causes deposition of white flakes (of dinaphthol), which become brown on heating Its solution in NaOHaq yields with mercuric chloride a pp $(\text{C}_{10}\text{H}_7\text{O})_2\text{HgHgCl}_2.4\text{aq}$ (Pouchet, C R 106, 276). It may be estimated by adding standard iodine

solution to its solution in warm aqueous NaOH (Messinger & Vortmann, *B* 23, 2754)

Reactions —1 Alkaline potassium permanganate oxidises it to α -carboxy cinnamic acid $\text{CO}_2\text{H}\cdot\text{C}_6\text{H}_4\cdot\text{CH}=\text{CH}\cdot\text{CO}_2\text{H}$ [184°], and an acid $\text{C}_{10}\text{H}_7\text{O}_4$ [281°] which forms the salts $\text{BaA}'\cdot 7\text{aq}$ and AgA' , an ether EtA' [123°] and a dihydride $\text{C}_{10}\text{H}_7\text{O}$ [224°] (Ehrlich & Benedikt, *M* 9, 527, 10, 115) When (8) naphthol is boiled with P_2O_5 , or even by itself in presence of air, it forms di (8) naphthylene oxide —2 The dry distillation of calcium (8) naphthylate $\text{Ca}(\text{OC}_{10}\text{H}_7)_2$ yields di (8) naphthylene oxide, naphthalene, (8) naphthol, and a compound $\text{C}_{10}\text{H}_7\text{O}$ (?) [300°–305°] (Niederhäusern, *B* 15, 1122) —3 Zinc chloride forms, on heating, isodinnaphthylene oxide —4 Chloride of sulphur in presence of CS_2 , or benzene forms $(\text{HO}\cdot\text{C}_{10}\text{H}_7)\cdot\text{S}$ and $(\text{HO}\cdot\text{C}_{10}\text{H}_7)_2\cdot\text{S}_2$ (Tassinari, *G* 17, 94, Onufiovitch, *B* 23, 3356) —5 Boiling with sulphur and caustic soda solution forms $(\text{HO}\cdot\text{C}_{10}\text{H}_7)_2\cdot\text{S}_2$ [210°] and a compound melting at 170° (Lange, *B* 21, 260) —6 By heating (8) naphthol (150 g) with aluminium (10 g) as long as hydrogen comes off there is formed a mixture of (8) naphthol and aluminium (8)-naphthylate which when distilled yields di (8)-naphthyl oxide (Gladstone & Tribe, *C J* 41, 15) —7 When heated in sealed tubes with ammonia, NH_4Cl , acetamide, ammonium acetate or ammonium formate, it yields (8) naphthylamine. Heated to 270°–280° for 8 hrs with four times its weight of ammoniacal CaCl_2 (damp) it yields 80 p.c. of (8) naphthylamine and 12 p.c. of (88) dinaphthylamine. If ammoniacal ZnCl_2 is used instead of CaCl_2 , the product is 4 p.c. of (8) naphthylamine and 82 p.c. of (88)-dinaphthylamine (Benz, *B* 16, 9) —8 Reacts with nitroso-dimethyl aniline forming (8) naphthol violet $\text{C}_{10}\text{H}_7\text{N}_2\text{O}$ (Meldola, *C J* 39, 37), which is converted by heat into 'cyanamine', a blue colouring matter $\text{C}_8\text{H}_7\text{N}_2\text{O}_2$ (Witt, *B* 23, 2247) —9 Di-chloro quinonimide $\text{C}_8\text{H}_4(\text{NCl})_2$ forms a red colouring matter $\text{HN}\cdot\text{C}_8\text{H}_7\cdot\text{N}$ which forms a blue solution in conc. H_2SO_4 (Nietzki & Otto, *B* 21, 1714) The free base is a yellow pp., v. sol. alcohol and ether, and is converted by heat into a greenish blue colouring matter, greatly resembling 'cyanamine' (*v. supra*) —10 Nitrogen iodide forms iodo (8) naphthol, a substance melting at 223°, and an amorphous body (Willgerodt, *J pr* [2] 37, 446) —11 Di-chloro di-ethyl oxide $\text{CH}_3\text{CH}_2\text{CHCl}\cdot\text{OEt}$ yields $\text{C}_{12}\text{H}_{17}\text{ClO}$ [174°] crystallising in plates, insol. water, sol. alcohol and HOAc (Wislicenus, *A* 243, 169) —12 When chlorine is passed into a solution of (8) naphthol in HOAc and the product is treated with an excess of SnCl_2 there is obtained $1/2[\text{C}_{10}\text{H}_7\text{Cl}\cdot\text{OH}]$ [71°] (Zincke, *B* 21, 3284) This chloro-(8) naphthol when dissolved in HOAc or chloroform and treated with chlorine yields $\text{C}_8\text{H}_7\cdot\text{C}(\text{Cl})_2\cdot\text{CO}$ (Zincke, *B* 21, 3540) When (8) naphthol dissolved in HOAc is treated with excess of chlorine there is formed the compound $\text{C}_8\text{H}_7\cdot\text{C}(\text{Cl})_2\cdot\text{CO}$ crystallising in plates [103°] or needles [102°] and converted by Na_2CO_3 into chloro-(8) naphthoquinone [172°] (Zincke, *B* 21, 3550) When chlorine is passed into a well-cooled 10 p.c. solution of (8)-naphthol, there is

formed $\text{C}_8\text{H}_7\cdot\text{C}(\text{Cl})_2\cdot\text{CO}$ which crystallises from hot alcohol in thick yellow needles [96°] (Z) —13 Chloroform in presence of a small quantity of aqueous NaOH forms on boiling crystalline $\text{C}_{12}\text{H}_{11}\text{O}_2$ or $\text{C}_{10}\text{H}_7\cdot\text{C}(\text{OH})_2\cdot\text{C}(\text{OH})_2$, its anhydride $\text{C}_{12}\text{H}_{11}\text{O}_2$, an aldehyde $\text{C}_{10}\text{H}_7(\text{OH})\cdot\text{CHO}$, an alcohol $\text{C}_8\text{H}_7\text{O}$, and resins (Ioussseau, *C R* 94, 133, 95, 30, 232) —14 An acetic acid solution of aldehyde slowly reacts in the cold forming the di (8) naphthyl ether of acetic orthoaldehyde $\text{CH}_3\cdot\text{CH}(\text{OC}_6\text{H}_7)_2$ [201°] (Claisen, *B* 19, 3318) —15 A few drops of HCl added to a cold solution of benzoic aldehyde and (8) naphthol in HOAc forms $\text{C}_8\text{H}_7\cdot\text{CH}(\text{OC}_6\text{H}_7)_2$ [205°] converted by heating with HOAc and hydrochloric acid solution into $\text{C}_8\text{H}_7\cdot\text{CH}(\text{C}_6\text{H}_5)_2\cdot\text{O}$ [190°] (Claisen, *B* 19, 3316) On adding H_2SO_4 (2 pts) to a solution of benzoic aldehyde (3 pts) and (8) naphthol (6 pts) in alcohol (3 pts) there is formed $\text{C}_8\text{H}_7\text{O}_2$ [191°] uncr., a crystalline substance, not affected by boiling Ac_2O , and converted by fuming HNO_3 into $\text{C}_8\text{H}_7(\text{NO})\cdot\text{O}$ (Trzebinski, *B* 17, 499) —16 Benzotrichloride at 100° forms $\{\text{C}_8\text{H}_7\cdot\text{O}\cdot\text{C}_6\text{H}_5\}_2$ which melts above 350° and may be distilled. It crystallises in white needles, insol. water, alcohol, and ether, sol. nitrobenzene (Doebner, *A* 257, 59)

Combinations —With picric acid $\text{C}_{10}\text{H}_7\cdot\text{O}\cdot\text{C}_6\text{H}_3(\text{NO})_3\cdot\text{OH}$ [155°] Orange yellow needles (from alcohol), almost insol. cold water (Machetti, *G* 12, 504) —With aniline $\text{C}_{10}\text{H}_7\cdot\text{OC}_6\text{H}_5\cdot\text{N}$ [82 1/2°] Crystalline powder (from lignol) (Dyson, *C J* 43, 469) —With *p*-toluidine $\text{C}_{10}\text{H}_7\cdot\text{OC}_6\text{H}_4\cdot\text{N}$ [80 1/2°] (D) —Acetyl derivative $\text{C}_{10}\text{H}_7\cdot\text{OAc}$ [70°] (O) Miller, *B* 14, 1602) Small needles —Benzoyl derivative $\text{C}_{10}\text{H}_7\cdot\text{OBz}$ [107°] Nodular groups of needles (Maikopar, *Z* 1869, 216)

Methyl ether $\text{C}_{10}\text{H}_7\cdot\text{O}\cdot\text{Me}$ or $\text{C}_{10}\text{H}_7\cdot\text{OMe}$ [72°] (Staedel, *A* 217, 43), [70 1/2°] (Vincent, *Bl* [2] 40, 106) (274°) (Marchetti, *G* 9 545) Formed from (8) naphthol, KOH, MeOH, and MeI or MeCl. Formed also by boiling (8) naphthol with MeOH and ZnCl_2 . White plates (from alcohol), insol. cold water, v. sol. ether. Volatile with steam. With HNO_3 (S G 15) it gives at 0° a tri nitro derivative [213°]

Ethyl ether $\text{C}_{10}\text{H}_7\cdot\text{OEt}$ [33°] (275°). Formed from (8) naphthol, KOH, and EtI (Schaffer, Liebermann, *B* 15, 1428) Crystalline mass, decomposed in a sealed tube at 310° into ethylene and (8) naphthol (Bamberger, *B* 19, 1819)

Bromo ethyl ether $\text{C}_{10}\text{H}_7\cdot\text{OC}_2\text{H}_4\text{Br}$ [96°] Prepared by the action of ethylene bromide and KOH on (8) naphthol (Koelle, *B* 13, 1954) Colourless plates, sol. alcohol. Alcoholic ammonia at 100° converts it into amorphous $\text{C}_{10}\text{H}_7\cdot\text{O}\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{NH}_2$, while aniline yields crystalline $\text{C}_{10}\text{H}_7\cdot\text{O}\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{NHPH}$ [75°]

Ethylene ether $\text{C}_8\text{H}_7(\text{OC}_2\text{H}_5)_2$ [134°] **Ethylene ether** $\text{C}_8\text{H}_7(\text{OC}_2\text{H}_5)_2$ [217°] S. (benzene) 5 Plates (from benzene), insol. alcohol and ether

Ethylidene ether *v.* ALDEHYDE, vol. I, p. 105

Benzyl ether *v.* BENZYL-NAPHTHYL OXIDE

Naphthylether v Di NAPHTHOL OXIDE**Nitroso- derivative v Oxim of (β)-NAPHTHOQUINONE****References**—AMIDO, AMIDO DI IMIDO-, BROMO-, BROMO-NITRO-, CHLORO, IODO, IODO NITRO, and NITRO- NAPHTHOLS

(α) **Naphthol tetrahydride** $C_{10}H_8O$ $\frac{1}{2}e$
 $CH_3CH_2C \equiv CH$
 $CH_2CH_2C(OH)CH$ *Tetrahydro (α) naphthol* [69°] (265.5°) at 705 mm. Obtained by reducing (α) naphthol in amyl alcoholic solution by sodium. Occurs in the distillate obtained in the preparation of the nitrile of the tetrahydride of (α) naphthoic acid (Bamberger a Bordt, *B* 22, 628, 23, 215). Formed also from the tetrahydride of (α) naphthylamine by the diazo reaction (Bamberger a Althausse, *B* 21, 1892). Silvery white monoclinic tables, smelling like phenol, and turning red in air, sl sol water, v sol alcohol and ether. Bleaching powder gives only yellowish flakes in its boiling aqueous solution (whereas with (α)-naphthol it gives a deep violet colour). $FeCl_3$ gives no colouration.

Ethylether $C_{10}H_{11}OEt$ (259°) at 705 mm. Formed by means of $EtOH$, KOH , and EtI .

(β) **Naphthol tetrahydride** ('aromatic')
 $CH_3CH_2C \equiv CHCOH$ *ar Tetrahydro (β) naphthol* [58°] (275°). Formed by the action of nitrous acid on 'aromatic' (β) naphthylamine tetrahydride (Bamberger a Kitschelt, *B* 23, 884). It is also one of the products of the reduction of (β)-naphthol by sodium (*v infra*). Flat silvery needles, sl sol water, v sol alcohol and ether. Smells like creosote. Not etherified by heating with alcohol and H_2SO_4 at 100°. Not affected by heating with conc H_2SO_4 , hot dilute H_2SO_4 appears to form di naphthyl oxide octohydride $C_{10}H_{11}O$ (Bamberger a Lengfeld, *B* 23, 1129). Bleaching powder added to its aqueous solution forms a white flocculent pp. $FeCl_3$ gives a bluish green colour, and, on warming, a brownish yellow flocculent pp. Chloroform and caustic soda gave a greenish yellow colour. $NaNO_2$ added to its solution in conc H_2SO_4 gives a rose red colour. Forms a wine red compound with diazobenzene sulphonic acid. The sodium salt $C_{10}H_7ONa$ crystallises in silky scales.

(β) **Naphthol tetrahydride** ('alicyclo')
 $CHCHC \equiv CH, CHOH$
 $CHCHC \equiv CH, CH_2$ *ac Tetrahydro-(β) naphthol* (178° at 53 mm.), (264°) at 716 mm. Formed by adding sodium to a boiling solution of (β) naphthol in isoamyl alcohol (Bamberger a Lodter, *B* 23, 204), and separated from the accompanying 'aromatic' isomeride by aqueous $NaOH$, in which it is insoluble (Bamberger a Kitschelt, *B* 23, 885). V sol water, v sol alcohol and ether. On warming with KOH it yields naphthalene dihydride. HI yields an iodide, which readily splits up into HI and naphthalene dihydride. Does not react with diazo compounds.

Benzoyl derivative $C_{10}H_7OBz$ [63°] (255° at 40 mm.) Formed by heating with $HOBz$ at 170° (Bamberger a Lodter, *B* 23, 209). Tables, v e sol warm alcohol and benzene. Split up on distillation into benzoic acid and naphthalene dihydride.

Acetyl derivative $C_{10}H_7OAc$ (169° at 44 mm.) Formed by the action of $HOAc$ at

140°-150°. Decomposed at 268°-280° into $HOAc$ and naphthalene dihydride.

NAPHTHO-LACTONE v Anhydride of Oxy-NAPHTHOIC ACID

NAPHTHOL ALDEHYDE v Oxy NAPHTHOIC ALDEHYDE

NAPHTHOL-AZO- compounds v Azo compounds

DINAPHTHOL v Di Oxy DINAPHTHOL

(α) **NAPHTHOL BLUE** $C_{16}H_{16}NO$ $\frac{1}{2}e$

$NMe_2, C_6H_5N < \begin{smallmatrix} C_6H_5 \\ O \end{smallmatrix} >$ *Indophenol*. Formed by the action of nitroso dimethylaniline on (α) naphthol, and by the action of dibromo (α) naphthol on dimethyl *p* phenylene diamine in alkaline solution (Kochlin, *Bull de Mulh* 52, 532, Witt, *S C I* 1, 255). Obtained also by oxidising a mixture of di methyl *p* phenylene diamine and (α) naphthol or (α) naphthylamine with dilute $K_2Cr_2O_7$ and HCl (Pabst, *Bl* [2] 38, 161, Möhlau, *B* 16, 2851, 18, 2918). Bluish violet crystals, with bronze lustre (from alcohol), insol water. Dissolves in $HClAq$ with yellow colour, being split up into (α) naphthoquinone and dimethyl *p*-phenylene diamine.

NAPHTHOL CARBOXYLIC ACID v Oxy NAPHTHOIC ACID

(α) **NAPHTHOL-GLYCURONIC ACID**

$C_{16}H_{16}O_7$ [203°]. Occurs in urine after taking (α) naphthol (Lesnik a Nencki, *B* 19, 1537). Long needles, v sl sol chloroform. Split up by dilute $HClAq$ into (α) naphthol and glycuronic acid. Its aqueous solution is coloured a transient green by H_2SO_4 .

(β) **Naphthol-glycuronic acid** $C_{16}H_{16}O_7$ [150°] $[α] = -88°$. Occurs in the urine of dogs dosed with (β) naphthol, and can be separated through the insolubility of the lead salt (Lesnik a Nencki, *B* 19, 1534). Needles (containing 2aq), sl sol water, v sl sol chloroform. Conc H_2SO_4 gives an intense green colour. Split up by $HClAq$ into (β) naphthol and glycuronic acid— CaA' , 4aq.

(α) **NAPHTHOL-MALEIN** $C_{14}H_{10}O_4$ $\frac{1}{2}e$
 $CHCHC(C_6H_5OH)_2$ [118°-120°]. Formed,

CO—O together with a compound $C_{14}H_{10}O_4$, by heating (α) naphthol with maleic anhydride and $ZnCl_2$. Violet powder, consisting of microscopic four sided tablets. Dissolves in alcohol to a red solution, which on addition of NH_3 assumes a deep greenish red fluorescence. Sol ether, chloroform, and acetic acid, insol benzene and CS_2 (Burekhardt, *B* 18, 2867).

NAPHTHOL SULPHIDE v Di-Oxy-Di NAPHTHOL SULPHIDE

(1, 2) **NAPHTHOL SULPHONIC ACID**

[1 2] $C_{10}H_7(OH)SO_3H$ (α) *-Naphthol 'a' sulphonic acid* [101°]. Prepared by heating (α)-naphthol (1 pt) with conc H_2SO_4 (2 pts) on a water bath (Schaffer, *A* 152, 293, Claus, *B* 15, 312, Baum, *G P B* 4197 of June 30, 1883, *Monit Scient* 1883, 1122). Long, radiating, very deliquescent needles, v sol water and alcohol. Dissolves in HNO_3 , the solution slowly depositing di-nitro (α)-naphthol. $FeCl_3$ colours its solution deep blue, changing to green on warming, but becoming blue again on cooling. Gives no colour with bleaching powder. PCl_5 (2 mols) at 120° yields chloro-naphthol [57°] and di-chloro naphthalene [94°] (Claus a Oehler, *B* 15, 813).

Salts— CaA'_2 3aq Small laminae, v sol. water— PbA'_2 4aq needles, v sol water— $\text{PbC}_{10}\text{H}_7\text{SO}_3$ (dried at 100°) minute needles

Ethyl derivative $\text{C}_{10}\text{H}_7(\text{OEt})\text{SO}_3\text{H}$ Obtained from the acid by treatment with alcoholic KOH and EtI (Maikopar, *Z* 1870, 306)— $\text{K}'_2\text{A}'_2$ 3aq crystalline powder, sl sol cold water

(1, 3?) Naphthol sulphonic acid $\text{C}_{10}\text{H}_7\text{SO}_3$, i.e. $\text{C}_{10}\text{H}_6(\text{OH})\text{SO}_3\text{H}$ (a)-Naphthol 'B' sulphonic acid [90° uncor] Formed, together with other sulphonic acids by sulphonation of (a) naphthol in acetic acid solution by means of fuming sulphuric acid (80 p.c. SO_3) It is separated from concomitant products by the sparing solubility of its barium or lead salt Deliquescent, long, fine needles Very unstable, being converted into (a) naphthol and H_2SO_4 by boiling its dilute aqueous or alcoholic solutions The sodium salt cannot be converted into the chloride by PCl_5 , but at once yields di chloro (a) naphthol

Salts— NaA' easily soluble white silvery plates— KA' easily soluble needles— BaA'_2 2aq colourless plates, v sl sol cold water— PbA'_2 2aq small plates, v sl sol cold water (Baum, Claus a Knyrin, *B* 18, 2924)

Ethyl derivative $\text{C}_{10}\text{H}_7(\text{OEt})\text{SO}_3\text{H}$ [1 3?] Obtained by heating the ethyl ether of (a) naphthol (7 pts) with H_2SO_4 (5 pts) at 100° (Maikopar)— KA' 2aq large glittering plates, sl sol cold water— BaA'_2 [55°-60°] This acid is perhaps identical with the preceding

(1, 4) Naphthol sulphonic acid

[1 4] $\text{C}_{10}\text{H}_6(\text{OH})\text{SO}_3\text{H}$ [170°] Formed by diazotising the corresponding (a) naphthylamine sulphonic acid and heating the resulting diazo naphthalene sulphonic acid with dilute H_2SO_4 (Neville a Winther, *C J* 37, 632, *Monat Scient* 1884, 39, Erdmann, *A* 247, 341) Plates, v e sol water Converted by dilute HNO_3 into di-nitro (a) naphthol Chromic acid oxidises it to (a) naphthoquinone FeCl_3 colours its solution greenish blue, but on warming the colour becomes red Its sodium salt is v sol 90 p.c. alcohol, from which it crystallises in needles

(1, 1') Naphthol sulphonic acid

[1 1'] $\text{C}_{10}\text{H}_6(\text{OH})\text{SO}_3\text{H}$ [107°] Obtained from the corresponding (a) naphthylamine *peri* sulphonic acid by diazotisation, the product being boiled with water The resulting anhydride (*infra*) is heated with alcoholic ammonia for half an hour at 130° , and the ammonium salt thus obtained converted into lead salt, and thence into the free acid (Erdmann, *A* 247, 346) Deliquescent crystalline mass (containing aq), v e sol water Gives with FeCl_3 a green colour changing to red

Salts— $\text{NH}_4\text{A}'$ v sol water, but not deliquescent— KA' plates— $\text{Na}_2\text{C}_{10}\text{H}_6\text{SO}_3$ 1½aq aggregates of needles— $\text{PbC}_{10}\text{H}_6\text{SO}_3$ 3aq white crystalline powder

Anhydride $\text{C}_{10}\text{H}_6\text{SO}_3 < \text{SO}_2 >$ Naphthosultone [154°] Formed as above Prisms (from benzene), v sl sol CS_2 , sl sol alcohol, v sol chloroform, insol water Boils between 360° and 448° Not attacked by aqueous NH_3 , Na_2CO_3 , or cold NaOH aq Boiling NaOH aq converts it into the corresponding acid

(1, 4') Naphthol sulphonic acid

[1 4'] $\text{C}_{10}\text{H}_6(\text{OH})\text{SO}_3\text{H}$ [110°-120°] Obtained from the corresponding naphthylamine sulphonic acid by diazotising and boiling the product with H_2SO_4 (1 pt) diluted with water (4 pts) (Erdmann, *A* 247, 343) Hygroscopic crystalline substance

(1, 2') Naphthol sulphonic acid Formed by partial hydrolysis of heteronuclear (a) naphthol disulphonic acid (Liebmann a Studer, *E P* 7812 [1887]) Yields azo dyes

(a) Naphthol disulphonic acid (Heteronuclear) $\text{C}_{10}\text{H}_6(\text{OH})(\text{SO}_3\text{H})_2$ Obtained, together with the trisulphonic acid, and probably also the (1, 2, 4) disulphonic acid, by heating (a)-naphthol (1 pt) with H_2SO_4 (containing an additional 20 p.c. of SO_3) (5 pts) for two hours on a water bath (Claus a Mieleke, *B* 19, 1182) Best prepared by heating (a) naphthol (1 pt) with conc H_2SO_4 (3 to 4 pts) at 180° Yields a nitroso compound $\text{C}_{10}\text{H}_6(\text{OH})(\text{NO})(\text{SO}_3\text{H})_2$ (Seltzer, *G P* 20,716, Jan 30, 1882) Combines with diazo compounds On nitration it forms di nitro naphthol sulphonic acid

Chloride $\text{C}_{10}\text{H}_6(\text{OH})(\text{SO}_2\text{Cl})_2$ Liquid, v sol ether Converted by PCl_5 into tri chloro naphthalene [82°]

Ethyl derivative $\text{C}_{10}\text{H}_7(\text{OEt})(\text{SO}_3\text{H})_2$ Formed by sulphonating the ethyl ether of (a) naphthol with fuming H_2SO_4 (10 p.c. additional SO_3) (*G P* D 1501, June 7, 1883) Conc HNO_3 converts it into di nitro naphthol sulphonic acid

(a) Naphthol disulphonic acid (Homonuclear) $\text{C}_{10}\text{H}_6(\text{OH})(\text{SO}_3\text{H})_2$ [1 2 4] Formed by heating (a) naphthol with H_2SO_4 (4 pts) at 70° Differs from the preceding acid in not yielding a nitroso derivative or forming azo dyes (Schultze, *Disertation*, Freiburg, 1883, Bender, *B* 22, 993) It yields di nitro naphthol on nitration

(1, 1', 4) (a) Naphthol disulphonic acid [1 1' 4] $\text{C}_{10}\text{H}_6(\text{OH})(\text{SO}_3\text{H})_2$ (a)-Naphthol (8) sulphonic acid Formed from (a) naphthylamine *peri* sulphonic acid by sulphonation and diazotisation Formed also by sulphonating naphtho sultone (Berntsen, *B* 23, 3088) Readily forms an anhydride— NaA' plates, v sol water FeCl_3 colours its solution deep blue— BaA'

Anhydride $\text{C}_{10}\text{H}_6(\text{SO}_3\text{H})_2 < \text{SO}_2 >$ Salts NaA' 3aq, m sol water Gives no colour with FeCl_3 — BaA'_2 v sol water

Mono amide $\text{C}_{10}\text{H}_6(\text{SO}_3\text{H})(\text{OH})(\text{SO}_2\text{NH}_2)$ From the anhydride and NH_3 — NaA' 2aq Plates

(1, 1', 3) (a) Naphthol disulphonic acid [1 1' 3] $\text{C}_{10}\text{H}_6(\text{OH})(\text{SO}_3\text{H})_2$ (a) Naphthol 'ε' disulphonic acid Formed from (a) naphthylamine 'ε' disulphonic acid by the diazo reaction (Berntsen, *B* 22, 3330, cf Ewer a Pick, *Monat Scient* 1889, 604)— NaA' 6aq prisms, v e sol water Its solution is coloured deep-blue by FeCl_3

Anhydride $\text{C}_{10}\text{H}_6(\text{SO}_3\text{H})_2 < \text{SO}_2 >$ Naphthosultone sulphonic acid Formed by boiling diazonaphthalene 'ε'-disulphonic acid with dilute H_2SO_4 Needles (containing aq)

Mono-amide [1' 3] $\text{C}_{10}\text{H}_6(\text{OH})(\text{SO}_2\text{NH}_2)(\text{SO}_3\text{H})$ Naphthol sulph amide sulphonic acid Formed by the action of NH_3 on the anhydride Needles or prisms, m. sol water— NaA' 2aq needles, v. sol hot

water— NH_4NaA aq crystals, v sol water— BaA'_2 5aq crystals, m sol water

(a) **Naphthol trisulphonic acid** $\text{C}_{10}\text{H}_6\text{S}_3\text{O}_{10} \cdot 2\text{e}$ $\text{C}_{10}\text{H}_4(\text{OH})(\text{SO}_3\text{H})_3$ [124'4] Formed by heating (a) naphthol with fuming H_2SO_4 (containing 70 p.c. additional SO_3) at 50° (Seltzer, *G P* 10,786, Dec 1879, Caro, *B* 14, 2028, Claus a Mielcke, *B* 19, 1182) Slender needles Dilute HNO_3 at 50° yields di nitro naphthol sulphonic acid It does not yield azo dyes or a nitroso-derivative— $\text{K}_2\text{C}_{10}\text{H}_3\text{S}_3\text{O}_{10}$, crystals, v sol water (Lauterbach, *B* 14, 2028)

Chloride $\text{C}_{10}\text{H}_4(\text{OH})(\text{SO}_2\text{Cl})_2$ Plates (from chloroform), sl sol either, decomposed by fusion Converted by PCl_5 into tetra chloro naphthalene $\text{C}_{10}\text{H}_2\text{Cl}_4$ [140°] and C_{10}Cl_8

(2, 1')-(β) **Naphthol sulphonic acid** [21'] $\text{C}_{10}\text{H}_7(\text{OH})(\text{SO}_3\text{H})$ (Pfützing a Duisberg, *B* 22, 396, Armstrong a Wynne, *C J Proc* 1889, 60) (β)-Naphthol 'a'-sulphonic acid **Bayer's acid** **Rumpff's acid** Formed, together with the isomeric acid of Schaffer, by stirring (β) naphthol (1 pt) with conc H_2SO_4 (2 pts) at about 50° (Bayer a Co, *G P* 18,027, March 18, 1881) When (β) naphthyl sulphate $\text{C}_{10}\text{H}_7\text{O}_4\text{S}_2$ (obtained by the action of H_2SO_4 on (β) naphthol at a low temperature) is mixed with H_2SO_4 at 20° it slowly changes to (β) naphthol 'a' sulphonic acid The two isomeric acids of Schaffer and of Bayer may be separated by means of their lead salts (that of the former acid crystallising well) or by treating their sodium salts with 90 p.c. spirit, which dissolves the salt of Bayer's acid but not that of Schaffer's acid Formed also from (β) naphthylamine 'a' sulphonic acid (Badische) by diazotising and heating with dilute H_2SO_4 (Forsling, *B* 20, 2102)

Reactions—1 Converted by PCl_5 into chloro-(β) naphthol [101°] and di chloro naphthalene [61°]—2 Potash fusion yields di oxy naphthalene [175°]—3 With diazotised xylidine it yields in concentrated, but not in dilute solutions, crocein scarlet

Salts—Forms two series of salts—neutral and basic— NaA' glistening six sided plates, v sol water, sl sol alcohol— $\text{Na}_2\text{C}_{10}\text{H}_6\text{S}_2\text{O}_7$ needles, v sol alcohol, v sol water— ZnA'_2 2aq needles— PbA'_2 2aq colourless glistening rhombohedra— $\text{C}_{10}\text{H}_6\text{S}_2\text{O}_7\text{Pb}_2$ small yellow crystals— $\text{C}_{10}\text{H}_6\text{S}_2\text{O}_7(\text{PbOH})_2$ red crystals (Claus a Volz, *B* 18, 3154)

(2, 3') **Naphthol sulphonic acid**
[23'] $\text{C}_{10}\text{H}_7(\text{OH})(\text{SO}_3\text{H})$ (β) Naphthol ' β '-sulphonic acid **Schäffer's acid** [125°]

Formation—1 By heating (β) naphthol (1 pt) with conc H_2SO_4 (2 pts) on a water bath (Schaffer, *A* 152, 296, Armstrong a Graham, *C J* 39, 135)—2 By fusing naphthalene (β) disulphonic acid with potash (Ebert a Merz, *B* 9, 610, 10, 592)—3 From (β) naphthylamine sulphonic acid (Brönner's) by the diazo reaction

Properties—Small, non deliquescent laminae, v sol water and alcohol FeCl_3 turns its solution slightly green and, on warming, brown flakes are deposited Bleaching powder gives a yellow colour

Reactions—1 Potash-fusion yields di oxy-naphthalene [213°]—2 Nitrous acid forms a nitroso-derivative—3 Bromine water gives mono- and di bromo derivatives The K salt

dissolved in HOAc gives with Br yellow plates of $\text{C}_{10}\text{H}_6\text{BrSO}_4\text{K}$, which form a blood red aqueous solution—4 Conc HClAq at 200° – 210° splits it up into (β) naphthol and H_2SO_4 —5 The potassium salt (1 mol) heated with PCl_5 (2 mols) at 100° forms gelatinous anhydro naphthol sulphonic acid $\text{C}_{10}\text{H}_4(\text{OH})\text{SO}_2\text{O}\text{C}_{10}\text{H}_6\text{SO}_3\text{H}$, sol water, alcohol, and ether The K salt of this acid crystallises in colourless plates, and is decomposed by boiling alkalis with reproduction of (β) naphthol sulphonic acid (Claus a Zimmernann, *B* 14, 1481) The K salt (1 mol) heated with PCl_5 (2 mols) at 150° forms $(\text{SO}_3\text{H}\text{C}_{10}\text{H}_6\text{O}\text{SO}_2\text{C}_{10}\text{H}_6)_2\text{O}$, an amorphous mass yielding a gelatinous potassium salt KA'' (C a Z) The (β) naphthol sulphonic acid heated with PCl_5 also yields chloro (β) naphthol, and finally γ di chloro naphthalene [135°], both of which bodies yield chloro phthalic acid [148°] on oxidation (Claus a Dehne, *B* 15, 319)

Salts— KA' 2aq S 2 at 15° — $\text{NH}_4\text{A}'$ S 3 at 24° Flat prisms or plates (Meldole, *C J* 39, 41)— CaA'_2 5aq silky laminae, v sol water and alcohol, decomposing at 100° — BaA' 6aq narrow prisms (from boiling saturated solution)— PbA' 6aq small silvery laminae, v sol water

Ethyl derivative $\text{C}_{10}\text{H}_7(\text{OEt})(\text{SO}_3\text{H})$ From the (? impure) acid, KOH, and EtI (Maikopar, *Z* 1870, 366)— KA' needles, sl sol cold water

(β) **Naphthol (γ) sulphonic acid**
[24'] $\text{C}_{10}\text{H}_6(\text{OH})(\text{SO}_3\text{H})$ Formed from the corresponding (β) naphthylamine sulphonic acid by the diazo reaction (Reverdin a Nolting, *Const de la Naphthalme*) Yields di oxy naphthalene [135°] and di chloro naphthalene [48°] (Claus, *J pr* [2] 39, 315)

(2, 2') (β) **Naphthol sulphonic acid**
[22'] $\text{C}_{10}\text{H}_6(\text{OH})_2\text{SO}_3\text{H}$ (β) Naphthol ' β ' sulphonic acid **Naphthol sulphonic acid F** [89°] Formed from (β) naphthylamine ' β ' sulphonic acid by the diazo reaction (Bayer a Duisberg, *B* 20, 1431) Formed also, together with Schaffer's acid, by heating (β) naphthol (100 g) with H_2SO_4 (70 g) for 2 or 3 hours at 105° (Green, *B* 22, 723, cf Armstrong, *B* 15, 22) It is also a product of the fusion of naphthalene 'a' disulphonic acid with NaOH at 250° (Weinberg, *B* 20, 2907) Needles (containing aq), v sol water and alcohol, insol ether (W) PCl_5 (3 pts) at 165° gives di chloro naphthalene [114°], the chief product being a chloro naphthyl phosphate [215°] On fusion with potash it yields $\text{C}_{10}\text{H}_6(\text{OH})_2$ [186°] Nitrous yields a nitroso-derivative, forming the salt $\text{C}_{10}\text{H}_6(\text{NO})(\text{OH})\text{SO}_3\text{Na}$ 2aq crystallising in golden needles

Salts— NaA' 23aq S 8 at 15° Plates— Ka' aq crystals, v sol water— MgA'_2 53aq plates— BaA' , prisms, sl sol water

(β) **Naphthol sulphonic acid** **Ethyl derivative** $\text{C}_{10}\text{H}_6(\text{OEt})_2\text{SO}_3\text{H}$ Formed by warming the ethyl ether of (β) naphthol with H_2SO_4 (Maikopar, *Z* 1870, 366)— KA' aq needles, sl sol cold water— BaA'_2 needles, v sl sol water

(β) **Naphthol sulphonic acid** **Ethyl derivative** $\text{C}_{10}\text{H}_6(\text{OEt})_2\text{SO}_3\text{H}$ Two acids of this formula are obtained by treating the ethyl derivative of (β) naphthol with ClSO_3H (Amphlett a Armstrong, *C J Proc* 3, 144) The Ba salt of one acid is insol water, that of the other is sol water One of the acids is doubtless identical with the preceding acid

(2, 1' 3') Naphthol disulphonic acid [2 1' 3'] $C_{10}H_7(OH)(SO_3H)_2$ (β) Naphthol 'β'-disulphonic acid (β) Naphthol-G-disulphonic acid Formed, together with the 'R' isomeride, by heating (β)-naphthol (1 pt) with conc or fuming H_2SO_4 (2 or 3 pts) at 100°–110°, and separated from its isomeride through the greater solubility of its Ba salt (Gress, B 13, 1956)

Properties —Glistening needles, v sol water and alcohol With diazo compounds it gives scarlets of a much yellower shade than the (α)-acid PCl_5 (5 mols) at 210° forms di chloro-(β) naphthol [125°] and tri chloro naphthalene [90°], this $C_{10}H_6Cl_3$, when oxidised with CrO_3 , yields a syrupy di chloro phthalic acid and a tri chloro naphthoquinone, whence aniline forms $C_{10}H_6Cl_3(NPhH)O$, melting at 228° (Claus a Schmidt, B 19, 3173)

Salts — Na_2A'' tables or prisms, sol water and dilute alcohol — BaA'' 8aq small prisms, v. sol water

(2, 3, 3') Naphthol disulphonic acid [2 3 3'] $C_{10}H_7(OH)(SO_3H)_2$ (β) Naphthol 'α' disulphonic acid (β) Naphthol R disulphonic acid Formed as described above (Gress) White glistening needles, v sol water and alcohol, insol ether Exhibits a bluish green fluorescence in ammoniacal solution When heated in a closed vessel with ammonia it yields a naphthylamine disulphonic acid which, on removal of NH_3 , gives rise to naphthalene 'α' disulphonic acid of Ebert and Merz (Pfitzinger a Duisberg, B 22, 398)

Salts — Na_2A'' very small soluble needles — BaA'' 6aq needles, sl sol cold water, v sol hot water, insol alcohol

(β) Naphthol-β'-disulphonic acid [2 2' 3'] $C_{10}H_7(OH)(SO_3H)_2$ Formed by sulphonating (2, 2') naphthol sulphonic acid (Weinberg, B 20, 2911) Solutions of its salts exhibit green fluorescence — Na_2A'' yellowish powder, v e sol water, sl sol 80 p c alcohol — BaA'' 2½aq prisms S 56 in boiling water

(β) Naphthol-γ'-disulphonic acid $C_{10}H_7(OH)(SO_3H)_2$ Formed by the action of $ClSO_3H$ on (β) naphthol (Armstrong, B 15, 204) The Ba salt crystallises in large prisms

(β) Naphthol trisulphonic acid $C_{10}H_7(OH)(SO_3H)_3$ Formed by heating (β)-naphthol (1 pt) with H_2SO_4 (2 pts) at 70°–80°, adding H_2SO_4 (2 pts) and heating at 120°, finally adding fuming H_2SO_4 (40 p c additional SO_3) (2 pts) and heating at 150° (Levinstein, B 16, 462) Gives no colour with diazotised xylidine

References —AMIDO-, and NITRO-NAPHTHOL SULPHONIC ACIDS

(β) NAPHTHOL VIOLET $C_{10}H_7N_2O$ Mel-dola's blue Formed from nitroso-dimethyl aniline and (β) naphthol Dark flocculent powder, forming a red solution in benzene (Mel-dola, C J 89, 38)

Hydrochloride $B'HCl \cdot a$.

$ClMe_3N \cdot C_6H_5 \cdot \begin{smallmatrix} \diagup O \\ \diagdown \end{smallmatrix} C_{10}H_7$ Bronzed needles, resembling $KMnO_4$ Sol water and alcohol Its aqueous solution is violet, but turned blue by H_2SO_4 Reduces to a leuco base by taking up H_2 . Converted by heat into a blue colouring matter $NMe_2 \cdot C_6H_5 \cdot N \begin{smallmatrix} \diagup O \\ \diagdown \end{smallmatrix} C_{10}H_7 \cdot N \begin{smallmatrix} \diagup O \\ \diagdown \end{smallmatrix} C_6H_5$ (Witt, B.

23, 2247)

Vol. III

NAPHTHOL-YELLOW s v DINITRO (α)-NAPHTHOL SULPHONIC ACID

NAPHTHONITRILE v Nitrile of NAPHTHOIC ACID

NAPHTHOPHTHALIC ACID A name for NAPHTHALENE DICARBOXYLIC ACID

NAPHTHO-OXY-QUINALDINE v OXY METYL-NAPHTHOQUINOLINE

NAPHTHOPHENAZINE $C_{10}H_7N$ s e

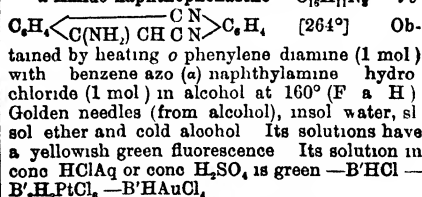

[142°] (above 360°) Prepared by boiling sulpho benzene azo phenyl-(β) naphthylamine with dilute H_2SO_4 (Witt, B 20, 574) Formed by boiling benzene azo phenyl-(β) naphthyl-amine

with conc HCl , aniline being eliminated (Zinke a. Lawson, B 20, 1169) Formed also by treating an alcoholic solution of phenyl (β) naphthyl nitrosamine with HCl (Fischer a Hepp, B 20, 2473), and by distilling with zinc dust oxy naphtho phenazine, which is itself obtained by heating with conc $HClAq$ at 190° the amido naphtho phenazine which results from the action of phenylene o diamine on benzene azo (α) naphthylamine hydrochloride (Fischer a Hepp, B 23, 846) Also got by the action of (β) naphtho quinone (1 mol) on o phenylene diamine (1 mol) in 50 p c acetic acid solution at 0°, and by oxidising a mixture of o phenylene diamine and (β) naphthol with alkaline K_2FeC_6 (Witt)

Yellowish white prisms, subliming at about 200° in long flat needles or prisms, v sol hot benzene, v sl sol alcohol and ether Conc H_2SO_4 dissolves it, forming a brownish red solution Its salts are dimorphous One sulphate crystallises in scarlet needles, the other in garnet red prisms One nitrate forms orange needles, the other brick red needles One hydrochloride forms long reddish yellow needles, and changes at 150° into the second form $SnCl_4$ reduces naphthophenazine to a hydride, crystallising in violet needles

α Amido-naphthophenazine $C_{10}H_7N_2$ s e

Acetyl derivative $C_{10}H_7AcN$, Yellow crystalline powder

Amido naphthophenazine $C_{10}H_7(NH_2)N \cdot C_6H_5$ [191°] Obtained by reducing the nitro compound with alcoholic ammonium sulphide (Zaerling, B 23, 176) Brownish-red crystals, sl sol alcohol and ether, v e sol boiling aniline — $B'HCl$

Phenyl-o-chloride of Amido-naphthophenazine $C_{10}H_7N \cdot Cl$ s e.

$C_{10}H_7 \cdot \begin{smallmatrix} \diagup N \\ \diagdown \end{smallmatrix} NPhCl \cdot C_6H_5 \cdot NH_2$ Formed by the action of quinone dichlorimide on phenyl-(β)-naphthylamine (Nietsch a. Otto, B 21, 1600).

H H

Yields a base which is a bluish-violet pp and a nitrate $C_{12}H_7N_2NO_3$, crystallising in slender needles. Yields naphthophenazine on elimination of NH_3 by the diazo reaction

Reference — EURHODINES

Nitro-naphthophenazine $C_{12}H_7(NO_2)N_2$, C_6H_5 , [222°] Formed by heating nitro (β) naphthoquinone with *o* phenylene-diamine, HOAc, and NaOAc on the water bath (Z) Greenish yellow prisms, sl sol alcohol and ether. Forms a crimson solution in conc H_2SO_4 , — $B'2H_2SO_4$, brown plates

NAPHTHOPHENAZINE CARBOXYLIC ACID $C_{12}H_7N_2(CO_2H)$ [above 300°] Obtained by heating its nitrile with KOHAq under pressure at 225° (Brunner a Witt, B 20, 2663) Needles in sol water and most solvents. Conc H_2SO_4 forms a deep red solution, becoming yellow on dilution.

Nitrile $C_{12}H_7CyN_2$ [237°] Formed from sodium naphthophenazine sulphonate and KCy. Forms a cherry red solution in conc H_2SO_4 , becoming yellow on dilution

Naphthophenazine sulphonic acid $C_{12}H_7(SO_3H)N_2$ [above 290°] Formed by sulphonating naphthophenazine with fuming H_2SO_4 (35 p c) (Brunner a Witt, B 20, 2660) Orange-red needles, sol boiling water and alcohol. KOH yields yellow flakes of a eurhodol. H_2SO_4 forms an orange red solution — NaA' 2aq

NAPHTHOPIASELENOL ν SELENIUM ORGANIC COMPOUNDS

NAPHTHOPIAZTHIOLE $C_{12}H_7\langle\begin{smallmatrix} N \\ N \end{smallmatrix}\rangle S$ [81°]. Formed by heating (αβ) naphthylene diamine (2 g) dissolved in alcohol, with a conc solution of sodium bisulphite (15 c c) at 190° for 7 hours (Hinsberg, B 23, 1393) Long needles (from MeOH), m sol water. Pleasant odour. Somewhat volatile with steam. Weak base. Gives a yellow colour with conc H_2SO_4 . Reduced by tin and HCl to H_2S and naphthylene diamine

NAPHTHOPICRIC ACID, so called, ν TRINITRO- α NAPHTHOL

NAPHTHO-QUINALDINE ν (Py 3) METHYL-NAPHTHO QUINOLINE

(a) **NAPHTHOQUINOLINE** $C_{13}H_9N$ ν $C_6H_5\langle\begin{smallmatrix} CH \\ CH \end{smallmatrix}\rangle C \begin{smallmatrix} CH \\ CH \end{smallmatrix}$ Formed by heating a mixture of (a) nitro naphthalene, (a) naphthylamine, glycerin, and H_2SO_4 (Skraup, M 2, 162, 4, 460) Formed also by distilling its dicarboxylic acid (Doebner a Peters, B 23, 1235) White prisms (from ether), insol water, sol alcohol, ether, benzene, and dilute acids. Smells like naphthylamine. On oxidation with chromic acid it yields the quinone $C_{12}H_6NO_2$ or

$C_6H_5\langle\begin{smallmatrix} CO \\ CO \end{smallmatrix}\rangle C \begin{smallmatrix} CH \\ CH \end{smallmatrix}$ which forms orange crystals, [205°], sol alcohol, benzene, ether, and HClAq, insol water. $KMnO_4$ oxidises it to phenyl pyridine dicarboxylic acid

Salts — Hydrochloride pale yellow needles — $B'H_2PtCl_4$ 2aq. bright-yellow prisms, ν sl sol water — $B'H_2SO_4$, yellowish prisms, ν sol. water — $B'H_2CrO_4$ 6aq needles, sl sol cold water — $B'CO_2H(NO_2)_2$, minute needles

Methylo-sodide B MeI 2aq. Needles.

Octohydrate $C_{13}H_9N_2 \cdot 8H_2O$

$CH_2CH_2C \begin{smallmatrix} CH \\ CH \end{smallmatrix} C \begin{smallmatrix} CH \\ CH \end{smallmatrix} CH_2$ Crystals (Bamberger, B 22, 354)

(β) **Naphthoquinoline** $C_{12}H_7N_2$

$C_6H_5\langle\begin{smallmatrix} CH \\ CH \end{smallmatrix}\rangle C \begin{smallmatrix} CH \\ CH \end{smallmatrix}$ [94°] (above 360°).

Formed by heating (β) naphthylamine (28 pts) with nitro-benzene (13 pts), glycerin (50 pts), and conc H_2SO_4 (40 pts) at 150°–160° (Skraup a Cobenzl, M 4, 436) The crude product is neutralised with alkali, extracted with ether, and distilled. In this reaction (1,2) bromo (β) naphthylamine [63°] may be substituted for (β) naphthylamine, and nitro phenol may be used instead of nitro benzene (Leimann a Schmidt, B 20, 3154) Formed also by heating (1,2) nitro (β)-naphthylamine with glycerin and H_2SO_4 (L a S) Obtained likewise by distilling its carboxylic acids

Properties — Colourless crystals, sl sol water, sol ether, alcohol, benzene, and acids. Its alcoholic solution gives a brown colouration with $FeCl_3$, and a green colour with cupric acetate

Reactions — 1. $KMnO_4$ oxidises it to (β)-phenyl pyridine dicarboxylic acid

Salts — $B'HCl$ 2aq long needles, ν sol water, sl sol alcohol — $P'H_2PtCl_4$ aq orange crystalline pp — $B'H_2CrO_4$, short golden prisms — $B'ClHCl$ [c 148°] Yellow needles, obtained by adding a solution of ICl in HClAq to a solution of the base (Dittmar, B 18, 1616) — Picrate [252°]

Methylo-sodide B MeI 2aq [200°–205°] Light yellow needles, exhibiting a blue fluorescence in aqueous solution

Octohydrate $C_{13}H_9N_2 \cdot 8H_2O$

$CH_2CH_2C \begin{smallmatrix} CH \\ CH \end{smallmatrix} C \begin{smallmatrix} CH \\ CH \end{smallmatrix} NH \begin{smallmatrix} CH_2 \\ CH_2 \end{smallmatrix}$ [60°] Obtained by boiling (β) naphthoquinoline with isoamyl alcohol, and sodium (Bamberger, B 22, 354) At the same time there is formed an isomeric $C_6H_5\langle\begin{smallmatrix} CH_2 \\ CH_2 \end{smallmatrix}\rangle C \begin{smallmatrix} CH \\ CH \end{smallmatrix} NH \begin{smallmatrix} CH_2 \\ CH_2 \end{smallmatrix}$ [91°]

Reference — Oxy, Oxy methyl, and PHENYL-NAPHTHOQUINOLINE

(β) **NAPHTHOQUINOLINE CARBOXYLIC ACID** $C_{12}H_7NO_2$ ν $C_6H_5\langle\begin{smallmatrix} CH \\ CH \end{smallmatrix}\rangle C \begin{smallmatrix} CH \\ CH \end{smallmatrix} CO_2H$

[187°] Obtained by oxidising methyl (β) naphthoquinoline with $KMnO_4$ and H_2SO_4 (Seitz, B 22, 261) White crystalline powder, insol water, m sol boiling alcohol — NaA' 2aq Crystals, sl sol cold water — BaA' 4aq flocculent pp, becoming crystalline on long boiling, insol water — $CuA' \cdot 1\frac{1}{2}$ aq crystalline, insol water — $B'HCl$ yellow needles, ν sl sol boiling dilute HClAq — $B'H_2PtCl_4$ 2aq yellow needles, ν sl sol hot dilute HClAq

(a) **Naphthoquinoline** (Py 1, 3) dicarboxylic acid $C_6H_5\langle\begin{smallmatrix} CH \\ CH \end{smallmatrix}\rangle C \begin{smallmatrix} CO_2H \\ CO_2H \end{smallmatrix}$ [278°]

Formed by oxidising (a) styryl-(a) naphthoquinoline carboxylic acid with cold aqueous $KMnO_4$ (Doebner a Peters, B 23, 1284) Groups of greenish yellow needles, insol cold water, sl sol hot water, ether, cold alcohol, and dilute HClAq, ν sol conc HClAq

Salts — The salts of the alkalis and alkaline earths are ν sol water. The Pb and Cd salts

are white pps— $\text{CuA}''2\text{aq}$ dirty green pp, sl sol water— AgA'' white flocculent pp

(β) Naphthoquinoline (*Py* 1, 3) dicarboxylic acid $\text{C}_{10}\text{H}_6\text{N}_2\text{O}_4$ $\begin{array}{c} \text{CH} \text{ CH} \text{ C} \text{ N} \\ \diagup \quad \diagdown \quad \diagup \quad \diagdown \\ \text{C} \text{ CO}_2\text{H} \end{array}$ [288°]

Formed by oxidation of (α) styryl (β) naphthoquinoline carboxylic acid by KMnO_4 (Doeberner, *Peters*, *B* 23, 1240) Very slender light yellow needles, sl sol ether, cold alcohol, and benzene, v sol HOAc and alkalis— $\text{BaA}'_2\text{aq}$ white flocculent pp— AgA'' powder, sl sol water

NAPHTHOQUINOLINE SULPHONIC ACID

$\text{C}_{10}\text{H}_6\text{NSO}_3 \cdot e$ $\text{C}_{10}\text{H}_6(\text{SO}_3\text{H})_2$ $\begin{array}{c} \text{C} \text{ CH} \text{ CH} \text{ C} \text{ N} \text{ CH} \\ \diagup \quad \diagdown \quad \diagup \quad \diagdown \\ \text{C} \text{ CH} \text{ CH} \end{array}$

Obtained from (β) naphthylamine sulphonic acid of Forsling (*B* 20, 2099) by heating with glycerin, H_2SO_4 , and nitrobenzene (Immerheiser, *B* 22, 404, cf Gentil, *B* 18, 201). Small needles, nearly insol water Very dilute solutions of the acid and its salts fluoresce blue— $\text{BaA}'_2\text{aq}$ Splendid prisms

(α)-NAPHTHOQUINONE $\text{C}_{10}\text{H}_6\text{O}_2 \cdot e$

$\text{C}_{10}\text{H}_6\text{O}_2$ $\begin{array}{c} \text{CO} \text{ CH} \\ \diagup \quad \diagdown \\ \text{CO} \text{ CH} \end{array}$ (α) Naphthoquinone Mol w 158 [125°]

Formation—1 By oxidation of naphthalene by CrO_3 in HOAc (Groves, *C J* 26, 209, cf Hermann, *A* 151, 63)—2 By oxidising with chromic acid the following bodies naphthylene *p* diamine, and its acetyl derivative (Liebermann a Dittler, *B* 6, 945), (α) naphthylamine and its sulphonic acid (Reverdin a Nolting, *B* 12, 2305), (α) amido (α) naphthol (Liebermann, *A* 183, 242), and the acetyl derivative of (α) naphthol (Miller, *B* 14, 1600)

Preparation—1 Naphthalene (10 g) is dissolved in HOAc (60 g), to this is slowly added a solution of CrO_3 (30 g) in water (20 cc) The mixture is heated at 100° Water (30 g) is added, and the liquid, when cooled to 20°, filtered from naphthalene From the filtrate water precipitates naphthoquinone Recrystallised from light petroleum (Japp a Miller, *C J* 39, 220, cf Groves, *C J* 26, 209, Plimpton, *C J* 37, 634, Miller, *Bl* [2] 43, 125)—2 (α) Naphthol orange (Tropaeoline 000 No 1) is reduced to sulphanic acid and (14) amido naphthol, the latter is oxidised and the quinone purified by distillation with steam, the yield is 40 p c—3 By oxidation of (α)-naphthylamine (1 pt) with H_2SO_4 (6 pts), water (25 pts), and $\text{K}_2\text{Cr}_2\text{O}_7$ (2½ pts), in the cold (Monnet, Reverdin, a Nolting, *B* 12, 2306)

Properties—Yellow triclinic needles, which begin to sublime below 100° Volatile with steam V sl sol water and ligroin, v sol benzene, CS_2 , chloroform, ether, HOAc, conc H_2SO_4 , and boiling alcohol Smells like quinine Alkalis form a reddish brown solution It is not attacked by SO_2 in the cold Reacts in alcoholic solution with primary amines forming compounds represented by $\text{C}_{10}\text{H}_6\text{O}_2\text{NR}$, which may be considered to be alkyl amido-(α) naphthoquinones or more probably as oxy-(β) naphthoquinone alkylimides Secondary amines act forming compounds represented by $\text{C}_{10}\text{H}_6\text{O}_2\text{NR}'\text{R}'$, but diphenylamine acts only in presence of HCl Tertiary amines do not react in this way Hydro naphthoquinone may be used instead of naphthoquinone, being oxidised by the air Salts of amines may be used instead of amines The compounds crystallise in needles (Plimpton, *C J* 37, 638)

Reactions—1 Naphthoquinone dissolves in aqueous KOH and Na_2CO_3 , and on adding acids a red body is ppd This is also got by oxidising naphthalene with CrO_3 in acetic acid and neutralising the hot liquid with Na_2CO_3 (A. Guyard, *Bl* [2] 31, 64, Plimpton, *C J* 37, 641) It is soluble in benzene and ppd from it by light petroleum as a dark red powder This substance was named carminaphthe by Laurent (*Rev Scient* 14, 560), who ascribed to it the formula $\text{C}_{10}\text{H}_6\text{O}_2$ —2 Boiling nitric acid oxidises it to phthalic acid—3 Boiling HIAq and P reduct to hydronaphthoquinone [176°] Tin and HCl act in like manner—4 When boiled with an aqueous solution of an equivalent of hydronaphthoquinone there is deposited on cooling dark purple crystals of naphthoquinhydrone $\text{C}_{20}\text{H}_{12}\text{O}_4$ It is readily converted by oxidising agents into naphthoquinone and by reducing agents into hydronaphthoquinone—5 Bromine in presence of iodine forms di bromo naphthoquinone [218°] (Miller, *Bl* [2] 43, 125)—6. Heated with benzoic acid at 160° it forms needles of 'benzonaphthone' $\text{C}_{12}\text{H}_8\text{O}_3$? which may be purified by successive boiling with aniline, and alcohol (Japp a Miller, *C J* 39, 221) This body is insoluble in ordinary solvents and in aqueous NaOH Aqueous KMnO_4 oxidises it to phthalic acid It is not affected by ZnEt, and therefore contains no hydroxyl—7 Boiling fuming HClAq forms a green amorphous powder, insol water, alcohol, and ether, but partially dissolving in HOAc forming a blue solution (Krappe a Schultz, *A* 210, 178)—8 Phenyl hydrazine reacts forming benzene azo-(α) naphthol $\text{C}_{10}\text{H}_6(\text{OH})\text{N}_2\text{Ph}$ —9 On adding aqueous ammonia to alcoholic naphthoquinone the liquid becomes brown and, by precipitation by water, a red brown amorphous body is formed, probably Laurent's 'carminaphthe' (Plimpton, *C J* 37, 641)—10 Yellow ammonium sulphide produces a red powder melting with complete decomposition at about 300° (Willgerodt, *B* 20, 2470)—11 When a solution of methylamine (acetate) is added slowly to a small quantity of naphthoquinone dissolved in alcohol, methylamido naphthoquinone $\text{C}_{10}\text{H}_6\text{O}_2\text{NMe}$ [232° uncol], is formed It crystallises from alcohol in red needles, which are reduced by SO_2 forming a substance crystallising in white needles (Plimpton, *C J* 37, 639)—12 When an alcoholic solution of naphthoquinone is mixed with excess of aqueous dimethylamine the solution neutralised with acetic acid and the liquid allowed to evaporate spontaneously, there is deposited a substance $\text{C}_{10}\text{H}_6\text{O}_2\text{NMe}_2$, which crystallises from alcohol in bright red needles [118°] (Plimpton, *C J* 37, 642)—13 With ethylamine acetate in alcoholic solution a brown liquid is formed If this is boiled with charcoal, filtered and evaporated deposits ethyl amido naphthoquinone $\text{C}_{10}\text{H}_6\text{O}_2\text{NEt}$ as red needles [140°] It may be sublimed, and is soluble in benzene, hardly so in light petroleum (Plimpton, *C J* 37, 640)—14 Aniline in alcoholic solution forms a red liquid. If this solution is heated to boiling and poured into water, the pp washed with dilute acetic acid and crystallised from alcohol, animal charcoal being used, the product is phenyl-amido-naphthoquinone $\text{C}_{10}\text{H}_6\text{O}_2\text{NPh}$ [191°] (Plimpton, *C J* 37, 635). It crystallises in red needles, v.

sol hot alcohol, benzene, and ether Insol light petroleum It forms a crimson solution in conc H_2SO_4 from which it is ppt unchanged by water It forms a purple solution in alcoholic potash It is not attacked by acetic or benzoic anhydride It is attacked by conc HCl at 170° and by aqueous SO_2 at 125° , aniline being among the products (Plimpton, *C J* 37, 635, cf Zincke, *B* 12, 1645, 14, 92)—15 *p* Bromo aniline forms, in like manner, when heated with (a)-naphthoquinone or oxy (a) naphthoquinone, red needles [266° – 269°] (Baltzer, *B* 14, 1899)—16 *m* Nitro-aniline yields $\text{C}_{10}\text{H}_7(\text{NHC}_2\text{H}_4\text{NO})_2$ [270°] (B) 17 *p* Nitro aniline forms $\text{C}_{10}\text{H}_7(\text{NHC}_2\text{H}_4\text{NO})_2$ melting above 270° , which may be reduced to $\text{C}_{10}\text{H}_7(\text{NH C}_2\text{H}_4\text{NH}_2)_2$ [177°] (B)—18 *Ethyl aniline* produces $\text{C}_{10}\text{H}_7(\text{NPhEt})_2$ crystallising in violet needles [155°] (Elsbach, *B* 15, 1810)—19 *o* Toluidine forms $\text{C}_{10}\text{H}_7(\text{NHC}_2\text{H}_4\text{NO})_2$ crystalising in red needles (Elsbach, *B* 15, 639)—20 *p*-Toluidine forms $\text{C}_{10}\text{H}_7(\text{NHC}_2\text{H}_4\text{NO})_2$ crystallising from alcohol in red needles [200°] and forming a crimson solution in conc H_2SO_4 (Plimpton, *C J* 37, 638, Elsbach, *B* 15, 687)—21 *Diphenyl amine* forms $\text{C}_{10}\text{H}_7(\text{NPh})_2$ O , crystallising from alcohol in needles [164°] (Plimpton)

Formed, together with a greater quantity of the (β)-oxim of (β)-naphthoquinone, by the action of nitrous acid on (a) naphthol (Fuchs, *B* 8, 626) Prepared by the action of hydroxylamine hydrochloride on (a)-naphthoquinone (Goldschmidt, *B* 17, 2064) Yellowish needles, decomposing at about 190° V sol alcohol and ether, sl sol CS_2 and hot benzene Slightly volatile with steam Dissolves in alkalis, but is reppd by CO_2 Does not colour mordants (Kos tanecki, *B* 22, 1347) *Reactions*—1 *Nitric acid* converts it into di nitro (a) naphthol—2 Alcoholic K_2FeCy_4 forms nitro (a)-naphthol—3 PCl_5 forms 'β' di chloro naphthalene [68°]—4 *Phenyl cyanate* unites, forming $\text{C}_{10}\text{H}_7(\text{OH}) \text{NO CO NHPH}$, which crystallises in yellow prisms [170°] (Goldschmidt a Strauss, *B* 22, 3106)—5 Boiling with aniline and HOAc yields phenyl-(β)-amido (a) naphtho quinone anilide $\text{C}_{10}\text{H}_7(\text{NHPH}) \begin{array}{l} \text{O} \\ \text{NPh} \end{array}$ [187° cor] (Brömme, *B* 21, 893)—6 *p* Toluidine forms, in like manner, *p* tolyl-amido (a)-naphthoquinone *p* toluidide [183° cor] (B)—7 *ψ* Cumidine forms *ψ*-cumyl amido (a)-naphthoquinone *ψ* cumidide [181° cor]—8 *Naphthylamine* forms (a) naphthyl amido-(a)-naphthoquinone-(a) naphthalide [178° cor]—9 *Bromine* in HOAc forms di-bromo-(a) naphthoquinone oxim $\text{C}_{10}\text{H}_7\text{Br}_2 \begin{array}{l} \text{O} \\ \text{NOH} \end{array}$ [175°] (Brömme, *B* 21, 891) *Methyl ether* A'Me [100°] Yellow crystals, v sol alcohol, ether, and benzene, insol water, dissolves in H_2SO_4 with a yellow colour (Ilinski, *B* 17, 2589)

Di-oxim $\text{C}_{10}\text{H}_7(\text{NOH})_2$ [14°] [207°] Formed by boiling the mono oxim for two days with hydroxylamine and alcohol (Nietzki a Guter-mann, *B* 21, 433) Slender colourless needles, sol. alcohol and ether, decomposed by melting With Ac_2O it yields $\text{C}_{10}\text{H}_7(\text{NOAc})_2$ [160°] Tin and HCl reduce it to naphthylene-diamine.

Alkaline KMnO_4 oxidises it to di-nitroso-naphthalene $\text{C}_{10}\text{H}_6(\text{NO})_2$, a yellow powder, exploding at 120°

Di-chloro-di-imide $\text{C}_{10}\text{H}_4(\text{NCl})_2$ [187°] Formed from naphthylene *p* diamine hydrochloride and a cold solution of bleaching powder (Friedlander a Böckmann, *B* 22, 591) Yellow needles (from alcohol and xylene), smelling strongly like quinone Reconverted by reducing agents to naphthylene-diamine Conc HClAq in HOAc converts it into di chloro (a) naphthoquinone [190°]

Di-phenyl di-imide $\text{C}_{10}\text{H}_4(\text{NPh})_2$ [187°] Formed by heating benzene azo (a) naphthylamine with aniline at 150° (Fischer a Hepp, *A* 256, 264) Golden plates, sl sol alcohol

Obtained by oxidising (a) naphthylamine tetrahydride with $\text{Na}_2\text{Cr}_2\text{O}_7$ and H_2SO_4 (Bamberger a. Lengfeld, *B* 23, 1131)

mation—By oxidation of amido-(β) naphthol, which is got by reducing its (a) oxim (nitroso (β) naphthol) (Stenhouse a Groves, *C J* 32, 47, 33, 415, *A* 189, 153, 194, 202, Liebermann a Jacobson, *A* 211, 40) The amido (β)-naphthol may also be obtained by reducing (β)-naphthol orange (v Azo-compounds)

Preparation—Amido-(β) naphthol hydrochloride (1 pt) is dissolved in saturated aqueous SO_2 , and when cold the solution is poured into ferric chloride solution (12 pts, containing 12 pts Fe_2O_3) The quinone is deposited as golden needles (Groves, *C J* 45, 298)

Properties—Orange needles (from alcohol) or red needles (from ether) Softens and decomposes at 115° – 120° Has no smell is not volatile with steam Dissolves in alkalis, forming a yellow solution, which absorbs oxygen from the air

Reactions—1 Boiling *nitric acid* forms phthalic acid—2 SO_2 reduces it to hydro (β) naphthoquinone HIAq acts in like manner (S a G) Tin and HClAq reduce it to 'di naphthyl dihydroquinone' $\text{C}_{10}\text{H}_8\text{O}$, crystallising in colourless needles [178°] (Korn, *B* 17, 8024) 3 Dilute H_2SO_4 forms, on warming, 'di naphthyl diquinhydrone' $\text{C}_{20}\text{H}_{12}\text{O}_4$, a black insoluble powder (S a G)—4 *Chlorine* passed into its solution in HOAc forms chloro naphthoquinone and the compound $\text{C}_6\text{H}_4 \begin{array}{l} \text{CO CO} \\ \text{CHCl CCl} \end{array}$ which crystallises in monoclinic needles (containing 2aq) [112°], and, when anhydrous, melts at 128° (Zincke, *B* 20, 2892)—5 An alcoholic solution of aniline forms the anilide $\text{C}_{10}\text{H}_7\text{NO}_2$, probably oxy (a) naphthoquinoneanilide $\text{C}_{10}\text{H}_7(\text{OH}) \begin{array}{l} \text{O} \\ \text{NPh} \end{array}$ (Liebermann a Jacobson, *A* 211, 75, Zincke, *B* 14, 1494) This substance crystallises in red or yellow needles melting above 240° insol water, sl. sol alcohol and hot benzene It is split up by boiling acids into aniline and oxy-(a)-naphthoquinone Boiling HOAc converts it into phenyl-amido-(a)-naphthoquinone With NaOEt and alkyl bromides it gives the compounds $\text{C}_{10}\text{H}_7(\text{OME})\text{O}(\text{NPh})$ [161°], $\text{C}_{10}\text{H}_7\text{Et}\text{NO}$ [104°], $\text{C}_{10}\text{H}_7\text{PrNO}$ [100°], and $\text{C}_{10}\text{H}_7\text{PrNO}$ [104°] (Zincke, *B* 15, 279). The so-called dianilide of

(β) naphthoquinone, which is formed by heating di-bromo (α)-naphthol with aniline, is probably the anilide of phenyl amido (β) naphthoquinone

$C_{10}H_7(NPhH) \begin{smallmatrix} \diagup O \\ \diagdown NPh \end{smallmatrix}$ It crystallises in orange red needles [179°] (Meldola, *C J* 45, 157, cf. Zincke, *B* 15, 481). This body has also been described as di-phenyl-di-imido-naphthol $C_{10}H_5(OH)(NPh)_2$ (Griess, *B* 13, 123). The corresponding di-*p* toluidine [c 175°] and di (β)-naphthalide [247°], prepared by the same reaction from di-bromo-(α)-naphthol, are probably constituted in a similar manner.—6 *Ethyl aniline* forms phenyl ethyl amido (β) naphthoquinone $C_{10}H_7(NPhEt)O_2$? which crystallises in thick red needles [165°], insol. NaOHAq, and is resolved by dilute HClAq into ethyl aniline and (β) oxy-(α) naphthoquinone (Elsbach, *B* 15, 691).—7 *o*-Toluidine forms $C_{10}H_7NO_2$, probably $C_{10}H_7(OH) \begin{smallmatrix} \diagup O \\ \diagdown NC_6H_5 \end{smallmatrix}$, which crystallises in red needles, sol. NaOHAq. It is not affected by HOAc at 150°. Boiling dilute HClAq splits it up into *o*-toluidine and (β) oxy (α) naphthoquinone (Elsbach, *B* 15, 689).—8 *p*-Toluidine forms the *p* toluidine $C_{10}H_7NO_2$, probably $C_{10}H_7(OH) \begin{smallmatrix} \diagup O \\ \diagdown NC_6H_4Me \end{smallmatrix}$, which crystallises in red needles [246°], sol. NaOHAq. On heating with dilute HClAq at 130° it forms (β) oxy (α) naphthoquinone, and this body is probably an intermediate product in the conversion of (β) naphthoquinone *p* toluidine into (α) naphthoquinone *p* toluidine, which takes place on heating with acetic acid at 150° (Elsbach, *B* 15, 686). It gives the following ethers— $C_{10}H_7MeNO_2$ [150°], $C_{10}H_7EtNO_2$ [137°], and $C_{10}H_7PrNO_2$ [139°] (Zincke a. Brauns, *B* 15, 1969).—9 Boiling with ammonium acetate forms (β) naphthazone

Phenyl hydrazide $C_{10}H_7 \begin{smallmatrix} \diagup O \\ \diagdown NHC_6H_5 \end{smallmatrix}$

Benzene-o azo-(α)-naphthol [138°] Formed by the action of phenyl hydrazine hydrochloride upon (β) naphthoquinone suspended in acetic acid (Zincke a. Bindewald, *B* 17, 3030). Long red needles, sol. hot alcohol and hot HOAc, insol. water. Does not combine with acids or bases. Yields amido naphthol on reduction with SnCl₂. Bromine in HOAc forms $C_{10}H_7Br_2N_2O$ [215°–219°]

o-Tolyl-hydrazide $C_{10}H_7N_2O_2$

$C_{10}H_7 \begin{smallmatrix} \diagup O \\ \diagdown NHC_6H_4 \end{smallmatrix}$ [156°] Red plates, with golden lustre, v. sol. alcohol. Reduced by SnCl₂ to amido naphthol. Nitric acid oxidises it to di-nitro-naphthol. Bromine forms $C_{10}H_7Br_2N_2O$ [254°]

p-Tolyl hydrazide $C_{10}H_7N_2O_2$

$C_{10}H_7 \begin{smallmatrix} \diagup O \\ \diagdown NHC_6H_4 \end{smallmatrix}$ [145°] Red needles (Zincke a. Bathgen, *B* 19, 2491). Forms $C_{10}H_7Br_2N_2O$ [186°]

(α) Oxim $C_{10}H_7 \begin{smallmatrix} \diagup C(NO)CO \\ \diagdown CH=CH \end{smallmatrix}$ (α) Nitroso-*(β)-naphthol* [109.5°] S (alcohol) 2.4 at 18°. Prepared by adding a concentrated aqueous solution of NaNO₂ (50 pts.) to a boiling solution of (β) naphthol (100 pts.) and ZnCl₂ (75 pts.) in spirit (600 pts.). After cooling, and standing for some hours, the brown zinc salt which separates is washed with alcohol, suspended in water

(1000 pts.), and digested for a short time with NaOH (90 pts.). After cooling, the sodium salt is filtered off, washed with a little water, and decomposed by cold HCl. The yield is 110 pts. of the naphthol (Henriques a. Ihmski, *B* 18, 704; cf. Groves, *C J* 45, 295, Stenhouse a. Groves, *C J* 32, 47, A 189, 146, Fuchs, *B* 8, 1026). *Properties*—Thin plates or short thick orange prisms. V. sol. boiling water, sl. sol. ligroin, v. sol. ether, benzene, and HOAc. Volatile with steam (when pure). *Reactions*—1

Aqueous ammonia at 100° forms a compound $C_{10}H_7N_2O$, probably the oxim of naphthoquinonimide $C_{10}H_7 \begin{smallmatrix} \diagup NH \\ \diagdown NOH \end{smallmatrix}$, which crystallises from alcohol in green needles [153°], soluble in alcohol, ether, acids, and alkalis. It is converted by nitrous acid into an unstable nitrosamine $C_{10}H_7 \begin{smallmatrix} \diagup N(NO) \\ \diagdown NOH \end{smallmatrix}$ [244°], which forms the salts $KC_{10}H_7N_2O_2$ and $AgC_{10}H_7N_2O_2$. Naphthoquinonimide oxim is reduced by ammonium sulphide to a base $C_{10}H_7N_2$ [92°–95°]. Naphthoquinonimide oxim forms the salts $KC_{10}H_7N_2O$, a red powder, $C_{10}H_7N_2OHCl$, yellow plates, ($C_{10}H_7N_2O$), H_2PtCl_4 , 2aq, orange needles, and $C_{10}H_7N_2OHNO_2$.—2 Dilute nitric acid forms nitro naphthol.—3 Ammonium sulphide reduces it to amido naphthol.—4 Chlorine passed into a cold solution of the oxim in chloroform yields

$C_{10}H_7 \begin{smallmatrix} \diagup C(NO)CO \\ \diagdown CH=CCl \end{smallmatrix}$ crystallising in yellowish red needles (Zincke a. Schmunk, *A* 257, 133). This body takes up more chlorine, forming

$C_{10}H_7 \begin{smallmatrix} \diagup C(NO)CO \\ \diagdown CCl=CHCl \end{smallmatrix}$ which crystallises in white needles [186°], and when treated with potash changes to the dichloro derivative $C_{10}H_7 \begin{smallmatrix} \diagup C(NO)CO \\ \diagdown CCl=CCl \end{smallmatrix}$ [166°].—5 Bromine added to its solution in chloroform unites forming $C_{10}H_7NO_2Br$, crystallising in colourless needles [131°], which dissolve in alkalis, changing to $C_{10}H_7 \begin{smallmatrix} \diagup C(NO)CO \\ \diagdown CH=CBBr \end{smallmatrix}$, crystallising in yellow needles [172°]. The last body is also formed by adding bromine to a solution of (β) naphthoquinone (α)-oxim in cold HOAc. Bromine added to a hot solution in HOAc forms a bromo naphthoquinone [201°] (Brömme, *B* 21, 386).—

6 *Phenyl cyanate* forms $C_{10}H_7 \begin{smallmatrix} \diagup O \\ \diagdown NO CO NPh \end{smallmatrix}$, crystallising in felted needles [128°] (Goldschmidt a. Strauss, *B* 22, 3106).—7 SO_2 or NaHSO₃, acting on its alcoholic solution, form amido-naphthol sulphonic acid (Schmidt, *J pr* [2] 42, 156).—8 *Aniline* in HOAc forms the same phenyl amido naphthoquinone anilide as it forms with the two other naphthoquinone oxims (Brömme, *B* 21, 893). Salts—NaA' green pp (from alcoholic solution), sl. sol. water—KA' lustrous green plates, sol. water and alcohol—NH₄A' green plates—CoA', brownish-red pp—CoA', purple-red pp, soluble without alteration in alcohol, aniline, phenol, conc. H₂SO₄, and HNO₃, it is very stable towards acids, alkalis, oxidising agents, and reducing agents (Ihmski a. Knorr, *B* 18, 699).—NiA', brownish-yellow pp, sl. sol. water and alcohol, easily decomposed by acids (difference from the cobalt salt).—FeA', black pp., insol. water, v. sol. aniline, forming a

dark-brown solution — CuA' , lustrous brown pp, sol dilute HClA' and 50 p c acetic acid — AgA' reddish-brown powder, insol water and alcohol $\text{Ag}(\text{NH}_4)\text{A}'$, slender green needles, insol water and alcohol — AgHA' , microcrystalline brown pp, sol alcohol (Ilinski, *B* 17, 2581, 18, 2728)

Methyl ether of the (a)-oxim

$\text{C}_6\text{H}_5\text{N} \begin{smallmatrix} \text{C(NOMe)} \\ \text{CH} \end{smallmatrix} \text{CO} \begin{smallmatrix} \text{CH} \\ \text{CH} \end{smallmatrix}$ [75°] Long yellow needles, v sol alcohol, ether, and benzene, m sol hot water, sl sol cold ligroin Forms a deep-red solution in H_2SO_4 . Yields (a) amido (β)-naphthol on reduction with tin and HClA' (Goldschmidt & Schmid, *B* 18, 571)

Ethyl ether of the (a) oxim

$\text{C}_6\text{H}_5\text{N} \begin{smallmatrix} \text{C(NOEt)} \\ \text{CH} \end{smallmatrix} \text{CO} \begin{smallmatrix} \text{CH} \\ \text{CH} \end{smallmatrix}$ [50°–60°] Needles (from alcohol-ligroin) (Ilinski, *B* 19, 341)

Benzoyl derivative $\text{C}_6\text{H}_5\text{N} \begin{smallmatrix} \text{C(NOBz)} \\ \text{CH} \end{smallmatrix} \text{CO} \begin{smallmatrix} \text{CH} \\ \text{CH} \end{smallmatrix}$ [114°]

(β)-Oxim $\text{C}_6\text{H}_5\text{N} \begin{smallmatrix} \text{C(NOBz)} \\ \text{CH} \end{smallmatrix} \text{CO} \begin{smallmatrix} \text{CH} \\ \text{CH} \end{smallmatrix}$ (β) Nitroso

(a)-naphthol [148°] (W), [152°] (G) This is the chief product of the action of nitrous acid on (a) naphthol (Fuchs, *B* 8, 626) It may be separated from the oxim of (a) naphthoquinone (*supra*), which accompanies it by means of their sodium salts (Worms, *B* 15, 1816) It is also obtained by boiling (β) naphthoquinone with hydroxylamine hydrochloride for half an hour (Goldschmidt, *B* 17, 215) Yellow needles (from benzene), almost insol cold water, m sol ether, v sol alcohol Somewhat volatile with steam Conc H_2SO_4 forms a deep-red solution Not decomposed by boiling alcoholic potash

Reactions — 1 Bromine acting on its solution in chloroform unites forming a dibromide $\text{C}_{10}\text{H}_6\text{N}_2\text{Br}_2$, crystallising in grey leaflets [155°] (Brömme, *B* 21, 390) Bromine acting on its solution in HOAc yields the bromo derivative $\text{C}_{10}\text{H}_6\text{N}_2\text{BrO}$, separating from alcohol in yellow crystals [175°] (B) — 2 Alkaline K_2FeC_4 oxidises it to (β) nitro (a) naphthol — 3 Nitric acid forms di nitro (a) naphthol and phthalic acid — 4 Phenyl cyanate unites with it, forming $\text{C}_{10}\text{H}_6\text{N} \begin{smallmatrix} \text{O} \\ \text{NO} \end{smallmatrix} \text{CO NHPH}$, crystallising from benzene in greenish yellow prisms (containing benzene) [120°] (Goldschmidt & Strauss, *B* 22, 3106) — 5 Aniline in HOAc forms the same phenyl-amido naphthoquinone amide as with the other two isomeric oxims (Brömme)

Salts — $\text{NH}_4\text{A}'$ lustrous green needles — NaA' (dried at 110°) reddish brown powder, insol conc NaOH , m sol water and alcohol — KA' lustrous green plates — BaA' , 2 aq bronzed plates — PbA' , dark brown scales, insol water — AgA' brownish-red pp

Methyl ether of the (β) oxim

$\text{C}_6\text{H}_5\text{N} \begin{smallmatrix} \text{C(NOMe)} \\ \text{CH} \end{smallmatrix} \text{CO} \begin{smallmatrix} \text{CH} \\ \text{CH} \end{smallmatrix}$ [98°] From the Ag salt and MeI (Fuchs) Formed also by heating (β)-naphthoquinone with the hydrochloride of the methyl ether of hydroxylamine (Goldschmidt & Schmid, *B* 18, 571, 2224) Yellowish green needles, v sol alcohol Reduced by tin and HCl to (β) amido (a)-naphthol

Ethyl ether $\text{C}_6\text{H}_5\text{N} \begin{smallmatrix} \text{C(NOEt)} \\ \text{CH} \end{smallmatrix} \text{CO} \begin{smallmatrix} \text{CH} \\ \text{CH} \end{smallmatrix}$ [101°] Flat greenish yellow needles

Benzoyl derivative $\text{C}_6\text{H}_5\text{N} \begin{smallmatrix} \text{C(NOBz)} \\ \text{CH} \end{smallmatrix} \text{CO} \begin{smallmatrix} \text{CH} \\ \text{CH} \end{smallmatrix}$ [162°]

Di-oxim $\text{C}_{10}\text{H}_6\text{N}_2(\text{NOH})_2$ [149°] (G & S), [166°] (B), [181°] (K & M) Formed by warming either the (a) or the (β) oxim in con-

centrated methyl alcoholic solution with hydroxylamine hydrochloride at 100° (Goldschmidt & Schmid, *B* 17, 2066, Brömme, *B* 21, 392) Formed also by adding an alkaline solution of hydroxylamine to a cold solution of the (a) oxim in caustic soda (Kehrmann & Messinger, *B* 23, 2816) Yellow needles, forming a reddish yellow solution in alkalis, and a dark red solution in H_2SO_4 . On warming with dilute H_2SO_4 or with alkalis it is converted into an anhydride Phenyl cyanate also brings about this change (Goldschmidt & Strauss, *B* 22, 3107) Phenyl hydrazine combines, forming $\text{C}_{10}\text{H}_6\text{N}_4\text{O}$, which crystallises from alcohol in tufts of long needles [105°–138°] (Polonovsky, *B* 21, 182) Stannous chloride reduces it to naphthylene (1,2) diamine Alkaline K_2FeC_4 oxidises it to di nitroso naphthalene $\text{C}_{10}\text{H}_6\text{N}_2(\text{NO})_2$, which crystallises in needles [127°], insol water and alkalis, v sol alcohol (Leuckart, *B* 19, 174, 349) The dioxim colours iron and cobalt solutions brown — $\text{KC}_{10}\text{H}_6\text{N}_2\text{O}$, brownish red amorphous pp, obtained by adding ether to an alcoholic solution of the dioxim and KOEt (Ilinski, *B* 19, 342) — $\text{AgC}_{10}\text{H}_6\text{N}_2\text{O}$, dark red pp, obtained by adding ammoniacal AgNO_3 to an alcoholic solution of the dioxim

(a) *Methyl ether of the dioxim*

$\text{C}_6\text{H}_5\text{N} \begin{smallmatrix} \text{C(NOMe)} \\ \text{CH} \end{smallmatrix} \text{C(NOH)} \begin{smallmatrix} \text{CH} \\ \text{CH} \end{smallmatrix}$ [159°] Formed by action of hydroxylamine on the methyl ether of the (a) oxim Insol water, sol alkalis

(β) *Methyl ether of the dioxim*

$\text{C}_6\text{H}_5\text{N} \begin{smallmatrix} \text{C(NOH)} \\ \text{CH} \end{smallmatrix} \text{C(NOMe)} \begin{smallmatrix} \text{CH} \\ \text{CH} \end{smallmatrix}$ Formed from the silver salt of the dioxim and MeI, and also by the action of hydroxylamine on the methyl ether of the (β) oxim Yellow oil, turning brown in air Sol alkalis

(a) *Ethyl ether of the dioxim*

$\text{C}_6\text{H}_5\text{N} \begin{smallmatrix} \text{C(NOEt)} \\ \text{CH} \end{smallmatrix} \text{C(NOH)} \begin{smallmatrix} \text{CH} \\ \text{CH} \end{smallmatrix}$ [153°] Formed by warming an alcoholic solution of the ethyl ether of the (a) oxim with hydroxylamine hydrochloride Green needles (from alcohol), insol water — $\text{KC}_{10}\text{H}_6\text{N}_2\text{O}_2$ brown needles

Anhydride of the dioxim

$\text{C}_{10}\text{H}_6\text{N} \begin{smallmatrix} \text{N} \\ \text{N} \end{smallmatrix} \text{O}$ [78°] Formed from the dioxim by the action of AcCl , alkalis, or acids Formed also by heating the (a) or (β) oxim with an alcoholic solution of hydroxylamine hydrochloride at 150° (Goldschmidt, *B* 17, 216, 801) Long colourless monoclinic needles (from ligroin) Insol alkalis

Peri Naphthoquinone $\text{C}_{10}\text{H}_6\text{O}_2$ i.e.

$\text{CH} \begin{smallmatrix} \text{O} \\ \text{C} \end{smallmatrix} \text{—} \text{C} \begin{smallmatrix} \text{O} \\ \text{C} \end{smallmatrix} \text{CH}$ Occurs in small quantity in the product of the oxidation of di bromo (a) naphthol by fuming nitric acid (Meldola & Hughes, *C J* 57, 632) Slender, pale yellow needles, no definite melting point observed Blackens and decomposes above 220° Sl sol boiling dilute NaOH Gives an azo compound with phenyl hydrazine Not reduced by cold aqueous SO_2 . Zinc-dust and HOAc reduces it to the corresponding dioxynaphthalene, which blackens at 205° and forms a diacetyl derivative melting at 227°.

THYL-GLYOXYLIC ACID

NAPHTHOYL FORMIC ACID v. NAPHTHYL-

GLYOXYLIC ACID

(aa) **DINAPHTHYL $C_{20}H_{14}$ s.e ($C_{10}H_7$)₂** Mol. w 254. [154°] (above 360°) V D 8.67 (calc 8.77)

Formation—1 Together with phthalic acid and other bodies by heating naphthalene with MnO_2 and dilute H_2SO_4 (Lossen, *A* 144, 77)—2 By distilling (ββ) dioxy dinaphthyl (1 pt) with zinc dust (12 pts), the yield being 65 p.c. of the theoretical (Walder, *B* 15, 2170, Julius, *B* 19, 2549)—3 By distilling (β) 'dinaphthyl diquinone' $C_{20}H_{14}O_2$ with zinc dust (Korn, *B* 17, 3019)—4 By diazotising di amido dinaphthyl (naphthidine), and boiling the tetra azo dinaphthyl sulphate with alcohol (Nietzki & Groll, *B* 18, 3256)

Preparation—Naphthalene is boiled with MnO_2 and H_2SO_4 (diluted with more than its own bulk of water) The product is boiled with water, filtered, and the residue extracted with alcohol, the alcohol boiled off (in a current of air), and the residue distilled The fraction coming over above 360° is boiled with light petroleum and animal charcoal, filtered, and allowed to crystallise (Watson Smith, *C J* 35, 225) No ββ compound is formed

Properties—Colourless plates (by sublimation), v sol benzene, CS_2 , HOAc, and ether, m sol alcohol Its solutions exhibit blue fluorescence (K)

Picric acid compound

$C_{20}H_{14} \cdot 2C_6H_3(NO_2)_3OH$ [145°] Reddish-brown needles

(αβ) **Dinaphthyl $C_{20}H_{14}$** [76°] (S), [80°] (W) V D 8.78 (calc 8.77) Formed, together with a larger quantity of the (ββ) and a very little of the (aa) isomerides, by passing the vapour of naphthalene, mixed with $SbCl_3$, through a red hot tube (Watson Smith, *C J* 32, 559) Small six sided tables, m sol alcohol, ether, and benzene than the (ββ) isomeride

Picrate $C_{20}H_{14} \cdot C_6H_3(NO_2)_3OH$ [156°] (Wegscheider, *B* 23, 3199)

(ββ) **Dinaphthyl $C_{20}H_{14}$** *Isodinaphthyl* [187°] (S), [189°] (G & T) V D 8.73 (calc 8.77)

Formation—1 By passing naphthalene through a red hot tube (Watson Smith, *C J* 24, 1184)—2 By passing naphthalene and CCl_4 through a tube at dull red heat $4C_{10}H_8 + CCl_4 = 2C_{20}H_{14} + 4HCl + C$ (Watson Smith, *C J* 35, 229)—3 By passing through a red hot tube, naphthalene with chloroform, (a) bromo naphthalene, $SbCl_3$ or $SnCl_4$ —4 By heating to redness (a) bromo naphthalene with naphthalene and soda lime (S)—5 By passing $C_{10}H_8$ and $C_{10}H_7Br$ through a red hot tube packed with Fe_2O_3 (S)—6 By distilling aluminium (β) naphthol (Gladstone a Tribe, *C J* 41, 16)—7 By dropping isomyl chloride upon naphthalene (100 g) and $AlCl_3$ (25 g) at 120°, pentane being also formed (Roux, *Bl* [2] 41, 379)

Properties—Plates (from benzene), with slight blue fluorescence Much less sol alcohol, ether, and benzene than either of its isomerides On oxidation with $KMnO_4$ or dilute HNO_3 at 160° it yields phthalic acid CrO_3 in HOAc produces a quinone $C_{20}H_{10}O_4$.

Picric acid compound
 $C_{10}H_7O_6N_3$ (NO₂)₃OH. [184°] Orange prisms (Wegecheider, *B.* 23, 3200)

($\beta\beta$)-Dinaphthyl sulphonic acid $C_{20}H_{13}SO_3$ \pm $C_{10}H_7$, $C_{10}H_7SO_3H$ Prepared by heating ($\beta\beta$)-dinaphthyl (15 g) with conc H_2SO_4 (3 g) for 5 hours at 200° (Watson Smith a Takamatsu, *C* J 39, 552) —CaA', 2aq white needles, m. sol. hot water, insol. alcohol, ether, and benzene —BaA', 2aq?

($\beta\beta$) Dinaphthyl disulphonic acid
 $C_{10}H_7(SO_3H)C_{10}H_7(SO_3H)$ Two isomeric acids of this formula are formed by heating ($\beta\beta$)-dinaphthyl (10 g) with conc H_2SO_4 (7 g) at 190° for 5 hours (S a T) One gives an insoluble barium salt, the other forms BaA' 2aq, v sol water, and PbA' 2aq, a yellowish white crystalline powder

($\beta\beta$) Dinaphthyl tetrasulphonic acid
 $C_{10}H_7(SO_3H)_2C_{10}H_7(SO_3H)_2$ Formed by heating ($\beta\beta$)-dinaphthyl with an excess of Nordhausen sulphuric acid (S a T) —PbA' 6aq v sol. water, insol alcohol, ether, and benzene

References —DI AMIDO-, DI BROMO-, TETRA-CHLORO-, and NITRO- DINAPHTHYL

NAPHTHYL-ACETAMIDINE $C_{17}H_{13}N_2$ \pm $CH_3C(NH)NHC_{10}H_7$. (a) *Naphthyl-ethenyl-amidine* Prepared by the action of (a) naphthylamine hydrochloride on acetonitrile at 165° (Bernthsen a Trompeter, *B.* 11, 1758) —B'HCl soluble prisms —B'H₂PtCl₆ small yellow tables —B'H₂C₂O₄ small crystals —B'H₂SO₄ white crystals —B HNO₃ oil

Di (a)-naphthyl-acetamidine $C_{22}H_{15}N_2$ \pm $CH_3C(NO_2H)NHC_{10}H_7$ Formed from (a)-naphthylamine (6 mols), AcCl (3 mols), and PCl₅ (Hofmann, *J* 1865, 415) Resinous

Di-(β)-naphthyl acetamidine
 $CH_3C(NO_2H)NHC_{10}H_7$ [168°] Formed by heating (β) naphthylamine (6 mols) with AcCl (3 mols) and PCl₅ (1 mol) at 150° (Maschke, *O C* 1886, 824)

(a)-NAPHTHYL-ACETIC ACID $C_{17}H_{13}O_2$ \pm $C_{10}H_7CH_2CO_2H$ [131°] Prepared by heating (a)-naphthyl-glyoxylic acid with HI and P (Boessneck, *B.* 16, 641) Long silky needles Sol alcohol, ether, acetic acid, benzene, and hot water, al sol cold water

Amides $C_{10}H_7CH_2CONH_2$ [181°] (B), [154°] (W) Formed from the acid (B) and perhaps also by the action of yellow ammonium sulphide on (a) naphthyl methyl ketone (Willgerodt, *B.* 21, 534) Colourless needles, sol benzene, acetic acid, ether, CS₂, and hot water

Nitrile $C_{10}H_7CH_2CN$ (above 300°). Formed from the amide and P₂O₅ Oil

DI-NAPHTHYL-ACETYLENE

$C_{10}H_7CC_2H_5$ [225°] (above 360°) Obtained by distilling *exo* di chloro di naphthyl-ethylene or *exo*-tri chloro di naphthyl-ethane (1 pt) with soda-lime (10 pts) (Grobowski, *B.* 11, 801) Long silky needles (from alcohol)

(a) NAPHTHYL-ACRYLIC ACID $C_{17}H_{13}O_2$ \pm $C_{10}H_7CH=CHCO_2H$ (a) *Naphthocinnamic acid* [207°] (L), [212°] (B) S 014 Obtained by heating naphthoic aldehyde (2 pts) with sodium acetate (1 pt) and Ac₂O (20 pts) at 170° (Lugl, *G.* 11, 894, Brandis, *B.* 22, 2155) Needles, m. sol. hot water, v sol. alcohol and ether Oxidised by KMnO₄ to naphthoic aldehyde and naphthoic acid Combines with bromine form-

ing $C_{10}H_7CHBrCHBrCO_2H$ [189°]. HBr at 100° yields $C_{10}H_7CHBrCHBrCO_2H$ [216°] —CaA', plates —BaA', needles —CuA', —AgA': white pp, blackening on exposure

NAPHTHYL-ALLYL-THIO UREA $C_{17}H_{13}N_2S$ \pm $C_{10}H_7NHCSNHC_2H_5$ [145°] Formed from (a) naphthylamine and oil of mustard (Zinin, *A.* 84, 346, Prager, *B.* 22, 3000) Crystals, insol water, v sol alcohol and ether

Dinaphthyl-allyl ψ -thiourea v Di NAPHTHYL-IMIDO THIO CARBAMIC ETHER

(a) NAPHTHYL-AMIDO-ACETIC ACID

$C_{17}H_{13}NO_2$ \pm $C_{10}H_7NHCH_2CO_2H$ *Naphthyl-glycocol* [199°] (B a N), [198°] (J), [192°] (M) Formed from (a) naphthylamine, chloroacetic acid, and NaOAc at 100° (Bischoff a Nastvogel, *B.* 22, 1808, Jolles, *B.* 22, 2372, Mauthner, *M.* 10, 251, Forte, *G.* 19, 361) Needles, insol water, almost insol ether, al sol alcohol, v sol acetone Forms a platinumchloride and a nitrosamine The Ca salt distilled with calcium formate gives a product crystallising in colourless plates [163°] —CaA', 3aq tufts of needles —BaA', 2aq —CuA', small plates —AgA' aq silvery plates

Anhydride $(C_{10}H_7NHCH_2CO)_2O$ [269°] Formed by heating the acid at 230° Scales, insol ether, sol alcohol

Acetyl derivative [154°] —BaA', 6aq

(β) Naphthyl-amido acetic acid

$C_{17}H_{13}NHCH_2CO_2H$ [135°] Formed by heating (β) naphthylamine (2 mols) with a solution of chloroacetic acid (1 mol) at 100° (Jolles, *B.* 22, 2372, Bischoff, *B.* 23, 2005) Minute crystals (from water), v sol alcohol, ether, and HOAc Yields a nitrosamine $C_{17}H_{13}N(NO)CH_2CO_2H$ crystallising from MeOH in reddish plates [126°]

Salts —The Ag salt decomposes on drying in the air (β) Naphthylamine salt $C_{10}H_7NH_2HA'$ [116°] Needles

(a) NAPHTHYL AMIDO-CROTONIC ACID

Ethyl ether $C_{10}H_7NHCH(Me)CHCO_2Et$ [45°] Formed by the action of acetoacetic ether on (a) naphthylamine (Conrad a Lampach, *B.* 21, 531) White silky needles, sol ether and benzene Yields on heating to 240° (Py 13) oxymethyl (a)-naphthoquinoline, with elimination of alcohol

(β) Naphthyl-amido-crotonic acid *Ethyl ether* $C_{10}H_7NHCH(Me)CHCO_2Et$ [66°] Formed by the action of acetoacetic ether on (β) naphthylamine at 100° (Conrad a Lampach, *B.* 21, 532) Large prisms (from alcohol) Yields (Py 13) Oxy methyl (β)-naphthoquinoline on heating to 240°

(β)-NAPHTHYL AMIDO-ETHYL OXIDE

$C_{17}H_{13}NO$ \pm $C_{10}H_7OC_2H_4NH_2$ Formed by the action of alcoholic ammonia on the chloroethyl ether of (β) naphthol (Koelle, *B.* 13, 1955) Amorphous mass —B'HCl aq. needles —B'H₂PtCl₆ needles

(a)-NAPHTHYL-AMIDO-METHYL-MALON-

AMIC ACID $CH_2C(NHC_2H_5)(CO_2H)(CONH_2)$

Ethyl ether A'Et [159°] Formed by dissolving α -cyano- α -(a)-naphthyl-amido-propionic ether (*q v*) in conc H_2SO_4 (Gerson, *B.* 19, 2969) Long white needles, al sol cold water, more easily in hot water with a beautiful green fluorescence, v sol alcohol and ether

(a) - NAPHTHYLAMIDO - (β) - NAPHTHO-QUINONE (a)-naphthylamide $C_{10}H_7N_2O$ *ts.*

$C_{10}H_7(NHC_6H_5) < \overset{O}{\underset{||}{N}} C_6H_5$, [178° cor] Formed from (a) naphthoquinone oxim and (a) naphthylamine (Brömme, B 21, 394) Forms a violet solution in alcohol and a blue solution in conc H_2SO_4 . Gives a green colour on heating with H_2SO_4 .

(β) Naphthyl-amido (β) naphthoquinone (β)-naphthylamide $C_{10}H_7(NHC_6H_5) < \overset{O}{\underset{||}{N}} C_6H_5$

[247°] Formed by heating di bromo (a)-naphthol with (β) naphthylamine (Meldola, C J 45, 160) Dull, reddish, fibrous needles. Feebly basic. Insol alcohol, but dissolves when boiled with alcohol and HCl, forming a violet solution. Dissolves in hot toluene or chloroform, giving a reddish brown liquid.

DI-(a) NAPHTHYL DI AMIDO-OIAZTHIOLE

$C_{22}H_{14}N_4S$ *ts* $S < \overset{C(NHC_6H_5)}{\underset{C(NHC_6H_5)}{N}} N$ [136°] Obtained by oxidising (a) naphthyl thio urea with hydrogen peroxide and dilute HClAq (Hector, B 23, 359) Crystallises from alcohol in white needles containing HOEt (1 mol) and melting at 104° Insol water. Cyanogen, passed into its warm solution, forms $C_{22}H_{14}N_4SCyN_4$ [203°]

Salts — $B^+H^+PtCl_6^-$ [225°] — **Picrate** $B^+C_6H_4(NO_2)_3OH^- + EtOH$ [below 100°] Small yellow grains — $B^+AgNO_3^-$ Pp, insol alcohol

Acetyl derivative $C_{22}H_{14}AcN_4S$ [263°] Needles (from alcohol)

Benzoyl derivative $C_{22}H_{14}BzN_4S$ [270°]**Di (β) naphthyl di-amido oiazthiole**

$C_{22}H_{14}N_4S$ [100°–117°] Prepared from (β)-naphthyl thio urea and H_2O_2 . Grey powder (from alcohol), more sol alcohol than the (a)-isomeride. Cyanogen passed into its warm alcoholic solution forms $C_{22}H_{14}N_4SCyN_4$ [200°] — $B^+H^+PtCl_6^-$ Begins to decompose at 236°–240° — $B^+C_6H_4(NO_2)_3OH^-$ [178°] Yellow powder, sl sol alcohol — $B^+AgNO_3^-$ white pp

Acetyl derivative $C_{22}H_{14}AcN_4S$ [203°] Needles (from alcohol)

Benzoyl derivative $C_{22}H_{14}BzN_4S$ [247°]

(β) NAPHTHYL PHENYL-AMIDO ETHYL OXIDE $C_{18}H_{11}NO$ *ts* $C_{10}H_7OCH_2NHC_6H_5$ [75°] Formed by the action of aniline on the chloro ethyl ether of (β) naphthol (Koelle, B 13, 1955)

TRI (β) NAPHTHYL - TRI AMIDO TRI-PHENYL CARBINOL $(C_{10}H_7NH C_6H_5)_3COH$ Formed by heating para rosaniline with (β) naphthylamine (Meldola, C N 47, 133, 147) Dyes wool or silk blue

TRI - NAPHTHYL - TRI - AMIDO - TRI-PHENYL CARBINYL CHLORIDE $C_{10}H_7N_3Cl$ *ts* $(C_{10}H_7NH C_6H_5)_3CCl$ C_6H_5NHCl $C_{10}H_7$ Phenyl-

(a) naphthylamine blue. Formed by heating phenyl (a) naphthylamine with oxalic acid (Hausdörfer, B 23, 1965) Dark brown powder, v sol hot aniline, sl sol cold alcohol, insol ether and benzene

NAPHTHYL-AMIDO-ISOSUCCINAMIC ACID

(a)-NAPHTHYLAMINE $C_{10}H_7N$ *ts* $C_{10}H_7 < \overset{C(NH_2)}{CH} \overset{OH}{CH} = CH$ **Naphthalamine** **Naphthal-amine** Mol w 148 [50°]. (300°) V.D (at

194°) 72.6 (calc 71.5) (Eykmann, B 22, 2757) S. 167 in the cold (Ballo, B 3, 875)

Formation — 1 By reduction of nitro-naphthalene by alcoholic ammonium sulphide (Zinin, J pr 27, 143), by iron and acetic acid (Béchamp, A Ch [3] 42, 186, Schützenberger a Willm, C R 47, 82, Ballo, B 3, 288, 673), or by tin or zinc and HClAq (Böttger, D P J 173, 480) — 2 By heating (a) naphthol with four times its weight of ammoniacal $CaCl_2$ to 270° for 8 hours, the yield being 74 p.c (Benz, B 16, 14, cf Calin, B 15, 616)

Preparation — Granulated nitronaphthalene (600 kilos) is slowly added to a warm mixture of iron borings (800 kilos), hydrochloric acid (40 kilos), and some water. The mixture is agitated and kept at about 50° by blowing in steam for 7 hours, after which milk of lime (containing 50 kilos of CaO) is added. The mixture is distilled in a current of superheated steam (Witt, Chem Industrie, 10, 215)

Properties — White silky needles, with powerful odour. May be sublimed. V sol alcohol and ether. Colours pine wood yellow. When not quite pure it rapidly becomes coloured in the air. Does not turn red litmus blue. Aqueous solutions of its salts give a blue pp with $FeCl_3$, $AgNO_3$, auric chloride, platinum chloride, $SnCl_4$, $HgCl_2$, chromic acid, H_2O_2 , and other oxidising agents (Pina, A Ch [3] 31, 217, 78, 64, Schiff, A 101, 92, Wurster, B 22, 1910) This blue pp, 'oxynaphthylamine' $C_{10}H_7NO$, is amorphous, v sol chloroform, and not reduced by SO_2 (Schiff, A 129, 255). If to a solution of (a) naphthylamine in alcohol or HOAc there be added a small quantity of nitrous acid and a little HClAq an intense purple colour is produced (Liebermann, A 183, 265)

Reactions — 1 Heated with $ZnCl_2$ or $CaCl_2$ at 280° it splits up to some extent into NH_3 and dinaphthylamine — 2 Distillation over PbO yields naphthazine — 3 Boiling chromic acid mixture oxidises it to naphthoquinone, phthalic acid, and other products (Reverdin a Nöling, B 12, 2306) — 4 Heated with nitro naphthalene and some HClAq at 200° it yields 'tri naphthylene diamine' $C_{30}H_{18}N_4$ (Salzmänn a Wichelhaus, B 9, 1107) — 5 Urea (1 pt) heated with (a)-naphthylamine (2 pts) at 120° forms only dinaphthyl urea, but both mono and di naphthylureas are formed on heating (a) naphthylamine hydrochloride with urea at 160° (Pagliani, G 9, 28) — 6 Cyanic acid forms (a) naphthyl urea — 7 Alkyl-thio-carbimides form alkyl naphthylthio ureas — 8 Alcoholic CS_2 forms di naphthylthio urea — 9 MeOH and $ZnCl_2$ at 190° form the methyl ether of (a) naphthol (Hantzsch, B 13, 1347) — 10 (a) naphthylamine hydrochloride heated with o-amido-azo-compounds yields azine colouring matters (eurydines) — 11 Readily converted into naphthalene by diazotising, and pouring the alkaline solution of the diazo-compound into a solution of $SnCl_4$ in aqueous NaOH (Friedländer, B 22, 587) — 12 SiF_4 in benzene solution forms minute crystals of $Si(NHC_6H_5)_4$ (Reynolds, C J 55, 482) — 13 The bisulphite warmed with benzoic aldehyde forms $C_{10}H_7CH_2NO_2$, a yellow powder (Papasogli, A 171, 188) — 14 Benzoic aldehyde and pyruvic acid form the compound $C_{10}H_7 < \overset{N^+O^+}{C} \overset{N^+O^+}{C} (CO_2H) > OH$ crystallising in yellow

needles [300°] (Doebner & Kuntze, *A* 249, 109)
 15 *Benzil* reacts on heating, forming the compounds $C_6H_5C(NC_6H_5)_2$, CO , C_6H_5 , [139°] and $C_6H_5C(NC_6H_5)_2C(NC_6H_5)_2$, C_6H_5 , [219°] both crystallising in yellow needles (Bandrowsky, *M* 9, 685) — 16 *a* cone boiling aqueous solution of *alloxan* forms a compound $C_{10}H_7N_3O_4$, which separates in transparent white needles, insol water, and coloured green by H_2SO_4 . Alkalis convert it into a crystalline acid $C_{10}H_7N_3O_5$ (Pellizzari, *G* 17, 409) — 17 *Cyanuric chloride* forms $N_3C_6Cl_3(NHC_6H_5)_3$, [149°], $N_3C_6Cl_3(NHC_6H_5)_2$, [215°], or $N_3C_6(NHC_6H_5)_3$, [228°], according to the proportions used (Fries, *B*, 19, 242, *C* *J* 49, 314) — 18 *Citraconic acid* at 145° forms $C_{10}H_7N_3C_6H_5O_4$, [143°] (360°) (Morawski & Glaser, *M* 9, 284) — 19 *Itaconic acid* heated with (a) naphthylamine in aqueous solution forms $C_{10}H_7N_3COCH_2CH_2COOH$, a white crystalline powder [206°], m sol hot alcohol (Scharfenberger, *A* 254, 151) — 20 *Chloro acetic ether* in ethereal solution forms $C_{10}H_7NO_2Cl$, crystallising in prisms [75°] (Bender, *B* 20, 2750)

Salts — B^+HCl^- Needles (by sublimation) or scales (from alcohol), v e sol water, alcohol, and ether — $B^+H_2PtCl_6^-$ yellow pp, sl sol water — B^+HBr^- — $B^+H_2SO_4^-$ — $B^+H_2SO_4^-$ 2aq — $B^+HNO_3^-$ scales — $B^+H_2C_2O_4^-$ stellar groups of small laminae — $B^+H_2C_2O_4^-$ nodules Yields on distillation $C_6O_2(NHC_6H_5)_2$ and the formyl derivative $CHO.NHC_6H_5$, (Zinn, *A* 108, 228) — $B^+H_2PtCl_6^-$ crystals (Scholtz, *M* 1, 905) — $B^+H_2SO_4^-$ pearly rosettes — *Citraconate* [99°] Formed by mixing solutions of (a) naphthylamine and citraconic acid in benzene (Morawski & Glaser, *M* 9, 285) — *Phenate* $B^+C_6H_5OH^-$ [30 1°] Formed by heating phenol with (a) naphthylamine (Dyson, *C* *J* 43, 468) Needles (from light petroleum) — *Benzene sulphate* [225°] (Norton & Westenhof, *Am* 10, 129) — *Toluene p-sulphonate* [239°] (Norton & Otten, *Am* 10, 140)

Formyl derivative $C_{10}H_7NH(COH)$ [139°] White silky needles (Tobias, *B* 15, 2447)

Acetyl derivative $C_{10}H_7NHAO$ [159°] Formed from the base by treatment with $AcCl$, Ac_2O , or $HOAc$ (Rother, *B* 4, 850, Tommasi, *C* *R* 76, 1267, Liebermann, *A* 183, 229) Formed also by heating (a) naphthol with ammonium acetate White silky needles, sl sol boiling water, v sol alcohol On heating with sulphur the products are ethenyl amido-naphthyl mercaptan and $C_{10}H_7<N>C<S>C<S>C_{10}H_7$, which crystallises in yellow plates [above 300°] (Hofmann, *B* 20, 1801) The only products of the nitration of acetyl-(a)-naphthylamine are the o- and p-nitro-derivatives of melting points [199°] and [190°] respectively, the supposed isomeride of melting-point [170°] is a molecular compound of the o- and p- bodies, and the so called 'β- and δ-nitroacetonaphthalides' are diacetyl derivatives of the same two nitro-(a) naphthylamines (Lellmann & Remy, *B* 19, 796) Chlorine passed into its solution in $HOAc$ forms $C_{10}H_7Cl_2NHAO$ [214°] (Cleve, *B* 20, 448)

Chloro-acetyl derivative $C_{10}H_7NClO$ *ts.* $C_{10}H_7NHCOCH_2Cl$ [121°] Formed from

naphthylamine and chloro acetyl chloride (Tommasi, *Bl* [2] 20, 21, Abenius, *J* pr [2] 40, 437) Silky needles

Thioacetyl derivative $C_{10}H_7NHCSCH_3$, [96°] (B & T), [111°] (J) Formed by heating (a) naphthyl acetamidine with CS_2 for several hours at 100° (Berntsen & Trompeter, *B* 11, 1760) Formed also by heating acetyl (a) naphthylamine with P_2S_5 (Jacobsen, *B* 20, 1897) White tables Gives $C_{10}H_7NHCH_2CH_2$ on reduction Oxidised by K_2FeCy_6 to ethenyl amido naphthyl mercaptan $C_{10}H_7<N>C<S>COH$

Benzoyl derivative $C_{10}H_7NHBz$ [156°] (W), [162°] (Kühn, *B* 18, 1477), [160°] (Hofmann, *B* 20, 1798) Colourless needles, v sol dilute alcohol, sl sol absolute alcohol and water (Ebell, *B* 7, 1317, 8, 562, Worms, *B* 15, 1814) Yields on nitration $C_{10}H_7(NO_2)NHBz$ [224°] PCl_5 converts it into $C_{10}H_7NCCl_2CH_3$, [60°] (Just, *B* 19, 984)

Thiobenzoyl derivative $C_{10}H_7NHSC_6H_5$, [148°] Formed from the benzoyl derivative by heating with P_2S_5 , or from (a) naphthyl acetamidine by heating with CS_2 (B & T, J) Yellowish needles or plates. Oxidised by K_2FeCy_6 to benzenyl amido naphthyl mercaptan

(a) Naphthylamine ar-tetrahydride $C_{10}H_{11}NH_2$, *ts.* $CH_2CH_2C(NH_2)CH$ CH_2CH_2COH — CH (275°) at 713 mm SG d_{20}^{20} 1.0625 Formed by the action of sodium on a solution of (a) naphthylamine in isomyl alcohol (Bamberger, *B* 20, 2916, 21, 1789) Thick colourless oil, sl sol water, v sol alcohol and ether, insol $NaOHAq$ Less basic than the (β)-isomeride Reduces Ag from hot solutions, but does not reduce Fehling's solution Readily diazotised Aqueous $NaNO_2$ (1 mol) acting on its hydrochloride (1 mol) at 0° forms $C_{10}H_{11}N_2C_6H_5NH_2$ (Bamberger & Lengfeld, *B* 23, 1134) Yields dyes with diazo-compounds $KMnO_4$ oxidises it to adipic acid

Salts — B^+HCl^- dimetric plates, v sol water and alcohol — $B^+HClHgCl_2^-$ flat white plates, sl sol cold, v sol hot water — $B^+H_2SO_4^-$ 1aq — *Picrate* yellow needles

Acetyl derivative $C_{10}H_{11}NHAO$ [158°] Needles, v sol ether, chloroform, and alcohol

(a)-Naphthylamine ac tetrahydride

$C_6H_5<CH(NH_2)CH_2$ — CH_2 (246.5°) at 714 mm. Formed by adding a 10 p.c solution of $CuSO_4$ slowly at 100° to a solution of amido naphthylhydrazine tetrahydride derived from (1,4') naphthylene diamine (Bamberger & Bammann, *B* 22, 968) Liquid, sol cold water, v sol hot water, alcohol, and ether Unlike its 'aromatic' isomeride it turns red litmus blue It cannot be diazotised Does not yield dyes with diazo-compounds $FeCl_3$ has no effect in the cold, but on warming produces a reddish-brown colour $K_2Cr_2O_7$ and H_2SO_4 give no colour. $KMnO_4$ oxidises it, in cold dilute solution, to o-carboxy β phenyl-propionic acid [166°] — B^+HCl^- needles, v e. sol water — $B^+H_2PtCl_6^-$ 2aq. [190°] Orange prisms, sol water — $B^+HNO_3^-$ [139°] Needles, v e sol water — $B^+H_2CO_3^-$ needles — *Picrate* needles, sol hot water.

Acetyl derivative $C_{10}H_{11}NHAO$, [146°] Prisms or needles, sl sol cold water

(β) Naphthylamine $C_{10}H_7N$ α
 $C_{10}H_7 \begin{smallmatrix} \text{CH} \text{CH} \text{NH}_2 \\ \text{CH} \text{CH} \end{smallmatrix}$ [112°] (294°) (Liebemann
 a. Jacobson, *A* 211, 41)

Formation—1 From the acetyl derivative of (α) naphthylamine by successive bromination, nitration, elimination of Ac, removal of NH_2 by the diazo reaction, and reduction of the resulting bromo nitro naphthalene by tin and HCl_{aq} (Liebemann & Scheiding, *A* 183, 258)—2 By heating (β)-naphthol with ammonia zinc chloride at 200°, di (β) naphthylamine being also formed (Merz & Weith, *B* 13, 1300)—3 By passing dry ammonia over strongly heated (β)-naphthol (Graebe, *B* 13, 1850)—4 By heating (β) naphthol with four times its weight of ammoniacal $CaCl_2$ (prepared by passing NH_3 over ordinary granulated $CaCl_2$ containing about 18 p.c. of H_2O) for 8 hours at 270°–280°, the yield being 80 p.c. on the naphthol, together with 12 p.c. of (β)-dinaphthylamine (Benz, *B* 16, 8)—5 In small quantity, together with a large quantity of dinaphthylamine, by heating (β)-naphthol with ammoniacal $ZnCl_2$ (*B*)

Preparation—1 By passing NH_3 under pressure into (β) naphthol at 150°–160°—2 By heating (β) naphthol (10 pts) with $NaOH$ (4 pts) and NH_4Cl (4 pts) (*G P* 14,612 [1880])

Properties—White plates (from water) with out odour Volatile with steam Gives no colouration with $FeCl_3$, chromic acid, or bleaching powder Its alcoholic solution is not coloured by nitrous acid and HCl

Reactions—1 Heated with PbO it gives azo naphthalene (Volodkevitch, *Bl* [2] 45, 178)—2 $SiCl_4$ forms $SiCl_2(NHC_{10}H_7)_2$ (Horden, *C J* 51, 40) A benzene solution of $SiCl_4$ forms $Si(NH C_{10}H_7)_4$ (Reynolds, *C J* 55, 481)—3 With *paraldehyde*, *acetone*, and HCl it gives dimethyl (β) naphthoquinoline (Reed, *J pr* [2] 35, 298)—4 With *methylal*, *acetone*, and HCl it forms methyl (β)-naphthoquinoline, (β) naphthoacridine and a base, $C_{10}H_7N_2$, which is probably methyl amido naphthyl naphthoquinoline dihydride $C_{10}H_7 \begin{smallmatrix} \text{CMe} \text{CH} \\ \text{NH} \text{CH} \text{C}_6\text{H}_4\text{NH}_2 \end{smallmatrix}$ This base [203°

uncor] forms the following derivatives $B''C_6H_4(NO_2)_2OH$ — $B''Et_2I_2$ — $C_6H_5N_2O$, [α 238°] (*R*)—5 *Cyanuric chloride* forms $C_6N_2Cl_2(NHC_{10}H_7)_2$ [154°], $C_6N_2Cl_2(NHC_{10}H_7)_2$ [278°], and $C_6N_2(NHC_{10}H_7)_3$ [209°] (Fries, *B* 19, 2056)—6 *Benzonic aldehyde* in hot alcoholic solution forms $C_{10}H_7CHNC_6H_5$ [103°] which may be reduced by sodium amalgam to $C_{10}H_7CH_2NHC_6H_5$ [68°] which forms a nitros amine $C_{10}H_7CH_2N(NO)C_6H_5$ [112°] (Claisen, *A* 237, 272, Kohler, *A* 241, 360)—7 *Benzil* at 215° forms $C_{10}H_7CH(OH)C(NC_{10}H_7)_2$ C_6H_5 crystallising from alcohol in yellow prisms [130°] (Voigt, *J pr* [2] 34, 22)—8 The compound of *glyoxal* with $KHSO_4$ yields $C_{10}H_7NSO_4K$ crystallising in white plates (Hinsberg, *B* 21, 110)—9 *Malic acid* reacts on heating, forming the compounds $C_{10}H_7O(CO NHC_6H_5)_2$ [263°] and $C_{10}H_7N \begin{smallmatrix} \text{CO} \text{CH} \text{OH} \\ \text{CO} \text{CH}_2 \end{smallmatrix}$ [193°] (Bischoff, *B* 23, 2046)—10 *Pyruvic acid* and *benzoic aldehyde* form $N C_{10}H_7 \begin{smallmatrix} \text{C} \text{CO} \text{H} \\ \text{CPh} \text{CH} \end{smallmatrix}$ (Doebner, *A* 249, 109)

11. *Quinone chlorimide* acts on an alcoholic solution forming a eurdiodine of the formula

$C_{10}H_7 \begin{smallmatrix} \text{N} \\ \text{C}_6\text{H}_4\text{NH}_2 \end{smallmatrix}$ (Nietzki & Otto, *B* 21, 1598)—12 *Chloro-acetic acid* forms $C_{10}H_7NHCH_2CO NHC_6H_5$ [170°] (Cosiner, *B* 14, 60)

Salts— $B'HCl$ colourless plates, v e sol water and alcohol, sl sol HCl_{aq} — $B''H_2PtCl_6$ yellow plates, sol water— $B''H_2SO_4$ plates, m sol cold water— $B'HNO_3$ colourless plates, sl sol cold water—*Picrate* [195°] Long yellow needles, v sol alcohol—*Citrate* $B''C_6H_5O_7$ [89°] (Hecht, *B* 19, 2616)—*Citraconate* [173°] Yellow needles (from acetone) (Morawski & Glaser, *M* 9, 285)

Compounds with metallic salts $B''CuSO_4$ (Lachovitch, *M* 9, 516) Forms also a compound with mercuric chloride

Formyl derivative $C_{10}H_7NHCHO$ [120°] (*O*, Tobias, *B* 15, 2447) [129°] (*L* & *J*) Formed by heating (β) naphthylamine with formic ether and alcohol (Cosiner, *B* 14, 58), or with formic acid (Liebemann & Jacobson, *A* 211, 42) Small plates, sl sol hot water

Acetyl derivative $C_{10}H_7NHAc$ [132°] Long needles or plates, sol hot water (Merz & Weith, *B* 13, 1300, 14, 2343) On heating with sulphur it yields $C_{10}H_7 \begin{smallmatrix} \text{N} \\ \text{C} \text{C} \end{smallmatrix} \begin{smallmatrix} \text{N} \\ \text{S} \end{smallmatrix}$ $C_{10}H_7$

crystallising in yellow plates, insol most solvents sol nitrobenzene (Hofmann, *B* 20, 1804) Bromine in $HOAc$ forms $C_{10}H_7BrNHAc$ [140°] (Lellmann & Schmidt, *B* 20, 3154)

Thio acetyl derivative $C_{10}H_7NS$ v e $C_{10}H_7NHCSCH_3$ [146°] Formed by heating the acetyl derivative with P_2S_5 (Jacobson, *B* 21, 2627) Needles or plates (from alcohol) Oxidised by K_2FeCy_4 to ethenyl amido naphthyl mercaptan $C_{10}H_7 \begin{smallmatrix} \text{N} \\ \text{S} \end{smallmatrix} \text{CMe}$ [81°]

Valeryl derivative $C_{10}H_7NHCOOC_4H_9$ [138.5°] (Bamberger & Muller, *B* 21, 1112)

Benzoyl derivative $C_{10}H_7NHBz$ [143°] (Cosiner, *B* 14, 58), [157°] (Hofmann, *B* 20, 1803) Minute needles, sol ether, benzene, and hot alcohol PCl_5 converts it into the compound $C_{10}H_7NCClC_6H_5$ [68°] (Just, *B* 19, 983)

(β) Naphthylamine *ar*-tetrahydride $C_{10}H_{11}N$ $\begin{smallmatrix} \text{CH}_2\text{CH}_2\text{CCHCNH}_2 \\ \text{CH}_2\text{CH}_2\text{CCHCNH}_2 \end{smallmatrix}$ [38°] (276°) at 713mm

Formed to the extent of 3 or 4 p.c. in the preparation of the alicyclic isomeride by reduction of (β) naphthylamine (Bamberger & Kitschelt, *B* 23, 882) Neutral in reaction Its salts are acid in reaction May be diazotised Yields adipic acid on oxidation

(β) Naphthylamine *ac* tetrahydride

$C_6H_5 \begin{smallmatrix} \text{CH}_2\text{CHNH}_2 \\ \text{CH}_2\text{CH}_2 \end{smallmatrix}$ (162°) at 36 mm, (249.5 cor) at 710 mm SG 1.031 Formed by reducing (β) naphthylamine with sodium and isoamyl alcohol (Bamberger & Muller, *B* 20, 2916, *B* 21, 850, 1115, Bamberger & Kitschelt, *B* 23, 877) Purified by dissolving in ligroun and ppg by CO_2 The carbonate is then dissolved in acetic acid, which leaves a brown oil Colourless liquid, smelling like piperidine, sl sol cold, m sol hot water, v sol alcohol and ether Powerful base with alkaline reaction, displacing ammonia from its salts Absorbs CO_2 from the air Possesses no reducing power Carbon disulphide at 0° forms tetrahydronaphthyl amine

nium tetrahydronaphthyl thio carbamate $C_{10}H_{11}NH_2$, 8 OS $NHCO_2H$, [142°] Phenyl cyanate forms $PhNH.CO.NH.C_{10}H_{11}$ [166 5°] Does not yield colouring matters with diazo compounds Powerful midratic poison $KMnO_4$ oxidises it to o-carboxy phenyl-propionic acid and phthalic acid Benzoz aldehyde forms $C_{10}H_7CH.NCO_2H$, [52°] $HBr.Aq$ at 160° forms naphthalene

Salts— $B'H_2CO_3$, and $B'H_2CO_3$, are white crystalline pps, giving off CO_2 in the air— $B'HCl$ [237°] Plates, v e sol water and alcohol— $B'H_2PtCl_6$ — $B'HAuCl_4$ — $B'HClHgCl_2$ (?) [241°] Prisms, sol hot water— $B'H_2SO_4$ — $B'H_2CrO_4$ — $B'HNO_3$, [212°] White satiny tables, sl sol cold water, v sol conc HNO_3 , At 220° it dissociates with explosive violence— $B'HNO_3$, [c 160°] Needles (from water), v e sol water, insol ether Not decomposed by boiling water— $B'HOAc$ [156°] Thick mono clinic crystals, v sol alcohol, sl sol ether

Acetyl derivative $C_{10}H_{11}NHAc$ [107°] Prisms, v e sol chloroform and benzene, v sol hot water, m sol ether, insol petroleum ether Not attacked by bromine in the cold

Benzoyl derivative $C_{10}H_{11}NHBz$ [151°] Needles, v sl sol water, v sol benzene

Di-(a)-naphthylamine $C_{20}H_{19}N$ e ($C_{10}H_9$) $_2NH$ [111° uncor] (L), [113°] (G a V) (318°) at 15 mm

Formation—1 By heating (a)-naphthylamine hydrochloride with (a) naphthylamine (Girard a Vogt, *Bl* [2] 19, 68)—2 A product in the preparation of methyl (a)-naphthylamine from (a)-naphthylamine and $MeCl$ (Landshoff, *B* 11, 638)—3 By heating (a)-naphthol with four times its weight of ammoniacal $ZnCl_2$ to 260°, the yield being about 60 p c (Benz, *B* 16, 15)—4 By heating a mixture of (a)-naphthylamine, (a)-naphthol, and $CaCl_2$ to 260°, the yield being 22 p c (B)—5 In small quantities by heating (a)-naphthylamine with $CaCl_2$ or $ZnCl_2$

Properties—Dimetric leaflets (from alcohol), m sol alcohol, v e sol ether $FeCl_3$ gives a green pp in its alcoholic solution

Picric acid compound
 $NH(C_{10}H_7)_2.2C_6H_3(NO_2)_3OH$ [169°] Small glistening black needles

Acetyl derivative $NAc(C_{10}H_7)_2$ [217°]

Nitrosamine $(C_{10}H_7)_2NNO$ [262°] Formed by adding rather more than the theoretical quantity of powdered $NaNO_2$ to a solution of di-naphthylamine in $HOAc$ (L, Wacker, *A* 243, 800) Yellow crystalline powder, v sl sol alcohol and $HOAc$ On adding alcoholic HCl to its ethereal solution it is changed to the isomeric nitroso dinaphthyl amine $C_{10}H_7(NO)NH.C_{10}H_7$, or $C_{10}H_7.NH(C_{10}H_7)O$ [169°] (Fischer a Hepp, *B* 20, 1248)

(aβ) Di-naphthyl amine $NH(C_{10}H_7)_2$ [111°]

Formed by heating a mixture of (β)-naphthol and (a)-naphthylamine with $CaCl_2$ or $ZnCl_2$

Preparation—A mixture of (β)-naphthol (100 pts), (a)-naphthylamine (100 pts), and $CaCl_2$ (200 pts), is heated for 8 hours to 280°, the yield is 70 pts (Benz, *B* 16, 17). Long colourless prisms Soluble in benzene, alcohol, and ether, sparingly soluble in petroleum-ether

Picric acid compound
 $NH(C_{10}H_7)_2.2C_6H_3(NO_2)_3OH$ [178°], small dark brown needles

Acetyl derivative $NAc(C_{10}H_7)_2$, [125°].
Di-(β)-naphthyl amine $NH(C_{10}H_7)_2$, [171°]. (471°) (Ris, *B* 20, 2619)

Formation—1 Together with (β) naphthylamine by heating (β) naphthol with ammonia zinc chloride at 200° (Merz a Weith, *B* 13, 1300)—2 In small quantity by heating (β)-naphthol with ammoniacal $CaCl_2$ —3 By heating (β)-naphthylamine with $CaCl_2$ or $ZnCl_2$

Preparation—1 By heating a mixture of (β)-naphthylamine (100 pts), (β) naphthol (100 pts), and damp $CaCl_2$ (200 pts) for 8 hours at 275°, the yield being good (130 pts) (Benz, *B* 16, 9)—2 By passing HCl into fused (β)-naphthylamine at 180°, the yield being quantitative (Klopsch, *B* 18, 1585)

Properties—White silvery leaflets, sol benzene and $HOAc$, sl sol hot alcohol Its solutions exhibit blue fluorescence

Reactions—1 Conc $HCl.Aq$ at 150° has no action, but at 200° it forms (β) naphthol and (β) naphthylamine (Ris, *B* 19, 2016)—2 Ammoniacal $ZnCl_2$ and NH_4Cl at 370° forms (β)-naphthylamine $(C_{10}H_7)_2NH + NH_3 = 2C_{10}H_7NH_2$ 3 Bromine in $HOAc$ forms a tetra bromo derivative $C_{20}H_{17}Br_4N$ [246°] Bromine and $AlBr_3$ form $C_{20}H_{17}Br_4N$ [over 300°] (Ris, *B* 20, 2621)—4 S_2Cl_2 , acting on its benzene solution at 35°, forms two isomeric imido di-naphthyl disulphides $NH(C_{10}H_7)_2S_2$, one crystallising from benzene in plates [205°], and the other in needles [220°] (Kym, *B* 21, 2807)—5 Phosgene acts in the cold, forming $(C_{10}H_7)_2NCOCl$ [173°] (Kuhn a Landau, *B* 23, 511, cf Kym, *B* 23, 427). This chloro formyl derivative is v sl sol cold alcohol, v sol benzene, and reconverted into di-(β) naphthylamine by alcoholic potash

Salts— $B'HCl$, white crystalline pp— $B'2C_6H_3(NO_2)_3OH$ [165°] Brown needles

Acetyl derivative $(C_{10}H_7)_2NAc$ [115°] Small colourless needles

Benzoyl derivative $(C_{10}H_7)_2Nbz$ [157°] Large needles (Klopsch, *B* 18, 1585)

Nitrosamine $(C_{10}H_7)_2NNO$ [140°] Needles, m sol alcohol and ether, v sol benzene (Ris, *B* 20, 2622)

References—BROMO-, BROMO NITRO, CHLORO, IODO, IODO NITRO, and NITRO NAPHTHYLAMINE

(a) -NAPHTHYLAMINE (a) -SULPHONIC ACID $C_{10}H_7NSO_3$, e $C_{10}H_7(NH_2)(SO_3H)$ [1 4] *Naphthionic acid* *S* 022 at 15°

Formation—1 By boiling nitro naphthalene (1 pt) with alcohol (5 pts) and aqueous ammonium sulphite (5 pts of SG 1.24), and maintaining an alkaline reaction by frequent addition of ammonium carbonate (Piria, *A Ch* [3] 31, 217, *A* 78, 81)—2 By heating the acid sulphate of (a)-naphthylamine (Neville a Winther, *C J* 37, 632, Witt, *B* 19, 55)—3 By heating (a) naphthylamine (1 pt with H_2SO_4 (4 pts) at 120° for an hour (Schaal a Schmidt, *B* 7, 1868, Erdmann, *A* 247, 313)—4 By heating (a) naphthylamine with $KHSO_4$ at 230° (Eischoff, *B* 23, 1913)—5 By reducing the corresponding nitro-naphthalene sulphonic acid by ammonium sulphide (Cleve, *B* 28, 961)

Properties—Small needles (containing $\frac{1}{2}eq$)

NAPHTHYLAMINE SULPHONIC ACID.

(from hot water), blackened by heat without melting. \forall sol alcohol, almost insol water. Not affected by boiling aqueous acids or alkalis. Dilute solutions of its salts exhibit violet fluorescence. The azo-colouring matters (e.g. Congo red), formed by its combination with diazo-compounds give on reduction *o*-naphthylene-diamine sulphonic acid, proving that they are *ortho*-azo-compounds, and hence that the HSO_3 group occupies the *para*-position to the NH_2 (Witt, *B* 19, 1719).

Reactions—1 Split up by water at 160° into naphthylamine and H_2SO_4 (N a W)—2 *Chromic acid mixture* forms a brown resinous product—3 *Benzonic aldehyde*, acting on its sodium salt forms $\text{C}_6\text{H}_5\text{OH}$, $\text{C}_6\text{H}_5\text{SO}_3\text{Na}$, crystallising in yellow plates, \forall sol cold water (Erdmann, *A* 247, 325)—4 *Succinic acid* heated with its K salt at 170° forms $\text{C}_6\text{H}_5\text{C}_2\text{O}_2\text{N}$, $\text{C}_6\text{H}_5\text{SO}_3\text{K}$, crystallising from water or dilute alcohol in small needles (containing 2aq) (Pellizzari, *A* 248, 157)—5 *Phthalic anhydride* heated with the K salt at 160° forms $\text{C}_6\text{H}_5\text{C}_2\text{O}_2\text{N}$, $\text{C}_6\text{H}_5\text{SO}_3\text{K}$, crystallising from hot water in small needles (containing 3aq) (P)—6 On displacing NH_2 by Cl, and distilling the resulting chloro naphthalene sulphonic acid with PCl_5 , there is formed (1,4)-di-chloro naphthalene.

Salts— KA' small micaceous laminae, \forall sol water and alcohol, sl sol KOH aq — NaA' 4aq monoclinic prisms— BaA' 8aq— CaA' 8aq, monoclinic crystals, \forall sol water, almost insol alcohol— MgA' 8aq monoclinic prisms— MgA' 10aq— PbA' 2aq, needles, sl sol water— ZnA' 2aq— CuA' 2aq— AgA' aq crystalline grains— $\text{AgA}'\text{N}_2\text{H}_5$ 2aq.

Amide $\text{C}_{10}\text{H}_7(\text{NH}_2)\text{SO}_2\text{NH}_2$ [206°] Formed by reducing the amide of (1,4) nitro naphthalene sulphonic acid with HI in HOAc and P (Cleve, *B* 23, 361). Needles (from alcohol)— B'HCl colourless needles, \forall sl sol water.

Acetyl derivative of the amide $\text{C}_{10}\text{H}_7(\text{NHAc})\text{SO}_2\text{NH}_2$ [241°] Small needles (a) Naphthylamine (α') sulphonic acid $\text{C}_{10}\text{H}_7(\text{NH}_2)(\text{SO}_3\text{H})$ [14°] S 1064 at 15° .

Formation—1 By reducing (a) nitro naphthalene sulphonic acid by ammonium sulphide (Laurent, Cleve, *Bl* [2] 24, 511)—2 Together with naphthionic acid by adding (a)-naphthylamine hydrochloride (1 pt) at 0° to (2 pts of) fuming H_2SO_4 (containing 25 p.c. additional SO_3) (Witt, *B* 19, 578, Mauzelius, *B* 20, 3401). 3 Together with a small quantity of the (1,4) acid from the acetyl derivative of (a) naphthylamine and fuming H_2SO_4 (Erdmann, *A* 247, 315, G Schultz, *B* 20, 3161, cf Lange, *B* 20, 2940).

Properties—Needles. Solutions of its salts exhibit green fluorescence, and reduce AgNO_3 on warming. Auric chloride, FeCl_3 , and CuSO_4 colour its solution red, and suffer reduction. By boiling its diazo-compound with HCl a chloro naphthalene sulphonic acid is obtained, the K salt of which on distillation with PCl_5 yields (γ)-di-chloro naphthalene [107°] (M). Benzoic aldehyde, acting on its sodium salt, forms $\text{C}_6\text{H}_5\text{CH}_2\text{N}$, $\text{C}_6\text{H}_5\text{SO}_3\text{Na}$, crystallising in pearly plates, decomposed by boiling water (Erdmann, *A* 247, 826).

Salts— KA' aq needles or prisms, \forall e sol. water— NaA' aq plates (O) or needles (M).—

NaA' 5aq plates (W)— BaA' 8aq (W)— BaA' 6aq (C, M)— CaA' 6aq (W) pearly plates, \forall e sol water— CaA' 9aq (C, M) tables, \forall sol hot water— MgA' 8aq plates, \forall sol water— PbA' 4aq 'nodules'— ZnA' 9aq needles, m sol cold water— AgA' .

Amide [260°] Tables. Yields an acetyl derivative [232°] and a diacetyl derivative [200°] (Ekborn, *B* 23, 1119)— B'HCl — $\text{B'H}_2\text{SO}_4$.

(a) Naphthylamine *para*-sulphonic acid $\text{C}_{10}\text{H}_7(\text{NH}_2)(\text{SO}_3\text{H})$ [11°] Naphthylamine sulphonic acid S 42 at 100° , 0207 at 21° . Formed, together with the (1,4') acid from naphthalene (a) sulphonic acid by nitration and reduction (Mensching, Schillkopf's *Aniline Co*, G P 40,571, G Schultz, *B* 20, 3162). Formed also, together with the (1,4') acid, from (a)-nitro-naphthalene by sulphonation and reduction (Cleve, *B* 20, 1535). White needles (from water) or tufts of needles (from HOAc). Its sodium salt is less soluble than that of the preceding isomeride. FeCl_3 colours its cold aqueous solution violet. The diazo-compound treated with PCl_5 gives $\text{C}_{10}\text{H}_7\text{ClSO}_3$, crystallising in yellow needles [175°]— NaA' S 267 at 100° , 113 at 24° — KA' Plates S 149 at 100° , 356 at 19° (Erdmann, *A* 247, 306).

Anhydride $\text{C}_{10}\text{H}_6\langle\text{SO}_2\text{NH}\rangle$ [167°] Small crystals, \forall sl sol water (Cleve).

(a) Naphthylamine (δ) sulphonic acid $\text{C}_{10}\text{H}_7(\text{NH}_2)(\text{SO}_3\text{H})$ [$12'$ or $3'$] S 2 at 15° , 7 at 100° . Obtained by heating (a) naphthylamine (1 pt) with conc H_2SO_4 (5 pts) at 125° – 130° for 8 hours until the naphthionic acid at first formed has disappeared (Hirsch, *B* 21, 2370). Plates, sl sol water and alcohol, insol ether and benzene. The K salt is crystalline, and sl sol cold water. Gives, on treatment with HNO_3 and HNO_2 , di-nitro naphthol sulphonic acid isomeride with naphthol yellow S.

(a) Naphthylamine (β' -sulphonic acid $\text{C}_{10}\text{H}_7(\text{NH}_2)(\text{SO}_3\text{H})$ [13°] Formed, together with its (γ) and (δ) isomerides, from naphthalene (β)-sulphonic acid by successive nitration and reduction (Cleve, *Bl* [2] 26, 447, *B* 20, 1535). Slender needles (containing 2aq) or anhydrous tables, sl sol cold, \forall sol hot, water— NaA' 4aq thin tables— KA' aq needles— MgA' 10aq rhombohedra— BaA' aq flat needles, m sol water— CaA' 7aq rhombohedra.

Anhydride $\text{C}_{10}\text{H}_6\langle\text{NH}\text{SO}_2\rangle$ [180°] Formed by treating the chloride of (β') nitro naphthalene (β) sulphonic acid with HI and HOAc . Yellow needles, \forall sl sol HOAc .

(a) Naphthylamine (γ) sulphonic acid $\text{C}_{10}\text{H}_7(\text{NH}_2)(\text{SO}_3\text{H})$ [13°] Formed, with isomerides, from naphthalene (β) sulphonic acid by nitration and reduction (Cleve, *B* 19, 2181, 21, 3271). Small needles, sl sol water. Gives rise to a di-chloro-naphthalene [61°].

Salts— NaA' scales, \forall sol water— BaA' aq thin plates, \forall sol water— PbA' aq prisms— AgA' aq minute needles.

Amide $\text{C}_{10}\text{H}_7(\text{NH}_2)\text{SO}_2\text{NH}_2$ aq. [181°]. Needles— B'HCl prisms, sl sol cold water. With potassium cyanate it forms $\text{NH}_2\text{CO NH C}_6\text{H}_5\text{SO}_3\text{NH CO NH}_2$ [273°].

Acetyl derivative of the amide
 $C_{10}H_7(NHAc)SO_2NH_2$ [221°].

Anhydride $C_{10}H_7\langle\begin{smallmatrix} NH \\ SO_2 \end{smallmatrix}\rangle$ [124°] Formed from (γ)-nitro naphthalene (β) sulphonic chloride, HOAc, and HI (Cleve, *B* 20, 1536) Lemon-yellow needles, v sl sol HOAc and alcohol.

(α)-Naphthylamine (θ)-sulphonic acid
 $C_{10}H_7(NH_2)(SO_3H)$ [1 2°] Formed, with isomerides, from naphthalene (β) sulphonic acid by nitration and reduction (Cleve, *Bl* [2] 29, 415, *B* 21, 3264) Crystals (containing aq) Gives rise to di chloro-naphthalene [61°] Its alcoholic solution yields with nitrous acid a deep violet dye $SO_3H.C_{10}H_7.N_2.C_{10}H_7(NH_2)SO_3H.2\frac{1}{2}aq$

Salts —NaA' 3aq thin needles, v sol water —CaA' 2aq powder, v sol water, turning red in air —BaA' flat needles —ZnA' 4aq needles
Amide $C_{10}H_7(NH_2)SO_2NH_2$ [181°] Needles. B'HCl aq —B'HI aq Yields the urea derivative $NH_2.CO.NH.C_{10}H_7.SO_2.NH.CO.NH_2$ [225°]

Acetyl derivative of the amide
 $C_{10}H_7(NHAc)SO_2NH_2$ [213°]

Anhydride $C_{10}H_7\langle\begin{smallmatrix} NH \\ SO_2 \end{smallmatrix}\rangle$ [173°] Formed from (θ) nitro naphthalene (β) sulphonic chloride, HOAc, and HI (Cleve, *B* 20, 1536) Yellow needles, sol boiling Ac_2O

(β) Naphthylamine 'α'-sulphonic acid
 $C_{10}H_7(NH_2)(SO_3H)$ [2 1°] 'Badische acid' S 599 (Forsling)

Formation —1 By heating (β) naphthylamine (1 pt) with conc H_2SO_4 (3 pts) at 100°–105° for 5 or 6 hours there is obtained a mixture of the 'α', 'β', (γ), and (δ) sulphonic acids of (β) naphthylamine in the proportion of about 50 p.c. of the 'α' acid, 40 p.c. of the 'β' acid, 5 p.c. of the (γ) acid, and 5 p.c. of the (δ) acid (Green, *C* J 55, 35, cf Badische Anilinfabrik, *G* P 14,612, 20,760, Dahl, *G* P 29,084, 32,271, 32,276) The same mixture heated at 120° gives a greater quantity of the 'β' acid, and less of the 'α' acid Fuming sulphuric acid (20 p.c. SO_3 extra) at 70°–80° gives 30 p.c. of the 'α' and 70 p.c. of the (γ)-acid (β) Naphthylamine sulphate, shaken with conc H_2SO_4 for three days in the cold, yields a similar mixture (Dahl) but on heating (β) naphthylamine with conc H_2SO_4 for an hour at 160° the 'β' and (δ) acid are formed in about equal quantities (Bayer a Duisberg, *B* 20, 1426, *G* Schultz, *B* 20, 1358) —2 By heating the (β) naphthol 'α' sulphonic acid (of Bayer) with ammonia in a closed vessel (Pätzinger a Duisberg, *B* 22, 396, cf Landshoff, *B* 16, 1931)

Properties —Needles or broad tables, v sl sol water, insol alcohol Solutions of its salts exhibit blue fluorescence

Reactions —1 Yields naphthalene (α) sulphonic acid when its amido-group is removed by the diazo-reaction (P a D, Nietzki a Zübelen, *B* 22, 453) —2 Yields by Sandmeyer's method a bromo-naphthalene sulphonic acid which can be converted into di bromo naphthalene [75°] (Forsling, *B* 22, 619) —3 Yields by Skraup's method (β)-naphthaquinoline sulphonic acid, which may be oxidised to $\langle\begin{smallmatrix} CO \\ C,NH \end{smallmatrix}\rangle.C_{10}H_7.SO_3H$, showing that the naphthylamine sulphonic acid is heteronuclear (Immerheiser, *B* 23, 402, 412, cf Armstrong a Wynne, *C* J. Proc 4, 108, 5,

49)—4 Heating with H_2SO_4 (8 pts) at 160° for $1\frac{1}{2}$ hours converts it into a mixture of the 'β' and (δ) isomerides (Weinberg, *B* 20, 3353) —5. Reacts with diazobenzene sulphonic acid, forming a yellow diazo amido- and not an azo-compound (Witt, *B* 21, 3483) —6 On conversion into the corresponding chloro naphthalene sulphonic acid and treatment of this with PCl_5 there is formed di-chloro naphthalene [61 5°]

Salts (Forsling, *B* 20, 2099) —NaA' plates, v. sol water, insol alcohol —KA' $\frac{3}{2}$ aq tables, v sol water — NH_4A' large prisms, v sol water —BaA' 4aq columns, v e sol water *S* 4 35 in the cold —CaA' 6aq tables. *S* 9 09 in the cold —MgA', $3\frac{1}{2}$ aq nodules, v e. sol water —ZnA' 6aq columns —PbA', needles —CuA', crystalline powder —AgA'

(β) Naphthylamine 'β' sulphonic acid
 $C_{10}H_7(NH_2)(SO_3H)$ [2 3°] 'Brönner's acid'

Formation —1 By heating the corresponding (β) naphthol sulphonic acid with ammonia under pressure (Farbfabrik vormals Brönner, *G* P 22,547), or by passing a current of ammonia over the potassium (β) naphthol sulphonate at 200°–250° (Landshoff, *B* 16, 1931, Green, *B* 22, 723) —2 Together with the 'α', (γ), and (δ) isomerides by heating (β) naphthylamine (1 pt) with conc H_2SO_4 (3 pts) at 105° (Bayer a Duisberg, *B* 20, 1426, Green, *C* J 55, 35) —3 By heating (β) naphthylamine with $KHSO_4$ at 230°, the yield being 60 p.c. of the theoretical (Bischoff, *B* 23, 1914) 4 The chief product obtained by heating (β)-naphthylamine acid sulphate at 200°

Properties —Plates or flat needles, sl sol warm water (Schultz, *B* 20, 3158) According to Forsling the laminar crystals contain aq Its solution exhibits blue fluorescence Yields, by conversion into diazo naphthalene sulphonic acid and application of Sandmeyer's reaction a chloro naphthalene sulphonic acid whence PCl_5 forms $C_{10}H_7Cl_2$ [136°]

Salts (Forsling, *B* 20, 76) — NH_4A' aq large thin plates, v sl sol water, forming a solution exhibiting violet fluorescence (Green) —NaA' 2aq flat needles *S* 2 5 at 15° —KA' aq long needles *S* 2 4 —BaA' 6aq needles *S* 22 at 15° —CaA' 6aq laminæ *S* 4 4 in the cold —MgA' 6aq laminæ or broad needles —PbA' 2aq v sl sol water —ZnA' 4aq —CuA' 4aq sl sol water —AgA' aq powder

(β) Naphthylamine (γ) sulphonic acid
 $C_{10}H_7(NH_2)(SO_3H)$ [2 4°] *Dahl's acid* *S* 077 in the cold (F). Formed by sulphonating (β) naphthylamine, and is the chief product when the sulphonation is carried out at 15° to 20° (Dahl, *G* P 32,276, Forsling, *B* 20, 2099, Claus, *J* pr [2] 89, 315) Small plates or needles, insol alcohol Its solutions show blue fluorescence May be converted into di chloro naphthalene [48°] Conc H_2SO_4 (3 pts) at 160° converts it into a mixture of the 'β' and (δ) isomerides (Weinberg, *B* 20, 3353)

Salts — NH_4A' exceedingly soluble tables KA' aq rhombohedra, v e sol water —NaA' 5aq tables, v e sol water —BaA' 2 $\frac{1}{2}$ aq nodules, v e sol water —CaA' 11aq needles *S* 9 09 in the cold —AgA' 8aq crystalline

(β)-Naphthylamine (δ) sulphonic acid
 $C_{10}H_7(NH_2)(SO_3H)$ [2 2°] (β)-Naphthylamine sulphonic acid *F. Bayer's acid* *S* 2857.

Formation.—1. Together with the 'β' isomeride, by heating (β)-naphthylamine with H_2SO_4 at 160°–170° (Bayer a Duisberg, *B* 20, 1426, 3158, Schultz, *B* 20, 1858, 8161) It is also formed when the sulphonation is conducted at temperatures between 105° and 160°, the quantity increasing with the temperature (Green, *C J* 55, 86) —2 By heating the corresponding (β)-naphthol sulphonic acid with ammonia at 200° (Weinberg, *B* 20, 2908, Erdmann, *B* 21, 637), or by heating naphthalene 'α' disulphonic acid with NaOH at 250°, and afterwards with NH_4Cl (Weinberg, *B* 20, 2906, 3353) —3 By heating the 'α' or (γ) isomeride with H_2SO_4 at 160° (B a D)

Properties.—Long silky needles (containing aq), m sol hot water nearly insol cold water On boiling with water the needles change to an almost insoluble crystalline powder With tetra-azo diphenyl it gives a yellowish red colouring matter (β-purpurn) Yields by the diazo reaction the (β) naphthol sulphonic acid of Weinberg, which by fusion with NaOH is converted into dioxynaphthalene [129°] Gives rise to (β) di chlorio naphthalene [114°]

Salts.— KA' needles, v sol water — NaA' 4aq white needles (from water) or plates (from hot 90 p c alcohol), v e sol hot water, S 14 in cold water, v sol hot spirit (90 p c) (difference from 'α' isomeride) — $\text{NH}_4\text{A}'$ small plates, m sol water — BaA' 4½aq plates, sl sol cold water (difference from (γ) isomeride) — MgA' aq white needles (B a D) — MgA' 5aq (W) — CaA' 6aq plates, with blue fluorescence S 38 at 15°

(α) Naphthylamine v sulphonic acid

$\text{C}_{10}\text{H}_7\text{NHSO}_3\text{H}$ *Thionaphthamic acid* Formed, together with the (1, 4) acid, by the action of ammonium sulphite on (α) nitro naphthalene (Piria, *A* 78, 54) The free acid, liberated from its salts, splits up at once into naphthylamine and H_2SO_4 — KA' pearly plates, v sol water, sl sol KOHAq — $\text{NH}_4\text{A}'$ plates, sl water and alcohol — BaA' 3aq plates — PbA' (OAc)

(α) Naphthylamine 'α' disulphonic acid

$\text{C}_{10}\text{H}_7\text{NS}_2\text{O}_6$, i.e. $\text{C}_{10}\text{H}_7(\text{NH}_2)(\text{SO}_3\text{H})_2$ [1 3 3'] Formed by reducing (α) nitro naphthalene 'α' disulphonic acid by ammonium sulphide (Alén, *Bn* 2, 407) Crystals, v e sol water and alcohol, insol ether and benzene Yields (α)-naphthylamine on treatment with sodium amalgam — $\text{NH}_4\text{HA}'$ 2aq (?) slender needles — KHA' 3aq needles, m sol hot water — CaA' 5aq — BaA' 4aq tables, m sol water — PbA' 4aq (?)

(α) Naphthylamine 'β' disulphonic acid

$\text{C}_{10}\text{H}_7(\text{NH}_2)(\text{SO}_3\text{H})_2$ [1 3 2'] Obtained by reducing (α) nitro naphthalene 'β' disulphonic acid (Alén) Small needles (from water), v sol water, sl sol alcohol Yields (α) naphthylamine on treatment with sodium amalgam — $\text{NH}_4\text{HA}'$ needles, m sol hot water — KHA' needles — CaA' 2aq — BaA' aq minute needles, sl sol water — PbA'

(α) Naphthylamine (δ)-disulphonic acid

$\text{C}_{10}\text{H}_7(\text{NH}_2)(\text{SO}_3\text{H})_2$ [1 1' 4] *Naphthylamine δ-sulphonic acid S* (Sohollkopf's *G P* 40,571) Formed by sulphonating (1, 1') naphthylamine sulphonic acid — NaA' 2aq long needles (Bernthsen, *B* 23, 8090)

(α) Naphthylamine (ε)-disulphonic acid

$\text{C}_{10}\text{H}_7(\text{NH}_2)(\text{SO}_3\text{H})_2$ [1 3 1'] Formed by heating naphthalene with conc H_2SO_4 at 90° and fuming

H_2SO_4 at 100°–120°, then nitrating, and reducing the product (*G P* 45,776, 46,953, Bernthsen, *B* 22, 8328) Formed also from naphthalene (αδ) disulphonic acid (corresponding to $\text{C}_{10}\text{H}_7\text{Cl}_2$ [48°]) by nitration and reduction (Ewer a Pick, *Monat scient* 1889, 604, cf Armstrong a Wynne, *C N* 54, 255) Colourless scales (containing 3aq), v e sol warm water — NaHA' 2aq needles or thin prisms, sl sol cold water — NaA' 6aq needles or prisms, v e sol water — BaA' 3aq — BaA' 4aq flat needles, v sol hot, m sol cold, water — $\text{Ba}(\text{HA}')_2$ 5aq minute needles, sl sol cold water

(α) Naphthylamine disulphonic acid

$\text{C}_{10}\text{H}_7(\text{NH}_2)(\text{SO}_3\text{H})_2$ [1 4 2'] S 7 at 20°, 5 at 100° Formed, together with two isomeric acids, by sulphonating (α) naphthylamine (1 pt) with H_2SO_4 (containing 25 p c SO_3 extra) (5 pts) at 120° The acids are separated by treatment of the lime salts with dilute alcohol, which dissolves the salts of the two isomeric acids (Dahl & Co, *G P* 41,957, Armstrong a Wynne, *C J Proc* 6, 125) Formed, together with a smaller quantity of the following acid, by treating (α)-naphthylamine 'α'-sulphonic acid (1 pt) with H_2SO_4 containing SO_3 (1½ pts) at 30° Groups of needles, insol 85 p c alcohol Its solutions and those of its salts exhibit blue fluorescence

Salts.— KA' 3aq — NaA' 3aq v sol water CaA' aq v sl sol water

(α) Naphthylamine disulphonic acid

$\text{C}_{10}\text{H}_7(\text{NH}_2)(\text{SO}_3\text{H})_2$ [1 4 3'] S 17 at 20° Formed in the preparation of the preceding, from which it may be separated by extracting the mixed calcium salts with dilute alcohol Alcohol of 90 p c extracts the salt of a third isomeride, subsequent treatment with alcohol of 85 p c extracts the present acid Needles, insol alcohol, v sol boiling alcohol of 85 p c The calcium salt is v sol water, insol alcohol of 90 p c The K and Na salts are v sol water Solutions of the acid and its salts exhibit blue fluorescence

(β) Naphthylamine 'α' disulphonic acid

$\text{C}_{10}\text{H}_7(\text{NH}_2)(\text{SO}_3\text{H})_2$ [2 3 3'] (β) *Naphthylamine R-disulphonic acid* Formed by heating the corresponding (β) naphthol R disulphonic acid with ammonia Readily yields dyes with diazo salts

(β) Naphthylamine (γ) disulphonic acid

$\text{C}_{10}\text{H}_7(\text{NH}_2)(\text{SO}_3\text{H})_2$ [2 1' 3'] (β) *Naphthylamine G disulphonic acid* Formed by heating the corresponding (β) naphthol G disulphonic acid with ammonia Formed also by heating (β) naphthylamine sulphate (10 kilos) with H_2SO_4 (30 kilos containing 25 p c SO_3 extra) at 110°–140° (Gans a Co, *G P* 35,019) v sol water, m sol alcohol Does not react with diazo-compounds (G Schultz, *B* 21, 3487) The salts are v sol water

(β) Naphthylamine disulphonic acid

$\text{C}_{10}\text{H}_7(\text{NH}_2)(\text{SO}_3\text{H})_2$ [2 1 3'] Formed, together with the (2, 1', 3') acid, from (2, 3')-naphthylamine sulphonic acid and H_2SO_4 (with 20 p c SO_3) at 20° (Armstrong a Wynne, *C J Proc* 6, 130) Needles Yields $\text{C}_{10}\text{H}_7\text{Cl}_2$ [92°]

(β) Naphthylamine disulphonic acid

$\text{C}_{10}\text{H}_7(\text{NH}_2)(\text{SO}_3\text{H})_2$ [2 3' 2'] Formed by heating (Brønner's) (β)-naphthylamine 'β'-sulphonic acid at 160° to remove water of crystallisation, adding fuming H_2SO_4 (4 pts) and heating at 110° (Forsling, *B* 21, 3495) Possibly identical with the preceding acid. White needles, v. e.

sol water, sl. sol alcohol Its dilute aqueous solution fluoresces blue It gives rise to a tri-chloro-naphthalene [91°]

Salts— K_2A'' 2aq large needles, v sol water— KHA'' aq needles, sl sol cold water— $NaHA''$ 2aq— Na_2A'' long needles— $(NH_4)_2A''$ aq monoclinic crystals— NH_4HA'' — CaA'' plates

(β)-Naphthylamine disulphonic acid $C_{10}H_7(NH_2)(SO_3H)_2$ [2 1 4'] Formed, together with a greater quantity of the (2, 2', 4')-isomeride from (2, 4') naphthylamine sulphonic acid and H_2SO_4 (with 20 p.c. SO_3) at 20° (A & W) Yields $C_{10}H_7Cl_2$ [78°]

(β)-Naphthylamine disulphonic acid $C_{10}H_7(NH_2)(SO_3H)_2$ [2 2' 4'] Formed as above. Yields $C_{10}H_7Cl_2$ [80°]

(β)-Naphthylamine disulphonic acid $C_{10}H_7(NH_2)(SO_3H)_2$ [2 3 2'] Formed from the corresponding naphthol disulphonic acid

Di-NAPHTHYL-ANTHYLENE $C_{22}H_{12}$ \pm $C_{10}H_6$ C ||| (?) [270°] Formed by distilling di- $C_{10}H_6$ C

naphthyl-acetylene, or by distilling (β) di naphthyl-tri-chloro-ethane (1 pt) with ZnO (15 pts) (Grabowski, B 11, 302) Large leaflets (by sublimation)— $C_{22}H_{12}C_6H_4(NO_2)_2OH$ crystals (from chloroform)

NAPHTHYL ARSENIOSULFONIC ACID Described as *Naphthalene arsenic acid*, vol 1 p 322

NAPHTHYL-BENZAMIDINE $C_{17}H_{13}N$ \pm $C_{10}H_7C(NH)NHC_6H_5$ [141°] Formed by heating (α) naphthylamine hydrochloride with benzonitrile at 200° (Bornthsen a Trompeter, B 11, 1757) Tables (from alcohol), may be sublimed—B HCl white prisms— $B_2H_3PtCl_2$ yellow needles— BH_3CO_2 prisms, sl sol water—Chromate yellow pp

(α) NAPHTHYL-BENZYL AMINE $C_{17}H_{15}N$ \pm $C_{10}H_7NHCH_2Ph$ [67°] Formed from (α) naphthylamine and benzyl chloride (Froté a Tommasi, B [2] 20, 67)

(β)-Naphthyl-benzyl-amine $C_{10}H_7NHCH_2Ph$ [68°] Formed by reducing $C_{10}H_7NCHPh$ (Köhler, A 241, 358) Prisms

Nitrosamine $C_{10}H_7N(NO)CH_2Ph$ [112°] Yellow needles, sol alcohol and ether

(α)-NAPHTHYL-BENZYLIDENE-AMINE $C_{10}H_7NCHPh$ [78°] Formed from (α) naphthylamine and benzoic aldehyde or hydrobenzamide (Lachovitch, M 9, 695, cf Papasogli, A 171, 138) Yellow needles (from alcohol)

(β)-Naphthyl-benzylidene-amine [101°] Resembles the preceding in preparation and properties (Claisen, A 237, 261)

NAPHTHYL BENZYL KETONE v BENZYL NAPHTHYL KETONE

NAPHTHYL BENZYL OXIDE v BENZYL NAPHTHYL OXIDE

NAPHTHYL BROMO-METHYL KETONE $C_{12}H_9BrO$ \pm $C_{10}H_7COCH_2Br$ Obtained by adding bromine (9.5 g) to a solution of naphthyl methyl ketone (10 g) in CS_2 (Fampel a Schmidt, B 19, 2898) Pungent oil

(α)-NAPHTHYL-CARBAMATE $C_{11}H_9NO_2$ \pm $C_{10}H_7OCO NH_2$ [158°] Formed from (α) naphthol and $HCO NH_2$ (Gattermann, A 244, 48). Needles (from alcohol)

(β)-Naphthyl carbamate [187°] From (β) naphthol and $OICONH_2$ (G). Long needles, almost insol. water, v. sol alcohol and ether.

(α)-NAPHTHYL-CARBAMIC ACID *Ethyl ether* $C_{11}H_{11}NO_2$ \pm $C_{10}H_7NHCO_2Et$ [79°] Formed from (α) naphthylamine and $ClCO_2Et$ (Hofmann, B 3, 657) Needles, insol water

Isopropyl ether $C_{10}H_7NHCO_2Pr$ [78°] From (α) naphthylamine and $ClCO_2Pr$ (Spica, G 17, 168) Groups of needles, sl sol water

(β) Naphthyl-carbamic acid *Ethyl ether* $C_{10}H_7NHCO_2Et$ [73°] Formed from (β) naphthylamine and $ClCO_2Et$ (Cosiner, B 14, 60) Needles, insol hot water, v sol alcohol

Isopropyl ether $C_{10}H_7NHCO_2Pr$ [70°] Needles, sol alcohol and ether (S)

Di-(β) naphthyl carbamate *Methyl ether* $(C_{10}H_7)_2NCO_2Me$ [114°] Formed from di-(β) naphthylamine and $ClCO_2Me$ at 155° (Ris, B 20, 2620) Needles (from alcohol and ether), v sol cold alcohol and ether

(α)-NAPHTHYL-CARBAMINE $C_{11}H_{11}N$ \pm $C_{10}H_7NO$ Formed from (α) naphthylamine, chloroform, and alcoholic KOH (Liebermann, B 16, 1640) Solid, v sol alcohol

(β) Naphthyl-carbamine $C_{10}H_7NO$ [54°] Formed from (β) naphthylamine, chloroform, and alcoholic potash (Liebermann, B 16, 1640) Needles, sol alcohol, ether, and benzene

(α)-NAPHTHYL *semi* CARBAZIDE $C_{11}H_{11}N_2O$ \pm $C_{10}H_7NHNHCO NH_2$ [231°] Formed by heating (α) naphthylamine hydrochloride with urea at 140° (Pinner, B 21, 1219) Thin plates (from boiling isomyl alcohol), insol water and ether, sl sol dilute alkalis

(β)-Naphthyl-*semi*-carbazide [225°] (P), [221°] (H) Formed like its isomeride, and also by mixing equivalent quantities of (β) naphthylamine hydrochloride and potassium cyanate in aqueous solution (Pinner, B 21, 1223, Hillinghaus, B 22, 2657, Hauff, A 253, 28) Silky plates, sl sol hot water, v sol hot alcohol Reduces Fehling's solution With $HClAq$ at 140° it yields a naphthazine

DINAPHTHYL-CARBAZOLE, so called, is described as *Imido dinaphthyl*

(α) NAPHTHYL CARBINOL $C_{11}H_{13}O$ \pm $C_{10}H_7CH_2OH$ *Naphthobenzyl alcohol* [60°] (301° cor) at 715 mm Formed by warming (α) naphthyl carbinylamine hydrochloride with aqueous $NaNO_2$ (Bamberger a Lodter, B 21, 258) Long needles, v e sol ether and alcohol, v sl sol cold water Yields (α) naphthoic aldehyde on oxidation with chromic acid mixture

(β) Naphthyl-carbinol $C_{10}H_7CH_2OH$ [80 5°] Resembles the preceding in mode of preparation and properties (Bamberger, B 20, 1118)

Tri naphthyl-carbinol $C_{30}H_{21}O$ \pm $(C_{10}H_7)_3COH$ Formed from naphthalene, $C(NO_2)Cl_3$, and $AlCl_3$, the product being boiled with water (Elbs, B 16, 1275) Crystalline powder (from acetone), melting below 278°, v sol benzene, sl sol ether, almost insol alcohol

(α) NAPHTHYL-CARBINYLAMINE $C_{11}H_{11}N$ \pm $C_{10}H_7CH_2NH_2$ *Menaphthylamine Naphthobenzylamine* (292°) Formed, together with *s*-di-naphthyl ethane, by reducing the amide of thionaphthoic acid in alcoholic solution with zinc and $HClAq$ (Hofmann, B 1, 101, Bamberger a Lodter, B 21, 256) Caustic liquid, absorbing CO_2 from the air Reduced in alcoholic solution by Na to the tetrahydride— $B'HCl$ long needles, sl. sol. water— $B'H_2PtCl_6$ crystalline pp— $B'HNO_3$ prisms [148 5°].

Tetrahydride $C_{10}H_7CH_2NH_2$ (270°) at 722 mm. Obtained by reducing the nitrile of (a)-naphthoic acid $C_{10}H_7CN$ in alcoholic solution by sodium (Bamberger & Lodter, *B* 20, 1707) — $BHCl$, white needles, v sol hot water — $B'H.PtCl$, yellow needles, sl sol cold water — $B'C_6H_5(NO_2)OH$ needles, v sol hot water

(β)-Naphthyl-carbonylamine $C_{10}H_7CH_2NH_2$ [60°] Formed from the amide of thio-(β) naphthoic acid $C_{10}H_7CSNH_2$ by treating its alcoholic solution with zinc and HCl at 35° (Bamberger & Lodter, *B* 21, 1117) Prisms, sl sol cold water, v sol alcohol. It is a powerful base, ppg the hydroxides from solutions of salts of copper, zinc, and lead

Salts — $B'HCl$ [260°–270°]. Prisms, v sol alcohol and water, insol ether — $B'H.PtCl$, yellow needles — $B'C_6H_5(OH)(NO_2)$, golden-yellow needles, v sol hot water

Tetrahydride $C_{10}H_7CH_2NH_2$ (270° cor) at 729 mm Formed by adding sodium to a hot alcoholic solution of (β) naphthothionitrile (Bamberger & Boekmann, *B* 20, 1711) Yields an acetyl derivative [65°] (Bamberger & Helwig, *B* 22, 1916) Carbon disulphide reacts forming $C_{10}H_7CH_2NHCS SHNH_2$, $CH_2C_{10}H_7$, [128°], which on boiling with alcohol gives rise to $CS(NHCH_2C_{10}H_7)$, [143°] — $BHCl$ [229°] Needles, v sol water and alcohol With potassium cyanate it gives $CO(NHCH_2C_{10}H_7)$, [226°] and $CO(NH_2)(NHCH_2C_{10}H_7)$, [135°] — $B'H.PtCl$, Needles — $B'H_2CO$, white needles — $B'H_2SO$, Prisms, v sol water — $B'C_6H_5(NO_2)OH$ Yellow prisms, sl sol water

DI NAPHTHYL-TRI CHLORO-ETHANE ν TRI-CHLORO DI NAPHTHYL-ETHANE

(a) NAPHTHYL CYANAMIDE $C_{10}H_7NHCON$ [188°] Formed by heating a solution of oxy-(a) naphthyl thio urea $C_{10}H_7NHCSNH_2$ (Tiemann, *B* 22, 1940)

Di-(a) naphthyl-cyanamide $C_{10}H_7N_2$, s $C_{10}H_7N_2CN$ $C_{10}H_7$, Di-(a) naphthyl carbimide Carbo-di (a) naphthyl imide [94°] Obtained by adding HgO to a boiling solution of di (a) naphthyl thio-urea in dry benzene, the yield being c 30 p c of the theoretical (Huhn, *B* 19, 2405) Large prisms v sol benzene, sl sol cold ether and petroleum ether By heating with dilute alcohol it is converted into di (a) naphthyl-urea H_2S passed into the boiling solution in dry benzene converts it into di-(a) naphthyl thio urea Heated with CS_2 at 200° it yields (a) naphthyl thiocarbimide.

Di-(β)-naphthyl cyanamide $H_7C_{10}N_2CN$ $C_{10}H_7$, Di-(β) naphthyl-carbimide. [146°] Obtained by adding HgO to a boiling solution of di-(β) naphthyl thio urea in dry benzene, the yield being 25 p c of the theoretical (Huhn, *B* 19, 2408) White granular crystals. V sol hot benzene, sl sol ether and petroleum ether By boiling with dilute alcohol it is converted into di (a) naphthyl urea If H_2S is passed into its solution in dry boiling cumene, di-(β)-naphthyl-thio-urea is regenerated With CS_2 at 200° it yields (β)-naphthyl-thio carbimide

(a) - NAPHTHYL - CYANATE $C_{10}H_7NCO$ (270°) Formed in small quantity by heating di-naphthyl-urea with P_2O_5 , and in larger quantity by the like treatment of naphthyl carbamis ether (Hall, *Pr* 9, 366, Hofmann, *Pr* 19, 108; *O* R 47, 425). Pungent liquid. With oxy-azo-

benzene it forms $C_6H_5N_2C_6H_5COONHC_6H_5$, [149°] (Goldschmidt & Rosell, *B* 23, 492)

NAPHTHYL CYANIDE ν NITRILE OF NAPHTHOIC ACID

NAPHTHYL CYANURIC ACID ν Cyanuric acid in the article CYANIC ACIDS

TRI-NAPHTHYL-CYANURATES

($C_{10}H_7$), C_3N_3O , Formed from cyanuric chloride and sodium-naphthyl dissolved in naphthol (Otto, *B* 20, 2239) The (a)- compound decomposes between 160° and 225°, the (β)- compound begins to decompose at 220° Both are powders, sl sol hot water and alcohol, m sol benzene

NAPHTHYLENE-ACETAMIDINE ν NAPHTHYLENE ETHENYL-AMIDINE

ν NAPHTHYLENE DIAMINE $C_{10}H_7N_2$, s $C_{10}H_7(NH_2)_2$ [12] Di amido-naphthalene Amido-naphthylamine Mol w 158 [95°]

Formation — 1 By reduction of p sulpho benzene azo (β)-naphthylamine with tin and HCl (Griess, *B* 15, 2193, Witt, *B* 21, 3482) — 2 By reduction of benzene azo (β) naphthylamine, of (β) naphthalene azo (β) naphthylamine, of the dioxim of (β) naphthoquinone, of (2,1) nitro-(a) naphthylamine, or of (1,2) nitro-(β) naphthylamine (Lawson, *B* 18, 800, 2423, Leuckart, *B* 19, 174, Lellmann & Remy, *B* 19, 803, Bamberger & Schieffelin, *B* 22, 1376)

Properties — Silvery trimetric plates (from hot water), sl sol water, sol alcohol and ether Its ethereal solution quickly turns brown. $FeCl_3$ colours its solution green

Reactions — 1 Phenanthraquinone yields naphthophenanthrazine which forms yellowish white crystals giving a scarlet solution in H_2SO_4 2 Phenyl cyanate in benzene solution reacts forming $C_{10}H_7NHCO NH C_6H_5NH_2$ [335°] and ($C_6H_5NHCO NH$) $C_{10}H_7$ — 3 Phenyl thiocarbimide unites forming ($C_6H_5NHCS NH$) $C_{10}H_7$, [355°–360°] — 4 On heating with excess of oil of mustard in alcoholic solution it yields, in like manner, silky needles of $C_{10}H_7(NHCS NHCH_2C_{10}H_7)$, which decompose at 170°–200° into naphthylene thio urea and di allyl thio urea (Lellmann, *B* 19, 808) — 5 An alcoholic solution of benzil reacts forming di phenyl naphthoquinoxaline $C_{10}H_7 \begin{smallmatrix} < N & CC_6H_5 \\ & N & CO_6H_5 \end{smallmatrix}$, [148°] (Leuckart, *B* 19, 174)

6 o Aldehyde-benzene acid $CHO C_6H_4 CO_2H$ forms $C_{10}H_7 \begin{smallmatrix} < N & NH \\ & N & \end{smallmatrix} C_6H_4 CO_2H$, which decomposes at 280° (Bistreyzky, *B* 23, 1044)

Salts — $B'H_2Cl$, [90°] Prisms or plates v sol water — $B'H_2SO$, white plates, sl sol water — Picrate nearly insoluble powder

Acetyl derivative $C_{10}H_7(NHAc)_2$, [234°] White needles

Propionyl derivative $C_{10}H_7(NHC_2H_5O)_2$, [192°] Formed from the base and propionic anhydride Prisms (from alcohol), insol ether

Benzoyl derivative $C_{10}H_7(NHBz)_2$, [291°] Plates, sl sol alcohol and $HOAc$ (Hinsberg, *A* 254, 256).

ar. Tetrahydride $C_{10}H_7N_2$, s $C_{10}H_7$

$CH_2CH_2C(O(NH_2)C(NH_2))$, [84°], (220°) at $CH_2CH_2COH=CH$

81 mm Formed, together with a smaller quantity of the alicyclic isomeride, by reducing naphthylene-o-diamine with sodium (Bamberger & Schieffelin, *B* 22, 1377). Needles, v sol alcohol, ether, and hot water. Reduces $AgNO_3$. Gives

a red colour with cold aqueous FeCl_3 , KMnO_4 oxidises it to adipic acid

Salts— $\text{B}^+\text{H}_2\text{Cl}_2$ [c 260°] Tables, v sol water— B^+HNO_3 [201°] Plates, m sol water

Acetyl derivative of the tetrahydride
 $\text{C}_{10}\text{H}_8(\text{NHAc})_2$ [245°] Needles, v e. sol alcohol, sl sol ether and cold water

ac-Tetrahydride
 $\text{CH CH C OH}(\text{NH}_2) \text{CH}(\text{NH}_2)$
 $\text{CH CH C CH}_2\text{—CH}_2$ Formed as above
 (B & S) Its hydrochloride and platinochloride crystallise in needles

Naphthylene-p-diamine $\text{C}_{10}\text{H}_8(\text{NH}_2)_2$ [1 4] [120°] (G), [118°] (B & S)

Formation—1 By reduction of naphthalene-azo-(a)-naphthylamine by tin and HCl (Perkin, *C J* 18, 178, *A* 137, 359, Friedlander, *B* 22, 587).—2 By reduction of p-sulpho-benzene azo-(a)-naphthylamine with tin and HCl (Griess, *B* 16, 2192)—3 By reduction of (a) nitro-(a) naphthylamine (Liebermann, *A* 183, 238)—4 By boiling benzene-azo-(a) naphthylamine with zinc dust and water (Bamberger & Schieffelin, *B* 22, 1881)

Properties—Colourless prisms or needles, sl. sol water, sol alcohol and ether Yields (a)-naphthoquinone on oxidation with FeCl_3

Salts— $\text{B}^+\text{H}_2\text{Cl}_2$ white soluble four sided plates, nearly insol HClAq — $\text{B}^+\text{H}_2\text{SO}_4$ needles

Mono-acetyl derivative
 $\text{C}_{10}\text{H}_8(\text{NH}_2)(\text{NHAc})$ Formed by reducing the acetyl derivative of (a)-nitro-naphthylamine with tin and HCl (Liebermann)— B^+HCl long needles— $\text{B}^+\text{H}_2\text{Cr}_2\text{O}_7$,— $\text{B}^+\text{C}_6\text{H}_5(\text{NO}_2)_2\text{OH}$ yellow needles

Di-acetyl derivative $\text{C}_{10}\text{H}_8(\text{NHAc})_2$ [205°] Formed from the base or its mono-acetyl derivative and Ac_2O (Kleemann, *B* 19, 334, B & S) Needles, sl sol alcohol, nearly insol water and ether

Mono-benzoyl derivative
 $\text{C}_{10}\text{H}_8(\text{NH}_2)(\text{NHBz})$ [186°] Formed by reducing $\text{C}_{10}\text{H}_8(\text{NO}_2)(\text{NHBz})$ (Ebell, *A* 208, 326)—Needles— B^+HCl — B^+HNO_3 — $\text{B}^+\text{H}_2\text{SO}_4$

ar-Tetrahydride $\text{CH}_2\text{CH}_2\text{C}(\text{NH}_2)\text{CH}(\text{NH}_2)\text{CH}_2\text{CH}_2\text{C}(\text{NH}_2)\text{CH}(\text{NH}_2)\text{CH}_2$
 The sole product of the reduction of p naphthylene-diamine by sodium (Bamberger & Schieffelin, *B* 22, 1882) Needles, resinified on exposure to air Yields adipic acid on oxidation with KMnO_4 — $\text{B}^+\text{H}_2\text{Cl}_2$ crystalline powder

Acetyl derivative of the tetrahydride
 $\text{C}_{10}\text{H}_8(\text{NHAc})_2$ [285°] Needles, v sl sol cold water, m sol boiling alcohol Reduces ammoniacal AgNO_3 , FeCl_3 colours a solution of its hydrochloride green, changing to brown

Peri-naphthylene-diamine $\text{C}_{10}\text{H}_8(\text{NH}_2)_2$ [1 1] [67°]

Formation—1 By reduction of peri di nitro-naphthalene with iodide of phosphorus and water (De Aguiar, *B* 3, 27, 7, 307, Beilstein & Kuhlberg, *A* 169, 90, Ladenburg, *B* 9, 1651)—2 By reducing di-nitro-(a)-naphthoic acid [265°] with tin and HCl (Ekstrand, *B* 20, 1353, *J pr* [2] 38, 263)—3 By the action of ammonia on peri di oxy-naphthalene at 150°–300° (Erdmann, *A* 247, 368)

Properties—Needles (from dilute alcohol), m sol water Gives a reddish-brown colour and pp with FeCl_3 , NaNO_2 added to a solution of the sulphate ppts red needles of the azimide.

By the diazo-reaction it yields di chloro-naphthalene [84°] Benzoic aldehyde forms $\text{C}_{10}\text{H}_7\text{—}\langle\text{N}=\text{CPh}\rangle\text{—N}(\text{CH}_2\text{Ph})$ (Hinsberg, *B* 22, 861)

Phenanthraquinone does not yield an azine Oxalic ether at 100° yields $\text{C}_{10}\text{H}_8\text{N}_2\text{O}_2$, crystallising from chloroform in red needles, carbonised at 195° (Aguar)

Salts— $\text{B}^+\text{H}_2\text{Cl}_2$ [c 280°] Small plates— $\text{B}^+\text{H}_2\text{SO}_4$ — $\text{B}^+\text{H}_2\text{CO}_3$

(1,4')-Naphthylene diamine $\text{C}_{10}\text{H}_8(\text{NH}_2)_2$ [1 4'] [190°] Formed by reducing the corresponding di nitro naphthalene in alcoholic solution with tin and HCl (Erdmann, *A* 247, 361, of Zinnin, *A* 52, 362, 85, 329, Hollemann, *Z* [2] 1, 555, De Aguiar, *B* 3, 33, 7, 307) Formed also by heating the corresponding di oxy-naphthalene with ammonia at 150°–180°, and finally at 250°–300° (E) Thin white needles, which may be sublimed, sl sol cold water, v sol alcohol FeCl_3 colours its solution bluish-violet Converted by the diazo reaction into di chloro-naphthalene [107°]— $\text{B}^+\text{H}_2\text{Cl}_2$ — $\text{B}^+\text{H}_2\text{I}_2$ — $\text{B}^+\text{H}_2\text{SO}_4$ — $\text{B}^+\text{H}_2\text{C}_2\text{O}_4$

Tetrahydride $\text{CH CH—C CH}(\text{NH}_2) \text{CH}_2$
 $\text{CH C}(\text{NH}_2) \text{C CH}_2\text{—CH}_2$ [77°] (264°) at 60 mm Formed by the action of sodium on a solution of the base in isoamyl alcohol (Bamberger & Hoskyns-Abraham, *B* 22, 944) Prisms (from ether) or needles (from ligroin), sl sol hot water, v sol alcohol FeCl_3 gives a deep reddish-brown colour in its hot solution, but no colour in the cold Boiling $\text{K}_2\text{Cr}_2\text{O}_7$ gives a claret-colour Gives off NH_3 when heated This base can be separated into dextro- and laevo-rotatory varieties by crystallisation of the bitartrate, for on adding a crystal of dextro rotatory conine tartrate, the laevo-rotatory tetrahydro naphthylene diamine tartrate crystallises out, while the mother liquor deposits the dextro-rotatory compound after long standing (Bamberger, *B* 23, 291) The rotatory powers of the two hydrochlorides, $[\alpha]_D$ are –7° 30' and +8° 9' respectively

Reactions
 1 Nitrous acid at 0° forms a diazo-compound which when boiled with water yields $\text{CH CH—C CH}(\text{NH}_2) \text{CH}_2$, the di acetyl derivative of which crystallises in needles [152°] (Bamberger & Bammann, *B* 22, 960)—2 Diazoisation and reduction by SnCl_4 and HCl yields

$\text{CH CH—C CH}(\text{NH}_2) \text{CH}_2$
 the hydrazine $\text{CH C}(\text{NH}_2) \text{C—CH}_2\text{—CH}_2$

3 A dilute ethereal solution of CS_2 forms $\text{C}_{10}\text{H}_8(\text{NH}_2)_2 \text{NH}_2\text{S CS NH C}_{10}\text{H}_7\text{NH}_2$ [145°], the alicyclic amidogen entering into reaction By treatment with PbO this substance is converted into the urea $\text{CO}(\text{NH C}_{10}\text{H}_7\text{NH}_2)_2$ Boiling with alcohol yields $\text{CS}(\text{NH C}_{10}\text{H}_7\text{NH}_2)_2$ [155°]—4 A warm alcoholic solution of CS_2 forms

$\text{C}_{10}\text{H}_7\text{—}\langle\text{NH CS NH}\rangle\text{—C}_{10}\text{H}_7$ [175°], both amidogens taking part in the reaction

Salts $\text{B}^+\text{H}_2\text{Cl}_2$ trimetric prisms, $a b c = 574 \cdot 1 \cdot 906$, v sol water, v. sl. sol alcohol— $\text{B}^+\text{H}_2\text{PtCl}_4$ aq prisms— $\text{B}^+\text{H}_2\text{PtCl}_4$ crystalline solid— $\text{B}^+\text{H}_2\text{SO}_4$ 2aq triclinic prisms *Acetyl derivative* $\text{C}_{10}\text{H}_8(\text{NHAc})_2$ [262° cor] Prisms (from alcohol), sol ether, sl sol boiling water

(2,2') Naphthylene-diamine $\text{C}_{10}\text{H}_8(\text{NH}_2)_2$ [2 2'] [159°] (B. & S.); [161°] (L). Formed by heat-

ing the corresponding di oxy naphthalene [186°] of Ebert and Merz with ammoniacal CaCl_2 at 265° (Lange, *B* 21, Ref 839, Bamberger a Schieffelin, *B* 22, 1884). Plates (from water), v sol boiling water, alcohol, and ether

(2,3'-Naphthylene - diamine $\text{C}_{10}\text{H}_8(\text{NH}_2)_2$ [218°] Formed from di-oxy naphthalene [218°], by heating with ammonia and NH_4Cl at 200°-250° (Lange, *B* 21, Ref 839) Its salts are more soluble than those of the (2,2')-isomeride

m-Naphthylene diamine $\text{C}_{10}\text{H}_8(\text{NH}_2)_2$ [13] Obtained by reducing di nitro naphthalene [144°] with tin and HCl (Urban, *B* 20, 978) A solution of its hydrochloride is coloured yellow by nitrous acid — $\text{B}^{\text{H}}\text{Cl}_2$ v. e sol water, m sol alcohol, insol ether

Acetyl derivative $\text{C}_{10}\text{H}_8(\text{NHAc})_2$ [156°]. Prisms, v sol benzene

Dinaphthylene-amine $\text{C}_{20}\text{H}_{16}\text{N}_2$ s.s.

$\text{C}_{10}\text{H}_7\text{NH} > \text{NH} (?)$ [159° cor] Formed by heating (ββ) dioxy dinaphthyl with ammoniacal zinc chloride (Walder, *B* 15, 2173) White trimetric plates or needles v sol ether, benzene, or acetone, insol dilute acids

Picric acid compound

$\text{C}_{20}\text{H}_{16}\text{N}_2 \cdot 2(\text{C}_6\text{H}_3(\text{NO}_2)_3\text{OH})$ [219° cor] blue-black needles

Acetyl derivative $\text{C}_{20}\text{H}_{16}\text{N}_2\text{Ac}$ [144° uncor], fine white needles, v sol ether, less sol alcohol

Tri naphthylene diamine $\text{C}_{30}\text{H}_{24}\text{N}_6$ s.s. ($\text{C}_{10}\text{H}_7\text{N}_2$)₃ (?) Formed by heating a mixture of naphthylamine, naphthylamine hydrochloride, and nitro naphthalene in molecular proportions for 3 hours at 190°-220° (Salzmänn a Wichelhaus, *B* 9, 1107) Amorphous blue black powder (containing aq), insol water and ether, forming a red solution in warm benzene Begins to decompose at 180° — $\text{B}^{\text{H}}\text{Cl}$ amorphous violet powder

References — Bromo-, Di-chloro-, and ETHENYL-NAPHTHYLENE DIAMINE

o NAPHTHYLENE DIAMINE - 'α'- SULPHONIC ACID

$\text{C}_{10}\text{H}_7\text{N}_2\text{SO}_3$ s.s. $\text{C}_6\text{H}_4 \begin{matrix} \text{C}(\text{NH}_2) & \text{C}(\text{NH}_2) \\ & | \\ & \text{C}(\text{SO}_3\text{H})\text{CH} \end{matrix}$ Formed,

together with benzidine, by reduction of Congo-red Not isolated (Witt, *B* 19, 1719)

o-Naphthylene-diamine 'β'-sulphonic acid $\text{CH CH C}(\text{NH}_2) \text{C}(\text{NH}_2)$ Obtained by

reducing 'gold-brown,' an azo dye obtained from Brönner's (β)-naphthylamine sulphonic acid, and diazobenzene (Witt, *B* 21, 3484) Yellowish-white crystals (from alcohol or ether), v sl sol water Quickly turns brown in air K_2FeCy_4 turns its solution first brown, then yellow FeCl_3 colours its aqueous solution dirty-green Phenanthraquinone bisulphate yields, in presence of NaOAc and HOAc , naphthophenanthrazine sulphonic acid, which dissolves in H_2SO_4 with reddish-violet colour, and which is converted by potash fusion into a eurhodol, forming in H_2SO_4 a solution coloured a pure ultramarine, turned cherry-red by water Naphthylene-diamine 'α'-sulphonic acid acts in the same way, but the compound formed by phenanthraquinone dissolves in H_2SO_4 with bluish-violet colour, and the eurhodol with indigo blue colour, the sul-

phate being ppd as a crimson crystalline powder

o Naphthylene-diamine (γ)-sulphonic acid $\text{CH CH} \text{---} \text{C}(\text{NH}_2) \text{C}(\text{NH}_2)$ Formed by reduction of azo dyes prepared from (β)-naphthylamine (γ) sulphonic acid (of Dahl) (Witt, *B* 21, 8486) Plates, sl sol water (more soluble than the 'β'-isomeride) FeCl_3 colours its solution emerald green The corresponding azines are rendered violet by H_2SO_4 , becoming orange on dilution The eurhodol gives a dark violet solution in H_2SO_4 , becoming cherry-red on dilution, the eurhodol sulphate being deposited in dirty-red flakes

o Naphthylene-diamine (δ) sulphonic acid $\text{SO}_3\text{H C} \text{---} \text{CH C}(\text{NH}_2) \text{C}(\text{NH}_2)$ Obtained by

reducing azo-dyes prepared from (β)-naphthylamine (δ) sulphonic acid (W) Grey powder, more soluble in water than the 'β'-isomeride Occurs also in a gelatinous (?) hydrated condition, v e sol water It resembles the 'β'-isomeride in its reactions with FeCl_3 , with K_2FeCy_4 , and with phenanthraquinone

o Naphthylene-diamine 'α'-disulphonic acid $\text{C}_{10}\text{H}_7(\text{NH}_2)_2(\text{SO}_3\text{H})_2$ [121' or 4'3'] Obtained by reducing benzene azo (β) naphthylamine 'α'-disulphonic acid formed from (β) naphthylamine R disulphonic acid (Witt, *B* 21, 3437) — NaHA'' sandy crystalline powder, v sol water, forming a solution with green fluorescence FeCl_3 gives a green colour Yields lemon yellow sodium naphthophenanthrazine disulphonate, which forms a bluish magenta solution in H_2SO_4 The eurhodol yields a deep greenish blue solution in H_2SO_4 , becoming claret red on dilution

Naphthylene-diamine disulphonic acid $\text{C}_{10}\text{H}_7(\text{NH}_2)_2(\text{SO}_3\text{H})_2$ Formed by reducing di-nitro naphthalene disulphonic acid (Alén, *Bn* 3, 1025) — KHA'' 3aq needles, m sol hot water — $\text{Ba}(\text{HA}'')_2$ 6aq

NAPHTHYLENE-BENZAMIDINE o BENZ ENYL NAPHTHYLENE AMIDINE

NAPHTHYLENE ETHENYL-AMIDINE $\text{C}_{12}\text{H}_{11}\text{N}_2$ s.s. [23] $\text{C}_{10}\text{H}_7 \text{---} \text{N} \begin{matrix} \text{NH} \\ > \end{matrix} \text{CCH}_3$ [168°].

Formed by the action of cold conc alcoholic HCl upon (β) naphthyl ethyl nitrosamine (Fischer a Hepp, *B* 20, 1248) Nodules (from water) Crystallises from methyl alcohol in prisms (containing MeOH) [75°] Sl sol hot water — $\text{B}^{\text{H}}\text{Cl}$ 3aq colourless needles, sl sol water, m sol alcohol — $\text{B}^{\text{H}}\text{PtCl}_4$ 3aq — $\text{B}^{\text{H}}\text{SO}_4$ — $\text{B}^{\text{H}}\text{C}_6\text{H}_4(\text{NO}_2)_3\text{OH}$ needles

Naphthylene ethenyl-amine

[12] $\text{C}_{10}\text{H}_7 \text{---} \text{N} \begin{matrix} \text{N} \\ > \end{matrix} \text{CMe}$ Formed from the acetyl derivative of nitro (β) naphthylamine by reduction with tin and HCl (Liebmann a Jacobson, *A* 211, 67) Formed also by the action of cold alcoholic HCl on (β)-naphthyl-ethyl-amine (Fischer a Hepp, *B* 20, 2472) — $\text{B}^{\text{H}}\text{Cl}$ 2aq needles, v sol water

NAPHTHYLENE-ETHYL-DIAMINE

$\text{C}_{10}\text{H}_7(\text{NH}_2)(\text{NHEt})$ [14] Formed by reducing nitroso-(α) naphthyl ethyl amine with SnCl_4 (Kock, *A* 243, 312) The free base is unstable. It yields (α)-naphthoquinone on oxidation — $\text{B}^{\text{H}}\text{Cl}_2$ [152°] Plates — $\text{B}^{\text{H}}\text{C}_6\text{H}_4(\text{NO}_2)_3\text{OH}$ [180°]. Needles, sl. sol. water and alcohol

DI NAPHTHYLENE-GLYCOL, so called

$C_{20}H_{14}O_2$, \pm $C_{10}H_7C(OH)(?)$ Formed by the action of chloroform and aqueous NaOH on (β)-naphthol (Rousseau, *A Ch* [5] 28, 151). Small crystals, insol water and alkalis, ν sol alcohol, HOAc, and chloroform, ν sol ether

Reactions—1 *Chromic acid mixture* yields crystalline $C_{20}H_{14}O$ [188°]—2 Red hot soda lime forms dinaphthyl [187°]—3 Fuming hydrochloric acid (15 pts) at 160° forms $C_{20}H_{12}Cl_2O$ 3aq crystallising in red needles—4 With fuming hydrobromic acid it forms the corresponding $C_{20}H_{12}Br_2O$ 3aq crystallising in lustrous green plates, whence alcoholic ammonia produces $C_{20}H_{12}(OH)(NH_2)$ crystallising from benzene in needles and forming the crystalline salts $B'H_4Cl_2$, $B'H_4PtCl_6$, and $B'H_4Br_2$. The compound $C_{20}H_{12}Br_2O$ 3aq is converted by hot HOAc into $C_{20}H_{12}BrOHOAc$ crystallising in lustrous green tables and giving off HOAc at 100°—5 *Bromine* in CS_2 forms orange plates of $C_{20}H_{12}Br_2O$ —6 *HIaq* (S G 17) forms, on boiling, crystals of $C_{20}H_{12}I_2O$ —7 Dilute nitric acid (S G 12) forms $C_{20}H_{12}(OH)(NO_2)$, which separates from HOAc as a red crystalline mass $C_{20}H_{12}(OH)(NO_2)HOAc$. Boiling dilute nitric acid forms red needles of $C_{20}H_{12}(NO_2)_2$ [190°]—8 H_2SO_4 (5 pts) at 100° forms $C_{20}H_{12}(OH)(SO_3H)H_2SO_4$ 3aq crystallising in red needles with golden lustre, and separating from HOAc as $C_{20}H_{12}(OH)(SO_3H)HOAc$

Di-acetyl derivative $C_{22}H_{12}(OAc)_2$ [192 5°] Needles, sl sol alcohol, ν sol C_6H_6

Anhydride $C_{20}H_{10}O$ [198 5°] Formed by heating 'dinaphthylene-glycol' with PCl_5 . Formed also by the action of boiling alcohol on the compounds $C_{20}H_{12}Br_2O$ and $C_{20}H_{12}Cl_2O$ (*supra*). Yellow needles (from benzene), almost insol cold alcohol, ν sol boiling benzene. Yields on reduction a compound $C_{20}H_{14}O$

(a)-DI-NAPHTHYLENE KETONE OXIDE

$C_{20}H_{12}O_2$, \pm $C_{10}H_7C(=O)C(=O)C_{10}H_7$ [240°] Formed by boiling (a) naphthyl ethyl carbonate (Bender, *B* 13, 702). Yellow prisms, sl sol alcohol

(b)-Dinaphthylene-ketone oxide (?) $C_{20}H_{12}O_2$

\pm $C_{10}H_7C(=O)C(=O)C_{10}H_7$ [194°] Formed, together with (β)-naphthol, alcohol, and CO_2 , by long boiling of di (β) naphthyl-di ethyl ortho-carbonate ($C_{10}H_7O_2$), $C(OC_2H_5)_2$, its formation is explained by assuming the intermediate formation, by molecular change, of (β) naphthol-carboxylic ether $C_{10}H_7(OH)CO_2Et$, which by elimination of H_2O and di-ethyl carbonate would give dinaphthylene-ketone oxide. Thin colourless prisms (from benzene) ν sl sol alcohol (Bender, *B* 19, 2267)

NAPHTHYLENE MERCAPTAN $C_{10}H_7S$, \pm $C_{10}H_7(SH)_2$ [181°] (G.), [174°] (E) (210° at 15 mm). Prepared by reducing the chloride of naphthalene 'a'-disulphonic acid with zinc-dust and H_2SO_4 , and extracting the product with ether (Grosjean, *B* 23, 2370; Ebert, *B* 24, 145). Pearly leaflets (from alcohol), ν sl sol cold alcohol and ether. Its alcoholic solution gives a yellow ppt with lead acetate. Its alkaline solution is rapidly oxidised by air

Acetyl derivative. [110°]. Crystals.

Benzoyl derivative. [158°].

NAPHTHYLENE-DI-METHYL-DIAMINE

$C_{10}H_7(NH_2)(NMe_2)$ [14] Formed by reducing nitroso naphthyl di methyl diamine or benzene azo-dimethylnaphthylamine (Friedlander, *B* 21, 3124). Liquid, ν sol hot water

Acetyl derivative $C_{10}H_7(NHAc)(NMe_2)$ [195°]

NAPHTHYLENE (a)-NAPHTHYL-DIAMINE

$C_{20}H_{14}N_2$, \pm [14] $C_{10}H_7(NH_2)(NHC_{10}H_7)$. Formed by reducing nitroso di (a) naphthylamine with $SnCl_4$ and HCl (Wacker, *A* 243, 303). Minute crystals (from benzene), ν sol alcohol

NAPHTHYLENE-NAPHTHYL-BENZAM

$INDINE$ $C_{27}H_{18}N_2$, \pm $C_6H_5C \begin{smallmatrix} \diagup N C_{10}H_7 \\ \diagdown N C_{10}H_7 \end{smallmatrix}$ [163°]

Formed by reducing benzoyl-nitro di (β) naphthyl amine with tin and HCl (Ris, *B* 20, 2626). Slender needles (containing C_6H_5) [114°], ν sol alcohol and ether

NAPHTHYLENE DI-NAPHTHYL-SULPH-

IDEOXIDE $C_{30}H_{20}SO$, \pm $C_{10}H_7O C_{10}H_7S C_{10}H_7$ [111°] Formed in small quantity as a by-product in the preparation of (a) and (β)-naphtho nitrile by distilling a mixture of (a) and (β)-potassium naphthalene sulphonate with potassium ferrocyanide (Ekstrand, *B* 17, 2601, *J pr* [2] 38, 140). Long needles. By $K_2Cr_2O_7$ and acetic acid it is oxidised to a compound [162°]. By heating with dilute HNO_3 at 130°-140° it yields a body $C_{20}H_{12}N_2SO$, which crystallises from hot acetic acid in small yellow prisms [231° uncor], nearly insoluble in alcohol and CS_2 . Br and I in CS_2 yield $C_{20}H_{12}Br_2SO$ [182°]

(a)-DINAPHTHYLENE OXIDE $C_{20}H_{12}O$, \pm $C_{10}H_7C(=O)C(=O)C_{10}H_7$ [182°] Formed by distilling (a)-naphthol (1 pt) with lead oxide (3 pts), the yield being 7 pc (Knecht a Unzeitig, *B* 13, 1724, *A* 209, 134), and, together with naphthalene, by heating (a) naphthol at 350°-400° (Merz a Weith, *B* 14, 195) or distilling it with an equivalent quantity of lime (Niederhäusern, *B* 15, 1121). Colourless needles, insol water, sl sol alcohol, ν sol ether

Picric acid compound

$C_{20}H_{12}O \cdot 2C_{10}H_7(NO_2)_2OH$ [173°] Red needles (β) Dinaphthylene oxide $C_{20}H_{12}O$ [155°] (K a U), [157°] (W), [161°] (M a W) ν D 9 05 (obs). Formed by distilling (β) naphthol (1 pt) with PbO (8 pts) (K a U). Formed also by passing a current of air into boiling (β) naphthol (Merz a Weith, *B* 14, 200) and by heating di-oxy (β) dinaphthyl (1 pt) with $ZnCl_2$ (4 pts) for 6 hours at 270° (Walder, *B* 15, 2171). Silvery plates, insol water, sl sol alcohol, ν sol ether

Picric acid compound

$C_{20}H_{12}O \cdot 2C_{10}H_7(NO_2)_2OH$ Red needles, ν sol hot benzene

References—DI-BROMO- and DI-CHLORO- DI-NAPHTHYLENE OXIDE

(a) DINAPHTHYLENE OXIDE SULPHONIC ACID $C_{20}H_{12}(SO_3H)_2O$ Prepared by sulphonating (a)-dinaphthylene oxide—A⁺Ba₂ 2aq needles, sparingly soluble in water with a beautiful blue fluorescence (Knecht a Unzeitig, *B* 13, 1725)

(b)-DINAPHTHYLENE OXIDE-TETRA-SULPHONIC ACID $C_{20}H_4(SO_3H)_4O$ Prepared by sulphonating (β) dinaphthylene-oxide.—A⁺Ba₂ 2aq; tables (K a U.)

DINAPHTHYLENE PHENYL-AMINE ν

PHENYL DINAPHTHYLENE AMINE

NAPHTHYLENE DISULPHOCYANIDE

$C_{10}H_7(SCN)_2$ [78°] Formed from $C_{10}H_7S_2Pb$, alcohol, and cyanogen chloride (Ebert & Kleiner, *B* 24, 146) Needles

 $(\alpha\beta)$ NAPHTHYLENE TOLAZINE $C_{11}H_{11}N_2$

ν $C_6H_5(CH_2)_2 \begin{smallmatrix} \diagup N \\ | \\ \diagdown N \end{smallmatrix} C_{10}H_7$ [141°] Formed by mixing acetic acid solutions, cooled to 0°, of (8) naphthoquinone and tolylene-*o* diamine (Hinsberg, *B* 18, 1229) Distils without decomposition at a high temperature Yellowish crystals ν sol alcohol, acetic acid, and benzene, insol water Dissolves in strong HCl with a brownish red colour

DI NAPHTHYLENE DI THIO DI-UREA

Octohydrate $CS \begin{smallmatrix} \diagup NH \\ | \\ \diagdown NH \end{smallmatrix} C_{10}H_7 \begin{smallmatrix} \diagup NH \\ | \\ \diagdown NH \end{smallmatrix} CS$ [175°] Formed by boiling the tetrahydride of (1,4')-naphthylene diamine with CS_2 and alcohol (Bamberger & Bammann, *B* 22, 951) Crystalline powder, ν sol alcohol

NAPHTHYLENE-UREA $C_{11}H_9N_2O$ ν

$C_{10}H_7 \begin{smallmatrix} \diagup NH \\ | \\ \diagdown NH \end{smallmatrix} CO$ [ν 380°] Formed from naphthylene diamine and $COCl_2$ in toluene at 100° (Hartmann, *B* 23, 1048)

($\alpha\alpha$) DI-NAPHTHYL-ETHANE $C_{22}H_{18}$ ν $(C_{10}H_7)_2C_2H_4$ [160°] Formed, together with (a) naphthyl carbonylamine, by reducing the amide of thio (a) naphthoic acid in alcoholic solution with zinc dust and HClAq (Bamberger, *B* 21, 54) Hexagonal plates, ν sol chloroform and benzene, m sol ether, sl sol alcohol The alcoholic solution exhibits greenish blue fluorescence¹

($\beta\beta$) Di naphthyl-ethane $C_{10}H_7CH_2CH_2C_{10}H_7$ [253°] Formed, in like manner, from thio (8)-naphthoic amide (B) Plates, ν sol hot chloroform and benzene, sl sol ether and alcohol Its solutions fluoresce bluish violet

TETRA NITRO DI NAPHTHYL ETHANE

NAPHTHYL ETHER ν DI NAPHTHYL OXIDE

(a) NAPHTHYL-ETHYL-AMINE $C_{12}H_{11}N$ ν $C_{10}H_7NHET$ Ethyl naphthylamine (303° ν V) at 723 mm (Bamberger & Helwig, *B* 22, 1312) Formed by cohobating naphthylamine with EtBr (Limpriecht, *A* 99, 117, Schiff, *A* 101, 90) Obtained also by reducing $C_{10}H_7NHCSCH_3$ with zinc dust and HClAq (Bernthsen & Trompeter, *B* 11, 1756) Colourless crystals, becoming dichroic (steel blue and brown red) in light Forms a nitrosamine, which, in contact with alcoholic HCl, changes to the isomeric nitroso derivative $C_{10}H_7 \begin{smallmatrix} \diagup N \\ | \\ \diagdown N \end{smallmatrix} O$ [133°] (Kock, *A* 243, 310) — $B'HCl$ [193°] — $B'_2H_2PtCl_4$, yellow prisms — $B'HB'r$ — $B'HI$ four sided prisms

(8) Naphthyl-ethyl-amine $C_{12}H_{11}NHET$ (305°) at 716 mm Oil (Henriques, *B* 17, 2663, Bamberger & Muller, *B* 22, 1297) Yields a red dye with diazotised sulphathio acid $FeCl_3$ gives no colour in the cold, a greenish-brown colour in warm solutions $K_2Cr_2O_7$ and H_2SO_4 give a brown colour and pp — $B'HCl$ [235°]. Plates, sl sol cold water

Nitrosamine $C_{10}H_7NHET(NO)$ [49°].

Crystals Converted by alcoholic hydrogen chloride at 5° into nitroso naphthyl-ethyl amine $C_{12}H_{11} \begin{smallmatrix} \diagup C(NO) \\ | \\ \diagdown CH \end{smallmatrix} NHET$ — $B'HCl$ [108°] Green prisms (from benzene) (Fischer & Hepp, *B* 20, 1248, 2471)

(a) Naphthyl-di-ethyl-amine $C_{12}H_{11}NEt_2$ (291°) S G 1005 Formed by heating (a)-naphthylamine (10 g) with EtBr (15 g) and alcohol or NaOHaq at 120° (B E Smith, *C J* 41, 180, Friedlander, *B* 21, 3129) Formed also by heating (a) naphthylamine hydrochloride with alcohol Oil, ν sol alcohol and ether Forms a nitroso-derivative $C_{12}H_{11}(NO)NEt_2$ [165°]. — $B'HCl$ silky plates, ν sol hot water. — $B'_2H_2PtCl_4$, golden yellow plates — Sulphate: thick prisms

Ethyl iodide $C_{12}H_{11}NEt_2I$ [100°] Cubes

Ethyl-bromide $C_{12}H_{11}NEt_2Br$ Tables (from water)

(8) Naphthyl-di-ethyl-amine $C_{12}H_{11}NEt_2$ (316° ν V) at 717 mm Oil (Bamberger & Williamson, *B* 22, 1760) Yields (8) naphthylamine on heating with lime — $B'HCl$ [175°] Tables or needles, ν e sol water — $B'_2H_2PtCl_4$ [95°]

Di (8) naphthyl-ethyl-amine $(C_{10}H_7)_2NEt$ [231°] From di (8) naphthylamine and EtI at 150° (Ris, *B* 20, 2619) Needles, m. sol cold alcohol, insol petroleum ether

(a) NAPHTHYL-ETHYL-AMINE TETRA

HYDRIDE $C_{12}H_{11}N$ ν $CH_2CH_2C(CNHET)CH$
 $CH_2CH_2C(CH)CH$ (287° ν V) at 717 mm Formed by adding sodium to a solution of naphthyl-ethyl-amine in isoamyl alcohol (Bamberger & Helwig, *B* 22, 1312) Colourless liquid, sl sol water, ν al sol NaOHaq, ν sol alcohol Reduces warm alcoholic $AgNO_3$ Diazobenzene sulphonic acid yields an orange dye $FeCl_3$ added to a solution of its hydrochloride gives a claret colour, changing to greenish yellow $K_2Cr_2O_7$ and H_2SO_4 give a dirty yellow pp in the cold, but in warm solutions a red colour, becoming greenish brown, further addition of $K_2Cr_2O_7$ ppts blue black flakes $KMnO_4$ oxidises it to adipic and oxalic acids — $B'HCl$ [118°] Prisms or needles, ν sol water — $B'_2H_2PtCl_4$ Plates, sl sol cold water

Nitrosamine $C_{10}H_{11}(NEtNO)$ Formed by adding $NaNO_2$ to a solution of the base in HClAq Yellow oil, exhibiting Liebermann's reaction Tin and HClAq reconvert it into $C_{10}H_{11}(NEtH)$ When dissolved in alcoholic HCl it slowly changes to the isomeric $C_{10}H_7 \begin{smallmatrix} \diagup C(NHET) \\ | \\ \diagdown C(NO) \end{smallmatrix} CH$ crystallising in golden needles [119°]

(α -(8) Naphthyl-ethyl-amine tetrahydride $CH_2CH_2C(CH)CH(CNHET)$ (291° ν) at 724 mm $CH_2CH_2C(CH)CH$ Formed, together with the alicyclic isomeride, by reducing (8) naphthyl ethyl amine (15 g) in isoamyl alcohol with sodium (24 g) (Bamberger & Müller, *B* 22, 1304) Colourless oil, volatile with steam, ν sol alcohol, ν al sol water, insol NaOHaq Smells like piperidine $FeCl_3$ colours a warm solution of its hydrochloride reddish-brown $KMnO_4$ oxidises it to adipic acid — $B'HCl$ [173° ν] Needles, ν sol water, ppd as plates by addition of HCl — $B'_2H_2PtCl_4$ Needles.

(α -(8) Naphthyl-ethyl-amine tetrahydride $C_{10}H_7 \begin{smallmatrix} \diagup CH \\ | \\ \diagdown CH \end{smallmatrix} NHET$ (267°) at 724 mm S G. $CH_2CH_2CH_2CH_2$

M 998 Formed as above (B & M) Colourless oil, sl sol water, very volatile with steam FeCl_3 , colours a warm solution of its hydrochloride reddish brown. Reacts with diazobenzene nitrate, forming $\text{C}_{10}\text{H}_{11}\text{N} \cdot \text{Et} \cdot \text{N}_2\text{C}_6\text{H}_4$, [58°] — B'HCl [223.5°] Prisms (from water) or needles (from CHCl_3). Ppd in plates by adding HCl to its aqueous solution — B'ONO_2 , [184°] Needles or plates, v sol hot water — B'ONO_2 , [180°] Needles — $\text{B'H}_2\text{PtCl}_6$, [204°] Orange yellow stellate crystals — $\text{B'C}_6\text{H}_5(\text{NO}_2)_2\text{OH}$, [183.5°] Needles, v sol water and alcohol.

Acetyl derivative $\text{C}_{10}\text{H}_{11}\text{N} \cdot \text{EtAc}$ (328° uncor.) at 718 mm Oil

Nitrosamine $\text{C}_{10}\text{H}_{11}\text{N} \cdot \text{Et}(\text{NO})$ Yellow oil, v sl sol cold water

Ar-(β) Naphthyl-di-ethyl-aminetetrahydride $\text{CH}_2\text{CH}_2\text{C}(\text{CH}_2\text{CH}_2\text{N} \cdot \text{Et})_2$ (298°) at 709 mm The $\text{CH}_2\text{CH}_2\text{C}(\text{CH}_2\text{CH}_2\text{N} \cdot \text{Et})_2$ chief product of the reduction of $\text{C}_{10}\text{H}_7\text{N} \cdot \text{Et}_2$ by sodium (Bamberger & Williamson, *B* 22, 1763) Liquid, sl sol water Yields a red dye with *p*-diazobenzene sulphonic acid KMnO_4 oxidises it to adipic acid — B'HCl granules, v e sol water

Ac-(β) Naphthyl-di-ethyl aminetetrahydride $\text{C}_6\text{H}_5\text{CH}_2\text{CH}_2\text{CH}(\text{CH}_2\text{CH}_2\text{N} \cdot \text{Et})_2$ Liquid, sl sol water, in-sol NaOH aq — $\text{B'H}_2\text{CO}_3$, white needles — B'HCl prisms, v sol water

(a) **NAPHTHYL ETHYL CARBONATE** $\text{C}_{10}\text{H}_7\text{O}_2$, v e $\text{C}_{10}\text{H}_7\text{OCO OEt}$ [31°] Obtained from (a)-naphthol and chloroformic ether (Bender, *B* 13, 702, 19, 2266) Tables, sol alcohol By heating to boiling for some time it splits up into (a) naphthol, a body $\text{C}_{21}\text{H}_{12}\text{O}_2$, [240°], which is probably a dinaphthylene-ketone-oxide $\text{C}_{10}\text{H}_6\text{C}(\text{O})_2\text{C}_{10}\text{H}_6$, alcohol, and CO_2

Di-(β) Naphthyl-di-ethyl-orthocarbonate $(\text{C}_{10}\text{H}_7\text{O})_2\text{C}(\text{OC}_2\text{H}_5)_2$ (298°–300°) Obtained by the action of chloroformic ether upon (β) naphthol (Bender) White amorphous mass, melting with the heat of the hand HCl at 250° decomposes it into (β) naphthol, EtCl , and CO_2 . By long boiling it is decomposed into (β) naphthol, a body $\text{C}_{21}\text{H}_{12}\text{O}_2$, which is probably a dinaphthylene ketone oxide, alcohol, and CO_2 .

(a) **NAPHTHYL-ETHYLENE** C_{10}H_6 , v e $\text{C}_{10}\text{H}_6\text{CH}(\text{CH}_2)_2$ Formed by the action of Na_2CO_3 on β bromo- α -naphthyl-propionic acid (Brandis, *B* 22, 2158) Oil, smelling like styrene Bromine in chloroform forms $\text{C}_{10}\text{H}_6\text{CHBrCH}_2\text{Br}$ [168°]

References — *Di-CHLORO-* and *Di-CHLORO-TETRA-NITRO-DI-NAPHTHYL ETHYLENE*

DI-(α)-NAPHTHYL-ETHYLENE-DIAMINE $\text{C}_{22}\text{H}_{20}\text{N}_2$, v e $\text{C}_2\text{H}_5(\text{NHC}_6\text{H}_4)_2$, [127°] Formed from naphthylamine and $\text{C}_2\text{H}_5\text{Br}_2$ (Reuter, *B* 8, 28) — $\text{B'H}_2\text{SO}_4$.

Di-(β) Naphthyl-ethylene-diamine $\text{C}_{22}\text{H}_{20}(\text{NHC}_6\text{H}_4)_2$, [153°] (M), [150°] (B) Formed, together with di-(β)-naphthyl-pyrazine tetrahydride $\text{C}_2\text{H}_4\text{N}(\text{C}_{10}\text{H}_7)_2\text{N}$, [228°] by the action of ethylene bromide on (β) naphthylamine in presence of sodium carbonate (Maschke, *O C* 1886, 824; Bischoff, *B* 23, 1885) Plates and needles, sl sol ether, in sol absolute alcohol.

DI-(α)-NAPHTHYL-ETHYLENE-DI-CARB-AMIC ETHER $\text{C}_{22}\text{H}_{22}\text{N}_2\text{O}$, v e $\text{C}_2\text{H}_5\text{N}(\text{C}_{10}\text{H}_7)_2\text{CO}_2\text{Et}$, [156°] Formed from $\text{C}_2\text{H}_5(\text{NHC}_6\text{H}_4)_2$ and ClCO_2Et (Reuter, *B* 8, 25) V sol alcohol

NAPHTHYL-ETHYL-NITROSAMINE v *Nitrosamine* of *NAPHTHYL-ETHYL-AMINE*

NAPHTHYL DI ETHYL PHOSPHINE $\text{C}_{10}\text{H}_7\text{P}$, v e $\text{C}_{10}\text{H}_7\text{PEt}_2$, (above 360°) Formed from $\text{C}_{10}\text{H}_7\text{PCl}_2$ and ZnEt_2 (Kelbe, *B* 11, 1501) Yellow oil

Ethyl iodide $\text{C}_{10}\text{H}_7\text{PEt}_2\text{I}$ [209°] Colourless leaflets

NAPHTHYL-GLYCOCOLL v *NAPHTHYL-AMIDO-ACETIC ACID*

DI-NAPHTHYL-GLYCOL v *DI-NAPHTHYLENE-GLYCOL*

NAPHTHYL-GLYCOLLIC ACID v *OXY-NAPHTHYL ACETIC ACID*

(a) **NAPHTHYL-GLYOXYLIC ACID** $\text{C}_{10}\text{H}_6\text{O}_3$, v e $\text{C}_{10}\text{H}_6\text{CO CO}_2\text{H}$ *Naphthoyl formic acid* [114°] Obtained by saponification of its nitrile (Boessneck, *B* 15, 3066, 16, 640), and by oxidation of (a) naphthyl methyl ketone by KMnO_4 (Claus & Feist, *B* 19, 3181) Needles or plates, in sol water, v sol alcohol and ether Gives a red colour on shaking with H_2SO_4 and benzene containing thiophene Yields (a)-naphthoic acid [160°] on oxidation — CaA_2aq v sl water — AgA' white pp, v sl sol water

Amide $\text{C}_{10}\text{H}_6\text{CO CONH}_2$, [151°] Long white needles (from alcohol)

Nitrile $\text{C}_{10}\text{H}_6\text{CO CN}$ *Naphthoyl cyanide* [101°] Formed by heating (a)-naphthoylchloride with HgCl_2 at 100° Needles

(β) **Naphthyl glyoxylic acid** $\text{C}_{10}\text{H}_6\text{CO CO}_2\text{H}$ [c 75°] Formed by gentle oxidation of (β)-naphthyl methyl ketone by dilute KMnO_4 (Claus & Tersteegen, *J pr* [2] 42, 518). Reduced by sodium amalgam to a oxy naphthyl-acetic acid $\text{C}_{10}\text{H}_6\text{CH}(\text{OH})\text{CO}_2\text{H}$

NAPHTHYL-GUANIDINE $\text{C}_{11}\text{H}_{11}\text{N}_3$, v e $\text{NH C}(\text{NH}_2)\text{NHC}_6\text{H}_4$ — $\text{B'H}_2\text{CO}_3$ Trimetric crystals, $a b c = 666 \cdot 1 \cdot 270$ — B'HCl Tri metric crystals (Haushofer, *J* 1882, 365)

Di (a) naphthyl-guanidine $\text{C}_{21}\text{H}_{21}\text{N}_3$, v e $\text{NH C}(\text{NHC}_6\text{H}_4)_2$ *Menaphthylamine* [c 200°] Formed by the action of gaseous cyanogen chloride on (a)-naphthylamine (Perkin, *C J* 9, 8, *A* 98, 238) Small white needles with bitter taste, nearly in sol water, sl sol alcohol and ether. Cyanogen passed into its ethereal solution forms $\text{C}_{22}\text{H}_{21}\text{N}_3$, a pale yellow crystalline mass, in sol. water, in sol alcohol and ether, decomposed by cold HCl aq in $\text{C}_{22}\text{H}_{21}\text{N}_3\text{O}_2$

crystallising in yellow scales [245°], and decomposed by acids into oxalic acid and di-naphthylguanidine—B'HCl amorphous, v sol alcohol and ether, sl sol water—B₂H₂PtCl₆.

Tri-(a) naphthylguanidine C₁₀H₇N₃ . 2e C₁₀H₇N C(NHC₁₀H₇)₂ [178°] Formed from (a) naphthylamine and MeS C(NC₁₀H₇)₂(NHC₁₀H₇) [174°] (Evers, B 21, 962) Flat needles, insol water, v sol alcohol

(β) NAPHTHYL-GUANIDO BENZOIC ACID C₁₀H₇N₂O₂ . 2e C₁₀H₇NH C(NH)NH C₆H₄CO₂H Formed by heating cyanocarbimidamido-benzoic acid with excess of (β) naphthylamine (Griess, B 16, 338) Small crystalline spherules, insol ether, v sl sol hot water and hot alcohol—HA'HCl sparingly soluble six sided plates.

(a) NAPHTHYL-HYDRAZINE C₁₀H₇N₂ . 2e C₁₀H₇NH NH₂ [116°] (203° at 20 mm) Formed by making a paste of (a) naphthylamine and HClAq, adding NaNO₂ in the cold, filtering, and reducing with SnCl₂, the yield being 66 p c (Fischer, A 232, 236) Plates, sl sol water, v sol other solvents—B'HCl plates—B₂H₂SO₄ plates

Reactions—1 Acetone forms C₁₀H₇N₂H CMe₂ [74°]—2 Pyruvic acid produces the acid C₁₀H₇N₂H CMe CO₂H [159°], which forms the ether EtA' [100°] (Schlieper, A 239, 231)—3 Di-bromo pyruvic acid forms the acid C₁₀H₇N₂H CH C(N₂HC₁₀H₇)₂CO₂H [196°] (Nast vogel, A 248, 89)—4 Aceto acetic ether forms oxy-naphthyl-methyl pyrazole C₁₀H₇N₂O [c 190°] (Knorr, B 17, 551)

Tetrahydride C₁₀H₇<CH CH>C(N₂H₇)OH Obtained by treating a solution of the tetrahydride of (a) naphthylamine hydrochloride (18 g) with an equivalent quantity of NaNO₂ and dropping the mixture into a solution of SnCl₂ (45 g) dissolved in HClAq at 0° (Bamberger a Bordt, B 22, 630) Prisms (from boiling ligroin), sl sol water Reduces Fehling's solution at 30°-40° K₂Cr₂O₇ sets free nitrogen in the cold—"B'HCl silvery plates, v sol water

(β) Naphthyl hydrazine C₁₀H₇N₂ . 2e C₁₀H₇NH NH₂ [124°] Formed in the same way as its (a) isomeride (Fischer, A 232, 242) Plates, m sol water, v sol hot alcohol Turns red in air Its solution in conc HOAc is ppd by water

Reactions—1 Acetone forms C₁₀H₇N₂H CMe₂ [65°] (Schlieper, A 236, 174)—2 Aldehyde yields C₁₀H₇N₂H CH CH₂ [128°]—3 Phenyl-acetic aldehyde forms a crystalline hydrazide decomposing at 100° (Ince, A 253, 40)—4 Acetophenone forms a hydrazide crystallising in needles [c 150°]—5 Acetyl-propionic ether forms C₁₀H₇N₂O₂ [130°], the acid corresponding to which at 175° forms the anhydride C₁₀H₇N<N CMe>CO CH₂ [119°] (Steché, A 242, 368)—6 Pyruvic acid in alcoholic solution yields C₁₀H₇N₂H CMe CO₂H [166°], which yields the ether EtA' [131°] (Schlieper, A 236, 176)—7 Di-bromo pyruvic acid yields yellow needles of C₁₀H₇N₂H CH CO C(OH)N₂HC₁₀H₇? insoluble in alkalis (Nastvogel, A 248, 86)—8 Aceto-acetic ether forms C₁₀H₇N₂O [190°]

Salts—"B'HCl needles or plates.—B₂H₂SO₄ plates, sl sol hot water—Nitrate very soluble needles.

(β) Naphthyl-thiocarbamate

C₁₀H₇N₂HS CS N₂H₇O₂H₇ [145°] Plates.

Acetyl derivative C₁₀H₇NH NHAc. [165°] (Hauff, A 253, 25), [167°] (Hillringhaus, B 22, 2657) Formed from (β) naphthyl-hydrazine and HOAc or Ac₂O Needles (from alcohol), m. sol hot water Reduces Fehling's solution

Benzoyl derivative C₁₀H₇NH NHBz [155°] Needles, insol water, v sol hot alcohol

Di-benzoyl derivative C₁₀H₇N₂HBz₂ [163°]

Di-(a)-naphthyl-hydrazine C₁₀H₇N₂H₂C₁₀H₇ Hydrazo naphthalene [275°]

Preparation—1 pt of azonaphthalene is finely suspended in a solution of 1½ pts of NaOH in 160-170 pts of alcohol, and the boiling mixture is treated with zinc dust till decoloured, it is then poured into water containing NH₄HS and the pp is dried and extracted with benzene, from which it crystallises on cooling

Properties—Colourless plates Sublimable v sol alcohol, ether, and benzene, insol water By warming with HCl it is converted into a mixture of two isomeric di-amido-dinaphthyls (Nietzki a. Goll, B 18, 3253)

(1,4)-NAPHTHYL-HYDRAZINE SULPHONIC ACID [14] C₁₀H₇(N₂H₇)SO₂H Formed by reducing the diazo-compound of naphthionic acid with stannous chloride (Erdmann, A 247, 333) Tufts of white needles, sl sol hot water, m sol hot HClAq—A'Na₄aq plates, sl sol cold water

(1,4') Naphthyl-hydrazine sulphonic acid [14'] C₁₀H₇(N₂H₇)SO₂H Formed by reducing the diazo compound of the (1,4') naphthylamine sulphonic acid with SnCl₂ Plates, m sol water, v sol HCl—A'Na₃aq needles, sl sol water

Peri-Naphthyl-hydrazine sulphonic acid [11'] C₁₀H₇(N₂H₇)SO₂H Formed, in like manner, from (1,1')-naphthylamine sulphonic acid Small plates, sl sol hot water—A'K needles, v sol hot water—A'Na plates, v sl sol water

(a) NAPHTHYL IMIDO-DIACETIC ACID C₁₀H₇N(CH₂CO₂H) [133°] Formed by the action of chloro-acetic acid and Na₂CO₃ on (a)-naphthyl amido acetic acid (Bischoff, B 23, 2004) Colourless crystals, v sol alcohol

(a) Naphthylamide C₁₀H₇N(CH₂CO₂H)(CH₂CONHC₁₀H₇) [199°] Crystals (from benzene alcohol)

Di-(a)-naphthylamide C₁₀H₇N(CH₂CONHC₁₀H₇)₂ [202°] Crystals, sl sol ligroin

(β)-Naphthyl-imido-diacetic acid C₁₀H₇NO [182°] Formed by heating chloro-acetic acid with (β)-naphthyl-amido-acetic acid and Na₂CO₃aq at 160° (B) Crystals, sl alcohol, sl sol ether, insol benzene The solutions have a bluish violet fluorescence

(a)-NAPHTHYL-β-IMIDO-BENZYL-MALONIC ETHER C₁₀H₇N₂ . 2e C₁₀H₇ C(NC₁₀H₇)₂CH(CO₂Et)₂ [145°] Formed by the action of α-chloro-benzylidene (a)-naphthylamine upon sodio-malonic ether Crystalline solid sl sol ether By dilute HCl at 120° it is split up into acetophenone and (a)-naphthylamine (Just, B 19, 987)

(β)-Naphthyl-β-imido-benzyl-malonic ether C₁₀H₇NO₂ . 2e C₁₀H₇ C(NC₁₀H₇)₂CH(CO₂Et)₂

[140°]. Formed by the action of ω -chlorobenzylidene-(β)-naphthylamine $C_{10}H_7N \cdot COCl \cdot C_6H_5$ upon sodio malonic ether. Crystalline solid. Sol in ether. By dilute HCl at 120° it is split up into acetophenone and (β)-naphthylamine (Just).

(β)-NAPHTHYL- β IMIDO-BUTYRIC ACID $CH_3C(ONC_6H_7)CH_2CO_2H$ [92°]. Needles, sol water. Formed, together with its naphthalide, by heating a mixture of acetoacetic ether and (β)-naphthylamine at 150°–180°. By boiling with HCl it is converted into (Py 13) oxy-methyl (β)-naphthoquinoline.

Naphthalide $C_{10}H_7NO$ [200°]. Needles, nearly insoluble in most solvents (Knorr, B 17, 543).

DI-NAPHTHYL-IMIDO-THIOCARBAMIC ETHERS $C_{10}H_7NH \cdot C(NC_6H_5)_2SR$ Di-naphthyl-alkyl ψ thioureas. Formed by heating di-naphthyl thio-ureas with alkyl iodides (Evers, B 21, 964).

Di-(a)-naphthyl-imido-thiocarbamic acid Methyl ether $C_{10}H_7NH \cdot C(ONC_6H_5)_2SMe$ [136°]. Plates, sol hot, v sl sol cold, alcohol. Gives off HSMe on heating, leaving di-(a)-naphthyl-cyanamide, which on boiling with dilute HCl aq yields di-(a)-naphthyl-urea. Boiling alcoholic potash also converts it into di-(a)-naphthyl-urea and HSMe. Dilute H_2SO_4 at 160° forms (a)-naphthylamine and $C_{10}H_7NH \cdot CO \cdot SMe$ —B'HI [174°]—B' $_2H_4PtCl_6$ [202°]. Yellow powder.

Ethyl ether EtA' [98°]. Prisms, sl sol hot alcohol—B'HI [157°]—B' $_2H_4PtCl_6$. Propyl ether PrA' [95°]. Plates—B'HI [97°]—B' $_2H_4PtCl_6$.

Ethylene derivative $C_{10}H_7N_2S$ v. $C_{10}H_7N \cdot C \left\langle \begin{smallmatrix} N(C_6H_5)_2 \\ S \cdot CH_2CH_2 \end{smallmatrix} \right\rangle$ [139°]. Formed by boiling di-(a)-naphthyl thio urea with ethylene bromide. Needles, v sol alcohol—B' $_2H_4PtCl_6$.

Di-(β)-naphthyl-imido thiocarbamic acid Methyl ether $C_{10}H_7NH \cdot C(ONC_6H_5)_2SMe$ [110°]. Needles, v. e sol warm alcohol and ether—B' $_2H_4PtCl_6$.

Ethyl ether EtA' [106°]—B' $_2H_4PtCl_6$ [155°].

Propyl ether PrA' [66°]—B' $_2H_4PtCl_6$ [120°].

Ethylene derivative $C_{10}H_7N \cdot C \left\langle \begin{smallmatrix} N(C_6H_5)_2 \\ S \cdot CH_2CH_2 \end{smallmatrix} \right\rangle$ [172°]. Plates (from alcohol)—B' $_2H_4PtCl_6$ [146°].

DINAPHTHYLYNE v DI-AMIDO-DINAPHTHYL ($\alpha\beta$) DI-NAPHTHYL-KETONE $C_{10}H_7O$ v. $(C_{10}H_7)_2OO$ Mol w 268 [136°]. S (alcohol) 13 at 14°. Formed by heating (a) naphthoic acid with naphthalene and P_2O_5 at 210° (Kolbantz a Merz, B 6, 544), by the action of a strip of zinc on a mixture of (a)-naphthoyl chloride and naphthalene (Grucarevic a Merz, B. 6, 1241), and by heating (β)-naphthoyl chloride with mercuric dinaphthyl at 175° (G a M). Pointed needles (from boiling alcohol). On distillation with soda lime it yields naphthalene and a mixture of (a) and (β) naphthoic acids.

($\beta\beta$) Di-naphthyl ketone $(C_{10}H_7)_2CO$ Obtained in two isomeric forms [125.5°] and [164°] by heating (β) naphthoic acid with naphthalene and P_2O_5 (K a M), or (β)-naphthoyl chloride with naphthalene and zinc (G a M). The two varieties may be separated by crystallisation

from ether chloroform. Both varieties yield naphthalene and (β) naphthoic acid on distillation with soda lime. The solubility of the variety melting at 164° in alcohol at 19° is less (08) than that of the variety melting at 125.5° (38). The latter variety may also be prepared by distilling calcium (β) naphthoate (Hausmann, B 9, 1515).

Di-naphthyl ketone $(C_{10}H_7)_2CO$ [140°]. Formed by distilling potassium naphthalene (β) sulphonate with KHC_2O_4 (Giuseppe, B 6, 546).

NAPHTHYL-MELAMINE v CYANTIC ACIDS

(a) NAPHTHYL MERCAPTAN $C_{10}H_7S$ v. $C_{10}H_7SH$ Thionaphthol Mol w 160 (285°) SG $\frac{1}{4}$ 1.1729, $\frac{2}{4}$ 1.1549. Formed by reducing naphthalene (a) sulphonic chloride with zinc dust and dilute H_2SO_4 (Scherer, A 132, 91, Krafft a Schönherr, B 22, 822). Formed also by saponifying its ethyl ether which may be formed by the action of potassium xanthate on (a) diazonaphthalene chloride (Leuckart, J pr [2] 41, 216). Colourless oil, with unpleasant smell, sl sol aqueous alkalis, v sol alcohol and ether. Oxidised in alcoholic solution by the air to di (a) naphthyl disulphide [91°]. Yields di naphthyl sulphide [107°] on heating— $Hg(SC_6H_5)_2$ —Pb(SC_6H_5) $_2$ yellow pp. Ethyl ether $C_{10}H_7SEt$ (187.5°) at 15 mm SG $\frac{1}{4}$ 1.1198, $\frac{2}{4}$ 1.0797. Formed from $C_{10}H_7SH$ by heating with EtI, alcohol, and KOH at 120°–150°.

Acetyl derivative $C_{10}H_7SAc$ (188° at 15 mm) SG $\frac{1}{4}$ 1.1519. Benzoyl derivative $C_{10}H_7SBz$ [117°] (262° at 15 mm).

(β) Naphthyl mercaptan $C_{10}H_7SH$ [75°] (Billeter, B 8, 463, L), [81°] (K a S) (286°). Formed by reducing naphthalene (β) sulphonic chloride, and also by heating (β) diazo-naphthalene chloride with a solution of EtOCS $_2$ K, saponifying the oily product, and boiling with zinc dust and HCl aq (Maikopar, Z 1869, 711, Leuckart, J pr [2] 41, 220). Small plates (from ether), sl sol water. Not volatile with steam. Yields the corresponding disulphide on oxidation—Pb(SC_6H_5) $_2$ orange powder.

Ethyl ether $C_{10}H_7SEt$ [16°] (170.5° at 15 mm).

Acetyl derivative $C_{10}H_7SAc$ [53.5°] (191° at 15 mm). Formed by heating the mercaptan with AcCl at 75°.

Benzoyl derivative $C_{10}H_7SBz$ [108°] (267° at 15 mm).

DI (a)-NAPHTHYL METHANE $C_{10}H_8$ v. $(C_{10}H_7)_2CH_2$ [109°] (above 360°) S (alcohol) 8 in the cold, 6.6 at 78°. Formed by the action of H_2SO_4 on a cooled mixture of naphthalene (5 pts), methylal (1 pt) and chloroform (20 pts) (Grabowski, B 7, 1805). Short prisms (from alcohol), v sol ether and chloroform. Not affected by chromic acid mixture. Picric acid compound $C_{10}H_7 \cdot 2C_6H_4(NO_2)_3OH$ [148°]. Reddish yellow prisms (from chloroform).

Di (β)-naphthyl-methane [92°]. Prepared by reducing di (β) naphthyl-ketone with P and HIAq (Richter, B. 13, 1728). Slender white needles, v sol alcohol and benzene. Yields $C_{10}H_7Br$ [164°] and $C_{10}H_7Br$ [150°–160°].

NAPHTHYL-METHYL-ALCOHOL v. NAPHTHYL CARBINOL.

(a) NAPHTHYL METHYL-AMINE

$C_{10}H_7NHMe$ *Methyl (a)-naphthylamine* (298° uncor) Formed, together with dinaphthylamine, by passing $MeCl$ into melted (a) naphthylamine (Landshoff, *B* 11, 688) Dark red oil Its alcoholic solution gives a violet pp with $FeCl_3$ — $B'_2H_3PtCl_6$, 2aq

Acetyl derivative $C_{10}H_7NMeAc$ [91°] (*L*), [95°] (Norton & Livermore, *B* 20, 2272) Small white prisms, sl sol water, v sol alcohol and ether Dilute nitric acid (10 p c) forms $C_{10}H_7(NO_2)NMeNO_2$, [157 5°]

Benzoyl derivative $C_{10}H_7NMeBz$ [121°] Formed by heating (a) naphthyl-di-methylamine with $BzCl$ at 180° (Hess, *B* 18, 687) Crystals

(a)-Naphthyl-di-methyl-amine $C_{10}H_7NMe_2$ ($C_{10}H_7NMe_2$, (267°) (*L*), (274 5° v at 711 mm) (Bamberger & Helwig, *B* 22, 1815) SG 22 1.0423 Formed by heating (a) naphthylamine (1 mol) with MeI (2 mols) and $MeOH$ (Landshoff, *B* 11, 643, *J pr* [2] 17, 386, Monnet, Reverdin, a Nolting, *B* 12, 2305) Prepared by heating (a)-naphthylamine hydrochloride with $MeOH$ for 8 hours at 170° (Hantzsch, *B* 13, 1348, Friedlander, *B* 21, 3124) Oil

Reactions—1 Forms a nitroso-compound which decomposes in an acid aqueous solution into (1, 4) nitroso naphthol and dimethylamine 2 Nitric acid forms two nitro derivatives [88°] and [128°]—3 By condensation with benzoic aldehyde in presence of $ZnCl_2$ at 110° it yields $C_{10}H_7CH(C_6H_5NMe_2)$, [188°]—4 $C_{10}H_7NMe_2CHO$ (1.4) yields, in like manner, $NMe_2C_6H_4CH(C_{10}H_7NMe_2)$, [179°]—5 $COCl_2$, followed by Aq , yields $NMe_2C_6H_4CO_2H$, [164°] Platinochloride $B'_2H_3PtCl_6$, yellow needles

Methylo-iodide $B'MeI$ Yellowish green flat needles, decomposed at 164° uncor Not affected by $NaOH$, but Ag_2O yields a strongly alkaline hydroxide—($B'MeCl$), $PtCl_6$

ar Tetrahydride $C_8H_7 \begin{smallmatrix} < NMe, CH \\ < CH CH \end{smallmatrix}$

(262°) at 721 mm Formed by reducing the base, dissolved in isoamyl alcohol, with sodium (*B a H*) Colourless oil Yields a colouring matter with *p* diazobenzene sulphonic acid Reduces $AgNO_3$. Oxidised to adipic acid by $KMnO_4$. Yields $B'_2H_3PtCl_6$ and $B'MeI$ [164 5°]

(*B*)-Naphthyl-methyl-amine

Benzoyl derivative $C_{10}H_7NMeBz$ [169°], glistering plates Formed by heating di-methyl-(*B*)-naphthylamine with benzoyl chloride at 180° (Hess, *B* 18, 688)

(*B*)-Naphthyl-di-methyl-amine $C_{10}H_7NMe_2$, [46°] (305° cor) Formed by heating commercial trimethylamine with (*B*)-naphthol at 200° (Hantzsch, *B* 13, 2055), and by heating (*B*)-naphthylamine with MeI and $NaOHAq$ at 120° (Bamberger & Müller, *B* 22, 1806) Forms very soluble salts— $B'_2H_3PtCl_6$

Methylo-iodide $C_{10}H_7NMeI$. Tables, sl sol cold water With Ag_2O it yields a strongly alkaline hydroxide

ar-Tetrahydride $C_8H_7 \begin{smallmatrix} < CH CNMe_2 \\ < CH OH \end{smallmatrix}$

(287°) at 715 mm Formed by reducing $C_{10}H_7NMeI$ dissolved in isoamyl alcohol with sodium (Bamberger & Müller, *B* 22, 1806) Colourless oil. Reduces auric chloride and $AgNO_3$. $FeCl_3$ gives a turbidity and a yellow

colour $K_2Cr_2O_7$ and H_2SO_4 give a yellow pp and, on heating, a dirty-green colour $KMnO_4$ oxidises it to adipic acid— $B'HCl$ — $B'_2H_3PtCl_6$ — $B'HClHgCl_2$. [127 5°] Needles, v sl sol cold, v sol hot water Picrate needles

ac-Tetrahydride $C_8H_7 \begin{smallmatrix} < CH_2 CHNMe_2 \\ < CH_2 CH_2 \end{smallmatrix}$

(166 5° at 22 mm) Formed at the same time as the aromatic isomeride— $B'HCl$ needles, v sol water— $B'_2H_3PtCl_6$, orange needles, v sol water

Di (B) naphthyl methyl-amine $(C_{10}H_7)_2NMe$ [140°] Formed from $(C_{10}H_7)_2NH$ and MeI at 100° (Ris, *B* 20, 2619) Needles, m sol cold alcohol, insol ligroin

Isomeride of naphthyl methyl-amine v NAPHTHYL-CARBINYL AMINE

(a) NAPHTHYL METHYL KETONE $C_{10}H_7O$ $C_{10}H_7COCH_3$, [34°] (297°) Formed by the action of $AcCl$ in presence of $AlCl_3$ on naphthalene dissolved in ligroin (Pampela Schmidt, *B* 19, 2898, Claus a Feist, *B* 19, 3180, *J pr* [2] 42, 517) Crystals, insol water, v sol alcohol and ether Oxidised by $KMnO_4$ to (a) naphthyl glyoxylic acid Yellow ammonium sulphide at 220° forms $C_{10}H_7CMe \begin{smallmatrix} < O \\ < NH \end{smallmatrix}$ [154°] (Willgerodt, *B* 20, 2468)

Oxim $C_{10}H_7CMe(NOH)$ [101°] (*P a S*), [145°] (*C a F*)

Phenyl hydrazide $C_{10}H_7CMe(N_2HPH)$ [146°] (*P a S*), [173°] (*C a F*) Needles

Anilide $C_{10}H_7CMe(NPh)$ [130°] It will be seen that the melting points of the oxim and phenyl hydrazide of the ketone prepared by Claus are the same as those of the like derivatives of the (*B*) ketone

(*B*) Naphthyl methyl ketone $C_{10}H_7COCH_3$, [52°] (301°) Formed, together with the (a)-isomeride by the action of Ac_2O on naphthalene in presence of $AlCl_3$ (Roux, *A Ch* [6] 12, 289, Müller a Von Pechmann, *B* 22, 2561) Leaflets, nearly insol cold water Oxidised by dilute $KMnO_4$ to (*B*) naphthyl glyoxylic acid [*c* 75°], further oxidation forms (*B*) naphthoic acid Sodium amalgam reduces it to $C_{10}H_7CH(OH)CO_2H$ [176°]

Oxim $C_{10}H_7C(NOH)CH_3$, [145°]

Acetyl derivative of the oxim [134°]

Phenyl-hydrazide [171°]

NAPHTHYL METHYL OXIDE v *Methyl ether of NAPHTHOL*

(a) NAPHTHYL-DI-METHYL-PYRROLE

$C_{10}H_7NMe_2$ $C_{10}H_7N \begin{smallmatrix} < CMe CH \\ < CMe CH \end{smallmatrix}$ [123°] (312°)

Formed by heating its dicarboxylic acid at 250° (Knorr, *A* 236, 309) Insol water, v sol alcohol, ether, and chloroform

(*B*) Naphthyl-di-methyl-pyrrole $C_{10}H_7N$ [71°] (341°) Formed in like manner

(a)-NAPHTHYL-DI METHYL PYRROLE DICARBOXYLIC ACID $C_{10}H_7NO_4$, $C_{10}H_7N \begin{smallmatrix} < CO CO_2H \\ < CO CO_2H \end{smallmatrix}$ [244°] Formed by sa

ponifying its ether, which is obtained by the action of (a)-naphthylamine on diacetyl succinic ether (Knorr, *A* 236, 308) Needles— K_2A'' — BaA'' — $AgHA''$.

Ethyl ether EtA'' . [91°]

(*B*). Naphthyl-di-methyl pyrrole-di-carboxylic acid $C_{18}H_{11}N_2$ $\begin{matrix} \diagup \\ \text{OMe} \text{ C CO}_2\text{H} \\ \diagdown \end{matrix}$ $\begin{matrix} \diagdown \\ \text{OMe} \text{ C CO}_2\text{H} \\ \diagup \end{matrix}$ Its di ethyl ether

is obtained by mixing acetic acid solutions of di aceto succinic ether and (*B*)-naphthylamine (Knorr, *B* 18, 304) Sparingly soluble in most solvents Begins to decompose at 260° with evolution of CO_2 —BaA' —BaH.A'.

Di-ethyl ether A' Et. [124°], needles
DI-NAPHTHYL METHYL- ψ THIOUREA *v*
Methyl ether of DI NAPHTHYL-IMIDO THIOCARBAMIC ACID

DI-(*a*)-NAPHTHYL OXIDE ($C_{10}H_7$)₂O *Naphthyl ether* [110°] Formed by heating (*a*) naphthyl with ZnCl_2 or HCl (Merz & Weith, *B* 14, 195) Plates or tables, sol hot alcohol and ether May be distilled unchanged —Picrate $C_{28}H_{17}O_{12}N_2$ (NO_2)₂(OH) [115°] Red crystals

DI-(*B*)-naphthyl oxide ($C_{10}H_7$)₂O [105°] Obtained by boiling (*B*) naphthol with dilute (50 p c) H_2SO_4 (Graebe, *B* 13, 1849), or by heating it with ZnCl_2 (2 pts) at 190°, or with gaseous HCl (M & W) Formed also by distilling aluminium (*B*)-naphthol (Gladstone & Tribe, *C J* 41, 15) Pearly plates (from alcohol), sol ether Gives an orange colour with conc H_2SO_4 .

Picrate $C_{28}H_{17}O_{12}N_2$ (NO_2)₂(OH) [122°] Small orange prisms

DI-(*a*) NAPHTHYL-PARABANIC ACID

$C_{28}H_{17}N_2O_4$ \pm $\text{CO} < \begin{matrix} \text{N}(\text{C}_6\text{H}_5) \text{ CO} \\ \text{N}(\text{C}_6\text{H}_5) \text{ CO} \end{matrix} >$ [246°]

Formed by passing cyanogen gas into an alcoholic solution of methyl di (*a*)-naphthyl-imido-thiocarbamate and heating the crystals that separate with alcoholic HCl (Evers, *B* 21, 973) Needles, \forall sol hot alcohol, sl sol ether, insol water and dilute acids Decomposed by boiling alcoholic potash into CO_2 , oxalic acid, and (*a*) naphthylamine

(*a*)-NAPHTHYL PHENYL-AMIDO METHYL

KETONE $C_{18}H_{13}NO$ \pm $C_{10}H_7$, $\text{CO CH}_2\text{NHC}_6\text{H}_5$ [130°] Formed by the action of aniline on $C_{10}H_7$, $\text{CO CH}_2\text{Br}$ in alcoholic solution (Pampel & Schmidt, *B* 19, 2899) Red crystals

NAPHTHYL-PHENYL compounds ψ .

PHENYL-NAPHTHYL COMPOUNDS

(*a*) NAPHTHYL DI PHENYL METHYLENE-AMINE $C_{28}H_{17}N$ \pm $C_{10}H_7$, N CPh_2 Formed from (*a*)-naphthylamine and benzophenone chloride Ph_2CCl_2 (Pauly, *A* 187, 215) Golden plates (from ether), split up by acids into benzophenone and (*a*)-naphthylamine

TRI-(*a*)-NAPHTHYL PHOSPHATE

($C_{10}H_7$)₃PO [145°] Prepared by heating (*a*)-naphthol with POCl_3 , the yield being 65 p c of the theoretical (Schäffer, *A* 152, 289, Heim, *B* 16, 1769) Small glistening needles

Tri-(*B*)-naphthyl-phosphate ($C_{10}H_7$)₃PO [111°] Prepared by heating a mixture of (*B*)-naphthol and phosphorus oxy-chloride, the yield being 65 p c of the theoretical (Heim, *B* 16, 1768, cf Schäffer) Fine white needles Insol water, sl sol cold alcohol

NAPHTHYL PHOSPHOROUS ACID *v* NAPHTHALENE PHOSPHINIC ACID

(*B*)-NAPHTHYL-PROPIONIC ACID $C_{18}H_{13}O_2$ \pm $C_{10}H_7$, $\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$ [148°]

Formed by reducing naphthyl-acrylic acid with sodium amalgam (Brandis, *B* 23, 2156). Needles (from alcohol), sol. boiling water.

(*a*) NAPHTHYL PROPYLENE ψ THIO UREA $\text{CH}_2\text{CH}_2\text{CH}_2\text{S} > \text{CNH } C_{10}H_7$, [184°] Formed by

heating *a* naphthyl allyl thio urea [145°] with HClAq at 100° (Frager, *B* 22, 3001) Tables, \forall sol chloroform, m sol ether, insol water — $\text{B}'\text{H}_2\text{PtCl}_6$ [206°] — $\text{B}'\text{C}_6\text{H}_5(\text{NO}_2)_3\text{OH}$ [192°]

NAPHTHYL PURPURIC ACID $C_{18}H_{11}N_3O_4$ The K salt is formed by the action of aqueous KCy on di nitro naphthol (Sommaruga, *B* 4, 94, *A* 157, 328) The free acid is unstable The K salt is golden brown with metallic lustre Potash fusion yields benzoic, phthalic, and hemimellitic acids The following salts were dried at 100° $\text{NH}_4\text{A}'$ — KA' — CaA' , — BaA' .

DI-(*a*)-NAPHTHYL PYRAZINE TETRAHY

DRIDE $C_{18}H_{11}N_4$ $< \begin{matrix} \text{CH}_2 \text{ CH} \\ \text{CH}_2 \text{ CH} \end{matrix} > \text{NC}_6\text{H}_5$, *Di-naphthyl-di-ethylene diamine* [265°] Formed from

ethylene bromide, (*a*) naphthylamine, and NaOAc (Bischoff, *B* 22, 1782) Prisms, \forall sl sol alcohol

Di (*B*) naphthyl-pyrazine tetrahydride

[228°] Formed by the action of C_6H_5Br , on (*B*) - naphthylamine in presence of Na_2CO_3 (Bischoff, *B* 23, 1984) Colourless crystals, insol water, alcohol, ether, and HClAq , sol hot HOAc

(*a*) NAPHTHYL-PYRIDINE HEXAHY

DRIDE $C_{18}H_{11}N_2$ (NO_2)₂ (185°–190° at 5–10 mm) Formed by heating piperidine (2 mols) with (*a*) bromo naphthalene (3 mols) for 10 hours at 255° (Lellmann & Buttner, *B* 23, 1383) Thick yellow oil, with faint fæcal odour, rapidly becoming brown \forall sol alcohol and ether A solution of its hydrochloride is pptd by HgCl_2 , by ZnCl_2 , and by chloride of gold — $\text{B}'\text{HCl}$ groups of needles, \forall sol water — $\text{B}'\text{H}_2\text{PtCl}_6$ 2aq (*B*)-Naphthyl pyridine hexahydride [58°]

Resembles the preceding in mode of preparation and properties Colourless prisms, becoming grey on keeping — $\text{B}'\text{HCl}$ — $\text{B}'\text{H}_2\text{PtCl}_6$ 6aq

DINAPHTHYL-DIQUINONE, so-called,

$C_{28}H_{18}O_4$ \pm $C_{10}H_7$ $\begin{matrix} \text{OO CO OH} & \text{OH CO CO} \\ \diagdown & \diagup \\ \text{O} & \text{O} \end{matrix} > C_{10}H_7$

Obtained by oxidation of dinaphthyl-diquinhydrone $C_{28}H_{18}O_2$, a black powder formed by the action of dilute H_2SO_4 on (*B*) naphthoquinone (Stenhouse & Groves, *C J* 33, 415) Formed also by the oxidation of (*B*)-amido (*a*) naphthol by FeCl_3 or CrO_3 (Zincke & Rathgen, *B* 19, 2483) Small orange prisms, insol water, \forall sl sol other solvents Not affected by boiling HNO_3 or by H_2SO_4 .

Reactions —1 Yields on reduction 'dinaphthyl dihydroquinone' —2 Distillation with *vacuo* converts it into dinaphthyl-8 Alkalies form a green solution which, on exposure to air, changes to red from formation of $C_{28}H_{18}(\text{OH})_2O_4$ [245°–260°] (Korn, *B* 17, 3020) —4 KMnO_4 oxidises it to diphtallic acid $C_{10}H_6O_4$ —5 Aniline forms $C_{24}H_{15}N_2O_4$ crystallising in red plates [250°] and forming a hydrochloride $C_{24}H_{15}N_2O_4\text{HCl}$ crystallising in needles

Iso-dinaphthyl-diquinone $C_{28}H_{18}O_4$ [250°–260°] Formed by oxidising di-(*B*) naphthyl with CrO_3 in HOAc (Staub & Watson Smith, *C J* 47, 104) Amorphous yellow powder, sol. HOAc , sl. sol. most liquids. Turns brown at 215°.

NAPHTHYL-ROSINDULINE $C_{20}H_{11}N$, *tc*

Formed by heating benzene azo-di-(α)-naphthylamine with aniline and alcohol at 165° (Fischer & Hepp, *A* 256, 246) Black needles, forming a blue solution in conc H_2SO_4 . Conc $HClAq$ at 210° splits it up into (α)-naphthylamine and rosindone $C_{20}H_{11}N_2O$

(α) **NAPHTHYL SILICATE** $C_{10}H_7SiO_3$, *tc* ($C_{10}H_7$), SiO_3 (425° – 430° at 180 mm) Needles (Hertkorn, *B* 18, 1696)

(β)-Naphthyl silicate. (430° at 183 mm.) Crystalline (H)

NAPHTHYL-SULPHAMIC ACID ν **NAPHTHYLAMINE** ν **SULPHONIC ACID****NAPHTHYL SULPHATE.**

Naphthyl sulphuric acid $C_{10}H_7SO_3$, *tc* $C_{10}H_7O SO_3 OH$ Formed by the action of $Cl SO_3 OH$ on a cold solution of (β) naphthol in CS_2 (Armstrong, *B* 15, 204) It is also formed by dissolving (β) naphthol (1 pt) in cold H_2SO_4 (2 pts) (Nietzki, *B* 15, 305) —* NaA' Slender leaflets, ν e sol water Ppd from aqueous solution by $NaCl$ Split up by boiling $HClAq$ into (β) naphthol and $NaHSO_4$. Does not react with diazo salts —* KA' scales (from hot water) With PCl_5 it yields chloro naphthalene Bromine forms bromo naphthol [84°]

DI-(α) NAPHTHYL SULPHIDE $C_{20}H_{11}S$, *tc* ($C_{10}H_7$), S [110°] (290° at 15 mm)

Formation—1 By distilling a dry mixture of potassium naphthalene (α) sulphate and potassium sulphocyanide (Armstrong, *B* 7, 407) 2 By distilling the lead salt of (α) naphthyl mercaptan under diminished pressure (Krafft & Schönherr, *B* 22, 823) —3 By heating (α) naphthyl mercaptan as long as H_2S is evolved (Leuckart, *J pr* [2] 41, 217) —4 By heating ($C_{10}H_7S$), Pb with (α) bromo naphthalene at 235° for 4 hours (Krafft & Bougois, *B* 23, 3045)

Properties—Needles, ν sol benzene and $HOAc$, sl sol alcohol Chromic acid in $HOAc$ oxidises it to the sulphoxide [165°], and finally to the sulphone [187°] (Krafft, *B* 23, 2368)

($\alpha\beta$)-**Di-naphthyl sulphide** ($C_{20}H_{11}S$), S [61°] (290° at 15 mm) Formed by heating the lead salt of (β) naphthyl mercaptan with (α) bromo naphthalene at 230° (Krafft, *B* 23, 2368) Lustrous leaflets (from alcohol) Oxidised by CrO_3 in $HOAc$ to ($C_{20}H_9$), SO_2 [123°]

Di (β) naphthyl sulphide ($C_{20}H_{11}S$), S [151°] (296° at 15 mm) Formed by distilling the lead salt of (β) naphthyl mercaptan under 10 mm pressure (K & S) Plates, ν sl sol hot alcohol, ν sol CS_2 . Oxidised by CrO_3 in $HOAc$ to ($C_{20}H_9$), SO_2 [177°] (Krafft, *B* 23, 2366)

($\alpha\alpha$) **Di-naphthyl disulphide** ($C_{20}H_9$), S_2 , [91°] Formed by oxidising (α) naphthyl mercaptan by exposing its alkaline solution to the air (Schertel, *A* 182, 91, Leuckart, *J pr* [2] 41, 217) Monoclinic crystals, sl sol alcohol

Di-(β) naphthyl disulphide ($C_{20}H_9$), S_2 [137°] (L), [189°] (O) The chief product obtained by saponification of the oil which is formed by the action of potassium xanthate on (β) diazo-naphthalene chloride (Leuckart, *J pr* [2] 41, 221) Formed also by reducing naphthalene (β)-sulphonic chloride with $HIAq$ (Cleve, *B* 21, 1100). Colourless plates, insol. water, ν sol.

alcohol and ether Reduced by zinc and H_2SO_4 , to (β) naphthyl mercaptan.

(β)-**NAPHTHYL SULPHOCYANIDE** $C_{11}H_7NS$, *tc* $C_{10}H_7SON$ [35°] Formed by the action of cyanogen chloride on $Pb(SC_2H_5)_2$ (Billeter, *B* 8, 463) Decomposes on distillation KHS forms $KSCN$ and HSC_2H_5 . Conc $HClAq$ forms $C_{10}H_7SH$, NH_4 , and CO_2 . Sodium amalgam reduces it to sodium cyanide and ($C_{10}H_7$), S_2

($\alpha\alpha$) **DI-NAPHTHYL SULPHONE** ($C_{20}H_{11}S_2$), SO_2 [187°] Formed by oxidising ($\alpha\alpha$)-di-naphthyl sulphide by CrO_3 in $HOAc$ (Krafft, *B* 23, 2368, cf Leuckart, *J pr* [2] 41, 218)

($\alpha\beta$) **Di naphthyl sulphone** ($C_{20}H_{11}S_2$), SO_2 [123°] Formed, together with the ($\beta\beta$) isomeride by heating naphthalene (8 pts) with H_2SO_4 (8 pts) at 180° (Stenhouse & Groves, *B* 9, 682, Cleve, *B* 10, 1723, *Bl* [2] 25, 256, cf Berzelius, *A Ch* [2] 65, 290) Formed also by oxidising the corresponding di naphthyl sulphide (Krafft, *B* 23, 2369) Prisms (from CS_2), m sol boiling alcohol and ether

($\beta\beta$) **Di-naphthyl-sulphone** ($C_{20}H_{11}S_2$), SO_2 [177°] Formed as above, and also by dissolving ($\beta\beta$) di naphthyl sulphide (1 pt) in $HOAc$ (200 pts), warming, slowly adding a mixture of $K_2Cr_2O_7$ (3 pts) dilute (1 3) H_2SO_4 (20 pts) and $HOAc$ (50 pts), filtering, evaporating, and crystals from alcohol (Krafft, *B* 23, 2366) Long white needles When heated with PCl_5 it yields (β) chloro naphthalene and naphthalene (β) sulphonic chloride (Cleve, *Bl* [2] 25, 25)

DINAPHTHYL SULPHONIC ACID ν **DI****NAPHTHYL****($\alpha\alpha$) DI-NAPHTHYL SULPHOXIDE**

($C_{20}H_{11}S$), SO [164.5°] Formed by oxidation of ($\alpha\alpha$) di naphthyl sulphide with chromic acid mixture and $HOAc$ (Krafft, *B* 23, 2367) Formed also by oxidation of naphthylene di naphthyl sulphoxide $C_{20}H_{11}SO$ [111°] (Ekstrand, *B* 17, 2603) White crystals (from alcohol)

NAPHTHYL SULPHURIC ACID ν **NAPHTHYL****SULPHATE****NAPHTHYL SULPHYDRATE** ν **NAPHTHYL****MERCAPTAN****(α) NAPHTHYL-THIOCARBAMIC ACID**

$C_{10}H_7NH CO SH$ *Methylether MeA'* [122°] Formed by the action of dilute H_2SO_4 on methyl di naphthyl imido thiocarbamate [136°] (Evers, *B* 21, 970) Needles, ν sol dilute alcohol, insol water, alkalis, and dilute acids Alcoholic ammonia forms, on heating, (α) naphthyl-urea

Ethylene derivative

$CO < \begin{array}{c} N(C_{10}H_7) \\ S CH_2 CH_2 \end{array} > [102^\circ]$ Formed by the action of dilute $HClAq$ at 200° upon the substance $C_{10}H_7N CO < \begin{array}{c} N(C_{10}H_7) \\ S CH_2 CH_2 \end{array} >$ (Evers, *B* 21, 970) Needles

(β) **Naphthyl-thiocarbamic acid** *Ethylether* $C_{10}H_7NH CS OEt$ [97°] Formed by heating (β) naphthyl thiocarbamide with alcohol at 130° (Cosner, *B* 14, 58) Needles or plates, ν e sol chloroform, m sol alcohol and ether — $C_{10}H_7N Ag CS OEt$ Ppd by adding ammoniacal $AgNO_3$ to the alcoholic solution

(α)-Naphthyl-thiocarbamic acid

Methylether $C_{10}H_7NH CS SMe$ [185°], Formed by heating $C_{10}H_7NH CO SMe$ with CS_2 (E). Small needles, m sol, hot dilute alcohol.

Ethylene derivative $\text{OS} \left\langle \begin{smallmatrix} \text{N}(\text{C}_6\text{H}_5) \\ \text{S CH}_2\text{CH}_2 \end{smallmatrix} \right\rangle$

[199°] Formed by the action of CS_2 on $\text{CO} \left\langle \begin{smallmatrix} \text{N}(\text{C}_6\text{H}_5) \\ \text{S CH}_2\text{CH}_2 \end{smallmatrix} \right\rangle$ at 160° (Evers, *B* 21, 972). Pearly plates (from hot alcohol)

(*β*) Naphthyl-dithiocarbamic acid *Tetrahydride*. Tetrahydronaphthylamine salt $\text{C}_{10}\text{H}_{11}\text{NH}_2\text{S CS NHC}_6\text{H}_5$ [142°] Formed from the tetrahydride of (*β*) naphthylamine and an ethereal solution of CS_2 (Bamberger & Müller, *B* 21, 857) Needles

(*β*) NAPHTHYL-THIO-SEMI-CARBAZIDE $\text{C}_{10}\text{H}_7\text{NH NH CS NH}_2$ [204°] Formed by heating (*β*)-naphthyl hydrazine hydrochloride with ammonium sulphocyanide in alcoholic solution (Hauff, *A* 253, 80, Hüllinghaus, *B* 22, 2657) Crystals, insol water, sol cold alcohol

(*α*)-NAPHTHYL-THIOCARBIMIDE $\text{C}_{10}\text{H}_7\text{N OS Naphthyl mustard oil}$ [58°] Formed from di-naphthyl-thio urea by distilling with P_2O_5 (Hall, *P M* [4] 17, 804) or by heating it with HClAq (84 p.c.) at 150° (Manger, *B* 15, 1414) Formed also by heating di naphthyl-cyanamide with CS_2 at 200° (Huhn, *B* 19, 2406) Long white needles, sol alcohol, ether, and benzene With naphthylamine in alcoholic solution it combines, forming di naphthyl thio-urea Aniline forms phenyl naphthyl thio urea

(*β*) Naphthyl thiocarbimide $\text{C}_{10}\text{H}_7\text{NCS}$ [62°] Obtained in the same manner as its (*α*) isomeride (Cosner, *B* 14, 61, Huhn, *B* 19, 2407) Needles

(*β*)-NAPHTHYL-THIOCARBIZINE $\text{C}_{11}\text{H}_7\text{NS}$, *is* $\text{C}_{10}\text{H}_7\text{N} \left\langle \begin{smallmatrix} \text{NH} \\ \text{CS} \end{smallmatrix} \right\rangle$ [254°] Formed by heating (*β*)-naphthyl thio-semi-carbazide with dilute (20 p.c.) H_2SO_4 at 135° (Hauff, *A* 253, 31) Pearly plates, insol water, sol ether, v sol warm alcohol May be sublimed— B'HOI needles, v sol hot water— B'HPtCl ,— B'HNO ,

DI-(*α*)-NAPHTHYL-THIOHYDANTOIN

$\text{C}_{10}\text{H}_7\text{N}_2\text{SO}$ *is*. $\text{C}_{10}\text{H}_7\text{N} \left\langle \begin{smallmatrix} \text{N}(\text{O}_2\text{H}) \\ \text{S CH}_2 \end{smallmatrix} \right\rangle \text{CO}$ [176°]. Formed by the action of chloro-acetic acid on di-(*α*) naphthyl thio-urea (Evers, *B* 21, 974) Plates, insol water, v sol alcohol

Di (*β*)-naphthyl-thiohydantoin [174°] Resembles the (*α*) isomeride in mode of preparation and properties

NAPHTHYL-THIOSINAMINE *is* NAPHTHYL-ALLYL-THIO UREA (*q v*)

(*α*) NAPHTHYL-THIO-UREA $\text{C}_{11}\text{H}_9\text{N}_2\text{S}$ *is*. $\text{C}_{10}\text{H}_7\text{NH CS NH}_2$ [198°] Formed by heating naphthylamine hydrochloride with ammonium sulphocyanide (De Clermont & Wehrhn, *C B* 82, 512) Small trimetric prisms (from alcohol); sol water, ether, and cold alcohol

Acetyl derivative $\text{C}_{10}\text{H}_7\text{NH CS NHAc}$ [198°]. *S* (alcohol) 2.5 at 78° Formed from (*α*)-naphthylamine and acetyl sulphocyanide (Miquel, *Bl* [2] 28, 103) Slender needles

Benzoyl derivative $\text{C}_{10}\text{H}_7\text{NH CS NHBz}$. [178°] *S* (alcohol) 2 at 78° Formed from (*α*)-naphthylamine and benzoyl sulphocyanide (Miquel, *A Ch* [5] 11, 328) Lustrous yellow prisms (from alcohol), insol ether

(*β*) - Naphthyl- thio- urea $\text{C}_{10}\text{H}_7\text{NH OS NH}_2$. [180°] Formed by heating (*β*)-naphthylamine hydrochloride with potassium sulphocyanide (Cosner, *B* 14, 61). White trimetric plates.

Di-(*α*)-naphthyl-thio-urea $\text{C}_{21}\text{H}_{15}\text{N}_2\text{S}$ *is*. $\text{CS}(\text{NHC}_6\text{H}_5)_2$ [207° cor] (*E*), [197°] Brieger, *B* 12, 1860, Huhn, *B* 19, 2405) Formed by heating (*α*) naphthylamine (100 g) with CS_2 (50 g) and alcohol (500 g) for 14 hours at 75° (Delbos, *A* 84, 371, Evers, *B* 21, 963) Formed also by passing H_2S into a boiling solution of di-naphthyl-cyanamide ($\text{C}_{10}\text{H}_7\text{N}_2\text{C}$) in dry benzene Needles, almost insol alcohol, ether, and benzene, sol nitrobenzene By adding HgO to its boiling solution in dry benzene it is converted into $\text{C}(\text{NC}_6\text{H}_5)_2$. Mel at 100° forms methyl di- naphthyl- imido- thio- carbamate $\text{C}_{10}\text{H}_7\text{N} \left\langle \begin{smallmatrix} \text{NHC}_6\text{H}_5 \\ \text{SMe} \end{smallmatrix} \right\rangle$ [186°] (*v* Di NAPHTHYL-IMIDO THIO CARBAMIC ETHERS

Octohydride $\text{CS}(\text{NHC}_6\text{H}_5)_2$ [170°] Formed by heating (*α*) naphthylamine tetrahydride with CS_2 and alcohol as long as H_2S is given off (Bamberger, *B* 21, 1795) Needles, v sol alcohol, m sol ether

Di (*β*) naphthyl-thio-urea $\text{CS}(\text{NHC}_6\text{H}_5)_2$ [193°] (*C*, *H*), [203° cor] (*E*) Prepared by heating (*β*) naphthylamine in alcoholic solution with CS_2 for 14 hours at 75° (Cosner, *B* 14, 61, Evers, *B* 21, 963) Formed also by passing H_2S into a boiling solution of di (*β*) naphthyl-cyanamide (carbo di (*β*) naphthyl imide) in dry cumene (Huhn, *B* 19, 2407) White plates (from hot nitrobenzene), v sol alcohol and ether With Mel it forms the compound $\text{C}_{10}\text{H}_7\text{NH} \left\langle \begin{smallmatrix} \text{N}(\text{C}_6\text{H}_5) \\ \text{CSMe} \end{smallmatrix} \right\rangle$ [110°], *v* Di NAPHTHYL-IMIDO THIO CARBAMIC ACID By adding HgO to its boiling solution in benzene it is converted into $\text{C}(\text{NC}_6\text{H}_5)_2$. When heated with alcoholic NH_3 at 100° it yields (*β*) naphthylamine and (*β*) naphthyl-thio urea (Gebhardt, *B* 17, 3045) With mercuric cyanide and ammonia it yields $\text{CN} \left\langle \begin{smallmatrix} \text{C}(\text{NC}_6\text{H}_5) \\ \text{NHC}_6\text{H}_5 \end{smallmatrix} \right\rangle$ [166°], which forms an acetyl derivative [141°] and a benzoyl derivative [188°] (Hefelmann, *C C* 1885, 884)

Octohydride $\text{CS}(\text{NHC}_6\text{H}_5)_2$ [166°] Formed by boiling with alcohol the product obtained by the action of CS_2 on the tetrahydride of (*β*)-naphthylamine (Bamberger & Müller, *B* 21, 858) White needles, v sol alcohol, v e sol ether and benzene

NAPHTHYL-TOLYL-AMINE *v* TOLYL NAPHTHYL AMINE

(*α*) NAPHTHYL UREA $\text{C}_{11}\text{H}_9\text{N}_2\text{O}$ *is* $\text{C}_{10}\text{H}_7\text{NH CO NH}_2$. Obtained by saturating a solution of (*α*)-naphthylamine in dry ether with cyanic acid gas, and crystallising from hot alcohol (Schiff, *A* 101, 90) Formed also, together with di naphthyl urea, by heating naphthylamine hydrochloride (3 pts) with urea (1 pt) at 150°–170° (Pagliani, *G* 9, 80) Flat needles, nearly insol water, m sol alcohol, v sol ether Decomposes at 250° without previous fusion

(*β*)-Naphthyl-urea $\text{C}_{10}\text{H}_7\text{NH CO NH}_2$ [c. 287°] Prepared by heating urea with (*β*)-naphthylamine hydrochloride (Cosner, *B* 14, 62) White needles, sol hot alcohol and hot water

Di-(*α*) naphthyl-urea $\text{CO}(\text{NHC}_6\text{H}_5)_2$ [270°].

Formation—1 By heating the acid oxalate of (*α*)-naphthylamine (Delbos, *A Ch* [4] 21, 68), di-naphthyl-oxamide being first formed (Zinn, *A* 108, 228)—2 By gradually heating (*α*)-naphthylamine (2 pts) with urea (1 pt) to 120° (Pagliani, *G* 9, 28)—3 By boiling di-(*α*) naphthyl-cyanamide with dilute alcohol (Huhn, *B* 19,

2405) —4 By heating (a)-naphthylamine with carbamic ether at 185° (Smolka, *M* 11, 200)

Properties —Plates or needles, insol water, al sol boiling alcohol. Yields naphthylamine and no NH_3 on decomposition by KOH

s-Di-(β)-naphthyl-urea $\text{CO}(\text{NHCO}_2\text{H})_2$ [293°] (H.), [286°] (E)

Formation —1 By the action of HgO on di (β) naphthyl thio-urea suspended in spirit (Huhn, *B* 19, 2406) —2 By boiling di (β) naphthyl cyanamide $\text{C}(\text{NC}_6\text{H}_4)_2$ with dilute alcohol (H.) —3 By boiling potassium di (β) naphthoyl-hydroxylamine with water (Ekstrand, *B* 20, 1360)

Properties —Slender needles, al sol alcohol, ether, benzene, and nitrobenzene

u Di-(β) naphthyl urea $\text{C}_{10}\text{H}_7\text{N CO NH}_2$ [193°] Formed by heating the chloro-formyl derivative of di (β) naphthylamine with ammonia for an hour at 140° (Kym, *B* 23, 428) Groups of long needles (from alcohol), al sol cold alcohol

Tetra (β) naphthyl-urea $(\text{N}(\text{C}_{10}\text{H}_7)_2)_2\text{CO}$ [288°] (K & L.), [295°] (K) Formed by heating di (β) naphthylamine with $(\text{C}_{10}\text{H}_7)_2\text{N COCl}$ at 200°–260° (Kuhn & Landau, *B* 23, 811, 2161, Kym, *B* 23, 1542) Prismatic needles, al sol alcohol and ether, v sol hot benzene

NAPHTHYL-URETHANE v NAPHTHYL-CARBAMIC ETHER

NARCEINE $\text{C}_{20}\text{H}_{24}\text{NO}_4$. [184°] (Blyth), [145° cor.] (Hesse, *A* 129, 251), [162°] (Claus Meixner, *J pr* [2] 37, 1, cf Dott, *Ph* [3] 20, 335) *S* 08 at 13° *S* 80 p alcohol 1 Occurs in opium (Pelletier, *A Ch* [2] 50, 262, Couerbe, *A Ch* [2] 59, 151)

Preparation —1 The aqueous extract of opium, from which morphine has been separated by Gregory's process, is mixed with ammonia, filtered, and pptd by lead acetate. The filtrate is freed from lead by H_2SO_4 , neutralised by ammonia, and evaporated. The narcaine is recrystallised from water (Anderson, *Tr E* 20, 347) —2 A solution of the opium bases in HCl aq is mixed with excess of NaOAc and allowed to stand for 24 hours. The filtrate evaporated to a small bulk on the water-bath deposits, after 24 hours, pure narcaine (Plugge, *Ar Ph* [8] 25, 343)

Properties —Silky needles (containing 2aq), v. sol hot water and alcohol, al sol cold water and chloroform, insol ether. Cannot be sublimed. It loses its water of crystallisation at 100°, and at 140° gives off another H_2O (Hesse, *B* 7, 105) It is insol conc KOH aq , al sol dilute caustic potash and ammonia. Ppd by NaHCO_3 from solutions of its salts. Inactive to light (Hesse, *A* 176, 198) Can be extracted both from acid and alkaline solutions by shaking with benzene or chloroform (Plugge, *Ph*, [8] 20, 401) Narcaine is a somniferous poison, 5 g being probably a fatal dose

Reactions —1 Zinc and HCl aq form a small quantity of an amorphous base $\text{C}_{20}\text{H}_{24}\text{NO}_4$, or $\text{C}_{20}\text{H}_{22}\text{NO}_4$ (Beckett & Wright, *C J* 28, 701) —2 Water at 150° carbonises it —3 Chromic acid mixture yields hemipic acid (10 p c), and methylamine (Beckett & Wright, *C J* 29, 467) —4 Ferric chloride forms hemipic, but no opianic acid. Hemipic acid is also formed, though in smaller quantity, by oxidation by KMnO_4 , or by

MnO_2 and H_2SO_4 . Alkaline KMnO_4 forms narcic acid (*v infra*) —5 Conc HNO_3 yields oxalic acid —6 Boiling caustic potash gives off ammonia and NMe_3 , and forms a sparingly soluble acid $\text{C}_{20}\text{H}_{22}\text{NO}_4$ [210°] —7 Potash-fusion yields protocatechuic acid

Tests —1 Weak sodium solution colours solid narcaine dark blue, the colour not being removed by ammonia. The blue colour is destroyed by boiling water —2 Conc H_2SO_4 turns it brown, and then dissolves it, forming a yellow solution. Narcaine is not coloured by diluted sulphuric acid, but on heating over a water bath a violet red colour appears, which ultimately becomes cherry red. If the red liquid be cooled and a trace of HNO_3 or KNO_3 be added, bluish-violet stripes appear (Plugge, *Ar Ph* [3] 25, 425) —3 Erdmann's solution gives a brown colour, turning reddish-brown on heating —4 Chloride of iodine forms a greenish yellow pp., which dissolves on heating (Dittmar, *B* 18, 1612) —5 Potassium chromate gives no pp in cold saturated solutions of salts of narcaine, but in hot solutions there is formed a pp of narcaine chromate and free narcaine (Plugge, *Ar Ph* [3] 25, 793) —6 Narcaine is a feeble base, so that its salts may be titrated by standard alkali as if they contained no base (Plugge, *Ar Ph* [3] 25, 45) —7 When strongly heated it gives off vapours smelling like herring brine (Hesse) —8 Chlorine-water followed by ammonia gives a red colour

Salts — B'HCl (dried at 100°) concentric needles, sol water and alcohol *S* 36 — B'HCl 2aq (Petit, *Bl* [2] 18, 534) *S* 7 — B'HCl 5aq (Wright, *C J* 27, 109) — B'HCl (Petit) — B'HCl (P) — $\text{B'H}_2\text{PtCl}_6$ (dried at 100°) crystalline powder [195°] Golden needles (Claus) — $\text{B'H}_2\text{PtCl}_6$ 2aq amorphous pp., changing to prisms (Hesse, *A* 129, 250) — $\text{B'H}_2\text{SO}_4$, 10aq crystals (Beckett & Wright, *C J* 27, 69) — $\text{B'H}_2\text{SO}_4$ — $\text{B'H}_2\text{SO}_4$ — $\text{B'H}_2\text{SO}_4$ —Mercuric-chloride, only at first, ultimately crystallising in concentric prisms (Hesse) [118°–122°] (Roser, *A* 247, 175) — $\text{B'H}_2\text{I}$, slender needles (Jørgensen, *B* 2, 460) — $\text{B'H}_2\text{I}$: needles (from alcohol)

Methylo-sodide B'MeI [173° uncor.] colourless needles (Claus & Ritzefeld, *B* 18, 1569)

Methylo-chloride B'MeCl [210° uncor.], easily soluble small white needles — (B'MeCl) PtCl_6 nearly insoluble yellow powder

Methylo-nitrate B'MeNO_3 [186° uncor.], small white soluble needles (C & R.)

Ethylo-sodide B'EtI granular crystals (Beckett & Wright, *C J* 28, 708) — B'EtI 2aq Yields alkaline B'EtOH which is readily split up into narcaine and alcohol

Ethylo-bromide B'EtBr [165° uncor.], fine white soluble needles — (B'EtBr) CdBr_2 : small colourless needles (C & R)

Ethylo-chloride B'EtCl [170° uncor.], small colourless needles — (B'EtCl) PtCl_6 glistering yellow crystals [170° uncor.] (C & R) — (B'EtCl) HgCl_2 aq [127°], white crystalline pp.

Ethylo-nitrate B'EtNO_3 : [155° uncor.], long colourless silky needles, sol water (C & R.) *Ethylo-oxalate* $\text{B'EtC}_2\text{O}_4$ [c 174° uncor.], glistering needles (containing 6aq)

Benzoylo-chloride $\text{B'CH}_2\text{Cl}$ [162° uncor.], fine white needles, v. sol. hot water and

alcohol, insol ether—(B'C,H,Cl),PtCl₄. [165° uncor]; yellow crystalline powder

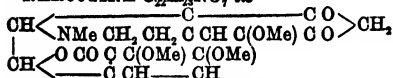

Methyl-narceine C₂₂H₃₂(OH)₂O₂N [175° uncor] Formed by adding KOH (2 pts) to a boiling solution of narceine methyl-iodide (1 pt) in 10 pts of water (Claus & Ritzfeld, *B* 18, 1578) Fine colourless needles *V* sol alcohol, *sl* sol water, nearly insol ether

Benzyl-narceine C₂₂H₃₂(O,H)₂O₂N [169° uncor] Formed by the action of aqueous KOH upon narceine benzyl-iodide (Claus & Ritzfeld, *B* 18, 1574) Long white needles *V* sol alcohol, nearly insol water and ether Alkaline reaction—(B'HCl),PtCl₄ 2aq [128° uncor], dark yellow crystalline pp

Narceic acid C₂₂H₃₂NO₂ [184°] Formed by oxidising narceine with KMnO₄ (Claus & Meixner, *J pr* [2] 87, 3) Prisms (containing 3aq), *v* sol alcohol, ether, chloroform, and hot water Decomposes at 180°–200° into CO₂, dimethylamine, and di-oxy-naphthalene dicarboxylic acid C₁₂H₈O₄ Not acted upon by FeCl₃, —Na₂A'''—Na₂HA''' 5aq [85°]—NaH₂A''' 4½aq—Ba₂A''' 5aq—Ag₂A'''

ψ-Narceine *v* NARCOTINE

NARCOTINE C₂₂H₃₂NO₂ *s*

(Roser, *A* 254, 357) Mol *w* 413 [155°] (Wynter Blyth, *C J* 33, 317, [176°] (Hesse) *S* 014 at 100° *S* (85 p c alcohol) 1 in the cold, 5 at 78° (Duflos, *B J* 12, 214) *S* (ether) 77 in the cold, 21 on boiling (Duflos), 6 at 16° (Hesse) *S* (isoamyl alcohol) 325 in the cold *S* (benzene) 461 in the cold (Kubly, *J* 1866, 823) *S* (chloroform) 38 (Pettenkofer) *S* (EtOAc) 17 (Henry) $[\alpha]_D = -130^\circ$ in ethereal solution (Bouchardat, *A Ch* [3] 9, 213), -185° in alcoholic solution, -207° in chloroform at 22° (Hesse, *A* 176, 192) Contained in opium to the amount of 5 to 8 p c, and was the first alkaloid extracted therefrom (Derosne, *A Ch* 45, 257, Robiquet, *A Ch* [2] 5, 275, Dumas & Pelletier, *A Ch* [2] 24, 188, 50, 269, Liebig, *A* 6, 35, Brandes, *A* 2, 274, Couerbe, *A Ch* [2] 59, 159, *A* 17, 174, Regnault, *A Ch* [2] 68, 137, Wöhler, *A* 50, 1, Blyth, *A* 50, 29, Wertheim, *A* 70, 71, 73, 208, Flückiger, *J* 1869, 797)

Preparation—1 The mother-liquor obtained in the preparation of morphine (*q v*) by Gregory's process is ppd by ammonia, and the pp recrystallised from boiling spirit (Anderson, *A* 86, 179)—2 Opium is extracted with dilute HCl and the bases ppd by KOH The bases are treated with oxalic acid to ppt papaverine, and the filtrate from acid papaverine oxalate ppd by ammonia The pp is recrystallised from alcohol (Hesse, *A Suppl* 8, 284)—3 Conc aqueous NaOAc added to a solution of the hydrochlorides of the opium bases throws down narcotine and papaverine The pp is redissolved in dilute HClAq and mixed with K₂FeCy₄ which ppts papaverine ferricyanide From the filtrate the narcotine is ppd by ammonia (Plugge, *Ar Ph* [3] 25, 348)

Properties—Trimetric prisms, or groups of needles Cannot be sublimed If cooled slowly after melting it forms slender radiating needles.

Insol cold water, *m* sol alcohol and ether. Lævogyrate in neutral solutions, dextrogyrate in acid solutions Insoluble in aqueous potash, nearly insol NH₄Aq Dissolves in boiling baryta-water, but ppd therefrom by NH₄Aq Its solutions do not give a blue colour with FeCl₃ Narcotic poison, 3 g killing a cat Not acted upon by Ac₂O

Reactions—1 Distillation with conc HIAq yields Mel (3 mols) (Matthiessen & Foster, *Tr* 1863, 345, *C J* 16, 342, *A Suppl* 6, 60)—2 Conc HClAq at 110° yields MeCl and, successively, di-methyl-nornarceine, methyl nornarceine, and nornarceine (Matthiessen & Foster, *C J* 21, 257, Matthiessen, *Pr* 17, 337, Matthiessen & Wright, *Pr* 17, 340) Distillation with equal volumes of H₂SO₄ and water gives MeHSO₄ and the three bodies last mentioned (Armstrong, *C J* 24, 56)—3 Boiling dilute KOHAq has no action, but potash-fusion at 200°–220° yields trimethylamine and other volatile amines (Hofmann, *A* 75, 367)—4 Dilute nitric acid at 50° forms meconin, opianic acid, hemipic acid and cotarnine—5 Distillation with HCl and platinum chloride also yields opianic acid and cotarnine The same products are formed by oxidation with H₂SO₄ and MnO₂ (Wöhler)—6 Water at 140° splits it up into meconin and hydrocotarnine (Beckett & Wright, *C J* 28, 583) Sodium-amalgam gives the same products—7 Iodine acting on an alcoholic solution of narcotine forms tarconine methyloperiodide and iodo tarconine methyloperiodide (Jørgensen, *J pr* [2] 2, 446, Roser, *A* 245, 317)

Tests—1 Conc H₂SO₄ forms a yellow liquid which, when heated becomes orange red and finally violet red (Husemann, *A* 128, 305)—2 H₂SO₄ containing a little HNO₃ gives a reddish-yellow colour—3 Does not liberate iodine from iodic acid—4 Does not reduce alkaline K₂FeCy₄ (Kieffer, *A* 103, 277)—5 Bromine gradually added to a boiling solution of narcotine in dilute HClAq forms a rose coloured liquid, the colour being destroyed by excess of bromine—6 Potassium mercuric iodide forms a yellowish white pp (Groves, *C J* 11, 97) Phosphomolybdic acid, picric acid, potassium sulphocyanide, and auric chloride also give pps in solutions of salts of narcotine—7 A solution of potassium chromate added to one of a salt of narcotine, ppts free narcotine (Plugge, *Ar Ph* [3] 25, 793), K₂Cr₂O₇ ppts narcotine bichromate—8 Salts of narcotine require, on titration, the same amount of alkali for neutralisation as if the base were absent (Plugge, *Ar Ph* [3] 25, 45)—9 Chloride of iodine gives a curdy yellowish pp (Dittmar, *B* 18, 1612)

Salts—B'HCl Needles, *v* sol water $[\alpha]_D = -47^\circ$ to -50° in a 2 p c solution containing excess of HCl $[\alpha]_D = -104.5^\circ$ in a 2 p c solution in 80 p c alcohol containing excess (1 mol) of HCl (Hesse, *A* 176, 192)—B'HClAq (Dott, *J* 1884, 1889)—B'HCl (Beckett & Wright, *C J* 29, 164)—B'HCl—B'HCl (B a. W.)—Mercuric chloride white pp (Hinterberger, *A* 82, 311)—B'H₂PtCl₄ yellow crystalline pp (Blyth) Decomposed by boiling water (De Coninck, *Bl* [2] 45, 181)—B'H₂PtCl₄ 2aq (Hesse)—B'H₂SO₄ 4aq (Dott)—B'H₂CrO₄—B'HI, shining laminae, converted by boiling alcohol into tarconine periodide C₂₂H₃₁NO₂HI,

Jørgensen, *B* 2, 460) — $B'HOAc$ aq needles (Dott) — Binoxalate v e sol water — Cyanurate $B'H_2O_2C_2N_3$ 1½aq, needles [c 175°], v sl sol water (Claus, *J pr* [2] 38, 229)

Methylo-chloride $B'MeCl$ Formed by heating narcotine with MeI and decomposing the viscid $B'MeI$ with $AgCl$ (Roser, *A* 247, 168) Groups of needles, v sol water and alcohol Yields ψ narceine (v *infra*) on distillation with aqueous $NaOH$ — $B'_2Me_2PtCl_2$

Ethylo iodide $B'EtI$ (How, *A* 92, 327)

Oil **Ethylo chloride** $B'EtCl$ Yields ψ methyl narceine [173°] on treatment with $NaOHAq$ — $B'_2Et_2PtCl_2$

Nornarcotine $C_{12}H_{17}NO$, Obtained by heating narcotine with fuming $HIAq$ (Matthiessen & Wright, *Pr* 17, 340) White amorphous mass, turning brown in air Almost insol water, insol alcohol and ether A concentrated solution of its hydrochloride is ppd by HCl and also by water The hydrochloride is tasteless, and its solution gives with KOH , Na_2CO_3 , and NH_3 , pps soluble in excess, and with platinum chloride a yellow pp, quickly turning brown

Methyl derivative $C_{12}H_{19}NO$, Formed by heating narcotine with $HClAq$ for some days White amorphous mass, almost insol water, insol alcohol and ether Its solution in conc $HClAq$ is ppd by water Astringent taste The platinumchloride is a yellow pp, slowly turning brown The ppd base is soluble in excess of NH_4Aq and Na_2CO_3Aq but sl sol $KOHAq$

Di-methyl derivative $C_{14}H_{21}NO$, Formed by heating narcotine with $HClAq$ for 2 hours or with diluted H_2SO_4 at 100° White amorphous mass, almost insol water, v sol alcohol, sl sol ether Its solution in $HClAq$ is ppd by water Its hydrochloride tastes bitter The platinumchloride is a yellow pp The ppd base is insol Na_2CO_3Aq , sl sol NH_4Aq , sol $KOHAq$

ψ -Narceine $C_{22}H_{27}NO_3$, [c 175°] Formed by boiling narcotine with MeI , decomposing the resulting methylo iodide by $AgCl$, adding an equivalent amount of $NaOH$, and distilling with steam (Roser, *A* 247, 169) Slender white needles (containing 3aq), v sol alcohol and hot water, sl sol cold water, insol ether Dissolves in aqueous KOH and NH_3 , but is reppd by CO_2 , Inactive to light Coloured blue by iodine Conc H_2SO_4 forms a brownish yellow solution, turned dirty violet on heating Chlorine water followed by ammonia gives a red colour According to Roser, this body is probably identical with narceine — $B'_2H_2SO_4$ 2aq tufts of needles — $B'HCl$ 3aq — $B'_2H_2PtCl_2$, [198°] Thin needles, insol water — Aurachloride [180°], yellowish red needles — Mercury double salt [123°]

ψ -Methyl-narceine $C_{14}H_{21}NO_3$, ψ -Homo-narceine [173°] Formed by passing steam through a mixture of narcotine ethylo chloride and aqueous $NaOH$ (Roser, *A* 247, 178) White needles (containing 3aq), v sol water and alcohol, insol ether Gives a blue colour with iodine The hydrochloride and sulphate are v sol water — $B'_2H_2PtCl_2$ 2aq small yellow needles

Teropiammon $C_{10}H_{15}NO_{12}$, A crystalline compound, insol. water, found among the pro-

ducts of the action of dilute HNO_3 on narcotine (Anderson) It forms a crimson solution in H_2SO_4 , and yields NH_3 and opianic acid on boiling with potash.

Cotarnine $C_{17}H_{19}NO_4$, s

$[314s] OH_2 \cdot \langle O \rangle \cdot C_6H(OMe)(CHO) OH, CH_2NMe_2$ (Roser, *A* 254, 354) [133°]

Formation — 1 By the oxidation of narcotine by MnO_2 and H_2SO_4 (Wöhler, *A* 50, 19, Matthiessen & Foster, *Pr* 11, 55, Beckett & Wright, *C J* 28, 575), by platinum chloride (Blyth, *Mem C J* 2, 168), by dilute nitric acid (Anderson, *C J* 5, 266, *A* 86, 196) or by $K_2Cr_2O_7$ (M & F) — 2 By the oxidation of hydrocotarnine (Beckett & Wright, *C J* 28, 580)

Properties — Colourless needles, sl sol water, v sol alcohol and ether Decomposed on fusion A solution of its hydrochloride is neither ppd by HCl nor by water Its salts taste bitter The freshly ppd base dissolves in excess of aqueous NH_3 and Na_2CO_3 , but is v sl. sol. $KOHAq$ Decomposes on fusion Cotarnine is not poisonous

Reactions — 1 Nitric acid forms a red solution and, on heating, oxidises it to apophyllenic and oxalic acids — 2 Aqueous HCl , HI , or H_2SO_4 at 140° yields $MeCl$, MeI , or $MeHSO_4$ and cotarnamic acid — 3 Zinc and dilute $HClAq$ yield hydrocotarnine — 4 Bromine-water forms $C_{17}H_{17}Br_2NO_4$ (Wright, *C J* 32, 533) Bromine water added to a solution of cotarnine hydrochloride forms $C_{17}H_{17}Br_2NO_4HBr$, a crystalline pp [190°–200°] (Von Gerichten, *B* 14, 311)

Salts — $B'HCl$ 2½aq long silky crystals (Blyth) — $B'_2H_2PtCl_2$ lemon-yellow crystalline pp, or dark red six sided prisms — $B'HClHgCl_2$ pale-yellow pp — B'_2H_2Br 2aq — $B'HI$ yellow needles, sl sol cold water and alcohol (Roser, *A* 249, 156) — $B'HI$, [142°] (Jørgensen, *J pr* [2] 2, 455)

Benzoyl derivative $C_{22}H_{21}BzNO_4$ ½aq [123°] Formed by shaking cotarnine with $BzCl$ and dilute $NaOHAq$ (Roser, *A* 254, 335) Long needles, insol water, v e sol hot alcohol

Oxim $C_{17}H_{19}NO_4(NOH)$ [168°] Prisms, insol water, m sol alcohol, sol alkalis — $B'HCl$ small yellow needles, v sol water, m sol alcohol — $B'_2H_2PtCl_2$ yellow crystalline pp decomposed by boiling water

Oxim of the benzoyl derivative $C_{24}H_{23}O_5(CHNOH) C_6H_5NMeBz$ [166°]

Formed by warming benzoyl cotarnine with alcoholic hydroxylamine hydrochloride Small pointed crystals, insol water and ether, v sol alcohol, sol $NaOHAq$

Methyl-cotarnine

Methylo-iodide $C_{17}H_{19}IO_4NMe_2I$ Formed by warming cotarnine with MeI (Roser) Yellow needles, sl sol cold water and alcohol Decomposed by boiling $NaOHAq$ into cotarnone and NMe_2

Methylo chloride $C_{17}H_{19}ClO_4NMe_2Cl$ ½aq. Formed from the iodide and $AgCl$ Crystals (from water) On warming with alcoholic hydroxylamine hydrochloride at 100° it yields $C_{17}H_{19}Cl_2N_2O_4$ 2aq or $C_6H_5O_2(CN) C_{17}H_{19}NMe_2Cl$ a crystalline body, v sol water, converted by hot $NaOHAq$ into NMe_2 and $C_6H_5O_2(CN) \cdot CH_2CH_2$

[16 The last body forms a dibromide [140°].

(C₁₁H₁₁O₂NMe₂Cl)₂PtCl₄
Bromo-cotarnine C₁₁H₁₁BrNO₂ [100°]

Formed by treating hydrocotarnine hydrobromide with bromine-water (Wright, *C J* 82, 525) Crystals (from ether), decomposing at 100° Reduced by zinc and HClAq to bromo-hydrocotarnine [78°] — B'Br — Crystals, v sol water Above 200° it melts, gives off gases, and forms a small quantity of tarconine hydrobromide, together with a blue substance C₁₁H₁₁N₂O₂HBr insoluble in alcohol

Cotarnone C₁₁H₁₁O₂ s s
CHO C₁₁H₁₁O₂ CH₂CH₂ [78°] Formed by warming methyl cotarnine methylo chloride with aqueous NaOH (Roser, *A* 249, 163) Plates (from alcohol), slightly volatile with steam Insol cold water, m sol alcohol, ether, and HOAc

Oxam C₁₁H₁₁O₂(CH NOH) CH CH₂ [182°]
Slender needles (from dilute alcohol).

Cotarn-lactone C₁₁H₁₁O₂ s s

CH₂—O—C₁₁H(OMe)—CH(CH₂OH)— [154°]

Formed by oxidising cotarnone with KMnO₄ (Roser, *A* 254, 341) Prisms, sl sol cold alcohol or water Forms with baryta the salt Ba(C₁₁H₁₁O₂)₂5aq

Acetyl derivative C₁₁H₁₁AcO₂ [174°]

Benzoyl derivative C₁₁H₁₁BzO₂ [184°]

Cotarnic acid C₁₁H₁₁O₂ s s

CH₂—O—C₁₁H(OMe)(CO₂H)₂[₂ 3 5 6] [178°]

Formed by oxidising cotarnone or cotarn lactone with aqueous KMnO₄ (Roser, *A* 249, 165, 254, 845) Plates Forms, on melting, the anhydride C₁₁H₁₁O₂ [162°] On heating with P and HIAq it yields gallic acid HClAq at 100° forms CH₂—O—C₁₁H(OMe)CO₂H [210°]

Bromine in HOAc produces the compound

CH₂—O—C₁₁HBr₂(OMe) [160°]

Salts —KHA''2½aq needles, v sol. water —BaA'': plates —Ag₂A'

Hydrocotarnine C₁₁H₁₁NO₂ s s

CH₂—O—C₁₁H(OMe)—CH₂CH₂· [50°] (H).

[55°] (B & W) Occurs in opium (Hesse, *A Suppl* 8, 326) Formed by reducing cotarnine with zinc and HClAq, and, together with meconin, by the action of zinc and HClAq on narcotine (Beckett & Wright, *C J* 28, 577) It is also formed in small quantity (2 to 5 p c) in the preparation of opianic acid by the oxidation of narcotine. Monoclinic prisms (from ether), v sol alcohol and benzene The crystals contain water of crystallisation (½aq) Conc H₂SO₄ forms a yellow solution, changing on heating to crimson and, finally, to a dirty violet colour Easily oxidised to cotarnine Not attacked by AcO Bromine added to a solution of its hydrobromide forms C₁₁H₁₁BrNO₂ [78° cor], which yields the crystalline salts C₁₁H₁₁BrNO₂HBr and (C₁₁H₁₁BrNO₂)₂H₂PtCl₄

Salts —B'HCl aq —B'₂H₂PtCl₄ —B'HI. S 2 at 18° —B'Br 1½aq

Ethyl-o-codide B'EtI White micaceous plates, sl. sol water Yields (B'Et)₂CO₂ 4aq, B'EtCl [100°], both crystalline, and (B'EtCl)₂PtCl₄

Acetyl-hydrocotarnine-acetic acid C₁₁H₁₁NO₂ [201°] Formed by boiling cotarnine (1 pt) with acetic anhydride (10 pts) for 1½ hours Small needles Sol alcohol and benzene, sl sol boiling water, insol cold water, and ether —A'Ag white pp —A'Ca very soluble small needles

Ethyl ether A'Et [118°], white feathery needles (Bowman, *B* 30, 2431).

Oxy-hydrocotarnine methylo-iodide

CH₂—O—C₁₁H(OMe)—CH(OH)NMe₂I

Methyl derivative

C₁₁H₁₁O₂ C₁₁H₁₁(OMe)NMe₂I [178°] Formed by the action of MeI in the cold on a solution of cotarnine in MeOH (Roser, *A* 254, 360) Yellow needles, v sol hot water and alcohol Ppd unchanged by adding NaOH to its warm aqueous solution Boiling with water and Ag₂O expels NHMe₂ —(C₁₁H₁₁NO₂Cl)₂PtCl₄ orange pp

Ethyl derivative C₁₁H₁₁O₂(OEt)NMe₂I [168°] Formed by the action of MeI on a cold solution of cotarnine in EtOH Plates, v e sol water and alcohol.

Isobutyl derivative C₁₁H₁₁O₂N(OEt)I [120°] Formed from cotarnine, MeI, and iso butyl alcohol Plates (from water)

Cotarnamic acid C₁₁H₁₁NO₂ Formed by heating cotarnine with aqueous HCl at 140° (Matthiessen & Foster, *A Suppl* 2, 379, Gerichten, *B* 14, 310) Yields apophyllenic acid on oxidation by dilute HNO₃ —C₁₁H₁₁NO₂HCl aq White needles, sl sol cold water On treatment with nitrous acid or on exposure to air its solution becomes green, with red fluorescence, and exhibits a spectrum resembling that of chlorophyll

Tarconine C₁₁H₁₁NO₂ Formed by heating bromo cotarnine hydrobromide at 200° (Wright, *C J* 82, 535) or tarconine methylo chloride with conc HClAq for 4 hours at 150° (Roser, *A* 245, 321) Ppd from solutions of its salts by KOH, but not by Na₂CO₃ Its hydrochloride heated at 200° forms a blue base C₁₁H₁₁N₂O₂, forming the blue salts B'₂H₂Br₂ and B'₂H₂SO₄ — Salts B'HCl 1½aq needles, v e sol water and alcohol —B'₂H₂PtCl₄ insol alcohol

Methylo-iodide B'MeI Formed by the action of H₂S on the periodide which is formed by boiling narcotine in alcoholic solution with iodine and some HCl Tufts of yellow needles (from water or alcohol) —B'MeI, [160°] Red dish brown needles (from alcohol or HOAc) —B'MeI, (Jørgensen) —B'MeBrI,

Methylo-chloride B'MeCl yellow needles —(B'MeCl)₂PtCl₄ yellow crystalline pp, sl sol water —B'HAuCl₄

Bromo-tarconine C₁₁H₁₁BrNO₂ s s

C₁₁H₁₁BrO C₁₁H₁₁N—CH₂—O [235°–238°] Formed by heating the hydrobromide of the compound C₁₁H₁₁BrNO₂ (v Cotarnine, Reaction 4) with water at 180° (Wright, Gerichten, *A* 210, 84) Orange red needles (containing 2aq), becoming crimson and anhydrous at 100° Sl sol cold water, insol. ether Water at 160° splits it up into cupronine and tarconine Conc HClAq at 120° forms narcic acid, tarconine, CO₂, and CO Chromic acid mixture yields bromoform and apophyllenic acid Bromine-water added to a solution of its hydrochloride yields cuprine, bromo apophyllenic acid, and dibromo apophyll-

lin. Distillation over soda-lime yields pyridine. —B'HCl 2aq crystals, sl sol cold water. —B'HBz 2aq —B'H₂PtCl₄ needles (from hot conc. HClAq)

Methylo-chloride C₁₁H₇BrNO₂MeCl slender needles, v e sol water, m sol alcohol —(B'MeCl)₄PtCl₄ —B'MeAuCl₄

Methylo-bromide C₁₁H₇BrNO₂MeBr Formed by the action of bromine water on an aqueous solution of tarconine methylo chloride, the perbromide first formed being decomposed by H₂S (Roser, A 245, 324) Long needles (containing aq), changing on standing to flat prisms —B'MeBr₂ [165°] Yellow rectangular plates (from alcohol or HOAc)

Methylo-iodide C₁₁H₇BrNO₂MeI [204°] Formed from bromo tarconine and MeI (Gerichten, A 210, 170) Yellow needles, sol water, insol ether Turns brown at 170° Boiling baryta water converts it into formic aldehyde and methyl bromo tarconic acid Moist Ag₂O forms the hydroxide crystallising in small red needles

Ethyl-iodide C₁₁H₇BrNO₂EtI [206°] Formed from ethyl iodide and bromo tarconine Yellow needles Yields (B'EtCl)₄PtCl₄

Iodo-tarconine C₁₁H₇INO₂ Formed by heating its methylo chloride at 180° (Roser, A 245, 319) Crystallises from water in yellowish red needles (containing aq), becoming dark red on drying —B'HCl 2aq silky yellow needles, v sol water, sl sol HClAq

Methylo-chloride C₁₁H₇INO₂MeCl aq Formed from the methylo-iodide and AgCl yellowish white needles (from alcohol), m sol water —(B'MeCl)₄PtCl₄ needles, sl sol hot water —B'MeAuCl₄ needles (from hot water)

Methylo iodide C₁₁H₇INO₂MeI Formed by the action of iodine on narcotine in alcoholic solution, the resulting periodides being decomposed by H₂S (Roser, A 245, 317) Yellow needles, changing on standing to prisms, almost insol cold water, sl sol hot alcohol —B'MeI₂ [171°] Needles, sl sol alcohol

Methyl tarconic acid C₁₁H₇NO₂ [244°] Formed from the aqueous solution obtained by the action of Ag₂O and water on tarconine methylo chloride by boiling alone or with baryta (Roser, A 245, 322, 254, 366) Not a true homologue of tarconic acid Thin yellow needles (containing 2aq), v sol hot water, alcohol, mineral acids, and KOHAq, insol ammonia —C₁₁H₇NO₂HCl aq white prisms or needles, turns yellow on drying at 100° —C₁₁H₇NO₂H₂SO₄ 3aq white prisms —(C₁₁H₇NO₂)₂H₂SO₄ 6aq yellowish crystals

Bromo - methyltarconic acid C₁₁H₇BrNO₂ [238°] Formed by boiling bromo tarconine methylo hydroxide with baryta water (Gerichten, A 210, 79, Roser, A 245, 326) The ppd Ba salt is decomposed by H₂SO₄ or HOAc Yellow prisms (containing 2aq), insol cold water and ether, sl sol hot alcohol Darkens at 215° Heated with conc HClAq it yields MeCl, HBr, and tarconic acid —CuA', —BaA', yellow pp —(HA'HCl)₄PtCl₄ needles, m sol dilute HCl

Ethyl - bromo - tarconic acid C₁₁H₇BrNO₂ [226°] Formed by the action of baryta on bromo-tarconine ethylo iodide (or ethylo hydroxide) (Gerichten, A 212, 182) Yellow needles (containing 2 aq), v sl sol cold water, v sol. alco-

hol, insol ether Its aqueous solution is neutral. Conc H₂SO₄ forms a yellow solution Conc HClAq converts it, on heating, into EtCl, HBr, and tarconic acid —HA'HCl yellow needles —(HA'HCl)₄PtCl₄ —CuA'.

Tarconic acid C₁₁H₇NO₂ Formed by heating bromo methyl tarconic acid with conc HClAq at 155° (Gerichten, A 212, 184) Slender yellow needles, turning brown in air Its alkaline solution is brown, becoming greenish blue on standing It reduces AgNO₃ in the cold —HA'HCl prisms, m sol hot water, insol cold alcohol FeCl₃ colours its solution red

Nartic acid C₂₀H₁₅N₂O₂ *Nartine* Formed by heating bromo tarconine or tarnine with conc HClAq at 130° (Gerichten, A 212, 194, 212, 170) Yellow needles, decomposing at 200° without melting Turns brown in air NaOH does not ppt it from acid solutions Its solution in NaOHAq turns greenish blue when exposed to air Reduces AgNO₃, KMnO₄ oxidises it to a pyridine carboxylic acid On distillation with soda lime it yields pyridine. —H₂A'H₂Cl₂ [above 273°] Yellow needles, m sol water —H₂A'HCl yellow needles, sl sol water

Tarnine C₁₁H₇NO₂ [above 290°] Formed by heating bromo-tarconine with water at 130° (Gerichten) Orange needles (containing 1½ aq) m sol hot water and dilute alcohol, insol ether. —B'HCl yellow needles, sol water, —B₂H PtCl₄ Decomposed by boiling water

Cupronine C₂₀H₁₅N₂O₂ Formed, together with tarnine, by heating bromo tarconine with water at 140° (Gerichten, B 14, 315, A 210, 190°) Black powder, insol hot water, alcohol, and ether Forms a brown solution in aqueous NaOH or Na₂CO₃ Conc H₂SO₄ forms a magenta-red solution, changing to violet on dilution Conc HClAq does the same —B'HCl coppery needles —B'HBz bluish green needles with coppery lustre, sl sol water, forming a blue solution

Cuprine C₁₁H₇NO₂ Formed by the action of bromine on a solution of bromo tarconine hydrobromide (Gerichten, A 210, 89) Minute blue needles with coppery lustre, sol water and alcohol, insol ether Weak base, the hydrochloride crystallising in concentric groups of needles, the platinochloride being a deep-blue flocculent pp

Apophyllic acid is the mono methyl ether of PYRIDINE DICARBOXYLIC ACID

Di bromo-apophyl. lin v vol i p 553

Oxy-narcotine C₂₀H₁₅NO₂ Crystals which remain undissolved in the process of purifying narcaine (Beckett & Wright, C J 29, 461) Small crystals (from alcohol), v sl sol water and alcohol, insol ether, nearly insol benzene and chloroform Ppd from solutions of its salts by NaOH and Na₂CO₃, but redissolved in excess Oxidised by FeCl₃ to hemipic acid and cotarnine —B'HCl 2aq crystals —B₂H₂PtCl₄

NARINGIN C₂₁H₁₉O₁₁ *Aurantium Hesperidins* [171°] S 35 in the cold [α]_D = -84.5 in aqueous solution, -87.6 in alcoholic solution (W), [α]_D = -64.6 (H) Occurs in the flowers and other parts of *Citrus decumana* The dry orange-blossoms contain about 2 p c It crystallises on cooling from the liquor left in the still after distilling over the oils with steam (Hoffmann, Ar Ph [3] 14, 189, Will, B 18, 1311.

K K

20, 295) White crystals (containing 4aq), nearly insol cold water, sol alcohol, insol ether. Has a very bitter taste. Split up by dilute H_2SO_4 (8 p c) at 95° quantitatively into naringenin and isodulcitol. It dissolves in alkalis with a yellowish-red colouration. Ferric salts produce a brownish-red colouration with dilute aqueous solutions. By sodium-amalgam it is converted into a colouring matter which dissolves in alcohol with a red colour and bluish fluorescence.

Naringenin $C_{15}H_{12}O_6$, probably

[4 1] $C_6H_4(OH)CH=CHCOOC_6H_4(OH)$, [1 8 5] [248 γ] Formed, together with isodulcitol, by heating naringin with dilute (2-3 p c) H_2SO_4 on the water bath. Glistening colourless, tasteless, and odourless crystals. V sol alcohol, ether, and benzene. Dissolves in alkaline hydrates forming yellow solutions, and is reprecipitated by CO_2 . Ferric salts give a brown-red colouration. By sodium-amalgam it is converted into a colouring matter which dissolves in alcohol with a red colour and bluish fluorescence. By boiling with concentrated aqueous NaOH it is decomposed into phloroglucin and *p* coumaric acid (Will, *B* 18, 1322, 20, 297).

Naringenic acid is *p* COUMARIC ACID

NARTIC ACID v NARCOTINE.

NATALOIN v ALOIN

NEODYMIUM The name given by Auer von Welsbach to that constituent of didymium which yields rose coloured salts (v DIDYMIUM, vol II p 883, cf METALS, RARE, this vol p 240)

NEOSSIDINE v PROTEIDS, Appendix C.

NEOSSINE v PROTEIDS, Appendix C

NERIODORIN A bitter yellow powder, extracted by alcohol from the bark and wood of *Nerium odorum*, an Indian plant prescribed for leprosy (Greenish, *Ph* [3] 11, 873). It is sol water, insol chloroform. Its solution is ppd by tannin and by ammoniacal lead acetate, and reduces Fehling's solution.

Neriodorin A bitter resin, accompanying the preceding body, sl sol water and alcohol, v sol $CHCl_3$.

NEURIDINE $C_8H_{11}N_2$ A product of the putrefaction of flesh, appearing on the second day and disappearing about the fourth day (Brieger, *B* 16, 1187, 1405; Bocklisch, *B* 18, 86; Gautier, *Bl* [2] 48, 12). It also occurs in fresh human brain (Brieger, *J Th* 1884, 92). Gelatinous mass with disgusting smell, v e sol water, insol alcohol and ether. Very poisonous (G.) Its solution is ppd by $HgCl_2$ and by lead acetate. Yields di- and tri-methylamine on boiling with NaOHaq— $B^+H_2O_2$ needles, v. sol water, insol alcohol and ether— $B^+H_2PtCl_6$.

NEURINE $C_8H_9NO_2$, v e

$CH_3(OH)CH_2NMe_2OH$ *Choline Di-methyl-oxy-ethyl-amine methyl-hydroxide Tri-methyl-oxyethyl ammonium hydroxide Sinealme*

Occurrence—In cotton seeds (Böhm, *J pr* [2] 80, 87), in putrefying flesh (Gautier, *Bl* [2] 48, 18), in germinating pumpkin sprouts (E Schulze, *H* 11, 365), in the seeds of *Trigonella Fenum graecum* (Jahns, *B* 18, 2518), in the seeds of vetch, *Vicia sativa* (Schulze, *B* 22, 1827), in hops and beer (Griess a. Harrow, *O J* 47, 298, *B* 18, 717), in areca nuts (Jahns, *B* 23, 2972), in the fly agaric (Harnack, *J* 1876, 808), in herring brine (Bocklisch, *B* 18, 1928),

in ergot of rye (Brieger, *H* 11, 184); and in beet root juice (Lippmann, *B* 20, 8201)

Formation—1 By boiling the bile of pigs or oxen with baryta (Strecker, *C R* 52, 1270, *A* 123, 353, Dybrowsky, *J pr* 100, 163, Hüfner, *J pr* [2] 19, 802)—2 By boiling ox-brain with baryta (Liebreich, *A* 184, 29, Baeyer, *A* 140, 306)—3 By extracting yolk of egg with ether and alcohol, evaporating the extract, and boiling the residue with baryta (Diaconoff, *J* 1867, 776, 1868, 780). In this preparation two similar bases occur, containing 34 and 32 p c Pt in their platinumchlorides (Hundeshagen, *J pr* [2] 28, 247)—4 Together with glycerophosphoric acid, oleic, and palmitic acids by the action of alkalis on lecithin (Liebreich, Gobley, *C R* 70, 1297, Bokay, *H* 1, 157, 12, 148)—5 Together with sinapic acid and barium sulphocyanide, by heating sinapine sulphocyanide with baryta water (Claus a. Keesé, *Z* [2] 4, 46)

Syntheses—1 By heating trimethylamine (5 g) with glycolic chlorhydrin (10 g) at 100° , the resulting chloride $HOCH_2CH_2NMe_2Cl$ being decomposed by moist Ag_2O (Wurtz, *C R* 65, 1015, 68, 1434, *A Suppl* 6, 116)—2 By the union of ethylene oxide with trimethylamine (Wurtz, *A Suppl* 6, 201)

Properties—Strongly alkaline syrup, decomposed on boiling in concentrated aqueous solution into glycol and trimethylamine. Conc HIAq and P at 140° forms $C_8H_{11}NMe_2I$. Weaker HIAq yields $C_8H_{11}NMe_2Cl$. Yields muscarine and betaine on oxidation. Not poisonous.

Salts— $C_8H_{11}(OH)NMe_2Cl$ Dimorphous usually as long needles, sometimes in thin trimetric plates— $(C_8H_{11}(OH)NMe_2Cl)_2PtCl_6$. Trimorphous orange prisms (from warm saturated solution), reddish brown trimetric tablets from a cold saturated solution, or regular octahedra from a solution containing 15 p c of alcohol. The first and third forms left in contact with their mother liquid change into the second form (Hundeshagen, *J pr* [2] 28, 245)— $(C_8H_{11}(OH)NMe_2Cl)AuCl$, yellow needles, sl sol cold water— $C_8H_{11}(OH)NMe_2I$ Formed from $C_8H_{11}(OH)NMe_2$ and MeI (Knorr, *B* 22, 1116)

Acetyl derivative of the chloride $C_8H_{11}(OAc)NMe_2Cl$ — $C_8H_{11}NO_2ClAuCl$, nodules

NEURO-KERATIN v PROTEIDS, Appendix C
NICKEL At w. 58.6 Mol w unknown, as element has not been gasified [α 1400° — 1420°] (Schertel, *N* 22, 543), [α 1450°] (Pictet, *C R* 88, 1317) SG 8.97 to 9.26 (Rammelsberg, *J* 2, 282, for other values v Clarke's *Table of Specific Gravities* [new ed.], 12) SH 14° to 97° 10916 (Regnault, *A Ch* [3] 63, 1) $V_r = V_0 (1 + 3 \times 0.0001279t)$ $t = 40^\circ$ (Fizeau, *C R* 68, 1125) EC at 0° (Hg at $0^\circ = 1$) 7.374 (Matthiessen a. Vogt, *P M* [4] 26, 242) SVS c 6.5 H_2O [Ni^2+ , O^2 , $3H^+$]=120,380 (*Th* 3, 307) For spectrum of Ni (ultra violet) v Liveing a. Dewar, *Pr* 43, 430

Occurrence—In some meteorites, from 8 to 8 p c associated with 2 to 1 p c of Co. In the sun's atmosphere (Cornu, *C R* 86, 983) Ni has been found, to the extent of 75 p c, in a Pt ore from the Ural (Terrell, *C R* 82, 1116). Chiefly as copper-nickel Ni_2As_2 , white nickel $NiAs_2$, and Mg-Ni silicate, garnierite. Ni antimonide, arsenate, oxide, sulphide, carbonate, &c., also occur, chiefly in combination with com-

pounds of Co, Fe, Sb, and Bi Ni compounds are always present in Co ores, and Co is almost invariably a constituent of Ni ores. Ni compounds have been known to the Chinese for centuries, Ni forms a constituent of Chinese armour. Copper nickel was known to the German miners in the Middle Ages, having in vain attempted to extract Cu from this mineral, they gave it the name of *kupfer nickel*, or false copper. In 1751 Cronstedt showed the mineral to contain a special metal, to which he gave the name of nickel. The metal was obtained in impure condition by Cronstedt, and examined by Bergmann, Richter, and others. Fleitmann prepared larger quantities of Ni, and applied it to coat iron and steel. Bottger, c 1840, introduced the practice of electro nickel plating, this application of Ni has become an important trade since c 1869.

Formation—*Copper nickel*, or *speiss* (a by-product in the production of smalt), is powdered and roasted (to remove As and oxidise Ni), again roasted with charcoal, dissolved in HNO_3Aq , saturated with H_2S , and the filtrate is pptd by Na_2CO_3 , the Ni is separated from the Fe and Co in the pp by different processes (*v Preparation*), the Ni is pptd by alkali as $\text{NiO} \cdot x\text{H}_2\text{O}$, the pp is dehydrated by heat, and reduced by C or in H. An ammoniacal solution of NiNH_4S sulphate is sometimes decomposed by electrolysis.

Preparation—A salt of Ni, tolerably free from Co, is obtained by such a method as the following from arsenical Ni sulphide, or *speiss*, *speiss* is a deposit formed in the pots in which roasted Co arsenide, mixed with *copper nickel*, is fused with K_2CO_3 and quartz, in the preparation of smalt. The roasted ore, or *speiss*, is fused with chalk and fluorspar, the slag being poured off, the metal is powdered and roasted for a long time in a reverberatory furnace till fumes of As_2O_3 cease to come off, the product is dissolved in HClAq , the solution is diluted, bleaching powder is added to oxidise the Fe salts, and milk of lime to ppt Fe_2O_3 with As oxide, the filtrate is acidified and pptd by H_2S , the filtrate from this pp is heated with bleaching powder to ppt Co oxide, and the Ni remaining in solution is pptd as oxide by milk of lime (Louyet, *J Ph* [3] 15, 204, for other methods v Wagner, *Berg und Hüttenm Zeit* 1870 134, Gilchrist, *B* 16, 264, Donath, *D P J* 236, 327, Wöhler, *P* 6, 227, Cloez, *J* 1857 619, v also DICTIONARY OF APPLIED CHEMISTRY).

Impure Ni may be purified by dissolving in HClAq with addition of HNO_3 , evaporating to dryness, dissolving in water, acidulating with HClAq , boiling with excess of NaHSO_4 (to reduce As_2O_3 to As_2O_5), saturating the warm liquid with H_2S (after SO_2 is all removed), filtering after 12 hours or so, evaporating the filtrate to dryness, dissolving the residue in water, filtering, treating the filtrate with Cl and then ppg Fe and Co by BaCO_3 , removing excess of Ba by dilute $\text{H}_2\text{SO}_4\text{Aq}$, filtering, and ppg Ni as carbonate by Na_2CO_3 (Cloez, *J* 1857 619). After ppg As, Cu, Sb, Pb, and Bi by H_2S , the filtrate may be much concentrated and Ni pptd. as oxalate, by addition of oxalic acid (Deville, *A Ch* [8] 46, 82). Winkler (*Fr* 6, 18) boils a solution of commercial NiCO_3 with NaClO till all Co is pptd, this occurs only when a large quantity of Ni is also thrown down; he filters, ppts. by H_2S , boils the filtrate, and

ppts NiCO_3 by addition of Na_2CO_3 . Co is the most difficult impurity to separate from Ni salts; the most effectual method is to dissolve in HNO_3Aq , concentrate, neutralise by KOH Aq , mix with KNO_3Aq , strongly acidify with acetic acid, and allow to stand for a few days, when the Co is completely pptd as Co K nitrite, and the filtrate contains the Ni (*cf* Zimmermann, *A* 232, 324).

Ni is obtained from NiCO_3 (or $\text{NiO} \cdot \text{H}_2\text{O}$ pptd from solutions by KOH Aq) by washing thoroughly, spreading out to dry, heating till CO_2 is all removed, and then reducing by H, at c 270 (Müller, *P* 136, 51), or by heating with C, the latter method is conducted by making the NiO into a paste with oil, placing this in a crucible lined with charcoal, and heating in a powerful air- or blast furnace.

NiCO_3 may be dissolved in HClAq , the solution evaporated to dryness, the residue of NiCl_2 thoroughly dehydrated, then sublimed in a porcelain tube in a stream of Cl, and finally reduced by heating in H (Winkler, *Fr* 6, 18).

NiCl_2O yields Ni when heated out of contact with air, this may be done by heating under a layer of pounded glass which does not contain any heavy metal.

Ni is also obtained by electrolysis solutions of its salts, using a weak current, the best solution to use seems to be an ammoniacal one of NiNH_4S sulphate (*v* Becquerel, *C R* 55, 18, *cf* Zimmermann, *A* 232, 324).

Properties—A very lustrous metal, white, with a slight greyish yellow tinge. Hard, easily polished, ductile, malleable, and very tenacious. By heating in a porcelain oven, crystals of Ni, apparently regular, have been obtained. Slightly magnetic, but less so than Fe or Co. Ni obtained by reduction of NiO by charcoal usually contains a little C, such C-containing Ni is softer and less malleable than the purer metal (Boussingault, *Chem Ind* 1878 130). As obtained by reducing NiO by H, or by heating NiCl_2O , Ni forms a greyish black, somewhat porous, pyrophoric powder. As obtained by reducing NiCl_2 in H, the metal forms a compact sponge, and also lustrous leaflets (Winkler, *Fr* 6, 18, Gard, *J* 1877 266). By electrolysis of Ni solutions by a very weak current, Ni is obtained as coherent, lustrous, white plates (Becquerel, *C R* 55, 18). After fusion of large quantities of Ni, the metal becomes porous and crystalline, and loses its ductility, this is probably due to absorption of gases, and may be prevented by adding $\frac{1}{2}$ p c of Mg (Fleitmann, *B* 12, 454).

Ni shows *passivity*, i.e. under certain conditions it is unacted on by HNO_3Aq . According to Saint-Etienne (*C R* 106, 1079), commercial sheet Ni is passive in ordinary HNO_3Aq , and passive Ni remains passive when heated to bright redness in H, whereas Fe loses its passivity (*cf* *Passivity of iron*, under Iron, this vol p 52).

Ni is a metallic element. The oxides are basic, or react as peroxides, NiO forms a series of corresponding salts, Ni_2O_3 probably forms salts by reacting with acids, but these salts are reduced very easily to salts of NiO . Ni is closely related in its chemical properties to Co, it is classed with Co and Fe, and also shows analogies with Mn, v Iron group of elements, this vol. p. 65. No Ni salts are known correspond-

ing with the cobalto and cobalti-cyanides, M_2CoCy_6 and M_2CoCy_8 , nor are nickel-ammonio-bases known analogous with the cobaltamines, although some Ni compounds, *eg* the haloid compounds, combine with NH_3 . The ultra-violet spectra of Ni and Co do not exhibit much analogy (*v. Luveing a Dewar, Fr 43, 430*).

The at w of Ni has been determined (1) by reducing NiO in H (Erdmann a Marchand, *A* 82, 76, Russell, *C J* [2] 1, 51), (2) by analysing Ni oxalate (Schneider, *P* 101, 387, 107, 605, 180, 303), by determining Cl in NiCl₂ (Dumas, *A Ch* [3] 55, 149), (3) by ppg NiSO₄Aq by BaCl₂Aq (Sommaruga, *W A B* 54 [2] 57), (4) by the reaction of AuCl₃Aq on Ni, and determining the Au ppd (Winkler, *Fr* 6, 22, *cf* Kruss a Schmidt, *B* 22, 11, but *v* also Winkler, *B* 22, 890), (5) by decomposing by heat strychnine Ni cyanide and bromine Ni cyanide (Lee, *C N* 24, 287), (6) by dissolving Ni in HClAq, and measuring H evolved (Russell, *C J* [2] 7, 294), (7) by determining SH of Ni, the result obtained shows that 58.6, and not a multiple of this number, is the at w, this result has been confirmed recently, (8) by determining V D of gaseous Ni(CO)₄ (Mond, Langer, a Quincke, *C J* 57, 749).

Alleged decomposition of nickel—Kruss a Schmidt (*B* 22, 11) found that by repeatedly treating NiS, prepared from the ordinary sulphate, with NH_4 sulphide, until the latter was no longer coloured brown, a bright yellow residue was obtained, from this residue they prepared various salts, which they regarded as compounds of a new metal, and finally they obtained the supposed new metal by electrolysis an aqueous solution of the chloride, and also by reducing the dichloride in H. Kruss a Schmidt (*B* 22, 2026) prepared what they considered to be pure Ni, and by fractionally ppg this as basic Ni NH_4 arsenite they obtained two different substances, one having an at w 56.58, and the other an at w 61.100, hence they concluded that their former results were confirmed, that is, that Ni is really a compound or a mixture of two elements. Considerable doubt was thrown on these results by the work of Winkler on the reaction between pure AuCl₃ and Ni (*B* 22, 890), and Fleitmann's experiments on large quantities of Ni also tend to show that Ni has not been separated into unlike parts (*Chem Zeitung*, 18, 757).

Reactions and Combinations—1 Pieces of Ni do not oxidise in ordinary air, heated in air Ni is superficially oxidised to NiO, Ni obtained by reduction of NiO at low temperatures is pyrophoric—2 Ni burns to NiO when heated in oxygen—3 By heating in chlorine, bromine, or iodine, NiCl₂, NiBr₂, or NiI₂ is produced—4 Heated with sulphur, NiS is formed—5 Ni combines with phosphorus when the elements are heated together—6 Combines with arsenic in several proportions (*v Nickel, arsenides of*, p 501)—7 Absorbs, and probably also combines with, carbon (*v Nickel, carbides of*, p 501)—8 Combines with carbon monoxide (*v Nickel carbon-oxide*, p 501)—9 By reducing NiO in presence of SiO₂, Ni is obtained, containing silicon (*v Nickel, silicides of*, p 503)—10 Steam is slowly decomposed by Ni at red heat, NiO being formed (Regnault, *A Ch.* [3] 62, 852).

11 Nitric acid forms Ni(NO₃)₂, but Ni is passive in conc HNO₃Aq—12 Sulphuric and hydrochloric acids react very slowly with Ni (*v Tassier, C R* 50, 106)—13 Aqueous sulphurous acid is decomposed by Ni at c 200°, with production of Ni₂S₃ (Geitner, *A* 139, 354)—14 Carbon dioxide is reduced to CO by heating with Ni to redness (Bell, *C N* 23, 358)—15 Heated in carbon monoxide to 850°–450°, C is deposited and CO₂ produced (*v supra*, No 8, also *Nickel carbon-oxide*, p 501)—16 Forms alloys with several metals (*v Nickel, alloys of, infra*)—17 Occludes about 165 times its volume of hydrogen (Raoult, *C R* 69, 826).

Detection and Estimation—Ni compounds give a bead with borax which is violet when hot and reddish brown when cold in the oxidising flame, and in the reducing flame becomes opaque and grey from reduced Ni. Brown black NiS is ppd by alkali sulphides, insol dilute cold HClAq, somewhat sol yellow NH_4 sulphide, H_2S produces no pp in acid solutions, moist NiS ppd from cold solutions, oxidises rather easily in the air. Very small traces of Ni may be detected, in the absence of most other metals, by the rose-red colour produced by adding K₂CS₂Aq (Braun, *J* 1868 376). To detect small quantities of Ni in presence of Co, Papasogli places a piece of Zn in a solution of the double cyanides of the two metals if Ni is present a red colour is produced (*J* 1879 1055), Donath a Mayrhofer (*Fr* 20, 879) add excess of NaOH Aq then I, boil, treat the pp with NH_4 Aq and NH_4 ClAq, and test the solution by NH_4 HS (*v* also Jorisson, *Fr* 21, 208).

Ni may be estimated as NiO after ppn as NiO xH_2O by addition of KOHAq to a hot solution. For separation of Ni from Co *v Cobalt*, vol II p 218. Classen recommends the ppn of Ni as oxalate, which on heating out of contact with air gives NiO (*Fr* 16, 471, 18, 189, 386). Ni may also be estimated by electrolysis a solution of Ni NH_4 oxalate in presence of excess of NH_4 oxalate (*v Classen*, for description of apparatus *v Dittmar's Exercises in Quantitative Chemical Analysis* [Glasgow, 1887], *cf* Merrick, *C N* 24, 100).

Technical Applications—Alloys of Ni with Cu, and with Cu and Zn, are used for coinage in some countries, and for other purposes. These alloys are nearly white and hard. Many articles of iron and steel are now covered with a deposit of Ni. This covering is only very slightly acted on by ordinary air. *Nickel plating* is usually accomplished by electrolysis an ammoniacal solution of Ni NH_4 sulphate, using Ni as one of the electrodes, and the substance to be plated as the other (*v D P J* 201, 145, 206, 288, 211, 74, 212, 160, 219, 469, *v* also Adams, *C R* 70, 123, 137, Bequerel, *ibid* 70, 124, 137, 181, *v* also *DICTIONARY OF APPLIED CHEMISTRY*).

Nickel, alloys of An alloy of Ni with aluminium, approximately Al₃Ni, is obtained by melting together 8 parts Al with 3 parts dry NiCl₂ and 20 parts mixed KCl and NaCl, and treating with dilute HClAq (Michel, *A* 115, 102). Alloys of Ni with copper, and with copper and zinc, are used for coinage and other purposes under the names of *German silver*, *packfong*, &c. Ramsay (*C J* 55, 582) found that an amalgam

of Ni with *mercury* could be obtained in small quantities by electrolysis dilute solutions of Ni salts in contact with Hg

Nickel, ammonio-compounds of Some Ni compounds, *eg* NiCl_2 and NiBr_2 , combine with NH_3 , *v* *Nickel bromide, Nickel chloride, &c*

Nickel, antimonates of, $\text{Ni}(\text{SbO}_3)_2 \cdot 6\text{H}_2\text{O}$ and $\text{Ni}(\text{SbO}_3)_2 \cdot 12\text{H}_2\text{O}$, *v* Heffter, *P* 86, 446

Nickel, antimonide of NiSb occurs native as *breithauptite*

Nickel, arsenates of, *v* vol 1 p 309 $\text{Ni}_2(\text{AsO}_4)_2 \cdot 8\text{H}_2\text{O}$ occurs native as *nickel bloom*

Nickel, arsenides of A brittle compound, Ni_2As , is formed by heating Ni with excess of As, also by very strongly heating Ni arsenates in a charcoal-lined crucible (For other arsenides *v* Descamps, *C R* 86, 1065) Various Ni ores are essentially compounds of Ni and As, Ni_2As , = *spess*, NiAs = *copper-nickel*, Ni_3As , = *white-nickel*

Nickel, arsenite of, *v* vol 1 p 306

Nickel, borate of, *v* vol 1 p 530

Nickel, bromide of, NiBr_2 This, the only compound of Ni with Br, is obtained by passing Br vapour over finely divided Ni heated to low redness NiBr_2 forms a brownish-yellow solid, it sublimes in yellow, glittering scales (Berthelot, *A Ch* [3] 44, 389, Rammelsberg, *P* 55, 243) Heated in air, or in steam, NiBr_2 forms NiO , it is completely decomposed by HNO_3 Aqueous alcohol and ether, deliquescent, soluble water to a green liquid

The *hydrate* $\text{NiBr}_2 \cdot 3\text{H}_2\text{O}$ is obtained, in green needles, by digesting Ni with BrAq , also by dissolving NiO or NiCO_3 in HBrAq , and evaporating (Rammelsberg, *P* 55, 243) This hydrate is dehydrated at c 200° H F [Ni, Br, Aq] = 71,820 (*Th* 3, 307)

A compound of *nickel bromide with ammonia*, $\text{NiBr}_2 \cdot 6\text{NH}_3$, is obtained as a violet powder, by passing NH_3 over powdered NiBr_2 , also, as a blue powder, by warming conc NiBr_2Aq with excess of NH_3Aq , and cooling NH_3 is given off when the compound is heated $\text{NiBr}_2 \cdot 6\text{NH}_3$ is soluble in a little water without decomposition, much water causes ppn of $\text{NiO} \cdot \text{H}_2\text{O}$ (Rammelsberg, *lc*)

Nickel, carbides of Commercial Ni always contains a little C For experiments on carbonisation of Ni *v* Gard, *Am S* [3] 14, 274, Boussingault, *C R* 86, 509, Péal, *A* 233, 160, Gautier, *A Hallopeau*, *C R* 108, 1111, Mond, Langer, *A Quincke*, *C J* 57, 749

Nickel carbon-oxide Ni(CO) , Mond, Langer, *A Quincke* (*C J* 57, 749) found that Ni decomposes CO at 850° – 450° , with separation of C and formation of CO_2 . When the product was allowed to cool in CO they noticed that the escaping gas caused a Bunsen flame to become very luminous, and when heated deposited Ni Following up this observation they found that when finely divided Ni, produced by reducing the oxide in H, is allowed to cool in a slow current of CO the gas is readily absorbed by the Ni when the temperature has fallen to c 100° , and that by replacing the CO by CO_2 , N, H, or air, a mixture of gases is obtained which deposits Ni when heated above 150° By analysing the mixture of gases thus obtained, and determining the Ni by passing the gases through a capillary tube at 180° , M, L, *A. Q* found that one volume of

the Ni compound present in the gases gave four volumes of CO. The analyses led to the formula $\text{Ni}_2\text{C}_2\text{O}_4$. By passing the mixed gases through a tube surrounded with salt and ice a colourless mobile liquid was obtained, which was proved, by estimations of Ni and C, to be $\text{Ni}_2\text{C}_2\text{O}_4$. The V.D. determined at 50° was found to be 86.9, $\text{Ni}_2\text{C}_2\text{O}_4$ requires 80.4 The new compound is called *nickel carbon-oxide* by its discoverers, it boils at 43° at 751 mm, solidifies at -25° to needle-shaped crystals, and has S.G. 1.8185 at 17° . The vapour is very poisonous The compound is sol. alcohol, benzene, and chloroform, it is not acted on by dilute acids or alkalis, nor by conc HClAq ; conc HNO_3 and *aqua regia* dissolve it readily. The vapour ppts Ag from AgCl in NH_4Aq , it is decomposed by Cl, giving NiCl_2 and COCl_2 . Br acts similarly, electric sparks produce Ni and CO

Nickel, chloride of, NiCl_2 H F. [Ni, Cl] = 74,530 (*Th* 3, 307), [NiCl_2 , Aq] = 19,170 S.G. 2.56 (Schiff, *A* 108, 21) Prepared by gently heating powdered Ni in a stream of dry Cl, and subliming in the Cl (H Rose, *P* 20, 156) Also by dissolving Ni or NiCO_3 in HClAq , or Ni in *aqua regia*, and evaporating to dryness Golden yellow scales Sublimes readily without melting Prepared in the wet way, NiCl_2 is deliquescent and easily soluble in water, sublimed NiCl_2 dissolves slowly in boiling water Heated in air Cl is evolved and NiO formed Heated in a stream of O, is entirely changed to Ni_2O_3 (Schulze, *J pr* [2] 21, 407) KOH Aq decomposes sublimed NiCl_2 only after prolonged boiling PH_3 forms Ni_2P_3 , and HCl , molten P forms Ni_3P_2 , and PCl_3 (H Rose, *P* 27, 117) For S.G. of conc NiCl_2Aq *v* Franz, *J pr* [2] 5, 274

The *hexa hydrate* $\text{NiCl}_2 \cdot 6\text{H}_2\text{O}$ (Laurent, *A Ch* [3] 60, 354) is obtained by cooling conc NiCl_2Aq Soluble in 1½–2 parts water, sol in alcohol Sabatier (*Bl* [3] 1, 88) describes a *dehydrate* $\text{NiCl}_2 \cdot 2\text{H}_2\text{O}$, obtained by placing the hexahydrate over H_2SO_4 *in vacuo* at 20° for three months Thomsen gives [Ni, Cl, $6\text{H}^\circ\text{O}$] = 94,860 (*Th* 3, 307)

The *oxychloride* $\text{NiCl}_2 \cdot 8\text{NiO} \cdot 18\text{H}_2\text{O}$ is obtained by adding a little NH_3Aq to NiCl_2Aq (Rasch, *C R* 69, 826)

Compounds with ammonia (1) $\text{NiCl}_2 \cdot 6\text{NH}_3$, is obtained by passing NH_3 over dry NiCl_2 (H. Rose, *P* 20, 155), also by adding alcohol to NiCl_2 in NH_3Aq (Erdmann, *Gm.-K* (6th edit) 3, 553, F. Rose, *Gm. K* (6th edit) 8, 561). Soluble without change in cold water, decomposed slowly by much cold water, quickly by hot water Slightly sol conc NH_3Aq , insol alcohol. (2) $\text{NiCl}_2 \cdot 9\text{NH}_3$, obtained by heating $\text{NiCl}_2 \cdot 6\text{NH}_3$ to 120° Gives NiCl_2 when heated *in vacuo*, and a little Ni when very strongly heated

Compounds with ammonium chloride (1) $\text{NiCl}_2 \cdot \text{NH}_4\text{Cl} \cdot 6\text{H}_2\text{O}$, green deliquescent crystals, obtained by evaporating a solution of the constituents in the ratio $\text{NiCl}_2 \cdot \text{NH}_4\text{Cl}$ (Hantz, *A* 66, 288) Jørgensen (*Gm.-K* (6th edit) 8, 561) obtained crystals containing c. 5 p.c. NiCl_2 by evaporating NiCl_2Aq with a large excess of NH_4Cl (2) $\text{NiCl}_2 \cdot 4\text{NH}_4\text{Cl} \cdot 7\text{H}_2\text{O}$, yellow, star-shaped, crystals, obtained by decomposing Ni-NH_4 sulphate solution by an equivalent of BaCl_2 , filtering and evaporating over H_2SO_4 (Adams *A Meyrick*, *J* 1871 308, *cf* Tuppitt, *A. Ch* [3] 78, 169)

NiCl_2 form *double salts* with CrCl_3 , CdCl_2 , and

AuCl_3 (v. Goddefroy, *B* 8, 9, von Hauer, *W A B* 20, 40; *ibid W A B* 17, 848)

Nickel, chlorates of, v. vol u p 156

Nickel, cyanide and double cyanides of, v. vol u p 848

Nickel, ferrieyanide of, v. vol u p 339

Nickel, ferrocyanides of, v. vol u p 336

Nickel, fluoride of, NiF_2 , SG 2 855 at 14° (Clarke, *Am S* [3] 13, 291) The hydrate $\text{NiF}_2 \cdot 3\text{H}_2\text{O}$ is obtained by dissolving NiO H_2O or NiCO_3 in HFAq , and evaporating (Berzelius, Clarke, *Am S* [3] 13, 291) Decomposed by much hot water to oxyfluoride $\text{Ni}_2\text{OF}_2 \cdot \text{H}_2\text{O}$ (Berzelius) Combines with AlF_3 , fluorides of the alkali metals (Wagner, *B* 19, 896), and with SiF_4 (v. Nickel, silicofluoride of, p 503), TiF_4 (v. TITANIUM FLUORIDE), and ZrF_4 (v. ZIRCONIUM FLUORIDE) With Mo_2O_7 forms the compound $\text{NiF}_2 \cdot \text{Mo}_2\text{O}_7 \cdot 6\text{H}_2\text{O}$ (Delafontaine, *J* 1867 236)

Nickel, hydroxides or hydrated oxides of, v. Nickel, oxides and hydrated oxides of, *infra*

Nickel, iodide of, NiI_2 [Ni , I , Aq]=41,400 (*Th* 3, 807) Prepared by heating Ni , reduced from NiO by H , with I , and subliming the NiI_2 from the residue of Ni and NiO (Erdmann, *J* pr 7, 249) Also by heating $\text{NiI}_2 \cdot 6\text{H}_2\text{O}$, which is obtained by dissolving NiO H_2O in HIAq , or by treating finely divided Ni with excess of I and water Iron black, lustrous, metal like, scales Deliquescent, soluble in water, forming a brown liquid, which becomes green on dilution Partly decomposed when strongly heated in air By digesting NiI_2 Aq with NiO H_2O , or by evaporating NiI_2 Aq , Erdmann (*lc*) obtained the oxyiodide $\text{NiI}_2 \cdot 9\text{NiO} \cdot 15\text{H}_2\text{O}$

Compounds with ammonia (1) $\text{NiI}_2 \cdot 4\text{NH}_3$, a yellow-white mass, by passing NH_3 over NiI_2 (Rammelsberg, *P* 48, 119) (2) $\text{NiI}_2 \cdot 6\text{NH}_3$, by adding excess of NH_3 Aq to conc NiI_2 Aq , warming, and cooling or adding alcohol (Erdmann, *lc*, Rammelsberg, *lc*)

Nickel, nitride of A compound of Ni with N is said to be formed by heating NiO to c 200° in NH_3 , it is decomposed at a higher temperature (Warren, *C N* 56, 155)

Nickel, oxides and hydrated oxides of Nickel forms three oxides, NiO , Ni_2O_3 , and Ni_3O_4 , a fourth oxide, Ni_4O_5 , probably exists, there are indications of the existence of oxides intermediate between Ni_2O_3 and Ni_3O_4 , and also of an oxide containing more O than Ni_3O_4 Hydrates of NiO and Ni_2O_3 , and perhaps of Ni_3O_4 , have been isolated The oxides of Ni are basic, but the only Ni salts which have been prepared with certainty correspond with NiO NiO is oxidised by heating to c 400°, but the product is reduced to NiO at c 600°

NICKEL MONOXIDE NiO (*Nickelous oxide Protoxide of nickel*) Occurs native as *bunsenite* Obtained by heating Ni or NiCl_2 in steam (Regnault, *A Ch* [3] 62, 352), by heating the hydrate or NiCO_3 in absence of air, by strongly heating $\text{Ni(NO}_3)_2$ (Russell, *C J* [2] 1, 58), NiSO_4 (Baubigny, *C R* 97, 951), or a mixture of NiSO_4 and K_2SO_4 (Debray, *C R* 52, 985), by reducing Ni_2O_3 by H at 190°–230° (Moissan, *A Ch* [5] 21, 288, cf Wright a Luff, *O J* 33, 1, also Müller, *P* 136, 59), or by NH_3 at c 180° (Vorster, *Dissertation*, Göttingen, 1861), at a moderate temperature NiO is obtained in green regular octahedra by heating Ni borate with CaO

in a porcelain oven, and treating the product with HClAq (Ebelmen, *C R* 33, 526)

NiO is a green powder, becoming deep yellow when heated (Moissan, *A Ch* [5] 21, 238, Zimmermann, *A* 232, 324) SG 5 6 (Playfair a Joule, *C S Mem* 3, 81), 6 66 (Rammelsberg, *J* 2, 282), 6 8 crystallised (Ebelmen, *C R* 33, 526) Heated to 350°–440°, NiO is oxidised to Ni_2O_3 , which is again deoxidised to NiO at c 600° (Moissan, *A Ch* [5] 21, 199) NiO is readily reduced to Ni , reduction by CO begins at c 120°, by H at c 220°, by C at c 450° (Wright a Luff, *C J* 33, 1), reduction by NH_3 begins at c 200° (Vorster, *Dissertation*, Göttingen, 1861) NiO is oxidised to Ni_2O_3 by ozonised O (Schönbein, *J pr* 93, 35) NiO , if not strongly heated, dissolves in NH_3 Aq , it decomposes NH_4 salts with evolution of NH_3 NiO dissolves in acids forming salts NiX_2 , $\text{X} = \text{NO}_3$, ClO_4 , $\frac{1}{2}\text{SO}_4$, $\frac{1}{3}\text{PO}_4$, &c

HYDRATE OF NICKEL MONOXIDE $4\text{NiO} \cdot 5\text{H}_2\text{O} = 4\text{Ni(OH)}_2 \cdot \text{H}_2\text{O}$ (*Nickelous hydrate, nickelous hydroxide*) This hydrate is obtained as a pale greenish pp, by adding alkali solution to solution of a Ni salt According to Teichmann (*A* 156, 17) the hydrate can be obtained free from acid only from $\text{Ni(NO}_3)_3$ Aq , T recommends to add NaOH Aq , free from carbonate, to cold $\text{Ni(NO}_3)_3$ Aq , to wash the excess of pp with cold water till the alkaline reaction disappears, then to wash with water containing a little NH_3 , and finally with boiling water, and to dry at 100° $4\text{NiO} \cdot 5\text{H}_2\text{O}$ is also obtained, as a green crystalline powder, by heating NiO or NiCO_3 in NH_3 Aq (*Gm K* (6th edit) 3, 536)

Nickelous hydrate is a pale green powder, slightly soluble in water (Fresenius) If not washed free from alkali it oxidises in presence of air and SO_2 Aq , but the product is reduced to NiO by excess of SO_2 Aq (Wicke, *Z* 1865 86) When strongly heated, H_2O is evolved and NiO remains $\text{H}_2\text{O Aq}$ forms a hydrate of Ni_2O_3 (Schönbein, *J pr* 93, 35), but, according to Bayley, $\text{H}_2\text{O Aq}$ is without action (*P M* [5] 7, 126) Oxidised by Cl and hypochlorites to $\text{Ni}_2\text{O}_3 \cdot x\text{H}_2\text{O}$ Soluble in NH_3 Aq and solutions of NH_4 salts $4\text{NiO} \cdot 5\text{H}_2\text{O}$ reacts with acids as a strong base, forming salts NiX_2 , $\text{X} = \text{NO}_3$, $\frac{1}{2}\text{SO}_4$, $\frac{1}{3}\text{PO}_4$, &c Thomsen gives $[\text{NiO} \cdot \text{H}^2, \text{H}^2\text{SO}_4 \text{Aq}] = 26,110$, and $[\text{NiO} \cdot \text{H}^2, 2\text{HClAq}] = 22,580$ (*Th* 8, 307)

NICKEL SESQUIOXIDE Ni_2O_3 (*Nickelic oxide* Sometimes called *nickel peroxide*) A black powder, SG 4 84 at 16° (Herapath, *P M* 64, 321) Obtained by decomposing by heat at the lowest possible temperature $\text{Ni(NO}_3)_2$ (Berzelius, Vorster, *Dissertation*, Göttingen, 1861), or $\text{Ni(ClO}_4)_2$ (Wachter, *J pr* 30, 327), also by melting NiCl_2 with KClO_4 (Schulze, *J pr* [2] 21, 407), also by treating Ni salts in solution with KClO_4 Aq or KBrO_3 Aq (Schröder, *C C* 1890 931) Heated in air to c 600° Ni_2O_3 is reduced to NiO (Moissan, *A Ch* [5] 21, 199), reduction in H begins at c 190° (*M, lc*) Dissolves in H_2SO_4 Aq or HNO_3 Aq with evolution of O , in HClAq with evolution of Cl_2 , in each case salts of NiO are produced Soluble in NH_3 Aq with evolution of N (Müller, *P* 136, 59)

HYDRATES OF NICKEL SESQUIOXIDE.

(1) $\text{Ni}_2\text{O}_3 \cdot 2\text{H}_2\text{O}$; brownish crust, SG 2 744, obtained by electrolysis an alkaline solution of

Ni K tartrate (Wächter, *J pr* 80, 827) (2) $\text{Ni}_2\text{O}_3 \cdot 8\text{H}_2\text{O}$, by oxidising NiO or $4\text{NiO} \cdot 5\text{H}_2\text{O}$, suspended in water, by ClO or BrAq , also by adding alkali and NaClO to solution of a Ni salt (Wächter, *lc*) A black solid, which reacts with acids and NH_4Aq as Ni_2O_3 does, reduced to $4\text{NiO} \cdot 5\text{H}_2\text{O}$ by SO_2Aq (Wicke, *Z* 1865 86), also by $\text{Na}_2\text{SO}_3\text{Aq}$ (Schulze, *J* 1864 270) HF [$\text{Ni}_2\text{O}_3 \cdot 8\text{H}_2\text{O}$] = 120,380 (*Th* 3, 307) Carnelley & Walker (*C J* 53, 91) think that no definite stable hydrate of Ni_2O_3 exists

NICKEL O NICKELIC OXIDE Ni_2O_3 A grey, metal like, non magnetic solid, obtained by passing O over NiCl_2 at 350° – 440° (Baubigny, *C R* 87, 1082)

NICKEL O NICKELIC HYDRATE A black powder, having the composition $\text{Ni}_2\text{O}_3 \cdot \text{H}_2\text{O}$ (= $\text{Ni}_2\text{O}_3 \cdot 6\text{NiO} \cdot \text{H}_2\text{O}$), is said to be formed by heating NiCO , to 300° (H Rose, *P* 84, 571)

NICKEL SUBOXIDE An oxide, Ni_2O , is said to be produced by reducing NiO in H at 210° – 214° (Muller, *P* 186, 59), also by reducing NiO in CO at a low temperature (Bell, *C N* 23, 258, 267)

NICKEL P FROXIDE By the reaction of hypochlorites on $\text{Ni}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$ one or more oxides are produced containing more O than Ni_2O_3 Wicke gives the composition Ni_2O_7 (*Z* 1865 303), Bayley (*C N* 39, 81) gives the formula Ni_2O_8 , Carnot (*C R* 108, 610) says that Ni salt solutions give Ni_2O_8 when treated with hypochlorites or with Br and KOH Aq

Nickel, oxychloride of, *v* Nickel chloride, p 501

Nickel, oxyfluoride of, *v* Nickel fluoride, p 502

Nickel, oxyiodide of, *v* Nickel iodide, p 502

Nickel, phosphides of Ni and P combine when heated together Various compounds have been described (1) Ni_3P_2 , by heating Ni , bone ash, quartz sand, and C (*Gm K* (6th ed) 3, 542) (2) Ni_2P , by reducing $5\text{NiO} \cdot \text{P}_2\text{O}_5$ in H (Struve, *J* 1860 76) (3) Ni_3P_2 , by reducing $3\text{NiO} \cdot \text{P}_2\text{O}_5$ in H (H Rose, *P* 24 332), also by heating NiCl or NiS in PH_3 , or by passing PH_3 over heated Ni (Davy, Schrotter, *W A B* 2, 304)

Nickel, salts of Compounds obtained by replacing H of acids by Ni The Ni salts which have been studied all correspond with the oxide NiO , and belong to the form NiX , where $\text{X} = \text{ClO}_4$, NO_3 , $\frac{1}{2}\text{SO}_4$, $\frac{1}{2}\text{CO}_3$, $\frac{1}{2}\text{PO}_4$, &c The oxide Ni_2O_3 probably forms salts, but they are very easily reduced to salts of NiO The Ni salts are obtained by dissolving Ni , NiO , or NiCO in acids The salts of Ni are generally yellowish when dehydrated, and green when combined with water Some of the compounds of Ni combine with NH_3 The haloid compounds, the sulphate and nitrate of Ni , and some of the other salts, are soluble in water, the oxides, sulphides, phosphate, carbonate, and a few other salts, are insoluble in water Solutions of Ni salts in water are green, they redden litmus slightly Most Ni salts are decomposed by heating in air, NiCl_2 , NiBr_2 , and NiI_2 can be sublimed unchanged The chief Ni salts of oxyacids are the antimonate, arsenate and -ite, borate, bromate, carbonate, chlorate, chromate, iodate and periodate, molybdates, nitrates and -ite, phosphates and -ite and hypophosphite, selenate, silicates, sulphates

and -ite, thiosulphate (*v* CARBONATES, NITRATES, &c)

Nickel, selenide of, NiSe A silver white, brittle, crystalline, solid, *SG* 846, obtained by action of Se vapour on finely powdered Ni Melts at red heat, with loss of Se Insoluble in HCl Aq , slowly dissolved by HNO_3Aq , quickly by *aqua regia* (Little, *A* 112, 211)

Nickel, silicides of Commercial Ni generally contains more or less Si For experiments on the quantity of Si taken up by Ni v Gard, *Am S* [3] 14, 274

Nickel, silicofluoride of, $\text{NiSiF}_6 \cdot 6\text{H}_2\text{O}$ Hexagonal rhombohedral, green crystals, *SG* 2109, by dissolving NiCO in $\text{H}_2\text{SiF}_6\text{Aq}$ De composed at red heat, giving NiF and SiF_4 (Berzelius, Mangnac, *Ann M* [5] 15, 262)

Nickel, sulphides of Four sulphides of Ni are known Ni_2S , NiS , Ni_3S_2 , and NiS_2 NiS is somewhat soluble in NH_3 sulphide, it also forms a compound with K_2S The only sulphide produced by the direct union of Ni and S is NiS

NICKEL MONOSULPHIDE NiS Occurs native as *capillary pyrites* or *millierite* Formed by heating Ni with S , by heating NiO with S , or in a stream of H_2S (Tapput, *A Ch* [3] 78, 133, 79, 153), also by heating NiCl_2 with K_2SAq in a sealed tube to c 160° (Sénarmont, *A Ch* [3] 30, 142) As prepared by these methods, NiS is a yellow, brittle, solid, decomposed very slowly by steam at red heat (Regnault, *A Ch* [3] 62, 280), not decomposed by H , slowly acted on by Cl when hot (*v* *P* 42, 540), oxidised by heating in air, acted on by PH_3 , when hot, with formation of Ni_3P_2 (Schrötter, *W A B* 2, 304), insol HCl Aq , sol HNO_3Aq and *aqua regia*

NiS , in combination with water, is ppd from neutral Ni solutions by H_2S , or by NH_4HSAq , also by heating Ni salts with $\text{Na}_2\text{S}_2\text{O}_3\text{Aq}$ preferably in sealed tubes at c 120° (Gibbs, *Am S* [2] 37, 346) Thomsen gives [$\text{Ni}_3\text{S}_2 \cdot \text{H}_2\text{O}$] = 19,400 (*Th* 3, 307) The pp thus obtained is brown black, if ppd from boiling solutions it may be washed and dried without change, but if ppd from cold solutions it oxidises in the air (Clermont, *C R* 84, 714, 85, 73) Decomposed by boiling with water (Geitner, *A* 139, 354) Some what soluble in NH_4Aq and alkali sulphide solutions, the brown solutions thus obtained deposit NiS by standing in air or on addition of a weak acid According to Baubigny (*C R* 94, 1417) the pp produced by H_2S in neutral solutions of Ni salts is a hydrosulphide which is decomposed to NiS and H_2S by filtration A very dilute aqueous solution of a *colloidal form* of NiS was obtained by Winsinger (*Bl* [2] 49, 452) by ppg from a very dilute solution and dialysing

Compound with potassium sulphide, $3\text{NiS} \cdot \text{K}_2\text{S}$ A yellow, lustrous, crystalline solid, obtained by fusing NiSO_4 with K_2CO_3 .

NICKEL DISULPHIDE NiS_2 A dark iron grey powder, obtained by strongly heating NiCO_3 with K_2CO_3 and S , and treating with water (Fellenberg, *P* 50, 75)

NICKEL O NICKELIC SULPHIDE Ni_2S_3 An amorphous greyish-black solid of this composition is obtained by heating NiCl_2Aq with polysulphides of K to 160° (Sénarmont, *A Ch* [8] 80, 142), by heating Ni with SO_2Aq or $\text{Na}_2\text{SO}_3\text{Aq}$ to 200° , Ni_2S_3 is obtained in rhombohedral crystals (Geitner, *A* 139, 354)

tufts, v sol water (Dreser, *Ar Ph* [3] 27, 266) — Nitroprusside sol water (Davy, *Ph* [3] 11, 756) — Chloro-iodide, dark-yellow pp (Dittmar, *B* 18, 1612) — Picrate $B''2C_6H_3(NO_2)_3OH$ [218°] Yellow needles (P a W)

Methylo iodide $B''Me_2I$ (Stahlschmidt, *A* 90, 222) With moist Ag_2O it yields a caustic base. It yields the salts $B''Me, PtCl_3, B''2MeAuCl_3$, and $B''Me_2Cl_4HgCl_2$. When the methylo-iodide is treated with alcoholic KOH at 45° it gives a ruby red colouration, on addition of acids the colour remains red, and, on pouring into a large quantity of water, shows a green fluorescence (O De Coninck, *C R* 104, 1374)

Ethylo-iodide $B''Et_2I$, prisms, v sol water, sl sol alcohol and ether (Von Planta a Kekulé, *A* 87, 2) Yields with Ag_2O a caustic base. It forms the crystalline salts $B''Et, PtCl_3$, and $B''2EtAuCl_3$, and amorphous $B''Et, Cl_3HgCl_2$. An alcoholic solution of the ethylo iodide is coloured garnet red, and finally crimson, by heating with addition of potash for 10 hours on a water bath. After acidifying and pouring into water the colour is still red (De Coninck, *C R* 104, 513)

Isoamylo iodide $B''2C_5H_{11}I$ Yields $B''(C_5H_{11}), PtCl_3$ (Stahlschmidt)

Nicotine dihydride $C_{10}H_7N_2$ *Hydronicotine* (264°) $SG \pm 993$ $[a]_D = -15.40^\circ$ in a 13.7 p c solution. Formed by heating nicotine with fuming $HIAq$ and red phosphorus at 265° for 10 hours (Etard, *C R* 97, 1218) Liquid, with faint odour, miscible with water, alcohol, and ether. Lævorotatory. Its hydrochloride is not ppd by $HgCl_2$. — $B''H_2PtCl_3aq$ pale-yellow crystals, v sl sol water

Isonicotinic v DIPYRIDYL TETRAHYDRIDE

NICOTINIC ACID v PYRIDINE CARBOXYLIC ACID

Homo nicotinic acid v DI METHYL PYRIDINE CARBOXYLIC ACID

NIGRANILINE v ANILINE BLACK

NIGROSINE A name used by Wolff (*Chem Ind* 2, 290, 319) to denote a blue black substance $C_{26}H_{12}N_8$, found among the products of the action of arsenic acid on aniline hydrochloride at 230°. Its hydrochloride $C_{26}H_{12}N_8HCl$ exhibits in solution blood red fluorescence, and is decolourised by reducing agents. The name 'nigrosine' has also been applied to indulines, more especially when obtained by the action of nitro benzene on a mixture of pure aniline and aniline hydrochloride

NIOBATES v p 506

NIOBIMUM *Nb* (*Columbium*) At w 94 Mol w unknown $SG 7.06$ at 15.5° (Roscoe, *C N* 37, 26)

Occurrence — Niobates occur in a few rare minerals, e.g. in *columbite*, *tantalite*, *samaraskite*, *ytro-ilmenite*, *euxenite*, and some varieties of *pitch blende*. Niobates are generally accompanied by tantalates, tungstates, titanates, zirconates, and compounds of Th, Ce, and Yt

History — In 1801, Hatchett found a new oxide in a mineral called *columbite* from Massachusetts, to the metal of the new oxide he gave the name *columbium* (*Crell's Ann* 1, 197, 257, 352). In the following year, Ekeberg (*Scher J.* 9, 597) examined two minerals—one from Finland, the other from Sweden—and announced the discovery of a new oxide, as the oxide was

soluble only in caustic alkalis and was ppd by acids. Ekeberg gave to the metal of this oxide the name *tantalum*. In 1809, Wollaston (*S.* 1, 520) pronounced the oxides discovered by Hatchett and Ekeberg, respectively, to be identical. Berzelius confirmed the decision of Wollaston (*P* 4, 6), he proposed to apply the name *tantalum* to the characteristic metal of *columbite* and the minerals examined by Ekeberg. Oxide of tantalum was recognised as present in several rare minerals (v Hermann, *J pr* 38, 91, H Rosa, *P* 63, 321). In 1844, H. Rose began a series of researches on the minerals containing tantalum compounds (*P* vols 63, 69, 73, 74, 90, 99, 100, 101, 102). Rose concluded that oxides of three distinct metals exist in these minerals: oxide of tantalum in *tantalite* from Finland and Sweden, and oxides of two new metals, which he called niobium and pelopium, in *tantalite* from Massachusetts (formerly called *columbite*) and in a *tantalite* from Bavaria. In 1853, Rose came to the conclusion that the compounds described by him as oxides of niobium and pelopium were really two different oxides of the same metal which was different from tantalum, this metal Rose called niobium (from Niobe, the daughter of Tantalus) (Rose, *P* 63, 317). As different specimens of niobium oxide showed considerable differences of SG, Margnac re examined the ground, and showed that some of Rose's oxides of niobium contained tantalum (*C R* 60, 234, 1355). Margnac also showed that the most probable formulae for the oxide and chloride of Nb are Nb_2O_5 and $NbCl_5$, respectively. Blomstrand (*J pr* 37, 57) confirmed Margnac's results. Determinations of SG of gaseous Nb chloride and oxychloride by Deville a Troost (*C R* 56, 891) have shown the formulae $NbCl_5$ and $NbOCl_3$ to be molecular. H. Rose supposed he had obtained Nb by reducing a compound of Nb, K, and F by Na, Delafontaine showed that Rose's supposed Nb was really NbO , and that the compound from which it was obtained contained O (*Ar Sc* 27, 167). Blomstrand obtained Nb, containing some H, in 1864 by reducing the chloride in H, in 1878 Roscoe prepared approximately pure Nb by the same method (*C N* 37, 25)

The existence of three other metals in niobium containing minerals has been asserted by von Kobell (*J pr* 79, 291, 83, 193, 449), and Hermann (*J pr* 38, 91, 119, *J pr* [2] 3, 373, 4, 178, 15, 105), but the researches of Blomstrand and Margnac (*l c*) make the existence of these metals—*dromium*, *ilmenum*, and *neptunium*—very doubtful

Preparation — Very finely powdered *columbite* is fused with 3 times its weight of $KHSO_4$ in an iron or Pt crucible, until completely dissolved, after cooling, the residue is powdered and treated with boiling water, whereby sulphates of K, Fe, and Mn are removed, the insoluble portion is washed, and digested with yellow NH_3 sulphide, sulphides of Sn and W thus go into solution and FeS remains mixed with Nb_2O_5 and Ta_2O_5 , the residue is washed and digested with $HClAq$ to remove FeS, the insoluble in acid is thoroughly washed with boiling water until white. To separate Nb from this mixture of Nb_2O_5 and Ta_2O_5 , the whole is dissolved in $HFAq$, the solution is heated to boiling, and

$\frac{1}{2}$ part KHF_2 is added for each part of mixed Nb_2O_5 and Ta_2O_5 used, the liquid is evaporated until $\frac{1}{2}$ g of the mixed oxides is present in about 7 cc, and allowed to cool, crystals of K_2TaF_7 separate, these are washed with cold water till the washings give no red, but a pure yellow, pp with tincture of galls, the filtrate is concentrated with addition of KHF_2 , and the second crop of K_2TaF_7 crystals is removed and washed. After one or two repetitions of this process, fine tablets of $\text{NbOF} \cdot 2\text{KF}$ separate on evaporating the filtrate from the K_2TaF_7 crystals, the tablets are collected, pressed, and heated in a Pt dish with H_2SO_4 until HF is completely removed, the residue is boiled with a large quantity of water for some time, when a white pp of $\text{Nb}_2\text{O}_5 \cdot x\text{H}_2\text{O}$ separates out (Berzelius, *v* also Marignac, *Ar Sc* 23, 167, 249, 25, 5). The pp of $\text{Nb}_2\text{O}_5 \cdot x\text{H}_2\text{O}$ is washed, dried, and heated to redness, it is then mixed with a large excess of charcoal, the mixture is heated, then placed in a large hard glass tube (a small quantity being used, as NbCl_5 is very voluminous), heated in dry CO_2 until perfectly dry, and allowed to cool in dry CO_2 , the CO_2 is then completely expelled by dry Cl, and the tube is then heated to redness while dry Cl passes through it, NbCl_5 collects in the tube, and is distilled in a stream of dry Cl. The NbCl_5 is then vapourised in a current of perfectly dry H, with precautions to prevent the entrance of air and moisture, and the mixed vapour is passed through a red hot tube of hard glass. The grey, lustrous crust of Nb which forms in the tube is finally strongly heated in a stream of perfectly dry H (Roscoe, *C N* 37, 25). Nb thus prepared contains about 27 p c H.

Properties and Reactions — A steel grey lustrous metal. SG 7.06 at 15.5° (Roscoe, *lc*). Insol HClAq , HNO_3Aq , or *aqua regia*, sol conc H_2SO_4 . Heated in air, burns to Nb_2O_5 . Heated in Cl forms NbCl_5 .

The at w of Nb has been determined (1) by determinations of V D of NbCl_5 and NbOCl_3 (Deville & Troost, *C R* 56, 891, 60, 1221), and by analyses of NbCl_5 (H Rose, *P* 104, 432, Blomstrand, *Acta Univ Lund* 1864, Marignac, *Bibl Univ Genève*, 1866 and 1866), (2) by analyses of $\text{NbOF} \cdot 2\text{KF}$ aq (Marignac, *lc*).

Nb is metallic in its physical properties. NbO and Nb_2O_5 dissolve in conc H_2SO_4 , but no definite sulphates or other salts of the oxides have been isolated. $\text{Nb}_2\text{O}_5 \cdot x\text{H}_2\text{O}$ forms several niobates, in which Nb forms part of the negative radicle. Nb forms the third member of the even-series family of Group V, it is closely related to Ta, and less closely to N, P, V, As, Sb, Bi, Er, and Bi (*v* NITROGEN GROUP OF ELEMENTS, this vol p 571).

Detection and Estimation. — Niobates dissolve in hot HClAq , on adding water and boiling, $\text{Nb}_2\text{O}_5 \cdot x\text{H}_2\text{O}$ ppts. Solutions in HClAq are coloured blue, then dark brown, by Zn. $\text{K}_2\text{FeCy}_2\text{Aq}$ gives a red pp, and $\text{K}_2\text{FeCy}_2\text{Aq}$ a bright-yellow pp, with aqueous solutions of alkali niobates, gall tincture gives an orange-red pp. Nb is estimated as Nb_2O_5 , the process is sufficiently described under *Preparation* (cf. Rammelsberg, *P* 186, 177, 362, 144, 56, 191).

Niobium, acids of, and their salts Niobic oxide, Nb_2O_5 , reacts with alkali oxides to form salts, these niobates may be regarded as derived

from various hydrates of Nb_2O_5 . Hydrated niobic oxide, $\text{Nb}_2\text{O}_5 \cdot x\text{H}_2\text{O}$, is obtained by fusing Nb_2O_5 with KHSO_4 , washing with water, dissolving in HClAq , and ppg by NH_4Aq , the pp thus obtained by Santesson (*Bl* [2] 24, 52) contained c 84 p c water, which corresponds with the composition $3\text{Nb}_2\text{O}_5 \cdot 4\text{H}_2\text{O}$ ($=\text{Nb}_2\text{O}_{11}(\text{OH})_4$). The hydrate $\text{Nb}_2\text{O}_5 \cdot 7\text{H}_2\text{O}$ is obtained, according to Santesson (*lc*), by reacting on NaNbO_3 with $\text{H}_2\text{SO}_4\text{Aq}$ and drying at 100° (*v* *Hydrates of niobic oxide*, p 509). Niobates have not been obtained by neutralising hydrates of Nb_2O_5 , but either by fusing Nb_2O_5 with basic oxides or carbonates, or by double decomposition from solutions of alkali niobates.

NIOBATES The niobates belong to the form $x\text{Nb}_2\text{O}_5 \cdot y\text{MO}$, where $\text{M} = \text{K}, \text{Ca}, \text{Mg}, \text{Mn}, \&c$. Niobates are known corresponding with the meta- and pyrophosphates, and, besides these, salts have been isolated in which the ratio of the basic to acidic oxide varies from 1.2 to 4.1. The niobates are prepared by fusing Nb_2O_5 with basic oxides, carbonates, and a few other salts, some niobates are obtained by ppg solutions of alkali niobates by solutions of metallic salts. The alkali niobates are soluble in water, the others are insoluble. Solutions of the alkali niobates are decomposed by $\text{H}_2\text{SO}_4\text{Aq}$ with ppg of $\text{Nb}_2\text{O}_5 \cdot x\text{H}_2\text{O}$, CO, ppts acid salts. Solutions of niobates in HClAq are reduced by Zn to Nb_2O_5 (blue), and then to Nb_2O_3 (brown black) (*v* *Niobium oxides*, p 508). *Fluoniobates* and *fluozyniobates* are also known (*v* next page).

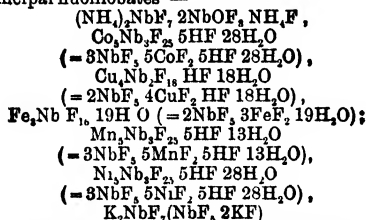

Potassium niobates (1) *Metaniobate*, KNbO_3 . Small rectangular tablets, sol water, obtained by dissolving Nb_2O_5 in molten CaF_2 , fusing the product with K_2CO_3 , in ratio $\text{K}_2\text{CO}_3 \cdot \text{Nb}_2\text{O}_5$, and repeatedly treating the mass (after cooling) with boiling dilute $\text{H}_2\text{SO}_4\text{Aq}$ (Joly, *Fremy's Encyclop Chmique*). (2) *Pyroniobate*, $\text{K}_2\text{Nb}_2\text{O}_7$. Insol water, obtained by melting Nb_2O_5 with a large excess of K_2CO_3 , and washing with water (Santesson, *Bl* [2] 24, 52). (3) $3\text{Nb}_2\text{O}_5 \cdot 4\text{K}_2\text{O} \cdot 16\text{H}_2\text{O}$, and (4) $7\text{Nb}_2\text{O}_5 \cdot 8\text{K}_2\text{O} \cdot 32\text{H}_2\text{O}$. The former salt is obtained by fusing Nb_2O_5 with 2 to 3 times its weight of K_2CO_3 , dissolving in water, and evaporating *in vacuo*, large monoclinic crystals, efflorescent in air, loses $12\text{H}_2\text{O}$ at 100° , and is dehydrated at red heat. The second salt is obtained in quad ratio octahedra by slowly evaporating a solution of the first salt (Marignac, *A Ch* [4] 8, 5, 13, 5). (5) $2\text{Nb}_2\text{O}_5 \cdot 3\text{K}_2\text{O} \cdot 18\text{H}_2\text{O}$, rhombic pyramids, by adding KOH to solution of salt (3) or (4), and evaporating slowly (Marignac, *lc*). (6) $2\text{Nb}_2\text{O}_5 \cdot 2\text{K}_2\text{O} \cdot 11\text{H}_2\text{O}$, the crystalline residue obtained by fusing Nb_2O_5 and K_2CO_3 , in the ratio $\text{Nb}_2\text{O}_5 \cdot \text{K}_2\text{CO}_3$, and treating with water, has this composition (Santesson, *Bl* [2] 24, 52). (7) $4\text{Nb}_2\text{O}_5 \cdot 3\text{K}_2\text{O}$, obtained by strongly heating Nb_2O_5 with twice its weight of KHSO_4 for some hours, and washing with water (Joly, *Fremy's Encyclop Chmique*). (8) $3\text{Nb}_2\text{O}_5 \cdot \text{K}_2\text{O} \cdot 5\text{H}_2\text{O}$, prepared by boiling $\text{KNbOF} \cdot 2\text{KFAq}$ with KHCO_3 , washing the powder which separates, and drying at 100° (Marignac, *lc*).

Sodium niobates (1) *Metaniobate*, $2\text{NaNbO}_3 \cdot 6\text{H}_2\text{O}$. Rhombic prisms, obtained by fusing Nb_2O_5 with 3 pts Na_2CO_3 , allowing to stand in contact with cold water (which dissolves Na_2CO_3), dissolving in hot water, and crystallising

(Joly, *Fremy's Encyclop Chimique*) Santesson (*Bl* [2] 24, 52) obtained this salt by boiling $\text{Nb}_2\text{O}_5 \cdot x\text{H}_2\text{O}$ with NaOH aq, the salt remained insoluble in NaOH aq, slightly soluble in cold water (2) $4\text{Nb}_2\text{O}_5 \cdot \text{Na}_2\text{O} \cdot \text{H}_2\text{O}$, a salt, probably with this composition, was obtained by Santesson (*lc*) as a gelatinous pp by passing CO_2 into solution of NaNbO_3 , (3) $3\text{Nb}_2\text{O}_5 \cdot 2\text{Na}_2\text{O} \cdot 9\text{H}_2\text{O}$. An insoluble amorphous salt, obtained by fusing Nb_2O_5 with NaOH and treating with water (Santesson, *lc*)

Niobates of Ca, Mg, and Mn—viz $\text{Ca}_2\text{Nb}_2\text{O}_7$, $\text{Ca}(\text{NbO}_3)_2$, $\text{Mg}_2\text{Nb}_2\text{O}_7$, $2\text{MgO} \cdot \text{Mg}_2\text{Nb}_2\text{O}_7$, $\text{MgO} \cdot \text{Mg}_2\text{Nb}_2\text{O}_7$, $\text{Mn}(\text{NbO}_3)_2$ —have been obtained by Joly (*lc*) by fusing CaCl_2 , MgCl_2 , and MnCl_2 with Nb_2O_5 . Joly also obtained a niobate of Fe, and a niobate of Fe and Mn. H. Rose (*P* 90, 456) obtained niobates of Cu, Hg, and Ag by adding salts of these metals to solutions of NaNbO_3 .

FLUONIOMATES These salts, which may also be regarded as compounds of NbF_5 with metallic fluorides, and sometimes also with HF , are obtained by dissolving $\text{Nb}_2\text{O}_5 \cdot x\text{H}_2\text{O}$ in large excess of HFAq , adding metallic carbonates, and evaporating, the fluoniomates are also formed by dissolving fluoxyniobates (*u infra*) in HFAq and evaporating (Marnagac, *A Ch* [4] 13, 5, Santesson, *Bl* [2] 24, 52). The following are the principal fluoniomates—

FLUOXINIOMATES These salts are obtained by dissolving Nb_2O_5 with alkali fluorides in HFAq , and evaporating. They may be regarded as derived from the hypothetical acids H_2NbOF_5 , H_3NbOF_6 , and H_4NbOF_7 , they may also be looked on as compounds of NbOF_5 with alkali fluorides. The fluoxyniobates have been examined chiefly by Marnagac (*A Ch* [4] 8, 5, 13, 5).

Ammonium fluoxyniobates 1 $(\text{NH}_4)_2\text{NbOF}_5$ ($=\text{NbOF}_5 \cdot 2\text{NH}_4\text{F}$) Obtained by dissolving Nb_2O_5 and NH_4F in HFAq , and evaporating, easily soluble rhombic prisms, isomorphous with $\text{WO}_3 \cdot 2\text{NH}_4\text{F}$ —2 $(\text{NH}_4)_3\text{NbOF}_6$ ($=\text{NbOF}_5 \cdot 3\text{NH}_4\text{F}$) Obtained similarly to the foregoing salt, forms octahedral crystals, isomorphous with $\text{ZrF}_3 \cdot 3\text{NH}_4\text{F}$ (Baker, *C J* 35, 762)—3 $(\text{NH}_4)_4\text{NbOF}_7$ ($=\text{NbOF}_5 \cdot 4\text{NH}_4\text{F}$) Obtained by dissolving $\text{Nb}_2\text{O}_5 \cdot x\text{H}_2\text{O}$ in conc NH_4FAq , cubic and octahedral crystals of the regular system (Joly, *P* 108, 467)—4 $(\text{NH}_4)_5\text{Nb}_2\text{O}_7 \cdot \text{H}_2\text{O}$ ($=3\text{NbOF}_5 \cdot 5\text{NH}_4\text{F} \cdot \text{H}_2\text{O}$) Obtained by adding less than an equivalent of NH_4F to Nb_2O_5 in HFAq , and evaporating.

Potassium fluoxyniobates—1 $\text{K}_2\text{NbOF}_5 \cdot \text{H}_2\text{O}$ ($=\text{NbOF}_5 \cdot 2\text{KF} \cdot \text{H}_2\text{O}$) Obtained by evaporating a solution of Nb_2O_5 in HFAq after addition of KF . By crystallising from water, the salt separates in such fine tablets that the liquid appears to gelatinise, monoclinic tables are obtained by crystallising from water contain-

ing a little HF . Loses H_2O at 100° , melts at red heat, sol in 12–13 pts water at 17° – 21° , easily soluble in hot water—2 K_3NbOF_6 ($=\text{NbOF}_5 \cdot 3\text{KF}$) Obtained by adding excess of KF to solution of the foregoing salt. Cubical crystals belonging to the regular system (Baker, *C J* 35, 761)—3 $\text{K}_4\text{Nb}_2\text{O}_7 \cdot \text{H}_2\text{O}$ ($=3\text{NbOF}_5 \cdot 5\text{KF} \cdot \text{H}_2\text{O}$) Obtained by adding less than an equivalent of KF to Nb_2O_5 in HFAq , evaporating a little, separating from $\text{K}_2\text{NbOF}_5 \cdot \text{H}_2\text{O}$ which separates, and evaporating the mother liquor—4 $\text{K}_5\text{NbOF}_6 \cdot \text{HF}$ ($=\text{NbOF}_5 \cdot 3\text{KF} \cdot \text{HF}$) Obtained by dissolving Nb_2O_5 in considerable excess of HFAq , and adding excess of KF , isomorphous with $\text{SnF}_6 \cdot 3\text{KF} \cdot \text{HF}$.

Fluoxyniobates of Cu and Zn have also been obtained, $\text{CuNbOF}_5 \cdot 4\text{H}_2\text{O}$, and $\text{ZnNbOF}_5 \cdot 6\text{H}_2\text{O}$.

Niobium, alloys of An alloy of Nb with Al, approximately of the composition Nb_2Al_3 , was obtained by Marnagac (*Ar Sc* 31, 89) by heating $\text{NbF}_5 \cdot 2\text{KF}$ with Al in a carbon crucible, and treating with cold HCl aq. A grey, crystalline, metal like powder, SG 4.45 to 4.52. Soluble in hot HCl aq with evolution of H. Insoluble in HNO_3 aq or dilute H_2SO_4 aq, boiling conc. H_2SO_4 forms SO_2 and S, soluble in HFAq .

Niobium, bromide of NbBr_3 . Formula probably molecular, because of similarity with NbCl_3 , which has been gasified. A purple red solid, obtained by passing CO_2 laden with Br vapour over a heated mixture of Nb_2O_5 and C (H. Rose, *P* 104, 442).

Niobium, carbide of By heating to c 1500° a mixture of 4 pts Nb_2O_5 , 1 pt sugar carbon, and 1 pt Na_2CO_3 , Joly obtained large violet needles of the composition NbC (*Bl* [2] 25, 206).

Niobium, carbonitride of By heating Nb_2O_5 with a mixture of Na_2CO_3 and C to c 1200° , Deville (*C R* 66, 180) obtained a crystalline mass, which evolved NH_3 when heated with molten KOH , according to Joly (*Bl* [2] 25, 206), this substance is either a carbonitride of Nb, or a mixture of carbide, NbC , with nitride NbN .

Niobium, chlorides of Two chlorides of Nb are known, NbCl_3 and NbCl_5 .

NIOBIUM PENTACHLORIDE NbCl_5 . Mol wt 270.85. VD 138.9 (Deville, a Troost, *C R* 60, 1221). Melts at 194° and boils at 240° (D. a. T., *lc*).

Preparation—Perfectly dry Nb_2O_5 is mixed with a large excess of dry sugar or starch, the mixture is completely charred by heating in a closed crucible, and a small quantity is then placed in a rather wide tube of hard glass, narrowed here and there, connected with a CO_2 and a Cl apparatus, the tube is gently heated for some time while a stream of perfectly dry CO_2 is passed through it, and is then allowed to cool in the CO_2 , when cold, perfectly dry Cl is passed through the tube, when every trace of CO_2 is expelled, the tube is gradually heated to bright redness in the stream of Cl, NbCl_5 , mixed with a little NbOCl_3 , collects in the wider parts of the tube. The NbCl_5 is separated from the less volatile NbOCl_3 by distillation in dry Cl.

As NbCl_5 is very voluminous the operation must be conducted in wide tubes and with small quantities of the mixed Nb_2O_5 and C (H. Rose). **Properties and Reactions**—Yellow needles, melts at 194° , beginning to sublime at 125° , boils at 240° (Deville a Troost *C R* 60, 1221). Vapour

is yellow Soluble in alcohol Fumes in air, giving off HCl Decomposed by water to HCl and $\text{Nb}_2\text{O}_5 \cdot x\text{H}_2\text{O}$ Soluble in cold conc HClAq ; Zn produces a blue colour in this solution, on dilution and heating, $\text{Nb}_2\text{O}_5 \cdot x\text{H}_2\text{O}$ separates. Soluble in conc H_2SO_4 with evolution of HCl. Vapour of NbCl_5 is reduced to Nb by heating with H (Blomstrand, Roscoe, *C N* 37, 25) NbOCl_3 is produced by heating with Nb_2O_5 . $\text{Nb}_2\text{O}_5 \cdot \text{S}_3$ is formed by heating in CS_2 vapour (Delafontaine, *Ar Sc* 27, 167)

Niobium trichloride NbCl_5 When vapour of NbCl_5 is slowly passed through a red-hot tube, a dark grey metal like crust forms on the sides of the tube, this crust is NbCl_5 (Roscoe, *C N* 37, 25) Not volatile, non-deliquescent, unchanged by H_2O or NH_3Aq , by HNO_3Aq gives HCl and $\text{Nb}_2\text{O}_5 \cdot x\text{H}_2\text{O}$ Heated in air, gives off white fumes When heated in CO_2 , produces CO and NbOCl_3 .

Niobium, fluoride of No fluoride of Nb has been isolated with certainty $\text{Nb}_2\text{O}_5 \cdot x\text{H}_2\text{O}$ dissolves easily in HFAq , on evaporation a non-crystallisable mass is obtained, which evolves white fumes when heated and leaves Nb_2O_5 Solution of $\text{Nb}_2\text{O}_5 \cdot x\text{H}_2\text{O}$ in HFAq yields *fluoniobates* when mixed with metallic carbonates and evaporated, these fluoniobates may be regarded as compounds of NbF_5 with metallic fluorides (*v Fluoniobates*, p 507)

Niobium, haloid compounds of. The only haloid compound of Nb which has been gasified is NbCl_5 , the trichloride is also known, and the formula NbCl_5 is probably molecular No fluoride or iodide has been isolated, but several compounds are known, which may be regarded as formed by the union of NbF_5 with more positive fluorides (*v Fluoniobates*, p 507) NbCl_5 reduces CO_2 to CO at a high temperature Oxihaloid compounds are known, of the form NbOX_2 , where X = Br, Cl, or F

Niobium, hydride of, ?NbH Margnac (*Ar Sc* 1868) obtained a heavy grey powder, having approximately the composition NbH_2 , mixed with a little Nb_2O_5 , by heating K.NbF_6 , mixed with a little KHF_2 , and covered with NaCl , with excess of Na in an iron crucible The reaction was energetic, the fused mass was broken up, treated with water, then with water containing a little HF, then washed with water, and finally filtered and dried The powder obtained by Margnac had SG 6 to 6.6, it dissolved in conc HFAq with rapid evolution of H, it was insoluble in HClAq , HNO_3Aq , and dilute $\text{H}_2\text{SO}_4\text{Aq}$, sol warm conc H_2SO_4 , also in molten KHSO_4 , heated in air or O to above 100° it burned to Nb_2O_5 and H_2O , it was unchanged when heated in H Krüss a Nilson (*B* 20, 1691) repeated Margnac's experiments, using a quantity of Na equivalent to the K.NbF_6 , they obtained a mixture of c 77 p c NbH , c 21.5 p c Nb_2O_5 , and c 1 p c Fe_2O_3 , K a N gave S.H of NbH as 0.97 at 0° to 100° , 0.92 at 0° to 210.5° , 0.87 at 0° to 301.5° , and 0.83 at 0° to 449° .

Niobium, nitride of, ?NbN NbCl_5 absorbs NH_3 , on heating, NH_4Cl is evolved, and a black mass remains which contains N Heated with KOH.Aq , NH_3 is evolved, it is not attacked by HNO_3Aq ; soluble in HFAq ; heated in air, it oxidises with incandescence The composition of this body is approximately NbN (H Rose;

Deville, *C R* 66, 180, Joly, *Bl* [2] 25, 206). By reducing Nb_2O_5 with a mixture of soda and O, Deville obtained a crystalline mass, probably a mixture of nitride and carbide of Nb

Niobium, nitro-carbide of, v Niobium, carbide of, p 507

Niobium, oxides of Three oxides of Nb have been isolated, NbO , NbO_2 , and Nb_2O_5 , a fourth, Nb_2O_3 , probably exists Nb_2O_5 is formed by heating Nb in air or O, also by decomposing NbOCl_3 by water, and in other ways, Nb_2O_5 is produced by the partial reduction of Nb_2O_5 in H, NbO is obtained by the incomplete reduction of NbOF_3 or NbOCl_3 by Na or Mg, when Nb_2O_5 in HClAq is reduced by Zn the solution becomes brown, and a solid separates, which is probably Nb_2O_3 Moist Nb_2O_5 reacts as an acid forming oxide, niobates are formed by fusing Nb_2O_5 with basic acids or carbonates (*v Niobates*, p 506) The mol wt of none of the oxides of Nb is known with certainty

Niobic oxide Nb_2O_5 (*Niobic anhydride* *Niobium pentoxide*)

Occurrence—Niobates occur in a few rare minerals, e.g. columbite, tantalite, and samarskite.

Preparation—1 NbOCl_3 is agitated with water, the insoluble $\text{Nb}_2\text{O}_5 \cdot x\text{H}_2\text{O}$ is washed till free from HCl, dried at 100° , and heated to incipient redness The solution after treating NbOCl_3 with water contains much Nb_2O_5 , the oxide is obtained by adding slight excess of NH_3Aq , warming till every trace of NH_3 is removed, collecting the pp, washing till free from HCl, and drying—2 Dilute $\text{H}_2\text{SO}_4\text{Aq}$ is added to a boiling solution of NaNbO_3 , the ppd $\text{Nb}_2\text{O}_5 \cdot x\text{H}_2\text{O}$ is thoroughly washed and heated—3 Impure Nb_2O_5 is fused with KHSO_4 , the fused mass is treated with water, and the pp is washed and heated.—4 Nb_2O_5 is obtained in crystals by dissolving in molten borax, heating in a porcelain oven, washing, and drying (Nordenskjöld, *P* 114, 612, Ebelmen, *A Ch* [3] 33, 34, Knop, *Z K* 12, 610, also by strongly heating Nb_2O_5 (from NbOCl_3) in a slow current of HCl (Deville, *C R* 66, 180) For preparation of Nb_2O_5 from columbite v NIOBIUM, Preparation, p 505

Properties—A white powder, becomes yellow when heated, and goes white on cooling Insoluble in water SG 4.4 to 4.53 (Marnagac, *A Ch* [4] 8, 5) The crystals of Nb_2O_5 are flat, right angled tablets, they are optically active (Nordenskjöld, *P* 114, 612, cf Ebelmen, *A Ch* [3] 33, 34, Knop, *A* 169, 56) SH 118 at 0° to 210.5° , 124 at 0° to 301.5° , 134 at 0° to 449° (Krüss a Nilson, *B* 20, 1691)

Reactions—1. Dissolves in hot conc *sulphuric acid*, the solution may be diluted with out ppn, but on heating all the Nb_2O_5 is ppd, the pp contains H_2SO_4 —2 Boiling *hydrochloric acid* dissolves only traces of Nb_2O_5 , the residue is easily soluble in water, and this solution is ppd on boiling with $\text{H}_2\text{SO}_4\text{Aq}$ (Wöhler, *P* 48, 93, Margnac, *A Ch* [4] 8, 15, 13, 20, H Rose, *P* 112, 484).—3. Easily dissolved by cold *hydrofluoric acid*—4. Soluble in *caustic potash* solution—5. *Caustic soda* does not dissolve Nb_2O_5 , but the product is soluble in water Nb_2O_5 , which has been strongly heated is insoluble in H_2SO_4 , HClAq , or HFAq , it is dissolved by molten alkalis.—6. Reduced by *hydrogen* to

NbO₂, at full red heat — 7 Moist Nb₂O₅ dissolved in HClAq is reduced by *zinc* with formation of a blue liquid which then becomes brown and deposits brown flocks, probably of Nb₂O₃ (Magnnac, *A Ch* [4] 18, 5) — 8 Strongly heated with *hydrogen sulphide*, or *carbon disulphide*, an oxysulphide is formed, probably Nb₂OS₂ (Delafontaine, *Ar Sc* 27, 167) — 9 Heated with *ammonia*, Nb nitride (*q. v.*) is formed — 10 Mixed with *carbon* and heated in *chlorine* or *bromine*, NbCl₃ (or NbBr₃) is formed along with some NbOCl₃ (or NbOBr₃) — 11 Fused with *basic oxides* or *carbonates*, niobates (*q. v.*) are produced

Combinations — 1 With *water* to form various hydrates (*v. infra*) — 2 Nb₂O₅ appears to combine with some acids, but no definite compounds have yet been isolated, *e.g.* the pp obtained by decomposing NbOCl₃ by water in presence of Na₂HPO₄ contains H₂PO₄, and the pp obtained by adding water to Nb₂O₅ in H₂SO₄ and boiling contains H₂SO₄ (*v. Blomstrand, Acta Univ Lund* 1864)

HYDRATES OF NIOBIC OXIDE Various hydrates of Nb₂O₅ are known. By fusing Nb₂O₅ with KHSO₄, boiling with water, dissolving the pp in HClAq, and ppg by NH₄Aq, Santesson (*Bt* [2] 24, 52) obtained a flocculent pp containing 8.04 to 8.41 p.c. H₂O, agreeing with the formula 3Nb₂O₅·4H₂O. The solid obtained by ppg NaNbO₄Aq by H₂SO₄Aq and drying at 100° has the composition Nb₂O₅·7H₂O, according to Santesson (*l.c.*) The hydrate obtained by decomposing NbOCl₃ by water is amorphous, that formed by the action of moist air on NbOCl₃ is said to be crystalline (*H. Rose, P* 112, 557). The hydrates of Nb₂O₅ react as weak acids (*v. Niobates*, p. 506)

NIOBOUS OXIDE NbO (Niobium monoxide) By reducing NbOF₃·2KF with Na, H. Rose obtained a black powder which he thought to be Nb (*P* 104, 312). This substance was recognised as an oxide by Delafontaine (*Ar Sc* 27, 167). Prepared by strongly heating NbOF₃·2KF with Na, under KCl, and washing with cold water SG 6.3 to 6.67. Obtained in crystals by passing vapour of NbOCl₃ over heated Mg wire (Deville a Troost, *C R* 60, 1221, *v. also* Deville, *C R* 66, 183). Black, lustrous, regular crystals. Moist NbO is soluble in boiling dilute HClAq, or in HFAq, H is said to be evolved. KOHAq dissolves NbO, forming K niobate. Molten KHSO₄ forms Nb₂O₅, heated in Cl NbOCl₃ is produced

NIOBIUM DIOXIDE Nb₂O₃ (Niobium tetroxide [Nb₂O₃]) A black powder with blue reflection, insol water and acids. Formed by heating Nb₂O₅ in a stream of H to full white heat (Delafontaine, *Ar Sc* 27, 167)

Wöhler (*P* 48, 93) noticed that Zn reduces a solution of Nb₂O₅ in HClAq, with production of blue and then brown coloured substances. Magnnac (*A Ch* [4] 13, 5) obtained a blue-brown pp by boiling Nb₂O₅·xH₂O with HClAq, dissolving the residue in water, and reducing by Zn

Niobium, oxybromide of, NbOBr₃ A voluminous, crystalline, yellowish solid, obtained by passing Br vapour over a heated mixture of Nb₂O₅ with a little charcoal (*H. Rose, P* 104, 442). Sublimes without melting. Heated in CO₂ gives Nb₂O₅ and NbBr₃. Decomposed by water, giving Nb₂O₅·xH₂O and HBrAq

Niobium, oxychloride of, NbOCl₃ Mol. w 216.1. Obtained, along with NbCl₃, by heating Nb₂O₅ mixed with charcoal in a stream of Cl₂, also by heating Nb₂O₅ in a stream of CO₂ charged with vapour of NbCl₃ (Deville a Troost, *C R* 60, 1221). A white, lustrous mass, sublimes at c. 400° without melting. VD at 440° to 810° — 114 (*D a T, l.c.*) Heated strongly in CO₂, NbCl₃ and Nb₂O₅ are formed, the same products are formed by heating in H (Blomstrand, *Acta Univ Lund*, 1864). Sol alcohol, decomposed by water to Nb₂O₅·xH₂O and HClAq

Niobium, oxyfluoride of, NbOF₃ Small crystals, optically active, resemble ZrF₄, obtained by strongly heating Nb₂O₅ mixed with a large excess of CaF₂ in HCl (*Joly, C R* 81, 1266). NbOF₃ forms various compounds with metallic fluorides (*v. Fluoxyniobates*, p. 507)

Niobium, oxysulphide of, Nb₂OS₂ A black powder, obtained by passing H₂S or CS₂ vapour over strongly heated Nb₂O₅. The product of these reactions was supposed by H. Rose to be a sulphide of Nb (*P* 111, 193, *v. also* Rose a Hermann, *J pr* 111, 393). Delafontaine (*Ar Sc* 27, 167) showed the substance to be an oxysulphide, Rammelsberg (*J pr* 108, 95) thought the composition was NbOS or Nb₂O₅S₂

Niobium, salts of No compounds obtained by replacing the H of acids by Nb have yet been isolated. There are indications that Nb₂O₅ combines with some acids (*v. Niobic oxide, Combinations*, No 2, *supra*) M M P M

NITRANILIC ACID v. DI NITRO DI OXYQUINONE

NITRANILINE v. NITROANILINE

NITRATES Salts of *nitric acid*, HNO₃. The greater number of the nitrates are normal salts, many basic nitrates also exist. The general formula for normal nitrates may be written Mⁿ·nNO₃, where Mⁿ denotes a metal of *n* valency. The normal nitrates may also be regarded as composed of a basic and an acidic radicle, on this view, they are classed under the general formulae M₂O N₂O₅, MO N₂O₅, M₂O·3N₂O₅, MO₂·2N₂O₅. The simplest way of looking at the composition of the basic nitrates is to regard them as compounds of the acidic radicle N₂O₅ with more than the normal quantity of base, thus normal lead nitrate is PbO N₂O₅, and basic lead nitrate is 3PbO N₂O₅. Several basic nitrates may be formulated as salts of the hypothetical orthonitric acid H₃NO₃, which bears the same relation to ordinary, or meta, nitric acid that orthophosphoric bears to metaphosphoric acid, thus basic lead nitrate 3PbO N₂O₅ may be written Pb₃(NO₃)₄.

Some nitrates occur native, *e.g.* Ca(NO₃)₂, Mg(NO₃)₂, KNO₃, NaNO₃. Alkali nitrates are found in river, spring, and drainage waters, and in the juices of some plants. With regard to the formation of nitrates in the soil *v. NITRIFICATION*, this vol. Nitrates are prepared by dissolving metals, metallic oxides or carbonates, in nitric acid, also, in some cases, by double decomposition from the alkali nitrates.

Most nitrates are crystalline salts. As no nitrate has been gasified, the formulae of these salts are not necessarily molecular. The normal nitrates are soluble in water, a few, *e.g.* Bi(NO₃)₃, are decomposed by water with production of insoluble basic nitrates. Nitrates are decomposed

by heat, a few give off HNO_3 , but in almost all cases O is evolved, along with oxides of N and H_2O , the final residue is generally a metallic oxide corresponding with the nitrate used, AgNO_3 leaves a residue of Ag. Heated with combustible bodies, nitrates cause deflagration or explosion, if the combustible body be an acid forming element, or a compound capable of forming an acid by oxidation, a salt is formed composed of the metal of the nitrate and the acid produced from the combustible body. Thus K_2SeO_4 is formed by deflagrating KNO_3 with Se, and K_2MnO_4 by deflagrating KNO_3 with an oxide or salt of Mn. Alkali nitrates are reduced to NH_3 by the action of potash and zinc, or by a pair of metals one of which is distinctly more electro-positive than the other, e.g. by Cu and Zn, Fe and Zn, Pt and Zn, &c. Alkali nitrates are also reduced to NH_3 by the action of common putrefactive organisms in presence of peptones and air, also by Pt black charged with O, in the presence of dextrose (v. Loew, *B* 23, 675). Nitrates are reduced to nitrites, N_2O , NO, and N, by organisms present in the soil (v. Warrington, *C* J 45, 669, 53, 742 [references are given here to other memoirs], 59, 484, Munro, *C* J 49, 667).

The greater number of the nitrates are insoluble in conc. nitric acid. A few dissolve in a large quantity of the acid, according to Ditte (*A. Ch.* [5] 18, 320) these nitrates combine with HNO_3 to form acid salts, e.g. $\text{KNO}_3 \cdot 2\text{HNO}_3$, $\text{NH}_4\text{NO}_3 \cdot \text{HNO}_3$, $\text{KNO}_3 \cdot 3\text{HNO}_3$, $\text{RbNO}_3 \cdot 5\text{HNO}_3$. Some other hydrated nitrates dissolve in warm HNO_3 . Aq. when dehydrated, on cooling, hydrates are deposited containing less water than those which crystallise from water, to this class of nitrates belong $\text{Mg}(\text{NO}_3)_2$, $\text{Mn}(\text{NO}_3)_2$, $\text{Zn}(\text{NO}_3)_2$, $\text{Al}(\text{NO}_3)_3$, $\text{Cu}(\text{NO}_3)_2$ (Ditte, *l.c.*).

The methods of detecting and estimating nitrates are numerous, reference must be made to *Manuals of analysis*.

Aluminium nitrates. The normal salt, $\text{Al}(\text{NO}_3)_3 \cdot 9\text{H}_2\text{O}$, obtained by dissolving AlO_3H_3 in HNO_3 Aq. and evaporating, crystallises in oblique rhombic prisms. Melts at 73° , deliquescent, e. sol. H_2O and HNO_3 Aq. (Ordway, *A* 76, 247, Salm Horstmar, *J* 1850 301, Thorey, *Russ. Zeitschr. Pharm.* 10, 321). The salt does not react with HCl gas (Thomas, *C* J 33, 367). Basic Al nitrates are obtained by digesting $\text{Al}(\text{NO}_3)_3$ with AlO_3H_3 (Ordway, *l.c.*).

Ammonium nitrate NH_4NO_3 . According to Tissandier (*C* R 82, 388) this salt is frequently present in rain water. It is obtained by adding a slight excess of NH_3 Aq. to HNO_3 Aq. and evaporating, also by passing the electric discharge through a mixture of H, N, and O, by passing H_2S into dilute HNO_3 Aq. by the interaction of certain metals, e.g. Sn, with HNO_3 Aq. NH_4NO_3 crystallises in various forms according to the temperature, the crystals formed at 36° are trimetric, those formed at 87° are rhombohedral, and monometric crystals are produced at 120° (Lehmann). The specific heats, volume changes, and heats of transformation, of the various modifications have been determined by Bellati a Romanese (*Nuovo Cimento*, [3] 21, 5, abstract in *C* J 54, 106). SG 1.707 (Kopp, *A* 36, 1), 1.709 (Sohiff, *A* 112, 88), for other results v. Clarke's *Specific Gravity Table*, new ed. 110. NH_4NO_3 dissolves in H_2O with a large

disappearance of heat. S at 18° c. 200; saturated solution contains 47.8 p.c. NH_4NO_3 , and boils at 164° . E. sol. alcohol. Deliquesces in air, losing NH_3 and acquiring an acid reaction. Melts at c. 152° , decomposition begins at c. 210° and becomes explosive at c. 300° , products are H_2O and N_2O , but part of salt volatilises (Berthelot, *C* R 82, 932), heated very rapidly, NH_3 , NO, and NH_4NO_3 are also formed (B). According to B (*l.c.*) NH_4NO_3 may be sublimed unchanged, by placing the fused salt in a basin covered with filter paper, over which is a paper cylinder filled with coarse fragments of glass, and heating gently not above 190° – 200° . NH_4NO_3 condenses considerable quantities of NH_3 , forming a liquid varying in composition according to temperature and pressure (v. Divers, *Pr* 21, 107, Raoult, *C* R 77, 788). At -10° , and 760 mm, the liquid $\text{NH}_4\text{NO}_3 \cdot 2\text{NH}_3$ is formed, heated to 28.5° a solid remains, $\text{NH}_4\text{NO}_3 \cdot \text{NH}_3$ (R, *l.c.*), cf. Mendelejeff (*B* 23, 3464), who regards $\text{NH}_4\text{NO}_3 \cdot \text{NH}_3$ and $\text{NH}_4\text{NO}_3 \cdot 2\text{NH}_3$ as amides obtained from NO OH ONH, ONH, and NO(OH), which are the NH, salts of hypothetical ortho-nitric acid NO(OH). The liquid compounds of NH_4NO_3 and NH_3 react with many salts, the reactions generally resembling those of NH_4NO_3 and dry NH_3 combined (for details v. Divers, *l.c.*). NH_4NO_3 absorbs dry HCl, forming NH_4Cl , after a time a little Cl and NO are evolved (Thomas, *C* J 33, 367). The Cu Zn couple reduces NH_4NO_3 Aq. to NH_3 and NH_4NO_3 , at B P NO is evolved (Gladstone a Tribe, *C* J 33, 150).

Antimony nitrate. The compound $\text{Sb}_2\text{O}_5 \cdot \text{N}_2\text{O}_5$ is said to be formed by dissolving Sb_2O_5 in cold fuming HNO_3 (Péligot, *C* R 23, 709).

Barium nitrate $\text{Ba}(\text{NO}_3)_2$. Crystallises in tetartohedral forms belonging to the regular system (Soacchi, *J* 1860 13, Baumhauer, *Z* K 1, 51, Lewis, *P. M.* [5] 3, 453). SG α 2.2 to 3.24 (Kremers, *J* 5, 15, for other determinations v. Clarke's *Specific Gravity Table* (new ed.), 111). H F [Ba , O, N°O Aq.] = 187,020 (?) (*Th* 3, 518). Melts at c. 593° (Carnelley, *C* J 33, 278). S 5 at 0° , 7 at 10° , 9.2 at 20° , 11.6 at 30° , 14.3 at 40° , 17.1 at 50° , 20.3 at 60° , 23.6 at 70° , 27 at 80° , 30.6 at 90° , 32.2 at 100° , saturated solution boils at 101.9° , SG and potge composition of $\text{Ba}(\text{NO}_3)_2$ Aq. are as follows (Mulder) —

SG	P. a. $\text{Ba}(\text{NO}_3)_2$	SG	P. c. $\text{Ba}(\text{NO}_3)_2$
1.009	1	1.05	6
1.017	2	1.06	7
1.025	3	1.069	8
1.034	4	1.078	9
1.042	5	1.087	10

$\text{Ba}(\text{NO}_3)_2$ is only slightly soluble in water containing HCl or HNO_3 , insol. alcohol.

$\text{Ba}(\text{NO}_3)_2$ is prepared by adding to BaCO_3 , or crude BaS, enough HNO_3 Aq. to decompose almost the whole of the salt, filtering, and crystallising, also by mixing equivalent weights of BaCl_2 and NaNO_3 in solution, and recrystallising the $\text{Ba}(\text{NO}_3)_2$, which separates (Bolley, *C* C 1860 830, Kuhlmann, *D* P. J. 150, 57, 108, 416). $\text{Ba}(\text{NO}_3)_2$ melts at a moderate temperature, at red heat it evolves O, N, and NO_2 , and leaves BaO, according to Rammelsberg (*B* 2, 147, 7, 542) the residue

contains more O than BaO , and has the composition $\text{Ba}_2\text{O} \cdot \text{Ba}(\text{NO}_3)_2$, is not acted on by HCl gas (Thomas, *C J* 33, 367)

Beryllium nitrates The composition of these salts is doubtful. They are very soluble in water and difficult to crystallise. By double decomposition from BeSO_4Aq and evaporating, Ordway (*J pr* 76, 22) obtained deliquescent crystals approximating to the composition $\text{Be}(\text{NO}_3)_2 \cdot 8\text{H}_2\text{O}$. By heating at 100° the crystals lost half of their nitric acid, and a basic salt remained, soluble in water. Other soluble basic salts seem to be formed by adding a little NH_3Aq to a solution of the normal salt, and by digesting the normal salt with BeO *xH*₂O.

Bismuth nitrates The normal salt has the composition $\text{Bi}(\text{NO}_3)_3 \cdot 10\text{H}_2\text{O}$ according to Gladstone (*J pr* 44, 179) and Hemtz (*J pr* 45, 102), according to the more recent work of Yvon (*C R* 84, 1164) the crystallised salt has the composition $2\text{Bi}(\text{NO}_3)_3 \cdot 11\text{H}_2\text{O}$. The normal salt is formed by dissolving Bi , Bi_2O_3 , or $\text{Bi}_2(\text{CO}_3)_3$ in HNO_3Aq , filtering through asbestos or powdered glass, and evaporating to the crystallisation-point. Forms large deliquescent crystals, SG 2.823 at 13° (Clarke's *Table of Specific Gravities* (new ed.), 112). Crystals are very caustic, they melt easily in the water of crystallisation, decomposition begins at $c 75^\circ\text{--}80^\circ$ with production of basic salts (*v infra*). Decomposed by HCl gas, giving BiCl , and also much Cl , along with NO , H_2O , and possibly other oxides of N and Cl (Thomas, *C J* 33, 367). Various basic salts have been described. According to Graham (*A* 29, 16) $2(\text{BiO} \cdot \text{NO}_2) \cdot \text{H}_2\text{O}$ is formed by heating the normal salt to 80° , and is not decomposed below 260° (*cf* Ruge, *J* 1862 163). Yvon (*C R* 84, 1164) assigns the composition $4(\text{BiO} \cdot \text{NO}_2) \cdot 3\text{H}_2\text{O}$ to the salt obtained by heating the normal salt to 120° , and also to the product of the action of water on the normal salt. Many basic salts, $x\text{BiO} \cdot y\text{N}_2\text{O} \cdot z\text{H}_2\text{O}$, seem to be produced by decomposing Bi_3NO_3 , or a solution of Bi in HNO_3Aq , by water, the composition of the most stable of these *subnitrates* is $\text{BiO} \cdot \text{NO}_2 \cdot \text{H}_2\text{O}$, in other cases x , y , and z have such values as 5, 4, and 9, or 5, 3, and 8, or 6, 5, and 9. The composition of these basic salts varies with the temperature of the water used, the amount of washing given to the pp, and the length of time the pp is allowed to remain in contact with the acid liquid above it. The compositions of these salts, and the preparation of a salt of constant composition for medicinal use, have been examined chiefly by Phillips (*J Ph* 18, 688), Duflos (*Ar Ph* [2] 23, 307), Herberger (*R P* 55, 289, 306), Ullgren (*B J* 17, 169), Dulk (*R P* 83, 1), Becker (*Ar Ph* 55, 81, 129), Janssen (*Ar Ph* 68, 1, 129), Ruge (*J* 1862 163), and Yvon (*C R* 84, 1164).

Cadmium nitrate $\text{Cd}(\text{NO}_3)_2 \cdot 4\text{H}_2\text{O}$ White, prismatic, deliquescent, needles, by dissolving Cd , CdO , or CdCO_3 in HNO_3Aq and evaporating SG 2.45 at 14° , 2.46 at 20° (Laws, *Am S* [3] 14, 281). H F [$\text{CdO} \cdot \text{N}^\circ\text{O} \cdot 4\text{H}^\circ\text{O}$] = 125,170, [$\text{CdO} \cdot \text{N}^\circ\text{O} \cdot \text{Aq}$] = 86,000 (*Th* 3, 518). Melts at $59^\circ\text{--}5^\circ$, and boils at $c 132^\circ$ (Ordway, *Am S* [2] 27, 14). Reacts with HCl gas to produce CdCl , evolving Cl and NO (Thomas, *C J* 33, 367). Wells (*Am* 9, 304) describes a basic salt, to this salt he has assigned the composition

$2\text{CdO} \cdot \text{N}_2\text{O} \cdot 3\text{H}_2\text{O}$, obtained by digesting hot $\text{Cd}(\text{NO}_3)_2\text{Aq}$ with CdO , and allowing to cool.

Cesium nitrate CsNO_3 . Obtained by dissolving Cs_2CO_3 in HNO_3Aq , and evaporating, the *habitus* of the crystals depends on the rate of evaporation. Melts below red heat, when strongly heated evolves O, and forms CsNO_2 , S 10.68 at 32° , very slightly sol in alcohol (Bunsen, *P* 119, 1).

Calcium nitrate $\text{Ca}(\text{NO}_3)_2 \cdot 4\text{H}_2\text{O}$. Occurs in soils when conditions are favourable to production of HNO_3 , and Ca salts are also present. This salt is prepared in some countries by the slow decomposition of animal and vegetable matter SG 1.79 when liquid, and 1.9 when solid, at $15^\circ\text{--}5^\circ$ (Ordway, *J* 12, 115). SG of $\text{Ca}(\text{NO}_3)_2 = 2.5$ at 17.9° (Favre a Valson, *C R* 77, 579). H F [$\text{CaO} \cdot \text{N}^\circ\text{O} \cdot 4\text{H}^\circ\text{O}$] = 218,440, [$\text{CaO} \cdot \text{N}^\circ\text{O} \cdot \text{Aq}$] = 177,160. Prepared by dissolving CaO or CaCO_3 in HNO_3Aq , and evaporating, if the evaporation is continued to dryness the anhydrous salt is obtained. The hydrated salt crystallises with difficulty in deliquescent, six-sided prisms, melts at 44° , boils at 182° , remaining clear till c one third of the water has gone, when the anhydrous salt is deposited (Ordway, *Am S* [2] 27, 14). The dry salt $\text{Ca}(\text{NO}_3)_2$ melts at 561° (Carnelley, *C J* 33, 278). Decomposed at high temperature, giving off O and NO, the partially decomposed salt is phosphorescent (*Baldwin's phosphorus*), not acted on by HCl gas (Thomas, *C J* 33, 367).

Cerium nitrates *Cerous nitrate*, $\text{Ce}(\text{NO}_3)_3 \cdot 6\text{H}_2\text{O}$, is obtained as a pale rose-coloured, deliquescent, crystalline mass, by dissolving Ce_2O_3 , or CeO , in presence of reducing substances, in HNO_3Aq , evaporating, and drying over H_2SO_4 (Lange, *J pr* 82, 129). Gives off $3\text{H}_2\text{O}$ at 150° , and decomposes at 200° . Forms several double salts with nitrates MNO_3 , and $\text{M}(\text{NO}_3)_2$, e.g. $\text{Ce}(\text{NO}_3)_3 \cdot 2\text{KNO}_3 \cdot 2\text{H}_2\text{O}$, $2\text{Ce}(\text{NO}_3)_3 \cdot 3\text{Mg}(\text{NO}_3)_2 \cdot 24\text{H}_2\text{O}$. These double nitrates have been examined by Lange (*l c*) and Holzmann (*J pr* 84, 76), and more recently by Zschiesche (*J pr* 107, 65). They are obtained by crystallising a mixed solution of $\text{Ce}(\text{NO}_3)_3$ and the other nitrate, and also by dissolving CeO_2 in HNO_3 , adding the other nitrate and a little alcohol, and evaporating. Should the metal of the nitrate which is added be capable of forming a higher oxide than that corresponding to the nitrate used, a little of this oxide is sometimes formed at the expense of the O of the CeO_2 , and the reduction from $\text{Ce}(\text{NO}_3)_3$ to $\text{Ce}(\text{NO}_2)_3$ proceeds without addition of alcohol, thus, addition of $\text{Mn}(\text{NO}_3)_2$ to CeO_2 dissolved in HNO_3Aq produces $2\text{Ce}(\text{NO}_3)_3 \cdot 3\text{Mn}(\text{NO}_3)_2 \cdot 24\text{H}_2\text{O}$, with simultaneous formation of a little MnO_2 . The double cerous nitrates are also formed by dissolving the various metals in an acid solution of CeO_2 in HNO_3Aq , reduction is effected to $\text{Ce}(\text{NO}_2)_3$, *Ceric nitrate*, $\text{Ce}(\text{NO}_3)_4$. Said to be obtained as a reddish yellow mass by evaporating CeO_2 in HNO_3Aq , decomposed by hot water forming a basic salt. Combines with KNO_3 and NH_4NO_3 to form $2\text{Ce}(\text{NO}_3)_4 \cdot 4\text{MNO}_3 \cdot 3\text{H}_2\text{O}$ (Berzelius, *P* 1, 29).

Chromium nitrates The normal salt, $\text{Cr}(\text{NO}_3)_3 \cdot 9\text{H}_2\text{O}$, is obtained by dissolving CrO_3H_2 in HNO_3Aq , evaporating, and crystallising from warm water; the crystals, which form with difficulty, are purple oblique prisms, melting at

87° to a green liquid which boils at 125.5° (Ordway, *Am S* [2] 9, 30, 27, 14) Various basic salts are described by Loewel (*Ph C* 1845, 580), Ordway (*Am S.* [2] 26, 197), and Siewert (*A.* 126, 86), they are formed by heating the normal salt, by dissolving CrO_3H_2 in solution of the normal salt, and by boiling HNO_3Aq with excess of CrO_3H_2 .

Cobalt nitrates The normal salt, $\text{Co}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$, forms red, prismatic, deliquescent crystals, SG 183 at 14° (Boedeker), melts below 100°, at higher temperatures gives off H_2O and oxides of N, and leaves black Co_3O_4 . Produced by dissolving Co, or CoCO_3 , in HNO_3Aq , and evaporating. Easily sol water. Franz (*J pr* [2] 5, 274) gives the following table showing p c $\text{Co}(\text{NO}_3)_2$ in aqueous solutions at 17.5° —

Ra. Co(NO_3),	SG
5	1.0462
10	1.0906
15	1.1378
20	1.1936
25	1.2538
30	1.319
35	1.3896
40	1.4662
Saturated at 17.5°	1.5382

Thomsen gives HF [Co, O', N'O', 6H'O'] 128,880, [Co, O, N'O'Aq] = 84,540. When HCl gas is passed over $\text{Co}(\text{NO}_3)_2 \cdot \text{CoCl}_2$, oxides of N, and Cl are formed (Thomas, *C J* 33, 367). Combines with cerous nitrate to form $\text{Co}(\text{NO}_3)_2 \cdot \text{Ce}(\text{NO}_3)_2 \cdot 8\text{H}_2\text{O}$ (Lange, *J pr* 82, 129).

Basic salts are obtained by adding NH_3Aq to $\text{Co}(\text{NO}_3)_2\text{Aq}$ under different conditions (v Winkelblech, *A* 13, 148, 253, Habermann, *M* 5, 442).

Copper nitrates The normal nitrate, $\text{Cu}(\text{NO}_3)_2 \cdot 3\text{H}_2\text{O}$, is obtained by dissolving Cu or CuO in HNO_3Aq , and evaporating. The solution is at first green owing to production of $\text{Cu}(\text{NO}_3)_2$. Blue prismatic crystals, SG 2.174 (Hassenfratz, *A* 28, 3). The salt $\text{Cu}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$ is deposited below 20° HF [Cu, O', N'O', 6H'O'] = 96,950 (*Th* 8, 518). The hexahydrated salt effloresces in air, losing $3\text{H}_2\text{O}$, it melts at 38°, and decomposes at 65°, forming a basic salt. The trihydrated salt melts at 114.5°, and decomposes at 170°. At red heat, $\text{Cu}(\text{NO}_3)_2$ evolves N oxides and leaves CuO , it is deliquescent, easily sol water, but ppd again by conc HNO_3Aq . Franz gives following table (*J pr* [2] 5, 274) —

S.G. of $\text{Cu}(\text{NO}_3)_2\text{Aq}$	P c $\text{Cu}(\text{NO}_3)_2$
1.0942	10
1.2037	20
1.3299	30
1.4724	40
1.5404	44

$\text{Cu}(\text{NO}_3)_2$ is rapidly decomposed by HCl, with formation of CuCl_2 , Cl, NO, and probably N (Thomas, *C J* 33, 367).

Basic nitrates of Cu are produced by boiling $\text{Cu}(\text{NO}_3)_2\text{Aq}$ with KNO_3Aq , or by passing N_2O_4 into H_2O holding $\text{CuO} \cdot \text{H}_2$ in suspension, the product is said to be $4\text{CuO} \cdot \text{N}_2\text{O}_4 \cdot 8\text{H}_2\text{O}$ (Vogel a Reimhauer, *J* 1859 216). For other basic salts v. Graham, *T* 1837 47, Casselmann, *Fzr* 4, 24; Tutschew, *Z.* 6, 109.

Didymium nitrate $\text{Dy}(\text{NO}_3)_3 \cdot 6\text{H}_2\text{O}$. Rose red crystals, by dissolving Dy_2O_3 in HNO_3Aq and crystallising, SG 2.249, loses $6\text{H}_2\text{O}$ at 200°. Easily sol water and alcohol, forms double salts with $\text{Co}(\text{NO}_3)_2$, $\text{Ni}(\text{NO}_3)_2$, and $\text{Zn}(\text{NO}_3)_2$ (v Mariagnas, *A Ch* [3] 88, 148, Hermann, *Rep Chim pur* 1861 53, Ferriehs a Smith, *A* 191, 346, Cleve, *Bl* [2] 43, 861).

Erbium nitrate $\text{Er}(\text{NO}_3)_3 \cdot 6\text{H}_2\text{O}$. Large crystals, sol water and alcohol. Decomposed by heat forming a basic salt $2\text{Er}_2\text{O}_3 \cdot 3\text{N}_2\text{O}_4 \cdot 9\text{H}_2\text{O}$ (Höglund, *Bl* [2] 18, 193, 279, Cleve, *C R* 91, 881).

Gallium nitrate $\text{Ga}(\text{NO}_3)_3$. Obtained by dissolving Ga in HNO_3Aq , evaporating at 100°, drying in an exsiccator, and heating in a dry air stream to 40°. Decomposes at 110°, and at 200° leaves Ga_2O_3 (de Boisbaudran).

Gold nitrates By dissolving $\text{Au}_2\text{O}_3 \cdot x\text{H}_2\text{O}$ in HNO_3Aq , a very unstable salt is obtained, Schottlander gives the formula $5(\text{AuO NO}_3) \cdot \text{H}_2\text{O}$ as approximately correct (*A* 217, 812). The compound $\text{Au}(\text{NO}_3)_3 \cdot 3\text{H}_2\text{O}$, which may be called *auronitric acid*, is obtained in large crystals by dissolving $\text{Au}_2\text{O}_3 \cdot x\text{H}_2\text{O}$ in HNO_3Aq with special precautions. This compound forms shining, yellow, tridinic octahedra, SG 2.84, it is readily decomposed by heat to $2\text{Au}_2\text{O}_3 \cdot \text{N}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$ (Schottlander, *A* 217, 312). Several salts are known derived from auro nitric acid, they are obtained by dissolving HNO_3 , $\text{Au}(\text{NO}_3)_3$, along with various nitrates in HNO_3Aq , and evaporating. The K salts are $\text{KAu}(\text{NO}_3)_4$ and $\text{HK}_2\text{Au}(\text{NO}_3)_6$ (Schottlander, *lc*).

Indium nitrate $2\text{In}(\text{NO}_3)_3 \cdot 9\text{H}_2\text{O}$. Large needle shaped crystals, by dissolving excess of In in HNO_3Aq , and evaporating in an exsiccator. Loses $6\text{H}_2\text{O}$ at 100° at red heat forms a basic salt, then In_2O_3 (Winkler, *J pr* 94, 1, 102, 273).

Iron nitrates According to Scheurer Kestner (*C R* 47, 927), Fe reacts with HNO_3Aq SG 1.034 to form $\text{Fe}(\text{NO}_3)_3$ and NH_4NO_3 , with acid SG 1.073 $\text{Fe}(\text{NO}_3)_3$ is also formed, with acid SG 1.115 only $\text{Fe}(\text{NO}_3)_3$ is produced, and with more conc acid basic salts begin to be formed.

Ferrous nitrate $\text{Fe}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$ is best prepared by dissolving FeS in cooled HNO_3Aq SG less than 1.12, the liquid is made as nearly neutral as possible by addition of FeS, decanted, evaporated slowly, and strongly cooled. The crystals may be kept unchanged at low temperatures in the mother liquor. S 200 at 0°, 800 at 25° (Ordway, *Am S* [2] 40, 325).

Ferric nitrate $\text{Fe}(\text{NO}_3)_3 \cdot 9\text{H}_2\text{O}$ (Ordway, *Am S* [2] 26, 197, 27, 14). Prepared by dissolving Fe in HNO_3Aq SG 1.29 till about 10 p c Fe is taken up by the acid, then adding an equal volume of HNO_3Aq SG 1.43, oblique rhombic prisms are deposited on cooling. SG 1.6885 at 20°, nearly colourless, slightly deliquescent, very soluble in water, very slightly soluble in cold HNO_3Aq , melts 47.2°, acid begins to be given off at 100°, boils 125°, completely decomposed at red heat (Ordway, *lc*). Hausmann obtained $\text{Fe}(\text{NO}_3)_3 \cdot 6\text{H}_2\text{O}$ (*A* 89, 109; v also Widenstein, *J pr* 84, 243). Scheurer Kestner obtained a dihydrated salt (*J* 1862, 198).

Numerous *basic ferric nitrates* were obtained by Ordway (*l.c.*) by dissolving FeO_2H_2 in $\text{Fe}(\text{NO}_3)_3\text{Aq}$, and evaporating (*v* also Hausmann, *A* 89, 109, and Scheurer-Kestner, *J*, 1862 193) Basic salts are also produced by heating $\text{Fe}(\text{NO}_3)_3\text{Aq}$ Basic ferric nitrates are slowly resolved by boiling water to normal salt and Fe_2O_3 , the change proceeds most rapidly by heating in a sealed tube

Several *ferric aceto nitrates*, e.g. $\text{Fe}(\text{NO}_3)(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot 3\text{H}_2\text{O}$, $\text{Fe}(\text{NO}_3)_2(\text{C}_2\text{H}_3\text{O}_2) \cdot 8\text{H}_2\text{O}$ have been prepared and described by Scheurer-Kestner (*A Ch* [3] 63, 422)

Lanthanum nitrate $\text{La}(\text{NO}_3)_3 \cdot 6\text{H}_2\text{O}$ Large prismatic, deliquescent, crystals, easily sol water and alcohol May be fused without decomposition at c 40° , but at rather higher temperature HNO_3 is removed and a basic salt formed completely decomposed at red heat (Ordway) Two *double salts*, $2\text{La}(\text{NO}_3)_3 \cdot 3\text{Ni}(\text{NO}_3)_2 \cdot 36\text{H}_2\text{O}$, and $2\text{La}(\text{NO}_3)_3 \cdot 3\text{Zn}(\text{NO}_3)_2 \cdot 69\text{H}_2\text{O}$, are described by Frerichs & Smith (*A* 191, 559)

Lead nitrates The normal salt, $\text{Pb}(\text{NO}_3)_2$, crystallises in octahedra from a solution of PbO or PbCO_3 in boiling very dilute HNO_3Aq *S G* 4 472 at 4° (Playfair & Joule, *C J* 1, 137), 4 41 at 15° (Holker, *P M* [3] 27, 214, *v* also Schroder, *P* 106, 226, Ditte, *B* 15, 1438) *H F* [Pb , N , O] = 105,500, [Pb , O , $\text{N}^\circ\text{O}^\circ$] = 109,470, [Pb , O , $\text{N}^\circ\text{O}^\circ\text{Aq}$] = 68,070 (*Th* 3, 518) *S* 39 at 0° , 48 3 at 10° , 60 6 at 25° , 80 at 45° , 101 at 65° , 120 5 at 85° , 138 9 at 100° (Kremers, *P* 92, 497) *S* in alcohol, *S G* 9282, 4 96 at 4° , 5 82 at 8° , 8 77 at 22° , 12 8 at 40° , 11 49 at 50° (Gerardin, *A Ch* [4] 5, 129) Insol conc HNO_3Aq $\text{Pb}(\text{NO}_3)_2$ is decomposed at low red heat giving PbO , O , and NO_2 In HCl gas, PbCl_2 is formed with evolution of NO and Cl (Thomas, *C J* 33, 367) Forms a compound with lead phosphate, viz $\text{Pb}(\text{NO}_3)_2 \cdot \text{Pb}_3(\text{PO}_4)_2 \cdot 2\text{H}_2\text{O}$ (Gerhardt, *A* 68, 286)

Many *basic lead nitrates* have been described The salt $2\text{PbO} \cdot \text{N}_2\text{O}_5 \cdot \text{H}_2\text{O}$, which formula may be written PbOHNO_3 , is obtained by boiling $\text{Pb}(\text{NO}_3)_2\text{Aq}$ with PbO , filtering hot, and allowing to cool (Berzelius, *P* 19, 312, Pelouze, *J p* 25, 486, Persoz, *A Ch* [3] 68, 191) *S G* 5 93 (Ditte, *C R* 94, 1180) Several other basic salts are known, according to Wakeman & Wells (*Am* 9, 299) the only recrystallisable basic salt, besides PbOHNO_3 , is $10\text{PbO} \cdot 3\text{N}_2\text{O}_5 \cdot 5\text{H}_2\text{O}$

Lithium nitrate LiNO_3 By neutralising HNO_3Aq with LiOH or Li_2CO_3 , and evaporating Rhombic prisms, *S G* 2 334 (Kremers, *P* 92, 520) *H F* [Li , N , O°] = 111,615, [Li , O , NO°] = 113,620, [Li°O , $\text{N}^\circ\text{O}^\circ\text{Aq}$] = 97,005 (*Th* 3, 518)

Melts at 264° (Carnelley, *C J* 33, 275) Easily sol water and alcohol Kremers (*P* 114, 41) gives following table —

<i>S G</i> LiNO_3Aq at $19^\circ 5'$	<i>P c</i> LiNO_3
1 0769	14 2
1 1346	26 7
1 193	40 6
1 255	57 5
1 3154	77 4

LiNO_3 , slowly reacts with dry HCl , a small quantity of Cl and NO being evolved (Thomas, (*J* 33, 370)

Vol III

The *hydrated salt* $\text{LiNO}_3 \cdot 5\text{H}_2\text{O}$ is said to be obtained by crystallising below 10° (Troost, *A Ch* [3] 51, 184)

Magnesium nitrate $\text{MgNO}_3 \cdot 6\text{H}_2\text{O}$ Occurs in mother liquor from saltpetre plantations, also in some well-waters of Stockholm, according to Berzelius Prepared by neutralising HNO_3Aq by *magnesia alba*, and evaporating Very deliquescent monoclinic crystals (Maignac, *J* 1856 336) *S G* 1 464 (Playfair & Joule, *C S Mem* 2, 401) *H F* [Mg , O° , $\text{N}^\circ\text{O}^\circ \cdot 6\text{H}_2\text{O}$] = 214,530 [Mg , O , $\text{N}^\circ\text{O}^\circ\text{Aq}$] = 176,480 (*Th* 3, 518) Very soluble water and alcohol Oudemans (*Er* 7, 419) gives the table —

<i>P c</i> $\text{Mg}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$	<i>S G</i> $\text{Mg}(\text{NO}_3)_2\text{Aq}$
1	1 0034
5	1 0202
10	1 0418
15	1 0639
20	1 0869
25	1 1103
30	1 1347
35	1 1649
40	1 1909
45	1 2176
49	1 2397

According to Graham (*T* 1837 47), $5\text{H}_2\text{O}$ are removed from $\text{Mg}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$ at c 330° (M.P. of lead), and the monohydrated salt can be fused without change, but is decomposed at red heat, leaving MgO Einbrodt (*A* 65, 115) found that acid began to be evolved before five sixths of the water was removed, hence he regarded the existence of $\text{Mg}(\text{NO}_3)_2 \cdot \text{H}_2\text{O}$ as very doubtful By heating $\text{Mg}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$ until water ceases to come off, a *basic salt* $3\text{MgO} \cdot \text{N}_2\text{O}_5$ is obtained, according to Chodnew (*A* 71, 241) Reacts with HCl gas to form MgCl_2 , Cl and O and H_2O being evolved (Thomas, *C J* 33, 370)

Manganese nitrate $\text{Mn}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$ Small monoclinic crystals (Hannay, *C J* 33, 269) Obtained by dissolving MnCO_3 in HNO_3Aq , also by dissolving MnO_2 in HNO_3Aq in sunlight or presence of deoxidisers, and evaporating *S G* 1 8199 when solid at 21° , 1 8104 when liquid at 21° (Ordway, *J* 12, 113)

H F [Mn , O , $\text{N}^\circ\text{O}^\circ \cdot 6\text{H}_2\text{O}$] = 157,700, [Mn , O , $\text{N}^\circ\text{O}^\circ\text{Aq}$] = 117,720 (*Th* 3, 518) Decomposed by heat, giving MnO_2 , Mn_2O_3 , or Mn_3O_4 , according to the temperature Reacts with HCl gas to form MnCl_2 , with evolution of Cl and NO (Thomas, *C J* 33, 370) According to Schultz Sellac (*Z* 1870 646) the salt $\text{Mn}(\text{NO}_3)_2 \cdot 3\text{H}_2\text{O}$ crystallises from solution in conc HNO_3Aq

Mercury nitrates *Mercuric nitrate*, $2\text{Hg}(\text{NO}_3)_2 \cdot \text{H}_2\text{O}$, is obtained by dissolving HgO in excess of slightly warmed HNO_3Aq , and evaporating over H_2SO_4 , after some minutes the liquid above the crystals has the composition $\text{Hg}(\text{NO}_3)_2 \cdot 2\text{H}_2\text{O}$ (Millon, *A Ch* [3] 18, 361) Ditte (*J* 1854 366) obtained $\text{Hg}(\text{NO}_3)_2 \cdot 8\text{H}_2\text{O}$ by cooling to -15° a nearly neutral conc solution of HgO in HNO_3Aq

Basic mercuric nitrates are readily formed by heating the normal salt, the chief are $2\text{HgO} \cdot \text{N}_2\text{O}_5 \cdot 8\text{H}_2\text{O}$ (Ditte, *l.c.*), $2\text{HgO} \cdot \text{N}_2\text{O}_5 \cdot 2\text{H}_2\text{O}$ (Maignac, *J* 1855 415), $3\text{HgO} \cdot \text{N}_2\text{O}_5 \cdot \text{H}_2\text{O}$, obtained by the prolonged action of water on any of the other basic salts

Mercuric nitrate forms several *double salts*

Li Li

With HgI_2 , the compounds $\text{Hg}(\text{NO}_3)_2$, HgI_2 , $\text{Hg}(\text{NO}_3)_2 \cdot 2\text{HgI}_2$, and $2\text{Hg}(\text{NO}_3)_2 \cdot 3\text{HgI}_2$ are formed (Preuss, *A* 29, 326; Liebig, *A* 72, 79). These iodo nitrates are decomposed by water, with separation of HgI_2 and solution of $\text{Hg}(\text{NO}_3)_2$. With HgS , the compound $\text{Hg}(\text{NO}_3)_2 \cdot 2\text{HgS}$ is formed, by digesting freshly pptd HgS with $\text{Hg}(\text{NO}_3)_2$ aq, also by passing into $\text{Hg}(\text{NO}_3)_2$ aq less H_2S than suffices to decompose it wholly.

Mercurous nitrate The nitrates derived from Hg_2O have been examined chiefly by Mitscherlich (*P* 9, 387), Lefort (*A* 56, 247), Margnac (*A Ch* [3] 27, 332), and Gerhardt (*A* 72, 74). Hg_2NO_3 is formed by the reaction of excess of Hg with HNO_3 aq, but if the action is continued basic salts are produced. Basic salts are also obtained by decomposing HgNO_3 by water.

The normal salt, $\text{HgNO}_3 \cdot 2\text{H}_2\text{O}$, is obtained in colourless monoclinic crystals by reacting on excess of Hg with cold HNO_3 aq S G c 12. To prevent admixture of basic salts it is advisable to allow the acid and Hg to remain in contact until crystals cease to be formed, then to warm gently, filter, and allow to crystallise S G 478 (Playfair a Joule, *C S Mem* 2, 401). The crystals effloresce somewhat in air, they are dissolved without change in a little water, but dilution produces basic salts. By heating HgNO_3 , with water HgO and NO_2 are formed. HgCl is formed when HCl is passed over HgNO_3 , and Cl and NO are evolved (Thomas, *C J* 33, 370).

Basic mercurous nitrates are formed by warming with Hg the mother liquor from the preparation of the normal salt, and by treating the normal salt with water. To the salt obtained by the first of these methods Gerhardt gave the formula $3\text{Hg}_2\text{O} \cdot 2\text{N}_2\text{O}_5 \cdot \text{H}_2\text{O}$, Margnac gave the formula $4\text{Hg}_2\text{O} \cdot 8\text{N}_2\text{O}_5 \cdot \text{H}_2\text{O}$. The other basic salts are (1) $2\text{Hg}_2\text{O} \cdot \text{N}_2\text{O}_5 \cdot \text{H}_2\text{O}$ (Gerhardt), obtained by the action of a little boiling water on HgNO_3 , Margnac formulates this salt as $5\text{Hg}_2\text{O} \cdot 8\text{N}_2\text{O}_5 \cdot 2\text{H}_2\text{O}$. (2) $2\text{Hg}_2\text{O} \cdot \text{N}_2\text{O}_5 \cdot \text{H}_2\text{O}$ (Gerhardt, Margnac), obtained by adding much water to HgNO_3 aq.

Mercurous nitrate forms double salts with NH_4NO_3 , $\text{Pb}(\text{NO}_3)_2$, $\text{Ba}(\text{NO}_3)_2$, and $\text{Sr}(\text{NO}_3)_2$. The compositions of these salts are expressed by the formulæ $2\text{HgNO}_3 \cdot 4\text{NH}_4\text{NO}_3 \cdot 5\text{H}_2\text{O}$ (Rammelsberg, *P* 109, 397), $2\text{M}(\text{NO}_3)_2 \cdot 2\text{Hg}_2\text{O} \cdot \text{N}_2\text{O}_5$, where $\text{M} = \text{Pb}$, Ba , or Sr (Städeler, *A* 87, 129).

Mercurous-mercuric nitrate, $\text{Hg}_2\text{O} \cdot 2\text{HgO} \cdot \text{N}_2\text{O}_5$, This salt is formed by the gradual oxidation of HgNO_3 in air. It is best obtained by boiling 1½ parts HNO_3 aq, S G 12, with 1 part Hg till all Hg is dissolved, and maintaining the solution near its B P. The salt separates as a yellow powder, after a time a white basic mercurous nitrate begins to form (Wittstock, Gerhardt, *A* 72, 74; Brooks, *P* 66, 63). Rubbed with NaCl , HgCl and oxychloride are formed, and on addition of water HgCl_2 goes into solution. Treated with HCl gas both HgCl and HgCl_2 are formed with evolution of Cl and NO (Thomas, *C J* 33, 370). The salt may be regarded as derived from orthoionic acid— $\text{NO}(\text{OH})_2$ —by replacing H by Hg^1 and H_2 by Hg^{11} .

Nickel nitrates The normal salt, $\text{Ni}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$, is obtained, in emerald-green, deliquescent, monoclinic crystals, by dissolving Ni , NiO , or NiCO_3 , in HNO_3 aq, and evaporating. Melts at 56° , and boils at 136° , remaining clear till $3\text{H}_2\text{O}$ is gone off (Ordway, *Am S* [2] 26, 197, 27, 14). S G 2 066 at 14° , 2 037 at 22° (Clarke's *Specific Gravity Table* [new ed], 112). H F $[\text{Ni}, \text{O}^2, \text{N}^2\text{O}^4, 6\text{H}^1\text{O}^1] = 124,720$, $[\text{Ni}, \text{O}, \text{N}^2\text{O}^4\text{Aq}] = 83,420$ (*Th* 3, 518). Several double salts of $\text{Ni}(\text{NO}_3)_2$ are known—with $\text{Ce}(\text{NO}_3)_3$, $\text{Di}(\text{NO}_3)_4$, and $\text{La}(\text{NO}_3)_3$ (v CERIUM NITRATES, DIDYMIUM NITRATE, LANTHANUM NITRATE). With ammonia forms

$\text{Ni}(\text{NO}_3)_2 \cdot 4\text{NH}_3 \cdot 2\text{H}_2\text{O}$
(Laurent, *A Ch* [3] 36, 354), and
 $\text{Ni}(\text{NO}_3)_2 \cdot 6\text{NH}_3 \cdot 1\frac{1}{2}\text{H}_2\text{O}$
(F Rose, *Ammon Kobaltverbind* [Heidelberg, 1871], 27). Also combines with nickel chloride and ammonia to form

$6(\text{Ni}(\text{NO}_3)_2 \cdot 4\text{NH}_3 \cdot \text{H}_2\text{O}) (\text{NiCl}_2 \cdot 6\text{NH}_3) \cdot 10\text{H}_2\text{O}$
(Schwarz, *W A B* 1850 272).

The basic salt $8\text{NiO} \cdot \text{N}_2\text{O}_5 \cdot 5\text{H}_2\text{O}$ is pptd as a white powder by adding boiling NH_3 aq to a solution of the normal salt (Habermann, *M* 5, 440).

Palladium nitrates The normal salt $\text{Pd}(\text{NO}_3)_2 \cdot x\text{H}_2\text{O}$ forms brown-yellow rhombic prisms, very deliquescent, obtained by dissolving Pd in cold HNO_3 aq, evaporating to a syrup at the ordinary temperature, and allowing to stand in a warm place (Fischer, *P* 10, 607). By dissolving the normal salt in water, and diluting, the Pd is gradually pptd as a basic salt. Basic salts are also obtained by evaporating Pd in HNO_3 aq at c 100° to 120° , and treating the residue with water (Fischer, *lc*, Kane, *B J* 24, 236).

Platinum nitrates A brown salt, probably $\text{Pt}(\text{NO}_3)_4$, is obtained by dissolving $\text{PtO}_2 \cdot x\text{H}_2\text{O}$ in HNO_3 aq, or by decomposing $\text{Pt}(\text{SO}_4)_2$ aq with $\text{Ba}(\text{NO}_3)_2$ aq, and evaporating (Berzelius).

Potassium nitrate KNO_3 (*Nitre Saltpetre*.) Melts at 339° (Carnelley, *C J* 33, 277). S G 2 0958 to 2 1078 at 4° (Playfair a Joule, *C J* 1, 137), 2 059 at 0° (Quinck, *P* 135, 642), 1 072 at M P (Braun, *P* 154, 190). H F

$[\text{K}, \text{O}, \text{NO}] = 121,485$, $\left[\frac{\text{K}^1, \text{O}_2, \text{N}^2\text{O}^4\text{Aq}}{2} \right] = 96,050$

(*Th* 3, 518). Heat of solution = -7967 at 15° -7814 at 34° , -7541 at 53° (Tilden, *Pr* 58, 401). S H 18° to $98^\circ = 23875$ (Regnault, *A Ch* [3] 1, 129). S 133 at 0° , 21 at 10° , 312 at 20° , 445 at 30° , 639 at 40° , 859 at 50° , 1109 at 60° , 139 at 70° , 172 at 80° , 206 at 90° , 247 at 100° (Mulder, *J* 1866 65, v also Tilden a Shen stone, *T* 175, 23). Schiff gives the following tables (*A* 107, 87, 293, for more extended tables v Gerlach, *Fr* 8, 286) —

Weight of alcohol in 100 parts	Weight of KNO_3 in 100 parts solution saturated at 15°
0	20.5
10	13.2
20	8.5
30	5.6
40	4.3
50	2.8
60	1.7
80	0.4

S.G. of KNO_3Aq at 21°	Weight of KNO_3 in 100 parts solution
1.1688	24.93
1.1078	16.62
1.0695	11.08
1.051	8.81
1.0337	5.54
1.017	2.77

S in glycerin S.G. 1.225 = 10 (Vogel, *N. R. P.* 16, 557) KNO_3 is dimorphous, it usually crystallises in trimetric prisms, $a:b:c = 589:1:701$, if a drop of KNO_3Aq is allowed to crystallise slowly under the microscope, rhombohedral crystals are formed (Frankenheim, *P.* 92, 354) If the rhombohedral crystals are touched by a prismatic crystal while the crystallisation is proceeding, they are changed to prismatic, the prismatic may be changed to rhombohedral by heating nearly to the melting point

Occurrence—In small quantities in all vegetable soils, also in most spring and river waters (Boussingault, *C. R.* 44, 108) Nitre is found in the soil of caves, in different parts of the world, wherein animal or vegetable matter undergoes putrefaction, and where alkalis or alkaline earths are present to combine with the nitric acid produced (*v.* NITRIFICATION, p. 521) Nitre is also found as an efflorescence on the surface of the soil in parts of India, Arabia, South America, and other warm countries, the percentage of KNO_3 in a Bengalese soil was found by Davy to be 83 KNO_3 occurs in the juices of certain plants, notably in the leaves of the castor oil plant

Formation—1 By the oxidation of nitrogenous matter in presence of air, moisture, and potash (*cf.* NITRIFICATION, p. 521)—2 By the action of K_2CO_3 or KOH on $\text{Ca}(\text{NO}_3)_2$ or NaNO_3 —3 By the oxidation of NH_3 in presence of moisture, air, and ferric oxide, and combination of the HNO_3 formed with KOH (Pesci, *G.* 1875 307)

In the artificial preparation of nitre by oxidation of nitrogenous matter in soils, the first step is to prepare a soil rich in N containing materials, this is done by mixing porous soil, preferably that left from the lixiviation of a former nitre bed, with farm yard manure, animal and vegetable refuse, and wood ashes or calcareous matter, and watering this with urine This soil is then formed into a mound under a shed, and the process of nitrification is allowed to proceed for perhaps a couple of years, air must be freely admitted, and great care must be taken to keep the soil neither too wet nor too dry About 5lbs crude nitre are obtained, on an average, from 1,000lbs of such soil (for more details *v.* DICTIONARY OF APPLIED CHEMISTRY)

Preparation—1 By purifying crude nitre prepared from the washings of *saltpetre earth* The liquor from the *saltpetre earth* contains $\text{Ca}(\text{NO}_3)_2$, $\text{Mg}(\text{NO}_3)_2$, with smaller quantities of KNO_3 and NaNO_3 , and also alkaline chlorides, K_2CO_3 (wood ashes) is added, the liquid is filtered and evaporated, the crude KNO_3 is then treated with enough boiling water to dissolve all KNO_3 but not all the NaCl present—S of KNO_3 at $100^\circ = 247$, S of NaCl at $100^\circ = 89$ —the liquid is boiled for a considerable time, when NaCl separates with CaCO_3 and MgCO_3 , the liquid is then run off, and while crystallising it

is constantly stirred to insure formation of small crystals containing little mother liquor, the crystals are recrystallised, washed with saturated KNO_3Aq (to dissolve the last traces of alkaline chlorides), and again crystallised.—2 From *Chili saltpetre* (NaNO_3), by adding this salt to hot conc $\text{K}_2\text{CO}_3\text{Aq}$, when Na_2CO_3 separates and KNO_3 remains in solution The mother-liquor is evaporated as long as Na_2CO_3 continues to separate, then run off and allowed to crystallise, with constant stirring—3 By neutralising pure HNO_3Aq with pure KOHAq or $\text{K}_2\text{CO}_3\text{Aq}$, evaporating, and crystallising

Properties—A white, crystalline salt, dimorphous, S.G. 2.1, easily sol water, solution tastes cool and bitter, melts below red heat to a colourless liquid which solidifies on cooling to a white fibrous mass, known as *mineral crystal* or *salprunella* At red heat evolves O, and N as temperature increases Deflagrates when heated with combustible bodies (for physical properties *v.* beginning of article)

Reactions—1 Decomposed by heat, at $c 300^\circ\text{--}400^\circ$ O is evolved, and KNO_3 formed, as temperature increases N is evolved, and finally a mixture of K_2O and K_2O remains—2 Evolves O when heated in presence of combustible substances such as P, S, Zn, C, &c Hence the use of KNO_3 in gunpowder, and as an oxidiser when molten—3 Heated with copper foil, nearly pure K_2O is formed, a similar change occurs when KNO_3 is heated with iron—4 Most elements are oxidised by heating with KNO_3 , if the oxide produced is acidic, a K salt of the corresponding acid is produced—5 Organic compounds are generally burnt (to CO_2 and H_2O) by heating with KNO_3 —6 Reduced by the copper-zinc couple, in presence of water, at first to KNO_2 , and then to NH_3 , a similar reduction takes place by hydrogen occluded by Pd, Pt, or Cu (Gladstone & Tribe, *C. J.* 83, 139, 306)—7 Reacts with hydrogen chloride gas to form KCl , evolving Cl and N oxides (Thomas, *O. J.* 83, 367) For methods by which nitre may be valued approximately, or completely analysed, reference must be made to *Manuals of Analysis*, for an account of the technical applications of nitre reference should be made to DICTIONARY OF APPLIED CHEMISTRY

Rhodium nitrate $\text{Rh}(\text{NO}_3)_3 \cdot 2\text{H}_2\text{O}$ (?) A gum-like, very deliquescent, mass, obtained by dissolving Rh_2O_3 in HNO_3Aq , and evaporating at 100° till HNO_3 ceases to be evolved (Claus, *J. pr.* 34, 428, Berzelius)

Rubidium nitrate RbNO_3 Obtained in long needles, or six sided prisms (according to rate of evaporation) by neutralising HNO_3Aq by Rb_2CO_3 and evaporating S 20.1 at 0° , 43.5 at 10° When heated evolves O (Kirohoff & Bunsen, *P. M.* [4] 22, 55) According to Ditte (*C. R.* 89, 641) an acid salt, $2\text{RbNO}_3 \cdot 5\text{HNO}_3$, is obtained by dissolving RbNO_3 in HNO_3 , H_2O , this salt is decomposed by water or heat

Samarium nitrate $\text{Sm}(\text{NO}_3)_3 \cdot 6\text{H}_2\text{O}$ Pale yellow prisms, e sol water, S.G. 2.375 (Cleve, *C. N.* 48, 74, 51, 145)

Scandium nitrate $\text{Sc}(\text{NO}_3)_3$ (?) Small plates, by evaporating at 100° a solution of Sc_2O_3 in HNO_3Aq Decomposed by heat, giving a basic salt soluble in water (Nilson, *E.* 13, 1444)

Silver nitrate AgNO_3 , (*Lunar caustic*) S G 4 238 to 4 328 (Schröder, *P* 107, 113) S 121.9 at 0°, 227.3 at 19.5°, 500 at 54°, 714 at 85°, 1111 at 110° (Kremers, *P* 92, 497), S 1622.5 at 125°, 1941.4 at 133° (Tilden, *A* Shenstone, *T* 175, 28) Saturated solution boils at 125° S in boiling alcohol = 25 Melts at 218° (Carnelley, *C* J 33, 276) H F [Ag, O, NO] = 30,745, [Ag, N, O] = 28,740 (*Th* 3, 517) Crystallises in trimetric system, $a b c = 9433 \ 1137 \ 8 \text{ H}$ 16° to 99° = 14352 (Regnault, *A* *Ch* [3] 1, 129)

Preparation — Pure Ag is dissolved in HNO_3Aq , the solution is evaporated to dryness, the residue is heated gently till all HNO_3 is removed, when it is dissolved in water and crystallised. If solution of Ag in HNO_3Aq proceeds in the cold the liquid becomes blue from solution of N_2O_5 , but no gas is evolved, on warming, NO escapes rapidly. AgNO_3 may be prepared from Ag which contains Cu by saturating warm fairly conc HNO_3Aq with the metal, adding enough KOHAq to a part of the solution to ppt Ag_2O along with CuO, digesting the pp with the rest of the solution, whereby the remaining CuO is pptd, filtering, and evaporating the filtrate.

Properties — White trimetric crystals, solution in water is perfectly neutral to litmus paper, has a metallic taste, and is poisonous, melts below red heat, is a powerful caustic, at once destroying flesh when applied to it. AgNO_3 is readily reduced by organic matter in light.

Reactions — 1 Decomposed by heat, leaving Ag — 2 With hydrogen chloride gas forms AgCl and HNO_3 , with evolution of a very little Cl and NO (Thomas, *C* J 33, 371) — 3 With organic matter, e.g. paper, dust, &c., forms Ag in presence of sunlight — 4 AgNO_3Aq is slowly and very partially decomposed by hydrogen with ppn of Ag (Russell, *C* J [2] 12, 3) — 5 Uraous oxide, UO_3 , ppts Ag, with production of $\text{UO}_2(\text{NO}_3)_2$ (Isambert, *C* R 80, 1087)

Combinations — 1 With ammonia, to form $\text{AgNO}_2\cdot 2\text{NH}_3$, by supersaturating conc AgNO_3Aq with NH_3 , decomposes above 100°, giving off NH_3 and N (Maignac, *P* 9, 413, Mitscherlich, *A* *Ch* [2] 72, 288, Kane, *P* 20, 153) Dry AgNO_3 absorbs NH_3 to form $\text{AgNO}_3\cdot 3\text{NH}_3$ (H Rose, *J* 1857 256) — 2 With silver bromide, to form $\text{AgNO}_3\cdot \text{AgBr}$, by dissolving freshly pptd AgBr in very conc hot AgNO_3Aq (Risse, *A* 111, 42) AgCl seems to form a similar compound — 3 With silver iodide, to form several compounds. $2\text{AgNO}_3\cdot \text{AgI}$ is obtained by boiling very conc AgNO_3Aq with AgI, pouring off, and allowing to cool (Risse, *A* 171, 23, Riche, *A* 111, 89, cf. Weltzien, *A* 101, 127, Kremers, *J* pr 71, 54, Preuss, *A* 29, 329, Schnauss, *Ar* Ph [2] 82, 260, Hofmann, *A* 171, 23, Sturenberg, *Ar* Ph [2] 143, 12) — 4 With ammonium and potassium nitrates to form $\text{AgNO}_3\cdot \text{MNO}_3$ (M = NH₄ or K) (Ditte, *C* R 101, 878)

Sodium nitrate NaNO_3 , (*Cubic saltpetre*, *Ohln saltpetre*) S G 2 2606 at 4° (Playfair, *A* Joule, *C* S *Mem* 2, 401), 2 246 at 15° (Holker, *P* M [3] 27, 218), 1 878 at melting point (Braun, *P* 154, 190) Melts at c 216° (Carnelley, *C* J 33, 276) H F [Na, N, O] = 111,250, [Na, O, NO] = 118,255,

$\left[\frac{\text{Na}_2\text{O}, \text{N}_2\text{O}_5\text{Aq}}{2} \right] = 91,310$ (*Th* 3, 518) Heat

of solution — 4786 at 16°, — 4255 at 54° (Tilden, *Pr* 38, 401) S 72.9 at 0°, 80.8 at 10°, 87.5 at 20°, 94.9 at 30°, 102 at 40°, 112 at 50°, 122 at 60°, 134 at 70°, 148 at 80°, 162 at 90°, 180 at 100°, 200 at 110°, saturated solution freezes at — 17.5° (Rudorff, *B* 2, 68), contains 216.4 parts NaNO_3 in 100 water, and boils at 119.7° (Mulder, *J* 1866 65, cf. Ditte, *C* R 80, 1164, Maumené, *C* R 58, 81, 81, 107) Schiff (*A* 110, 75) gives a table showing S G and p.c. composition of NaNO_3Aq S in alcohol (61.4 p.c.) at 26° = 21.2 (Pohl, *W* A B 6, 600, v also Wittstein, *Vierteljahr Zeit Pharm* 12, 109) 75 parts NaNO_3 added to 100 parts water at 13.2° lower the temperature through 18.5° 50 parts NaNO_3 mixed with 100 parts snow lower the temperature to — 17.5°

Occurrence — In large quantities in Chili, Peru, and some other parts of South America.

Preparation — 1 The crude salt is purified by repeated solution and crystallisation, or it is recrystallised once or twice, the first portions of each crop of crystals being rejected, then heated with HNO_3Aq , whereby chlorides are transformed into nitrates and again crystallised. 2 By neutralising HNO_3Aq with NaOHAq or $\text{Na}_2\text{CO}_3\text{Aq}$, and evaporating.

Properties — White obtuse rhombohedrons, having much the aspect of cubes, hence the name *cubic saltpetre*. Absorbs water from moist air. Melts c 316°, and solidifies to white mass on cooling, decomposes at higher temperature similarly to, but more readily than, KNO_3 , deflagrates with charcoal, &c., but less quickly than KNO_3 .

Reactions — Decomposed by heat at c 350° — 380°, evolving O, and at higher temperature N also — 2 Heated in presence of oxidisable bodies, produces oxides, which, if acidic, form Na salts of corresponding acids — 3 With hydrogen chloride forms NaCl, and evolves NO and Cl (Thomas, *C* J 33, 367)

Sroutium nitrate $\text{Sr}(\text{NO}_3)_2$ Prepared by adding to SrCO_3 enough HNO_3Aq to dissolve nearly all the salt, filtering, and crystallising. Separates without water of crystallisation from hot conc solutions, from cold and more dilute solutions crystals of $\text{Sr}(\text{NO}_3)_2\cdot 4\text{H}_2\text{O}$ are obtained (Souchay, *A* Lessens, *A* 99, 45) The anhydrous salt crystallises in octahedrons, S G 2 98 at 16.8° (Favre, *A* Valsen, *C* R 77, 579) The hydrate forms triclinic crystals, $a b c = 5895 \ 1 \ 808$, S G 2 249 at 15.5° (F v, *l* c) H F [$\text{Sr}, \text{N}, \text{O}$] = 109,910 (*Th* 3, 517) S anhydrous salt 20 in cold water, 200 in boiling water. Melts at red heat with decomposition, leaving SrO. Does not react with HCl gas (Thomas, *C* J 33, 371) A compound with Sr acetate, viz $\text{Sr}(\text{NO}_3)_2\cdot \text{Sr}(\text{C}_2\text{H}_3\text{O}_2)_2\cdot 8\text{H}_2\text{O}$, is obtained by allowing a mixed solution of the salts to evaporate (von Hauer, *J* pr 74, 432)

Tellurium nitrate The compound $8\text{TeO}_2\cdot 2\text{N}_2\text{O}_5\cdot 8\text{H}_2\text{O}$ is obtained by dissolving Te in excess of hot HNO_3Aq S G greater than 1.15 the salt crystallises in forms which are probably orthorhombic, soluble in HNO_3Aq , easily decomposed by water with separation of TeO_2 , (Klein, *A* *Ch* [6] 5, 59)

Thallium nitrates *Thallous nitrate*, TiNO_3 , is obtained by dissolving Tl in not very conc HNO_3Aq , keeping as small an excess of acid as possible, and evaporating Rhombic prisms, S G 5 5 (Lamy a Des Cloizeaux, *N* 1, 116) S 10 6 at 15°, 43 5 at 58°, 588 at 107° (Crookes, *C* J 17, 141, Lamy, *C* R 54, 1255) Insol alcohol Melts at 205° without decomposition and solidifies to a glass S G 5 8 (Lamy, *l* c) H F $[\text{Ti}, \text{N}, \text{O}] = 58,150$ (*Th* 3, 517) Strongly heated in a crucible leaves TiNO_2 and Ti_2O_3 (Carstanjen, *J* pr 102, 65, 129)

Thallous nitrate $\text{Ti}(\text{NO}_3)_3$ Separates in large deliquescent crystals from solution of TiO OH in HNO_3Aq S G 1 4, according to Strecker (*A* 135, 207) the crystals contain $6\text{H}_2\text{O}$, and according to Willm (*A* Ch [4] 5, 5) $8\text{H}_2\text{O}$ Decomposed at c 100°

Thorium nitrate $\text{Th}(\text{NO}_3)_4 \cdot 12\text{H}_2\text{O}$ Large, translucent tables, very hygroscopic, lose $8\text{H}_2\text{O}$ over H_2SO_4 Forms a very soluble double salt with KNO_3

Tin nitrates No definite salt has been isolated Stannous oxide dissolves in very dilute cold HNO_3Aq , but the solution decomposes on heating with separation of SnO_2 (cf Ditté, *A* Ch [5] 27, 145) Sn dissolves in cold very dilute HNO_3Aq , with production of NH_4NO_3 and probably $\text{Sn}(\text{NO}_3)_2$ Freshly pptd SnO_2 dissolves in HNO_3Aq on heating SnO_2 is pptd

Titanium nitrate By evaporating a solution of TiO_2 in HNO_3Aq over lume, Merz obtained lustrous plates $5\text{TiO}_2 \cdot \text{N}_2\text{O} \cdot 6\text{H}_2\text{O}$, soluble in cold water (*J* pr 99, 157)

Uranium nitrate By dissolving U or an oxide of U in HNO_3Aq , and evaporating, large, yellow, rhombic crystals are deposited having the composition $\text{UO}_2(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O} = \text{uranyl nitrate}$ S G 2 807 (Boedeker) Effloresces somewhat in dry air, melts at 59 5°, and boils at 118° (Ordway, *J* 1859 114) A trihydrated salt, $\text{UO}_2(\text{NO}_3)_2 \cdot 3\text{H}_2\text{O}$, was obtained by Schultz-Sellack (*Z* [2] 6, 646) by evaporating a strongly acid solution of the ordinary salt over H_2SO_4 , and KOH Reacts with HCl to form U oxychloride with evolution of Cl and NO (Thomas, *C* J 33, 371)

Vanadium nitrates No definite salt has been isolated By dissolving VO or VO_2 in HNO_3Aq , a blue solution is obtained which cannot be evaporated without decomposition (Berzelius) By dissolving V_2O_5 in HNO_3Aq , and allowing to evaporate, a reddish residue is obtained (Berzelius)

Yttrium nitrate $\text{Y}(\text{NO}_3)_3 \cdot 6\text{H}_2\text{O}$ Large translucent crystals, by evaporating over H_2SO_4 , a solution of Y_2O_3 in HNO_3Aq (Cleve, *Bl* [2] 21, 344) Heated till NO_2 is evolved, the basic salt $2\text{Y}_2\text{O}_3 \cdot 3\text{N}_2\text{O} \cdot 9\text{H}_2\text{O}$ is obtained (*v* Bahr a Bunsen, *A* 137, 1)

Zinc nitrate $\text{Zn}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$ Zn dissolves in HNO_3Aq with formation of NH_4NO_3 and $\text{Zn}(\text{NO}_3)_2$, from very dilute HNO_3Aq , N_2O is evolved The salt is prepared by evaporating a solution of Zn, ZnO , or ZnCO_3 , in HNO_3Aq Large 4 sided prisms, deliquescent, very soluble water and alcohol, melt at 36 4° and boil at 181° (Ordway, *Am* S [2] 27, 14), lose $2\text{H}_2\text{O}$ *in vacuo* over H_2SO_4 (Vogel a Reischauer, *N* J P 11, 137), lose all H_2O by heating to 105° in stream of dry air (Pierre, *A* Ch [3] 16, 247) S G. 2 063 at 18° (Clarke's *Table of Specific*

Gravities (new ed) 110) H F $[\text{Zn}, \text{O}, \text{N}^2\text{O}^4, 6\text{H}^2\text{O}] = 142,180$, $[\text{Zn}, \text{O}, \text{N}^2\text{O}^4\text{Aq}] = 102,510$ (*Th* 3, 518) The S G of $\text{Zn}(\text{NO}_3)_2\text{Aq}$ and p c of $\text{Zn}(\text{NO}_3)_2$ are given by Franz (*J* pr [2] 5, 274) —

S G	P c	S G	P c
1 0496	5	1 3268	30
1 0968	10	1 3906	35
1 1476	15	1 4572	40
1 2024	20	1 5258	45
1 264	25	1 5984	50

$\text{Zn}(\text{NO}_3)_2$ with HCl gas gives ZnCl_2 , evolving Cl and NO (Thomas, *C* J 33, 371) Many basic nitrates of zinc are known, they are obtained by heating the normal salt, by treating HNO_3Aq with a large excess of Zn, and by digesting hot $\text{Zn}(\text{NO}_3)_2$ with ZnO (*v* Schindler, *N* J P 11, 137, Vogel a Reischauer, *ibid*, Ordway, *Am* S [2] 27, 14, Grouvelle, *A* Ch [3] 19, 137, Wells, *Am* 9, 304)

Zirconium nitrates The normal salt $\text{Zr}(\text{NO}_3)_4$ is said to be obtained by evaporating a solution of $\text{ZrO}_2 \cdot x\text{H}_2\text{O}$ in excess of HNO_3Aq , by heating to 100°, the pyro salt ZrN_2O_5 is formed, and by boiling a dilute aqueous solution of this, the basic salt $3\text{ZrO} \cdot 2\text{N}_2\text{O}_5$ is produced

Occurrence—In small quantities in rain-water, varying from c 1 to c 16 pts per million pts of rain, for measurements *v* Goppelsröder, (*Fr* 10, 259, 11, 16), Warrington (*C* J 55, 537, references are given to various other results) Ekin (*C* J [2] 9, 64) found HNO_3 in the spring water of an uncultivated hill near Bath, not exposed to contact with organic matter Salts of HNO_3 occur in almost all soils, although not generally in large quantities, and also in the juices of many plants

Nitric acid has been known from early times. Geber mentions it (8th cent), Glauber (17th cent) gave directions for its preparation from

nitric by the use of H_2SO_4 . Lavoisier showed that this acid contained O. Cavendish proved the presence of N in it, and obtained it by passing electric sparks through moist O and N.

Formation—1 By burning H in O in presence of air (Lavoisier, Kolbe, *A* 119, 176, Hofmann, *B* 8, 668). The experiments of L. T. Wright (*C* *J* 85, 42) tend to show, although they do not absolutely prove, that the HNO_2 is formed by oxidation of NH_3 , not of N—2 By passing electric sparks for some time through a mixture of moist N and O (Böttger, *J pr* 73, 494, Perrot, *C R* 49, 204, Buff, a Hofmann, *A* 113, 140)—3 By exploding air with electrolytic gas (H_2 + O) (Bunsen). Hempel's experiments (*B* 23, 1456) show that HNO_2 is formed when air is burnt with O and electrolytic gas under pressure of several atmos. Hempel also proves that considerable quantities of HNO_2 are formed when O is burnt in compressed air in presence of strongly compressed O—4 By burning air in coal-gas (Ilosva, *Bl* [3] 2, 734), or coal gas in air (Wright, *C J* 36, 42)—5 According to Berthelot (*C R* 108, 543), a very little HNO_2 is formed when ether and P are slowly oxidised by air in presence of water—6 Nitrates are formed by the oxidation of nitrogenous animal or vegetable matter in the soil (*v Nitratification*)—7 Ozone produces NH_4NO_3 from NH_3 , and NH_4NO_2 easily oxidises to NH_4NO_3 (Carius, *A* 174, 31, Schönbein, *J pr* 75, 99, Weith, *A* Weber, *B* 7, 1745, Wöhler, *A* 136, 256)—8 By oxidising NH_3 in presence of moisture, e.g. by passing NH_3 and air over Pt black heated to c. 300° , by distilling $(\text{NH}_4)_2\text{SO}_4$ and conc H_2SO_4 with $\text{K}_2\text{Cr}_2\text{O}_7$, or distilling $(\text{NH}_4)_2\text{SO}_4$ with KMnO_4 and dilute H_2SO_4 (Tessie du Mothay, *W J* 1871 260)—9 HNO_2 is a product of the reaction of NO_2 with H_2SO_4 , and NaNO_2 is formed by acting on NaOH with N_2O_4 (Lunge, *B* 12, 1058)—10 By heating MnCl_2 or MnSO_4 with NaNO_2 (Kuhlmann, *W J* 1862 239)—11 By decomposing $\text{Ba}(\text{NO}_3)_2$ or $\text{Pb}(\text{NO}_3)_2$ with H_2SO_4 , filtering, and concentrating by evaporation—12 By heating NaNO_2 with AlO_3H_2 or SiO_2 (Wagner, *D P J* 183, 76).

Preparation—1 A mixture of 101 pts thoroughly purified and dry KNO_3 , in coarse powder, and 98 pts pure H_2SO_4 , is heated in a capacious glass retort, the neck of which passes some way into a glass receiver which is kept cold. The distillate is again distilled till one-third has passed over, when a quantity of conc H_2SO_4 equal to the contents of the retort is added (when the retort is cold), the receiver is changed, and distillation is continued, the distillate is again distilled at as low a temperature as possible, to get rid of H_2SO_4 , the distillate thus obtained is gently warmed, and a current of perfectly dry CO_2 is passed through it until it is quite colourless, oxides of N are thus removed. HNO_2 may be removed by distilling with a little urea, which decomposes HNO_2 , giving CO_2 , H_2O , and N.—2 Commercial acid is distilled, after addition of a little KNO_3 , to decompose H_2SO_4 , until a few drops give no pp, when diluted, with AgNO_3 , the receiver is then changed and distillation continued.

Preparation of fuming nitric acid.—The red fuming acid consists of a solution of NO_2 in HNO_3 , it is a more powerful oxidiser than the

ordinary acid. It is prepared by heating a. 202 pts KNO_3 , with 98 pts H_2SO_4 , and continuing the distillation as long as liquid comes over, the second stage of the process, which is represented by the equation $\text{KHSO}_4 + \text{KNO}_3 = \text{K}_2\text{SO}_4 + \text{HNO}_3$, occurs only at a temperature so high that part of the HNO_3 is decomposed with formation of NO_2 . A better method is to arrange the materials so that a portion of the HNO_3 is reduced to NO , as soon as it is formed; this may be done by mixing 100 pts KNO_3 with $3\frac{1}{2}$ pts starch, placing the mixture in a large retort the beak of which passes inside a glass tube 3 to 4 feet long which tube dips into a glass receiver kept very cold, and adding 100 pts H_2SO_4 , *S G* 1 85. The process goes on almost without the application of heat. About 60 pts red fuming acid are obtained from 100 pts KNO_3 (Brunner, *Rép Chim app* 3, 188).

Properties.—Perfectly pure HNO_3 , has not been isolated, Roscoe obtained an acid with from 99.5 to 99.8 p.c. HNO_3 (*A* 116, 211). Nitric acid is a colourless, highly corrosive liquid, according to Berthelot it solidifies at c. -47° , the B.P. is 86° , but decomposition begins below this temperature, at c. 256° the change $2\text{HNO}_3 = 2\text{NO}_2 + \text{H}_2\text{O} + \text{O}$ is complete. The following table shows the process of decomposition by heat (Carius, *B* 4, 828) —

t	S.G. of vapour		Po decom position	cc of O from 1 g HNO_3
	Air=1	H=1		
86°	2.05	29.6	9.53	8.43
100	2.02	29.1	11.77	10.41
130	1.92	27.6	18.78	16.62
160	1.79	25.8	28.96	26.22
190	1.59	23.0	49.34	43.69
220	1.42	20.4	72.07	63.79
250	1.29	18.6	93.03	82.30
266	1.25	18.0	100.0	88.47
265	1.24	17.9		
312	1.23	17.8		

By mixing the vapour from HNO_3 with dry air, Playfair a Wanklyn (*C J* 15, 142) found the V.D. at $40.5^\circ = 34.3$, that calculated from HNO_3 , being 31.5. HNO_3 is slowly and partially decomposed by sunlight, giving NO_2 , O, and H_2O , so that when exposed to sunlight the acid becomes yellow and contains NO_2 . Solution of HNO_3 in water, and dilution of the liquid, are accompanied by production of heat, Thomsen (*Th* 3, 66) gives the following table —

#	$[\text{HNO}_3, x\text{H}^+ \text{O}]$	$[\text{HNO}_3, x\text{H}^+ \text{O}, x\text{H}^+ \text{O}]$
5	2005	1280
1	3285	
15	4160	1550
25	5276	1389
3	5710	
5	6685	658
10	7818	140
20	7458	-22
40	7436	-15
80	7421	29
100	7439	
160	7450	45
320	7493	

If these results are plotted, and a curve drawn, with the horizontal lines showing molecules of H_2O and the vertical lines showing quantities of heat, the curve shows no signs of irregularity; hence, Thomsen concludes that the heat of solution and dilution of HNO_3 does not indicate the formation of any definite hydrates of HNO_3 . Considering the results which have followed a very close and extended examination of the heat of dilution of H_2SO_4 (v especially Pickering, *C J* 57, 64), it seems inadvisable to draw conclusions in favour of, or against, the formation of hydrates of HNO_3 , from the limited number of thermal observations made by Thomsen. Berthelot (*Bl* [2] 22, 530) has also measured the heat produced on adding water to HNO_3 , already diluted with known quantities of water, and concludes that a hydrate $HNO_3 \cdot 2H_2O$ exists in aqueous solutions of HNO_3 . Perkin has determined the magnetic rotatory power of HNO_3 and $HNO_3 \cdot xH_2O$ (*C J* 55, 680), his results are $-M M HNO_3 = 1.18$, $M M HNO_3 + 2.67H_2O = 3.656$. Now by deducting $2.67 (M M \text{ of } 2.67H_2O)$ from 3.656 , we get 986 as the $M M$ of HNO_3 , in presence of $2.67H_2O$, but pure HNO_3 gave $M M 1.18$, hence the water has reduced the $M M$ of HNO_3 by 194 . From these results, Perkin concludes that HNO_3 and H_2O combine to form H_3NO .

The electrical conductivity of HNO_3 Aq for increasing dilution has been measured by Kohlrausch a Grottrian (*P M* [4] 49, 417) and by Ostwald (*Z P C* 1, 74). Conductivity increases slightly with dilution, but soon reaches a maximum. The behaviour of HNO_3 Aq in this respect is characteristic of that of the strong monobasic acids (cf also Bouty, *C R* 106, 654). Roscoe (*C J* 13, 150) has shown that distilling HNO_3 Aq at 760 mm results in production of an acid containing 68 p.c. HNO_3 , the formula $2HNO_3 \cdot 3H_2O$ requires 70 p.c., and $HNO_3 \cdot 2H_2O$ requires 63.6 p.c. HNO_3 , the liquid of constant B.P. is therefore not a definite hydrate. This liquid boils at 120.5° under 735 mm pressure. By distilling at 150 mm pressure, Roscoe obtained an acid containing 67.6 p.c. HNO_3 , at 70 mm (B.P. $65^\circ-70^\circ$) the acid contained 66.7 p.c. HNO_3 , at pressure greater than 760 mm rather more than 68 p.c. HNO_3 was present in the acid of constant B.P. The percentage of HNO_3 in the liquid obtained by passing dry air into HNO_3 Aq containing from 64 to 68 p.c. HNO_3 , varies with temperature, the higher the temperature the greater the percentage of HNO_3 . For every mixture of HNO_3 and H_2O there is a fixed temperature, whereat HNO_3 and H_2O evaporate in the same proportion as they are present in the residual acid, for 66.2 p.c. HNO_3 , this temperature is 100° , for 64.5 p.c. it is 60° (Roscoe, *l.c.*, for older observations v Millon, *J pr* 29, 349, Smith, *Ph C* 1848 203). When HNO_3 and H_2O are mixed, the maximum contraction takes place for the ratio $2HNO_3 \cdot 3H_2O$ (Kolb, *A Ch* [4] 10, 140).

Kolb (*A Ch* [4] 10, 186) gives the following table, showing weight of HNO_3 is 100 pts of HNO_3 Aq (p) at 0° and 15° . The numbers marked with an asterisk were directly determined by adding a weighed excess of $CaCO_3$, and weighing the residue —

On adding water to the fuming red nitric acid, the liquid becomes green, then blue, and finally colourless when dilute, red vapour of NO_2 is evolved, the more rapidly the higher is the temperature. The NO_2 present in the fuming acid is slowly decomposed by the added water, giving HNO_3 , which colours the liquid blue (the green colour being the result of the yellow caused by NO_2 and the blue caused by HNO_2), on further dilution NO is evolved, and only HNO_3 remains

Reactions —1 *Heat* decomposes HNO_3 to NO_2 , H_2O , and O , the decomposition is complete at c 256° (Carius, *B* 4, 828) —2 *Light* slowly decomposes HNO_3 in the same way as heat, hence very conc HNO_3 kept in an open place always contains some NO_2 —3 The products of electrolysis of HNO_3 vary with the dilution of the acid, with acid 2HNO_3 , $3\text{H}_2\text{O}$ no H is evolved at first, after a little NO comes off, and then H begins, while the NO slowly ceases, as dilution increases H is evolved and products of reduction — N_2O , NO , N , and NH_3 —are produced, the more rapid the electrolysis the greater is the quantity of H evolved, very dilute acid evolves H only without the formation of reduced products (Bourgois, *J Ph* [4] 13, 266 [abstract in *C J* [2] 9, 885], Gladstone & Tribe, *C J* 35, 172) —4 Conc HNO_3 is rapidly reduced by *hydrogen occluded* by Pt or Pd , with oxidation of the H (G & T , *l c*) —5 HNO_3 is also reduced by many *metals*, the products vary with temperature, concentration of the acid, and the nature of the metal Mg with 68 p.c acid *plus* an equal quantity, or twice the quantity, of water, produces H along with gaseous reduction products (G & T , *C J* 35, 178) The gaseous reduction products are generally N_2O , NO , and N , these gases are formed by the reaction with HNO_3 of *e.g.* Al , Cd , Co , Cu , In , Fe , Pb , Mg , Ni , Ag , Ti , Sn , Zn (Acworth, *C J* 28, 828, Acworth & Armstrong, *C J* 32, 54) It appears to be the case that the greater the heat of formation of a metallic oxide the more completely is HNO_3 reduced by the

metal (*cf* Thomsen, *Th* 3, 547) Al , Cd , Fe , Mg , Pb , Sn , Zn , and the alkali metals produce NH_4NO_3 and NH_4OH , but no nitrous acid or nitrites, Bi , Cu , Hg , and Ag produce nitrites but no NH_4NO_3 or NH_4OH (Divers, *C J* 43, 443, for the combined action of HNO_3 and H_2SO_4 on Zn *v* Divers & Shimidzu, *C J* 47, 597) In most cases nitrates of the metals are formed, but sometimes these are decomposed with the final formation of oxides, *e.g.* Sb , Sn , and W (*v* also Veley, *Pr* 48, 458) Ta , Ti , Au , and most of the Pt metals do not react with HNO_3 —6 All the solid *non metals* are oxidised by nitric acid —7 *Oxidisable compounds* are oxidised by HNO_3 , *e.g.* ferrous compounds are changed to ferric, stannous to stannic, arsenious to arsenic, sulphides generally yield sulphates and nitrates —8 *Hydriodic acid* and *iodides* yield H_2O , NO , and I —9 *Hydrochloric acid* gives H_2O , NOCl , and Cl (*v* *aqua regia* under CHLORHYDRIC ACID, vol II p 8, *Reactions* No 17) —10 *Organic compounds* are oxidised by HNO_3 , straw, hay, cotton, &c., are in flamed by the conc acid (Kraut, *B* 14, 301) Many organic compounds, especially those of the benzenoid class, form nitro derivatives, H being replaced by NO . —11 With *starch*, N_2O_5 or a mixture of this with NO_2 is produced, HNO_3 S G 1.3 to 1.35 gives almost pure N_2O_5 , if the S G is greater than 1.35 NO_2 is also produced, if S G is less than 1.3 the chief gaseous product is NO (Lunge, *B* 11, 1229, 1641)

Combinations —1 With *water*, it is still undecided whether a hydrate or hydrates of HNO_3 are produced when HNO_3 is dissolved in water, *v* *Properties*, p 519 —2 With *ammonia* to form NH_4NO_3 —3 With *dry sulphur dioxide* to form $\text{SO}_2\text{NO}_2\text{OH}$ (*v* NITROGEN DERIVATIVES OF SULPHUR ACIDS in vol IV) —4 With some *metals* to form acid salts, according to Ditté (*A Ch* [5] 18, 320), the nitrates which combine with HNO_3 when dissolved in excess of the acid are those of NH_4 , K , Rb , and Tl —5 With *nitric anhydride* to form $(\text{HNO}_3)_2\text{N}_2\text{O}_5$ ($=\text{H}_2\text{N}_2\text{O}_{11}$, *v* *Dinitric acid*, *infra*)

Detection and Estimation *v* *Manuals of Analysis*

DINITRIC ACID $\text{H}_2\text{N}_2\text{O}_{11}$ ($=(\text{HNO}_3)_2\text{N}_2\text{O}_5$) Weber (*J pr* [2] 6, 342) obtained this compound by adding very conc colourless HNO_3 to melted N_2O_5 , and cooling to c 8° (for details of preparation *v* Weber, *l c*) A bluish yellow liquid, so solidifying at c 5°, S G 1.642 at 18° Fumes in air, dissolves in water with production of much heat, when gently warmed N_2O_5 is evolved. It is very dangerous to keep the compound in sealed tubes as explosions generally occur. Acts as a powerful oxidiser, forms NO_2 derivatives with many carbon compounds. The relation of this acid to nitric acid is probably similar to that of disulphonic to sulphonic acid $\text{H}_2\text{SO}_4 + \text{SO}_3 = \text{H}_2\text{S}_2\text{O}_7$, $2\text{HNO}_3 + \text{N}_2\text{O}_5 = \text{H}_2\text{N}_2\text{O}_{11}$, M M P M

NITRIDES *Compounds of N with one other more positive element* The term is generally applied to the binary compounds of N with B , P , Si , and the metals. The metallic nitrides have for the most part the composition denoted by the formulae R_3N , or R_2N , R = monovalent metal. They are mostly obtained by the action of ammonia on metallic oxides or chlorides; frequently also by the direct action of atmospheric

nitrogen on metals at the moment of separation from their oxides by charcoal. Some metallic nitrides are also obtained by the reaction of metals or oxides of metals with hydrazoic acid, HN_3 (*q v p 559*). Most of them have a metallic aspect, are easily decomposed by heat, sometimes

that nitrates are formed in a fertile soil from NH_3 salts applied to the soil. The following table, taken from the article NITRIFICATION in the first edition of this Dictionary (Supp. in p 1399), exhibits very clearly the oxidation of NH_3 salts to nitrates in the soil —

Nitrogen existing as nitrates in one million parts of drainage water.

Dates on which drainage water was collected	Plots which received no NH_3 salts				Plots which received 400lbs NH_3 salts per acre, between March 10 and 13

with explosion, some of them, however, with stand a very high temperature without decomposition. Many of them are reduced to metals by strongly heating in hydrogen or ammonia gas, heated with water or hydrate of potassium they often yield metallic oxides and ammonia, they burn when heated in the air. They unite with other metallic compounds, especially with metalamides. The chief metallic nitrides are those of Al, Cu, Cr, Fe, Mg, Hg, Mo, Ni, Nb, Pt, K, Na, Ta, Th, ?Sn , Ti, W, U, Y, Zn, and Zr. For descriptions of the nitrides *v* the several metals enumerated above. M M P M

NITRIFICATION Nitre occurs in many parts of the earth. In some places it is found as an efflorescence on the surface of the soil, it is formed on the sides of caves (generally those frequented by animals), on the walls of old stables, and in the soil surrounding some of the villages in North India (*v* Palmer, *C J* [2] 6, 318). Nitre also occurs in Algeria, Spain, &c., and very large deposits of NaNO_3 are found in Peru. Nitrates are found in all, or almost all, soils, especially in those which are fertile and well manured. Nitrates are obtained by the artificial oxidation of nitrogenous matters in soils, by arranging the conditions so that there is first an accumulation of nitrogenous compounds, and then a slow oxidation in presence of moisture and some base which combines with the HNO_3 , as it is produced (*v* Potassium nitrate, Formation, p 515).

That HNO_3 is formed by the oxidation of nitrogen compounds has been abundantly proved (*eg* by Boussingault, *C R* 32, 477). There is no convincing experimental proof that the N of the air is oxidised to HNO_3 , under normal naturally occurring conditions. L T Wright (*C J* 35, 42) found that HNO_3 is formed by burning H in air, but that if special precautions are taken to remove all NH_3 from the air, HNO_3 is not formed. Boussingault (*C R* 76, 22) found that there was no increase in the total N in a quantity of soil rich in N compounds, after keeping in a closed vessel full of air for 11 years, although there was a marked increase in the nitrates in the soil. Various experimenters have proved that NH_3 can be oxidised to HNO_3 , *eg* by ozone, by KMnO_4 and H_2SO_4 , &c. (*v* Nitric acid, Formation, p 518). Experiments conducted at Rothamsted have proved conclusively

In 1862, Pasteur suggested that the oxidation of nitrogen compounds in the soil to nitrates is accomplished by a living organism. In 1877 Schloesing a Muntz (*C R* 84, 301, 85, 1018) showed that nitrification did not take place in sewage slowly filtered through a column of pure sand and limestone until after 20 days, that nitrification then proceeded rapidly, but was completely stopped by allowing vapour of chloroform free access to the surface of the sand and limestone, 7 weeks after the application of CHCl_3 , a little vegetable earth, which was known to nitrify easily, was placed on the surface of the sand, and then nitrification began again. S a M also showed that heating soil to 100° destroyed the power of that soil to produce nitrates from nitrogenous matter.

Warrington has conducted, at Rothamsted, an extensive, laborious, and accurate, series of experiments on nitrification in soils, his memoirs are to be found in *C J* 33, 44, 35, 429, 45, 637 [numerous references here to other workers], 47, 758, 51, 118, 53, 751, *cf* also Munro, *C J* 49, 632. The results fully confirm the view that the production of nitrates in soils from nitrogenous compounds is due to the activity of a living organism. Summarising the results, Warrington says (*C J* 45, 461) 'Nitrification in soils and waters is found to be strictly limited to the range of temperature to which the vital activity of low organisms is confined. Nitrification is also dependent on the presence of plant-food suitable to organisms of low character. Further proof is afforded by the fact that antiseptics are fatal to nitrification. The action of heat is equally confirmatory. By raising sewage or soil to the temperature of boiling water, its nitrifying power is entirely destroyed. Finally, nitrification can be started in boiled sewage, or in other sterilised liquids of suitable composition, by the addition of a few particles of surface soil, or a few drops of a solution which has lately nitrified, while, if no such addition is made, these liquids may be freely exposed to filtered air without nitrification taking place. Schloesing has apparently given a final blow to the theory that air exists in a condensed state in the pores of a soil, and may on that account exert special oxidising powers, by his recent experiments (*Ann de la Science agronomique*, 1884 1), showing that the gases in a vegetable soil simply occupy the normal

volume due to temperature and atmospheric pressure.

The result of Warrington's examination of the classes of bodies that undergo nitrification in soils is, that all nitrogenous substances which yield ammonia by the action of organisms existing in fertile soils are nitrifiable (*C J* 45, 658).

The conditions under which nitrification proceeds in soils, sewage, &c., are as follows (*W. C J* 45, 654 *et seq.*)—(1) A sufficient quantity of some base must be present to combine with the nitric acid. When the whole of the bases present are neutralised the nitrification stops, although nitrifiable compounds may still be present. There is a limit to the quantity of alkaline carbonate which can be present in a liquid undergoing nitrification. This fact renders impossible the nitrification of urine, except when diluted with water, because the first product of the action on urine of organisms in the soil is NH_3 , carbonate, and unless this be present in very moderate quantity nitrification cannot proceed. Warrington's experiments showed that 14 parts urine in 100 water did not nitrify when kept in contact with soil containing nitrifying organisms for 172 days. Addition of gypsum allows nitrification to proceed in cases where it would either not occur or be stopped by the presence of NH_3 , carbonate (*W. C J* 47, 758, Pickard, *Ann. de Science agronomique*, 1884 302, Joule, *ibid* 1884 289). Thus, whereas a 14 p.c. urine solution did not nitrify after 172 days, a 80 p.c. solution, to which gypsum was added, nitrified after 78 days, and a 50 p.c. solution containing gypsum nitrified after 151 days. (2) In order that a nitrogenous liquid shall nitrify, the concentration of the liquid must not exceed a certain degree (for experiments *v C J* 45, 662). (3) A sufficient quantity of the nitrifying organism must be present. The vigour of the organisms obtained in different cultivations differs considerably. A liquid which refuses to nitrify when seeded, because its concentration is excessive, may be caused to undergo nitrification by seeding it with a very vigorous organism, &c. one which has been obtained by cultivation in a fairly conc. solution well supplied with nutriment. 'The plan that has proved most effective in producing rapid nitrification is to make use of the sediment lying at the bottom of the vessel in which the nitrification of a fairly strong solution has been conducted' (*W. C J* p. 665). (4) Stagnant liquids of considerable depth nitrify much less quickly than a shallow liquid of similar composition, or than a liquid which is poured over a porous solid and so brought into contact with fresh supplies of oxygen. (5) Some quantity of carbon in combination—'organic carbon'—is needed for the nourishment of the nitrifying organism, but no advantage accrues from the presence of more C than is required for this purpose (*cf* Munro, *C J* 49, 661 *et seq.*). (6) Nitrification proceeds within certain limits of temperature, the organism seems to be destroyed at, or somewhat below, 100° , at 8° – 5° nitrification proceeds much more slowly than at somewhat higher temperatures. (7) Light tends to decrease, or even stop, the process of nitrification (*v W. C J* 88, 44). The product of nitrification is sometimes a nitrite, sometimes a nitrate, and sometimes both. The exact con-

ditions under which nitrite and nitrate are formed have not yet been determined satisfactorily. In a later communication (*C J* 59, 484) Warrington describes the isolation of two organisms one of these oxidises ammonia to nitrous acid and has no effect on nitrites, the other produces neither nitrites nor nitrates in ammoniacal solutions, but in absence of ammonia rapidly converts nitrites into nitrates. P. F. Frankland and G. O. Frankland (*Pr* 47, 296) seem to have isolated a bacillus, which grows slowly in broth, and which converts ammoniacal salts into nitrates.

With regard to the distribution of the nitrifying organisms in the soil, Warrington's experiments show that the organisms are not evenly distributed below a depth of about 9 inches in clay-soils (*C J* 45, 649), and that nitrification occurs chiefly, if not altogether, in the surface soil, and rarely in a clay-subsoil 2 or 3 feet from the surface (*C J* 51, 118). M. M. P. M.

NITRILES. Compounds of the form RCN where R is an organic radicle.

Formation—1 By distilling potassium alkyl sulphates (KRSO_3) with potassium cyanide (Dumas, *C R* 25, 474).—2 From alkyl iodides and potassium cyanide in presence of dilute alcohol (Schlagdenhauffen, *C R* 48, 228, Henry, *C R* 104, 1181).—3 By dehydrating amides by distillation with P_2O_5 or P_2S_5 (Dumas, Malaguti, & Leblanc, *A* 64, 333).—4 By distilling organic acids with potassium or lead sulphocyanide. This reaction is most successful with aromatic acids (Krusch, *B* 17, 1766).—5 By boiling the formyl derivatives of aromatic amines (*eg* formanilide) with zinc dust (Gasiorowski, *B* 17, 73).—6 By the action of bromine and NaOH on the amide of the acid containing one C atom more $\text{XCH}_2\text{CONH}_2 + 3\text{Br}_2 + 8\text{NaOH} = \text{XCN} + 6\text{NaBr} + \text{Na}_2\text{CO}_3 + 6\text{H}_2\text{O}$. This reaction, which gives a means of descending the series, is particularly applicable to the higher homologues (yield from monoamide = 30 p.c.), but the lower the homologue the smaller is the yield, till in the case of valeramide hardly any nitrile at all is formed, the chief product of the reaction being butylamine (Hofmann, *B* 17, 1406).—7 By distilling the formyl derivatives of aromatic monamines with zinc dust, the yield being 10 p.c.–20 p.c. (Gasiorowski & Merz, *B* 18, 1008).—8 By warming the oxim of the corresponding aldehyde with Ac_2O .—9 Aromatic nitriles may be formed from diazo-compounds by Sandmeyer's reaction, using cuprous cyanide (Sandmeyer, *B* 17, 2653).

Reactions—1 Readily converted into NH_3 , and the corresponding acid by heating with acids or alkalis. Cold conc. HCl aq. forms the intermediate amides.—2 Alcohol (1 mol.) and gaseous HCl form the salt of an imido-ether, *eg* $\text{CH}_3\text{CH}(\text{OEt})\text{NH}_2\text{Cl}$.—3 Zinc and dilute acids yield the corresponding amine (Mendius, *A* 121, 129).—4 H_2S unites, forming a thioamide, *eg* CH_3CSNH_2 .—5 Sodium polymerises many fatty nitriles. Sodium acting on an alcoholic solution of aromatic nitriles often reduces them to the aromatic hydrocarbons or their hydrides (Bamberger & Lotter, *B* 20, 1702).—6 HBr combines with nitriles. The product is decomposed by water, fatty nitriles yielding the acid, while benzotrile yields benzamide—

7 *Hydroxylamins unites, forming amidoxims*
 $R\text{C}(\text{NH}_2)\text{NOH}$

Isonitriles v. CARBAMINES

NITRILIO DIACETONAMINE v. ACETON-AMINE

NITRILIO-PROPIONITRILE A name for hydrocyanaldimine *v* vol 1 p 104

NITRILES *Salts of nitrous acid, HNO₂, v. Nitrous acid and Nitrites, under Nitrogen, p 567*

NITRO- *Use of this prefix applied to inorganic compounds for nitro-compounds and nitro salts v the element the nitro compound of which is sought for, or the salts to the names of which nitro is prefixed. Thus, nitroferrocyanides are described under ferrocyanides, a section of the group CYANIDES, nitrochromate of potassium is described under CHROMATES*

NITRO-ACENAPHTHENE $\text{C}_{12}\text{H}_7\text{NO}_2$, [155°] (J), [102°] (A) Formed by nitrating acenaphthene dissolved in HOAc (Jandrier, C R 104, 1858, Quincke, B 20, 609, 21, 1454) Pale-yellow needles (by sublimation) Easily reduced by zinc and HCl to an amido derivative, which yields a bluish-violet product on oxidation

Dinitro-acenaphthene $\text{C}_{12}\text{H}_5(\text{NO}_2)_2$, [206°] Yellow needles, formed at the same time as the preceding (Q, cf Berthelot, B 1, 8, 250)

NITRO ACETIC ACID $\text{CH}_3(\text{NO}_2)\text{CO}_2\text{H}$ or $\text{CH}_3(\text{ONO})\text{CO}_2\text{H}$

Ethyl ether EtA' (c 155°) SG ± 1.133 Formed from bromo or iodo acetic ether and silver nitrate at 130° Extracted with ether Forrand, B 1 [2] 31, 536, Steiner, B 15, 1605, Lewkowsch, J pr [2] 20, 163 Oil, smelling like nitrous ether Yields amido acetic ether on reduction Splits up when boiled for a long time, yielding CO_2 , oxalic ether, and NO

NITROACETAMIDO-DI METHYL-HYDRO-QUINONE v Acetyl-di methyl derivative of Nitro amido-hydroquinone

NITRO ACET ANILINE v Acetyl derivative of Nitro ANILINE

NITRO-ACET-NAPHTHALIDE v Acetyl derivative of Nitro NAPHTHYLAMINE

NITRO ACETONITRILE A name formerly given to fulminic acid (*v* vol 11 p 817)

NITRO ACETONYL-UREA

$\text{CMe}_2\text{CO}\text{NH}\text{N}(\text{NO}_2)\text{CO}$ (?) [141°] Obtained by nitrating acetonyl urea (Franchimont & Klobbie, R T C 7, 241) Slender needles, sl sol water and benzene, sol alcohol and ether Decomposed by boiling water, forming a oxy-isobutyric acid

NITRO-ACETOPHENONE $\text{C}_6\text{H}_5\text{NO}_2$, *v* $\text{CH}_3\text{CO}\text{C}_6\text{H}_4\text{NO}_2$ [12] Nitro phenyl methyl ketone Formed, together with the *m*-isomeride, by nitration of acetophenone, especially at 40° (Engler, B 18, 2238) Prepared by boiling *o*-nitro-benzoyl-acetoacetic ether with dilute H_2SO_4 for 8 hours, and extracting with ether (Guthzeit, A 221, 325) Oil, v sol alcohol With PCl_5 it yields chloro-*o*-nitro-styrene Boiling alcoholic ammonium sulphide converts it into indigo KMnO_4 yields *o*-nitro benzoic acid Tin and HCl yield *o*-amido-acetophenone (242°-252°).

***m* Nitro-aceto-phenone**
 $\text{CH}_3\text{CO}\text{C}_6\text{H}_4\text{NO}_2$ [18] [81°] (Buchka, B 10, 1714) Formed by the action of *m* nitro-benzoyl chloride on sodio acetacetic ether and digesting the product with water (Gevekoht, B 15, 2084)

Obtained also by nitrating acetophenone in the cold Needles, volatile with steam Yields *m*-nitro-benzoic acid on oxidation

Oxim [132°] Forms a methyl-ether [84°] (Gabriel, B 15, 5063)

***p*-Nitro-acetophenone** $\text{CH}_3\text{CO}\text{C}_6\text{H}_4\text{NO}_2$, [144] [81°] Formed by the action of *p* nitro-benzoyl chloride on sodio acetacetic ether, and digesting the product with water (Gevekoht, B 15, 2084) Formed also by warming *p*-nitro phenyl-propionic acid with dilute H_2SO_4 , or by allowing its ether to stand with conc H_2SO_4 at 40°, pouring the *p* nitro-benzoyl acetic acid which is formed into water, and expelling CO_2 by boiling (Drewson, A 212, 160, Engler & Zulke, B 22, 203) Yellow prisms Yields chloro-*p*-nitro-styrene with PCl_5 Yields *p*-amido acetophenone [106°] on reduction by tin and HCl

Phenyl-hydrazide

NITRO-ACET TOLUIDE v Acetyl derivative of Nitro TOLUIDINE

NITRO ACET-XYLIDE v Acetyl derivative of Nitro XYLIDINE

DI-NITRO-ACETYLENE-DI-UREA $\text{C}_2\text{N}_4\text{H}_2\text{O}_4$, *v* $\text{CO}\text{C}(\text{NH}\text{C}(\text{NO}_2)\text{NH})\text{CO}$ *Di-nitroglycoluril* Formed by nitrating acetylene-di-urea (Franchimont & Klobbie, R T C 7, 18) Charas at 180° On boiling with water it is decomposed into CO_2 , water, and an isomeride of hydantonic acid.

NITRO-ACIDS v Nitro-compounds

(a) **NITRO-ACRIDINE** $\text{C}_{12}\text{H}_7\text{N}_3\text{O}_2$, *v* $\text{C}_{12}\text{H}_7(\text{NO}_2)_2\text{N}$ [214°] Formed, together with the two following bodies, by nitrating acridine (Graebe & Caro, A 158, 275) Golden-yellow plates (by sublimation), insol water, sl sol alcohol and ether Its solution in dilute acids shows blue fluorescence The hydrochloride crystallises in yellow prisms

(B) Nitro-acridine [154°] Plates, v sol. hot alcohol Forms salts with acids

Di-nitro acridine $\text{C}_{12}\text{H}_5(\text{NO}_2)_2\text{N}$. Reddish-yellow tables, sl sol alcohol and ether Does not dissolve in dilute acids

TRI NITRO ACRIDINE CARBOXYLIC ACID
 $\text{C}_{12}\text{H}_5(\text{NO}_2)_3\text{NCO}_2\text{H}$ Formed by boiling methyl-acridine with HNO_3 (SG 133) (Bernthsen, A. 224, 40) Yellow prisms

NITRO ALDEHYDO BENZOIC ACID

$\text{C}_6\text{H}_4(\text{CHO})(\text{NO}_2)\text{CO}_2\text{H}$ [124] [160] Formed, together with a small quantity of $\text{C}_6\text{H}_3(\text{CHO})(\text{NO}_2)_2\text{CO}_2\text{H}$ [184°] by nitrating *p* aldehyde benzoic acid (Löw, A 231, 869) Four sided prisms (from water), v sol alcohol and ether With acetone and NaOH it forms indigo carboxylic acid—AgA' sl sol water

Ethyl ether EtA'

NITRO ALDEHYDO-CINNAMIC ACID

$\text{C}_6\text{H}_5\text{NO}_2$, *v* $\text{C}_6\text{H}_4(\text{CH}\text{CH}\text{CO}_2\text{H})(\text{NO}_2)(\text{CHO})$ [124] [194°]. Formed by nitration of aldehydo-cinnamic acid (Löw, A 231, 376) Prisms *v*. sol glacial acetic acid, acetone, and hot water, hardly sol. ether or chloroform Does not give the indigo reaction with acetone and NaOH, so that NO_2 is probably not *ortho* to CHO —AgA' aq.

Ethyl ether EtA' [80°] Prisms

NITRO ALIZABIN v Nitro-DI-oxi ANTHRA-QUINONE

DI NITRO ALLYL-ANILINE $\text{C}_8\text{H}_7\text{N}_2\text{O}_4$, *v* $\text{C}_8\text{H}_7\text{NHC}_6\text{H}_4(\text{NO}_2)_2$ [76°] Formed from bromo-

m di nitro-benzene, allylamine, and alcohol (Romburgh, *R T C* 4, 192) Yellow needles

Tri-nitro-allyl-aniline $C_9H_7N_3O_6$ *ze* $C_9H_7N_3O_6$ [80°] Formed by the action of allylamine on chloro tri nitro benzene (peryl chloride) (R)

p-NITRO-ALLYL-BENZOYL-ACETIC ETHER $C_{12}H_{11}(NO_2)COCH(C_2H_5)CO_2Et$ [46°] Formed (from sodium *p* nitro benzoyl acetate ether and allyl iodide (Perkin & Bellenot, *C J* 49, 452)

NITRO-AMIDO-ACETAMIDE $C_8H_8N_2O_4$ *ze* $CH_3(NHNO_2)CONH_2$ Formed by decomposing nitro hydantoin by boiling water (Franchimont & Klobbie, *R T C* 7, 239) Long prisms, decomposing at 130°

NITRO-DI-AMIDO-BENZENE *o* Nitro-phenylene diamine

NITRO-AMIDO-BENZENE SULPHONIC ACID $C_8H_7N_2SO_3$ *ze* $C_8H_7(NO_2)(NH_2)(SO_3H)$ [2 1 4] *o* Nitraniline sulphonic acid Formed by heating (1, 2, 4) bromo nitro benzene sulphonic acid with alcoholic NH_3 at 180° (Goslich, *A* 180, 103) and by nitrating acetyl *p* amido benzene sulphonic acid (Nietzki, *B* 18, 294, 21, 3220). The same acid appears to be formed by sulphonating *o*-nitro aniline (Post & Hardtung, *B* 13, 88) Yellow needles, extremely sol water, *m* sol alcohol and $HClAq$ Boiling aqueous KOH converts it into $C_8H_7(NO_2)(OK)(SO_3K)$ $HClAq$ at 180° yields *o*-nitro aniline

Salts — KA' *aq* *S* 5 at 6° — NH_4A' *S* 13 at 6° — BaA' , 2½ *aq* *S* 5 at 9° — CaA' , 2½ *aq* (*P a H*) — PbA' , 2½ *aq* *S* 2 at 6°

Chloride $C_8H_7(NO_2)(NH_2)SO_2Cl$ [60°] **Amide** [156°] Yellow needles

Nitro-amido-benzene sulphonic acid $C_8H_7(NO_2)(NH_2)(SO_3H)$ [1 2 4] Formed by the action of HNO_3 (1 mol) on acetyl amido benzene *m*-sulphonic acid (1 mol) dissolved in conc H_2SO_4 (Eger, *B* 21, 2579, 22, 847) Yellow needles (from water), *sl* sol alcohol, almost *insol* ether — KA' golden yellow plates (from water) — NaA' yellow needles, *v* sol water

Nitro-amido-benzene sulphonic acid $C_8H_7(NO_2)(NH_2)(SO_3H)$ [3 1 6] Formed by heating *m*-nitroaniline sulphate at 120°–170° with $ClSO_3H$ (Lumprecht, *B* 18, 2186) Long colourless prisms or glistening plates Easily soluble in hot water, more sparingly in cold

Salts — $A'K$ *aq* long thin glistening red prisms or yellowish-red plates — $A'Na$ 2½ small yellow plates — $A'Ca$ 4½ easily soluble large orange tables or thick red prisms — $A'Ba$ *aq* red tablets or prisms, sparingly soluble in cold water

Nitro-amido-benzene sulphonic acid $C_8H_7(NO_2)(NH_2)(SO_3H)$ [3 1 4] ? Formed by heating *m* nitro aniline with fuming H_2SO_4 at 160° (Post & Hardtung, *A* 205, 102, *B* 13, 40) Yellowish-brown prisms — BaA' 2½ long spikes *S* 14 at 100° — CaA' , 4½ small needles, *v* sol water This acid is perhaps identical with the preceding

Nitro-amido-benzene sulphonic acid $C_8H_7(NO_2)(NH_2)(SO_3H)$ [4 1 8] Formed in small quantity by heating $C_8H_7Br(NO_2)(SO_3H)$ [1 4 8] with alcoholic ammonia at 160° (Thomas, *A* 186, 132) Needles, *v* sol water — BaA' , 1½ *aq* *S* 15 at 15°

Nitro-amido-benzene disulphonic acid $C_8H_7(NO_2)(NH_2)(SO_3H)_2$ Formed by the action

of ammonium sulphide on di nitro benzene di-sulphonic acid obtained from nitro benzene *m* sulphonic acid (Lumprecht, *B* 8, 289) Very deliquescent mass — BaA' 2½ *aq*

(a) **NITRO-AMIDO-BENZOIC ACID** $C_8H_7N_2O_4$ *ze* $C_8H_7(NO_2)(NH_2)CO_2H$ [2 5 1]. Mol *w* 182 Formed by boiling (a) di nitro-*m*-uramidic benzoic acid with water (Griess, *B* 5, 198, 11, 1734) Yellow needles or prisms, *m* sol hot water, *v* sol hot alcohol Yields nitro oxy benzoic acid [169°] Yields on reduction a diamido benzoic acid which forms *p* phenylene-diamine on distillation — BaA' , 3½ *aq*

(b) **Nitro-amido-benzoic acid** $C_8H_7(NO_2)(NH_2)CO_2H$ [4 3 1] [298°] Formed by boiling (b) di nitro *m* uramidic benzoic acid with water (Griess) Formed also by saponifying its acetyl derivative (Kaiser, *B* 18, 2946) Red plates or needles Yields on reduction a diamido benzoic acid which forms *o* phenylene-diamine on distillation — CaA' , *aq* red crystals, *sl* sol water — BaA' , 2½ *aq*

Ethylether EtA' [139°] Red needles **Formyl derivative** [221°] (Zehra, *B* 23, 3634)

Acetyl derivative

$C_8H_7(NO_2)(NHAc)CO_2H$ [206°] Formed, together with the (2, 3, 1) isomeride, by nitrating *m* acetamido benzoic acid below 0° (K) Yellow tables — CaA' , 7½ *aq* — BaA' , 7½ *aq*

γ **Nitro-amido-benzoic acid**

$C_8H_7(NO_2)(NH_2)(CO_2H)$ [2 3 1] [157°] Formed by boiling (γ) di nitro *m* uramidic benzoic acid with water (Griess, *B* 2, 435, 5, 199) Formed also by saponifying its acetyl derivative which is prepared as above (K) Long yellow needles, *v* sol hot water Yields *o* nitro benzoic acid on elimination of NH_3 (Griess, *B* 11, 1734) Yields on reduction a di amido benzoic acid which forms *o* phenylene diamine on distillation — KA' 2½ *aq* — BaA' , 7½ *aq* — $HA'HCl$, white crystals, decomposed by water

Acetyl derivative

$C_8H_7(NO_2)(NHAc)CO_2H$ [241°] Colourless crystals — CaA' , 6½ *aq* — BaA' , 2½ *aq*

(δ) **Nitro amido benzoic acid**

$C_8H_7(NO_2)(NH_2)CO_2H$ [3 4 1] [284°] Formed by heating di-nitro-*p* uramidic benzoic acid with water (Griess, *B* 5, 855) Formed also by heating $C_8H_7(NO_2)(OMe)CO_2H$ [3 4 1] with aqueous ammonia at 140°–170° (H Salkowski, *A* 173, 52) Reddish yellow needles (from alcohol), *sl* sol hot water Yields, on reduction, di amido benzoic acid [210°] Converted into *m* nitro benzoic acid by the diazo reaction — KA' *aq* orange prisms — BaA' , 5½ *aq*

Ethyl ether EtA' [145°] Formed by heating $C_8H_7Br(NO_2)CO_2Et$ [4 3 1] with alcoholic NH_3 for 3 hours at 150° (Grohmann, *B* 23, 3449) Yellow crystals

Amide $C_8H_7(NO_2)(NH_2)CONH_2$ [227°] Formed by heating $C_8H_7Br(NO_2)CONH$ [4 3 1] with alcoholic NH_3 at 180° (G) Lemon yellow crystals, *insol* water, *sl* sol alcohol

Acetyl derivative

$C_8H_7(NO_2)(NHAc)CO_2H$ [221°] Formed by nitration of acetyl *p* amido benzoic acid below 10° (Kaiser, *B* 18, 2948) Thick yellow tables, *v* *sl* sol cold water — CaA' , 2½ *aq* — BaA' , 6½ *aq*

(e) **Nitro-amido-benzoic acid**

$C_8H_7(NO_2)(NH_2)(CO_2H)$ [5 2.1] [263°].

Formation — 1 By boiling di nitro-*o* uramido benzoic acid with water (Griess, *B* 11, 1730) — 2 By heating $C_6H_3(NO_2)_2(OEt)CO_2Et$ with alcoholic NH_3 at 140° and boiling the resulting amide with baryta water (Hubner, *A* 195, 21) — 3 By heating $C_6H_3Br(NO_2)CO_2H$ [2 5 1] with conc NH_3 aq at 145° (Rahlis, *A* 198, 112) — 4 From its amide which is formed when nitro isatoic acid is warmed with aqueous ammonia (Kolbe, *J pr* [2] 30, 477)

Properties — Slender yellow needles, v sol boiling water. On elimination of NH_3 , it yields *m* nitro benzoic acid

Salts — $KA'2aq$ — $CaA'3aq$ — $BaA'3aq$ v sol cold water, sl sol hot water — $PbA'2aq$ — $HA'HCl$ needles, decomposed by water

Amide $C_6H_3(NO_2)_2(NH_2)CONH_2$ [200°–210°] Yellow needles (from acetone)

(ζ) Nitro-amido-benzoic acid
 $C_6H_3(NO_2)(NH_2)(CO_2H)$ [3 2 1] [204°] Formed by heating $C_6H_3(NO_2)(OEt)(CO_2Et)$ [3 2 1] with alcoholic NH_3 at 130° – 160° and saponifying the resulting amide (Hubner, *A* 195, 37) Yellow needles (from water). On elimination of NH_3 , it yields *m* nitro benzoic acid — $KA'2aq$ — $CaA'2aq$ — $SrA'2aq$ — $BaA'2aq$ purple needles, sl sol cold water — $Pb(OH)A'$ — $CuA'2$ — AgA' — $HA'HCl$ needles

Ethyl ether EtA' [204°] Plates
Amide $C_6H_3(NO_2)(NH_2)(CONH_2)$ [109°] Yellow plates, almost insol water and alcohol

(η) Nitro-amido-benzoic acid
 $C_6H_3(NO_2)(NH_2)CO_2H$ [5 3 1] [208°] Formed by reducing *s* di nitro benzoic acid with NH_3 and H_2S (Hubner, *A* 222, 81) Small golden prisms (from water). On elimination of NH_3 , it yields *m* nitro benzoic acid. Reduces to di amido benzoic acid which, when distilled with steam, forms phenylene *m* diamine — NaA' aq red needles — $NH_4A'3aq$ bright yellow needles — $BaA'4aq$ — $CaA'5\frac{1}{2}aq$ — $PbA'3\frac{1}{2}aq$ — AgA' aq

Ethyl ether EtA' [155°] Yellow needles
Di-nitro-*o*-amido-benzoic acid $C_6H_3N_2O_5$ *ie* $C_6H_3(NO_2)_2(NH_2)CO_2H$ Mol w 227 [256°] Formed, together with its methyl ether, by heating $C_6H_3(NO_2)_2(OEt)CO_2Me$ with aqueous ammonia (H Salkowski, *B* 4, 870, *A* 173, 40) Golden yellow scales (from alcohol) — NH_4A' aq

Methyl ether MeA' [165°] Needles

Ethyl ether EtA' [135°] Laminæ

Di nitro *p* amido benzoic acid
 $C_6H_3(NO_2)_2(NH_2)(CO_2H)$ [5 3 4 1] **Chrysamic acid** [260°] Formed by the action of aqueous ammonia upon $C_6H_3(NO_2)_2(OMe)CO_2H$, which is a product of the action of warm fuming HNO_3 on anisic acid (Cahours, *A Ch* [3] 27, 454, Beilstein *A Kellner*, *A* 128, 104) Formed also by oxidation of di nitro *p* toluidine by chromic acid mixture (Friedrich, *B* 11, 1976) Plates (from alcohol), sl sol cold Aq — NH_4A' — AgA'

Methyl ether MeA' [144°] Plates

Ethyl ether EtA' [114°] Plates

Acetyl derivative

$C_6H_3(NO_2)_2(NHAc)CO_2H$ [270°] Silky needles

Nitro-di-amido-benzoic acid $C_6H_3N_2O_5$ *ie* $C_6H_3(NO_2)(NH_2)_2CO_2H$ [5 4 3 1] Formed by reducing chrysamic acid with H_2S and alcoholic NH_3 (*B* *a K*) Minute red crystals, v sol alcohol, sl sol hot water — NH_4A' aq Monoclinic prisms, *a b c* = 1.073 : 1 : 809, β = $77^\circ 32'$

DI - NITRO - AMIDO - BENZYL - METHYL KETONE $C_6H_3N_2O_5$ [214°] Formed by reducing tri nitro benzyl methyl ketone in alcoholic solution with the theoretical quantity of $SnCl_4$ and HCl (Ditttrich, *B* 23, 2724) Groups of golden yellow needles (from alcohol)

NITRO AMIDO-ISOBUTYL-BENZENE
 $C_6H_3C_4H_7(NO_2)(NH_2)$ [1 2 3] Nitro isobutyl aniline [124°] Formed by saponifying its acetyl derivative (Gelzer, *B* 21, 2941) Yellow crystals, v sol boiling water

Acetyl derivative
 $C_6H_3C_4H_7(NO_2)(NHAc)$ [106°] Obtained by nitrating $C_6H_3C_4H_7NHAc$ Yellow needles, v sol sol boiling water

Nitro amido isobutyl benzene
 $C_6H_3C_4H_7(NO_2)(NH_2)$ [1 3 4] [106 5°] Formed from its acetyl derivative and alcoholic potash (Gelzer, *B* 20, 3254) Orange crystals, sl sol hot water

Acetyl derivative
 $C_6H_3C_4H_7(NO_2)(NHAc)$ [105°] (252°) Yellow needles. Obtained from $C_6H_3C_4H_7NHAc$ [1 4] and fuming HNO_3 at 0°

Di nitro amido isobutyl benzene
 $C_6H_3(C_4H_7)(NO_2)_2(NH_2)$ [127°] Got by heating di nitro isobutyl phenol [93°] with NH_3 aq at 175° (Barr, *B* 21, 1544) Yellow needles

p NITRO DI AMIDO - DI-ISOBUTYL - TRI PHENYL METHANE

$C_6H_3(NO_2)CH(C_6H_5)(NH_2)C_6H_5$ [126°] Formed from *p* nitro benzoic aldehyde, *p* amido isobutyl benzene, and conc H_2SO_4 (Bischler, *B* 21, 3207) Yellow needles. Its hydrochloride and platinochloride are both crystalline. Its di acetyl derivative melts at 114° , and its di benzoyl derivative at 126°

m Nitro di *p* amido di isobutyl tri phenyl methane $C_6H_3N_2O_5$ [65°] Formed from *m* nitro benzoic aldehyde, *p* amido isobutyl benzene, and conc H_2SO_4

Di benzoyl derivative [114°] Plates

(α) NITRO-*o*-AMIDO CINNAMIC ACID

$C_6H_3N_2O_5$ *ie* $C_6H_3(NH_2)(NO)CHCHCO_2H$ [240°] Formed from *o* amido cinnamic acid (1 pt), conc H_2SO_4 (15 pts), and KNO_3 (3 pts) at 0° . On dilution with water (β) nitro *o* amido cinnamic acid separates as brownish needles, while the (α) compound may be ppd by nearly neutralising the mother liquor with $NaOH$ (Friedlander *a Lazarus*, *A* 229, 241) Brown needles. Insol benzene, ether, or petroleum, sl sol water, v sol alcohol and acetone. Dissolved by mineral acids, but ppd by sodic acetate. With HCl at 150° it gives (α)-nitro carbostyryl (nitro oxy quinoline), which forms slender white needles, v sl sol alcohol, glacial acetic acid, or acetone, and does not melt below 320°

Ethyl ether EtA' [160°] Formed, along with (β) nitro-carbostyryl, by nitrating *o*-amido cinnamic ether. Compact brown needles

(β) Nitro-*o* amido cinnamic acid

$C_6H_3(NH_2)(NO_2)CHCHCO_2H$ [254°] Prepared as above. Brownish yellow needles. Insol dilute mineral acids, and in water. Sol alkalis. With HCl at 150° it gives (β)-nitro carbostyryl [260°], which crystallises from glacial acetic acid in compact yellow needles

(3 4 1)-Nitro amido cinnamic acid

$C_6H_3(NO_2)(NH_2)C_4H_7CO_2H$ [225°] Formed by saponifying its acetyl derivative, which is

formed by nitration of acetyl-*p*-amido cinnamic acid (Gabriel & Herzberg, *B* 16, 2021) Red needles Sol hot alcohol and acetic acid, less sol water, nearly insol. benzene and ligroin

Acetyl derivative [261°-266°]

NITRO-AMIDO-*o*-CRESOL

$C_6H_4Me(NO_2)(NH_2)(OH)$ [1 3 5 2] [118°] Obtained by nitrating $C_6H_4Me(CO_2H)(NHAc)(OH)$ [1 3 5 2] and saponifying the resulting acetyl derivative (Nietzki & Ruppert, *B* 28, 8478) Brownish red needles (from alcohol)

Di-acetyl derivative

$C_6H_4Me(NO_2)(NHAc)(OAc)$ [146°]

Nitro-amido-cresol Methyl ether

$C_6H_4Me(NO_2)(NH_2)(OMe)$ [1 2 4 5]. [182°]

Formed from its acetyl derivative. Needles On elimination of NH_2 and reduction it yields $C_6H_4Me(NH_2)(OMe)$ [111°] Reduction yields $C_6H_4Me(NH_2)_2OMe$ [166°]

Acetyl derivative

$C_6H_4Me(NO_2)(NHAc)(OMe)$ [156°] Formed from $C_6H_4Me(NHAc)(OMe)$ in $HOAc$ by treatment with HNO_3 (S G 1 48) (Limpach, *B* 22, 89) Needles

*Nitro-*o*-amido cresol Methyl ether of the acetyl derivative*

$C_6H_4(CH_3NHAc)(NO_2)(OMe)$ [1 3 4] *Methyl derivative of acetyl-nitro oxy benzylamine* [137°]

Formed by nitrating $C_6H_4(CH_3NHAc)(OMe)$ in the cold (Goldschmidt & Polonowska, *B* 20, 4410) Prisms, v sl sol hot water Yields nitro amide acid on oxidation

Di-nitro amido m cresol

$C_6H_4Me(NO_2)_2(NH_2)OH$ [151°] (L & D), [156°] (E & O) Formed by reducing tri-nitro-cresol $C_6H_4Me(NO_2)_3OH$ [1 2 4 6 8] with H_2S and alcoholic NH_3 (Kellner & Beilstein, *A* 128, 166, Liebermann & Dorp, *A* 163, 104, Emmerling & Oppenheim, *B* 9, 1094) Thin yellow needles (from hot water)

Di nitro amido-m-cresol

$C_6H_4Me(NO_2)_2(NH_2)(OH)$ [1 2 5 4 6 8] [160°] Formed by nitrating $C_6H_4Me(CO_2H)(NHAc)(OH)$ (Nietzki & Ruppert, *B* 23, 8479) Large red needles Perhaps identical with the preceding

Mono-acetyl derivative [225°]

Di-acetyl derivative [175°]

NITRO AMIDO ISO CYMENE

$C_6H_4(NO_2)(NH_2)PrMe$ [x 50r 6 3 1] Formed from its phthalyl derivative by heating with conc HCl for 24 hours at 180° (Kelbe & Warth, *A* 221, 176) Oil Volatile with steam

Benzoyl derivative

$C_6H_4(NO_2)(NHBz)PrMe$ [177°] Formed by nitration of the benzoyl derivative of amido-isocymene

Phthalyl derivative

$(C_6H_4(NO_2)PrMe)_2C_2O_2C_6H_4$ [167°] Formed by nitration of the phthalyl derivative of amido isocymene

Di-nitro-amido-cymene $C_6H_4MePr(NO_2)_2(NH_2)$ [1 4 2 6 8] [118°-115°] From the ethyl ether of di-nitro-thymol and alcoholic NH_3 at 180° (Mazzara, *G* 19, 160) Yellow tables (from dilute alcohol), sl sol hot water

NITRO-*p* AMIDO-ETHYL-BENZENE

$C_6H_4(C_2H_5)(NO_2)(NH_2)$ [1 8 4] [47°] Yellowish-red prisms Sol. alcohol, ether, benzene, chloroform, and CS_2 , more sparingly in ligroin The acetyl compound is obtained by careful nitration of acetyl-*p*-amido-ethyl-benzene.

Acetyl derivative

$C_6H_4(C_2H_5)(NO_2)(NHAc)$ [47°], long yellow silky needles, extremely soluble in alcohol, ether, &c, less easily in ligroin (Paucksoh, *B* 17, 769)

*Di-nitro-*p*-amido-ethyl-benzene*

$C_6H_4(C_2H_5)(NO_2)_2NH_2$ [1 3 5 4] [185°] Orange-yellow prisms Sol benzene and chloroform, less easily in alcohol and ether The acetyl derivative is obtained by nitration of acetyl *p* amido ethyl-benzene

Acetyl derivative

$C_6H_4(C_2H_5)(NO_2)_2NHAc$ [182°], needles

NITRO AMIDO-HYDROQUINONE

Acetyl di-methyl derivative

$C_6H_4(NO_2)(NHAc)(OMe)_2$ [164°], yellow needles Formed by nitration of acetyl-amido-*o*-methyl-hydroquinone (Baessler, *B* 17, 2121)

NITRO-AMIDO HYDROTOLUQUINONE

$C_6HMe(NO_2)(NH_2)(OH)$ Formed by reducing di nitro hydrotolugunone with $SnCl_2$ (Kehrmann & Brasch, *J pr* [2] 39, 389) Its hydrochloride crystallises in long yellow needles changing to small plates

NITRO AMIDO MESITYLENE

$C_6HMe_2(NO_2)(NH_2)$ [73°] *Nitro-mesidine*

Formed by reducing di-nitro mesitylene with alcoholic ammonium sulphide (Maule, *C J* 2, 116, *A* 71, 137, Knecht, *A* 215, 98, Klobbie, *R T C* 6, 81) $-B^+HCl - B^+H.PtCl_6 - B^+H_3PO_4$

Acetyl derivative $C_6HMe_2(NO_2)(NHAc)$ [191°] Formed by nitrating acetyl mesidine (Biedermann & Ledoux, *B* 8, 58, Ladenburg, *B* 7, 1133, *A* 179, 163) Silky needles, m sol alcohol Feeble base

Benzoyl derivative $C_6HMe_2(NO_2)(NHBz)$ [168 5°] Formed by nitrating benzoyl mesidine (Schack, *B* 10, 1711)

Nitro-di amido mesitylene $C_6Me_2(NO_2)(NH_2)_2$ [184°] Formed, together with di nitro amido mesitylene by reduction of tri nitro mesitylene by alcoholic ammonium sulphide (Fittig, *A* 141, 139) Orange laminae (from water) or monoclinic crystals (from alcohol), $abc = 1.625 : 1.417$, $\beta = 60^\circ 4'$ (Lang, *A* 141, 140, Hintze, *A* 235, 183), v sl sol cold water $-B^+HCl_2$ tables

Di-nitro amido mesitylene $C_6Me_2(NO_2)_2(NH)$

Di nitro mesidine [194°] Formed as above Sulphur yellow crystals (from alcohol), insol water Very feeble base, its hydrochloride being decomposed by water

Acetyl derivative $C_6Me_2(NO_2)_2(NHAc)$ [275°] S (alcohol) 5 at 78° Formed by nitrating the acetyl derivative of nitro amido-mesitylene Needles

NITRO AMIDO - DI - METHYL ANILINE v

NITRO PHENYLENE DI-METHYL DIAMINE

TETRA NITRO DI-METHYL-DI AMIDO-DI-PHENYL-METHANE *Di-nitro- derivative*

$CH_3(C_6H_4(NO_2)_2NMeNO_2)_2$ Formed by the action of HNO_3 (S G 1 48) on $CH_3(C_6H_4NMe)_2$, dissolved in $HOAc$ (Bomburgh, *R T C* 7, 226)

Decomposes at 218° On boiling with aqueous KOH it gives off methylamine CrO_3 in $HOAc$ forms $CO(C_6H_4(NO_2)_2NMeH)_2$

NITRO-AMIDO-METHYL-QUINOLINE

$O_2H \cdot C(NH_2)C(NO_2) \cdot NMe$ [201°]. Formed by heating chloro-nitro-(*Py* 8)-methyl-quinoline with alcoholic NH_3 at 190° (Conrad & Limpach, *B* 21, 1965). Yellow needles (from alcohol).

NITRO AMIDO (a) NAPHTHOIC ACID

$C_{10}H_7N_2O_4$, i.e. $C_{10}H_7(NO_2)(NH_2)CO_2H$ [c 110°] Formed by reducing di nitro naphthoic acid [215°] with H_2S and NH_3 (Ekstrand, *J pr* [2] 38, 271, *B* 19, 1985) Needles (from water)

Nitro-amido-(β) naphthoic acid

$C_{10}H_7(NO_2)(NH_2)CO_2H$ [235°] Formed by reducing di nitro (β) naphthoic acid [226°] (Ekstrand, *J pr* [2] 42, 301) Stellate groups of small needles— HA/HCl needles

Nitro amido (α) naphthoic acid Acetyl derivative $C_{10}H_7(NO_2)(NHAc)CO_2H$ [259°] Formed by nitrating the acetyl derivative of (4', 1) amido naphthoic acid (Ekstrand, *J pr* [2] 38, 247) Yellow needles, v sol alcohol

Nitro amido-naphthoic acid

$C_{10}H_7(NO_2)(NH_2)CO_2H$ [4' 1' 1] *Anhydride* $C_{10}H_7(NO_2)<\frac{NH}{CO}>$ Nitro naphthostyryl [300°]

Formed by nitrating naphthostyryl (Ekstrand, *J pr* [2] 38, 180) Orange needles (from $HOAc$)

Di-nitro-amido-naphthoic acid Anhydride

$C_{10}H_4(NO_2)_2<\frac{NH}{CO}>$ [above 290°] Formed by nitrating the preceding anhydride (E) Plates, v sol $HOAc$ and alcohol

NITRO-AMIDO (α) NAPHTHOL $C_{10}H_7N_2O_4$

i.e. $C_{10}H_7(NH_2)(NO_2)OH$ [180°] Formed by reducing di nitro-(α) naphthol with ammonium sulphide (Ebell, *B* 8, 564) Small yellowish needles, insol water, sol alcohol

Benzoyl derivative $C_{10}H_7BzN_2O_4$ [158°] Small red needles (from alcohol) (Hubner, *A* 208, 332)

Nitro di-amido (α) naphthol Tri-acetyl derivative $C_{10}H_4(NO_2)(NHAc)_3OAc$ [235°] Formed by nitrating $C_{10}H_7(NHAc)_3OAc$ [280°] (Meerson, *B* 21, 1195) Yellow powder, yielding phthalic acid on oxidation by potassium permanganate Fuming $HClAq$ converts it into $C_{10}H_4(NO_2)(NH_2)<\frac{O}{N}>CMe$, whence boiling dilute

potash forms $C_{10}H_4(NO_2)(OH)<\frac{O}{N}>CMe$ crystallising in brown needles [163°]

NITRO-AMIDO-NAPHTHOL SULPHONIC ACID $C_{10}H_7N_2SO_4$, i.e. $C_{10}H_7(NO_2)(NH_2)(OH)SO_3H$ Formed by reducing di-nitro-naphthol sulphonic acid with $SnCl_2$ (Lauterbach, *B* 14, 2029) Golden yellow plates, m sol hot water Its alkaline solution is blood red

NITRO-AMIDO-TETRA OXY-BENZENE

$C_6(NO_2)_2(NH_2)_2(OH)_2$, Formed by partial reduction of di nitro di oxy quinone (nitraniline acid) with $SnCl$ Small violet needles, nearly insol alcohol, ether, and benzene (Nietzki & Benckiser, *B* 16, 2094, 18, 500) Its alkaline solution is readily oxidised by the air to nitro amido di-oxy quinone $C_6(NO_2)(NH_2)(OH)_2O_2$ Nitrous acid converts it into nitro-diazo di-oxy quinone $C_6(NO_2)(N.OH)(OH)_2O_2$

NITRO-α-AMIDO-PHENOL $C_6H_7N_2O_4$, i.e. $C_6H_7(NO_2)(NH_2)OH$ [6 2 1] [111°] Formed by reducing the corresponding di-nitro-phenol with ammonium sulphide (Post & Stuckenberg, *A* 205, 85) Red needles, sl sol water, v col alcohol and ether Gives a dirty-green colour with $FeCl_3$ — $B'H_2SO_4$ colourless pyramids

Nitro-α-amido-phenol. Methyl ether $C_6H_7(NO_2)(NH_2)(OMe)$ [3 2 1] [76°]. Formed

from $C_6H_7(NO_2)_2(OMe)$ [118°] by heating with alcoholic ammonia at 190° (Bantlin, *B* 11, 2106) Long yellow needles.

Nitro-α-amido-phenol $C_6H_7(NO_2)(NH_2)OH$ [4 2 1] [142°] Obtained by reducing the corresponding di-nitro-phenol with ammonium sulphide (Laurent & Gerhardt, *Compt Chim* 1849, 468, *A* 75, 68, Post & Stuckenberg, *A* 205, 71) Orange prisms (containing aq) melting at 80° to 90° or anhydrous crystalline crusts, melting at 142°, v sol hot water, alcohol, and ether— $C_6H_7KN_2O_4$, dark red nodules— $AgHA'$ brownish yellow pp (L & G)

Benzoyl derivative $C_6H_7BzN_2O_4$ [above 200°] Yellow needles, sl sol alcohol

Nitro-benzoyl derivative [218°]

Methyl ether $C_6H_7(NO_2)(NH_2)(OMe)$ Nitro anisidine Formed by reducing $C_6H_7(NO_2)_2(OMe)$ by alcoholic ammonium sulphide (Cahours, *A* 74, 301) Long garnet red needles, insol cold, sol boiling water— $B'HCl$ — $B'H_2PtCl_6$ — $B'HBBr$ — $B'HNO_3$ — $B'H_2SO_4$

Benzoyl derivative of the methyl ether $C_6H_7(NO_2)(NHBz)(OMe)$ Needles (from alcohol), m sol boiling alcohol

Ethyl ether $C_6H_7(NO_2)(NH_2)(OEt)$ [97°] Formed by heating the di-ethyl ether of di nitro di oxy s di phenyl hydrazine (hydrazonitro phenetole) with conc $HClAq$ (Andraee, *J pr* [2] 21, 818) Yellow needles, m sol water Yields p nitro phenetole on elimination of amidogen— $B'HCl$

Nitro-α-amido phenol

$C_6H_7(NO_2)(NH_2)(OH)$ [5 2 1] *Carbonyl derivative* $C_6H_7(NO_2)<\frac{NH}{O}>CO$ [241°] Obtained by nitrating carbonyl α amido phenol (Chelmicki, *J pr* [2] 42, 441) Long yellow needles (from water) Converted by boiling $KOHAq$ into nitro pyrocatechin [170°]

Nitro-α-amido phenol. Acetyl derivative of the methyl ether $C_6H_7(NO_2)(NHAc)(OMe)$ [143°] Formed by nitrating $C_6H_7(NHAc)(OMe)$ [1 2] (Muhlhauser, *A* 207, 242) Yellow needles (from alcohol)

Nitro-amido-phenol [134°]. Formed by boiling nitrated m phenylene diamine with aqueous KOH (Barbaglia, *B* 7, 1259) Orange plates

Nitro m amido phenol Methyl ether $C_6H_7(NO_2)(NH_2)(OMe)$ [4 3 1] [129°] Formed by heating (4, 3, 1) di nitro anisole with alcoholic NH_3 at 190° (Bantlin, *B* 11, 2106) Yellow leaflets (by sublimation)

Nitro-p-amido-phenol $C_6H_7(NO_2)(NH_2)(OH)$ [3 4 1] [148°] Got by saponifying its acetyl derivative (Hahle, *J pr* [2] 43, 63) Dark-red prisms, forming a violet solution in alkalis— KA' HA/HCl plates or prisms

Di-acetyl derivative [147°] Formed from di acetyl p amido phenol and fuming HNO_3 , Pale yellow prisms (from dilute alcohol)

Methyl ether $C_6H_7(OMe)(NO_2)(NH_2)$ [123°] Formed in small quantity by distilling $C_6H_7(OMe)(NO_2)NMe_2OH$, a crystalline compound got by mixing nitro-p amido-phenol with NMe_2OH . Crystals Yields $C_6H_7(OMe)(NO_2)(NHAc)$ and $C_6H_7(OMe)(NO_2)(NH_2)Cl$

Nitro-p-amido-phenol $C_6H_7(NO_2)(NH_2)OH$ [206°] Formed by boiling its m nitro-benzoyl derivative with alkalis (Hübner, *A* 210, 883) Colourless needles (containing aq) melting at

188° or anhydrous golden needles, melting at 206° —KA' 1:1aq red silky needles —NaA' 2aq —BaA' 4aq

Nitro benzoyl derivative

$C_6H_5(NO_2)(NH_2)O \cdot CO \cdot C_6H_5NO$ [225°] Formed by nitrating benzoyl-*p*-amido phenol [228°] Yellow needles (from HOAc)

Nitro-di-amido-phenol $C_6H_4N_2O_4$ 1, 2

$C_6H_4(NO_2)(NH_2)_2OH$ [4 6 2 1] Formed by reducing picric acid with aqueous ammonium sulphide (Griess, *A* 154, 202) Long dark yellow needles (containing aq) or narrow plates, sl sol water and alcohol, v sl sol ether —(HA') $_2$ H $_2$ SO $_4$ 5aq yellowish needles —BaA' $_2$ 2aq ruby red needles

Nitro-di-amido phenol Dibenzoyle derivative $C_6H_4(NO_2)(NHBz)_2OH$ [167°-170°] Formed by nitrating di benzoyl (a) diamido phenol

Nitro-di-amido phenol Dibenzoyle derivative $C_6H_4(NO)(NHBz)_2OH$ [201°] Formed by nitrating (6, 2, 1) di-amido phenol (Post a Stuckenberg, *A* 205, 79) Long brown needles, sl sol alcohol

Di-nitro-o-amido phenol $C_6H_3N_2O_4$ 1, 2 $C_6H_3(NO_2)_2(NH_2)(OH)$ [6 4 2 1] *Pyramic acid* [170°] S 14 at 22° (Darney, *Am* 5, 36)

Formation—1 By reduction of picric acid (Wöhler, *P* 13, 488, Girard, *A* 88, 281, *J* 1855, 535, Pugh, *A* 96, 83, Lea, *J* 1861, 637 2 By nitration of nitro *o* amido phenol (Stuckenberg, *A* 205, 75), or of benzoyl-*o* amido phenol (Hubner, *A* 210, 392)

Properties—Red needles. Converted by the diazo reaction into $C_6H_3Cl(NO_2)_2$ [110°] The salts do not explode when struck Cyanogen passed into its alcoholic solution forms 'ethoxycarbamidamido - dinitrophenol' $C_6H_3N_2O_4$ (Griess, *B* 15, 448), a crystalline body converted by boiling HClAq into uramidodinitro phenol

Salts—NaA' aq S 206 at 15° Dark red crystalline crusts (Smolka, *M* 8, 391) —NH $_4$ A' orange red tables —KA' —BaA' $_2$ —CuA' $_2$ —MgA' $_2$ 3aq S 558 at 17° —ZnA' $_2$ aq S 017 at 23° —CdA' $_2$ aq S 08 at 23°, 314 at 100° —Hg $_2$ A' $_2$ red powder —HgA' aq yellow needles S 032 at 18°, 08 at 100° —PbA' $_2$ red needles S 038 at 20°, 067 at 100° —MnA' $_2$ 2aq S 1026 at 19° —CoA' S 081 at 100° —NiA' S 0286 at 100° —AgA' —HA'HCl reddish brown needles (Petersen, *Z* 1868, 378) —(HA'HCl).PtCl $_4$

Acetyl derivative $C_6H_3(NH_2)(NO_2)_2(OAc)$ [193°] (Schiff, *B* 19, 849)

Methyl ether $C_6H_3(NH_2)(NO_2)_2(OMe)$ Dark violet needles (from alcohol), insol cold Aq

Nitro-m-amido-phenol

$C_6H_3(NO_2)(NH_2)(OH)$ [6 4 3 1] [225°] Formed by warming di nitro aniline with alcoholic KOy (Lippmann a Fleissner, *M* 7, 96) Brownish-red crystals, v sl sol water Yields di nitro-resorcin on warming with aqueous alkalis Its salts explode on heating —KA' —BaA' $_2$ —HgA' aq

Di-nitro-amido-phenol $C_6H_3(NO_2)_2(NH_2)(OH)$ [202°] Formed by the action of aqueous NH $_3$ on (3) tri nitro-phenol (Henriques, *A* 215, 334) —KA' aq

Di-nitro amido-phenol

$C_6H_3(NO_2)_2(NH_2)(OH)$ [6 2 4 1] *Isopiramic*

acid [170°] S 082 at 22°, 81 at 100°. Formed by heating its benzoyl derivative with HClAq (Dabney, *Am* 5, 33) Yellowish brown needles (from water) —KA' bluish black crystals (from alcohol) Explodes when heated

Benzoyl derivative

$C_6H_3(NO_2)(NHBz)(OH)$ [250°] Formed by heating $C_6H_3(CO_2H)(NHBz)(OH)$ [15 2] dissolved in HOAc with HNO $_3$ at 80° (D) Yellow plates (from alcohol) —KA' aq —BaA' $_2$ 3aq —CaA' $_2$ 4 $\frac{1}{2}$ aq —PbA' $_2$

Di-nitro-o-amido-phenol Benzoyl derivative $C_6H_3(NO_2)(NHBz)OH$ [4 3? 2 1] [220°] Formed by nitrating benzoyl *o* amido phenol in HOAc at -4° (Hubner, *A* 210, 387) Greenish yellow needles, insol water On treatment with POCl $_3$ it yields $C_6H_3(NO_2)_2 \begin{smallmatrix} <O \\ >N \end{smallmatrix} C_6H_5$ [219°]

—KA' 2aq —NH $_4$ A' aq —BaA' $_2$ 5aq —ZnA' $_2$ 3aq. —AgA' red needles

Di nitro-o-amido phenol Acetyl derivative of the methyl ether $C_6H_3(NO_2)_2(NHAc)(OMe)$ [157°] Formed by nitration of *o* acetanilidine (Mühlhauser, *B* 13, 921, *A* 207, 234) Prisms

Tri nitro-amido-phenol Ethyl ether $C_6H_3(NO_2)_3(NH_2)(OEt)$ Formed by heating $C_6H_3(NO_2)_3(OEt)NHCO_2Et$ with dilute H $_2$ SO $_4$ (Kohler, *J pr* (2) 29, 283) Small yellow needles (from alcohol)

o **NITRO-*p*-AMIDO-DIPHENYL** $C_{12}H_9N_2O_4$ 1, 2 $C_6H_4(NO_2)C_6H_4NH_2$ [98°] Formed by reducing *op* di nitro diphenyl with ammonium sulphide (Schultz, *A* 174, 225, 207, 350) Reddish brown monoclinic crystals, *abc* = 1 52 1 2 19, β = 69° 31' —B'HCl needles

p Nitro *p*-amido diphenyl

$C_6H_4(NO_2)C_6H_4NH_2$ [198°] Formed by reducing *pp* di nitro diphenyl with alcoholic ammonium sulphide in the cold (Fittig, *A* 124, 273, Schultz, *A* 174, 222) Small red needles (from alcohol) Gives *p*-nitro benzoic acid on oxidation —B' H PtCl $_6$

Nitro p amido diphenyl Benzoyl derivative $C_6H_4C_6H_3(NO_2)(NHBz)$ [1 3 4] [143°] Formed by nitrating benzoyl *p* amido diphenyl (Hubner, *A* 209, 339) Needles (from HOAc) Reduced by tin and HOAc to

$C_6H_5C_6H_3 \begin{smallmatrix} <N \\ >NH \end{smallmatrix} C_6H_5$ [198°]

Di nitro-p amido diphenyl Benzoyl derivative $C_6H_4(NO_2)_2NHBz$ [206°] Formed by nitrating benzoyl *p* amido diphenyl (Hubner) Dark yellow needles (from HOAc)

Nitro-di-amido-diphenyl

[4 1] $C_6H_3(NH_2)C_6H_3(NO_2)(NH_2)$ [1 2 4] [143°] Formed by mixing benzidine sulphate (28 g) in H $_2$ SO $_4$ (300 g) with KNO $_3$ (10 g) (Tauber, *B* 23, 796) Long red needles —B'H $_2$ SO $_4$ 3aq

Di-nitro di-p amido-diphenyl $C_{12}H_9N_2O_4$ 1, 2 $C_6H_3(NO_2)NH_2$ [1 3 4]

Di-nitro benzidine

$C_6H_3(NO_2)NH_2$ [1 3 4] [221°] Formed by nitration of di acetyl benzidine and saponification of the product with KOH (Brunner a Witt, *B* 20, 1024, cf. Strakosch, *B* 5, 237) Obtained also by hydrolysis of di nitro di phthalyl benzidine (Bandrowski, *M* 8, 471) Red needles Sol phenol, v sl sol alcohol, insol water Its tetrazo compound combines with α -naphthylamine *p* sulphonic acid to form a dye stuff, which dyes

unmordanted cotton the shade of alizarine-violet. By SnCl_2 and HCl it is reduced to tetra-amido diphenyl

Di-acetyl derivative [above 300°]

Di-nitro-di-p-amido-diphenyl [197°]. Obtained, together with the preceding, by hydrolysis of di nitro di phthalyl-benzidine (Bandrowski) Yellow needles (from alcohol)

Di-nitro-di-amido-diphenyl

$[\text{4 } 8 \text{ 1}] \text{C}_6\text{H}_4(\text{NH}_2)(\text{NO}_2) \text{C}_6\text{H}_4(\text{NO}_2)(\text{NH}_2) [\text{1 } 2\text{or } 3 \text{ 4}]$
Di nitro benzidine [214°] Formed by stirring KNO_3 (20 g) into benzidine sulphate (28 g) dissolved in H_2SO_4 (300 g) (Tauber, *B* 23, 795) Yellow plates (from alcohol) Its azo compounds do not dye cotton

NITRO-AMIDO-PHENYL-ACETIC ACID

$\text{C}_6\text{H}_4\text{N}_2\text{O}_6$, $\pm \text{C}_6\text{H}_4(\text{NO}_2)(\text{NH}_2) \text{CH CO}_2\text{H}$ [2 4 1] [186°] Formed by reducing (4,2,1) di nitro-phenyl acetic acid with aqueous ammonium sulphide (Gabriel & Meyer, *B* 14, 824) Reddish yellow needles, v sol hot water and alcohol, sl sol ether. Forms salts with acids and bases — $\text{HA}'\text{HCl}$ colourless needles

Methyl ether MeA' [94°]

Ethyl ether EtA' [100°] Yellow needles

Nitro-amido-phenyl-acetic acid

$\text{C}_6\text{H}_4(\text{NO}_2)(\text{NH}_2)\text{CH}_2\text{CO}_2\text{H}$ [3 4 1] [144°] Prepared by saponification of its nitrile (nitro amido benzyl cyanide) by boiling with HCl (Gabriel, *B* 15, 836) Orange-yellow plates or needles Sol alcohol and ether, insol CS_2 . By the action of amyl nitrite and HCl it gives (3,4,1) nitro diazo- nitroso toluene $\text{C}_6\text{H}_4(\text{N}_2\text{Cl})(\text{NO})(\text{CH NO})$

Nitrile $\text{C}_6\text{H}_4(\text{NO}_2)(\text{NH}_2) \text{CH CN}$ [118°] Formed by saponifying its acetyl derivative with potash Orange plates, sol water and alcohol

Acetyl derivative of the nitrile

$\text{C}_6\text{H}_4(\text{NO}_2)(\text{NHAc}) \text{CH CN}$ [113°] Formed by nitrating $\text{C}_6\text{H}_4(\text{NHAc}) \text{CH}_2\text{CN}$ (Gabriel) Flat yellow needles or plates, sol alcohol and hot water

m-Nitro- α -amido-phenyl-acetic acid

$\text{C}_6\text{H}_4(\text{NO}_2) \text{CH}(\text{NH}_2) \text{CO}_2\text{H}$ [172°] Formed by adding HNO_3 (1 mol) to a cold solution of α -amido phenyl acetic acid in H_2SO_4 (Plöchl & Loé, *B* 18, 1179) Silky needles, v sol hot water, insol alcohol — CuA' , pale blue needles

DI-NITRO-AMIDO-DIPHENYLAMINE

$\text{C}_{12}\text{H}_{10}\text{N}_4\text{O}_6$, $\pm \text{C}_6\text{H}_4(\text{NH}_2) \text{NH C}_6\text{H}_4(\text{NO}_2)_2$ [1 2 4] [177°] Formed by the action of chloro di nitro benzene on *p* phenylene diamine in alcoholic solution in presence of NaOAc (Nietzki, *B* 23, 1852) Brownish red plates, sl sol alcohol — $\text{B}'\text{C}_6\text{H}_4(\text{NO}_2)_2\text{OH}$ brown needles

Acetyl derivative $\text{C}_{12}\text{H}_8\text{AcN}_4\text{O}_6$ [238°] Red needles

Di nitro-amido diphenylamine [172°] Formed from *m* phenylene-diamine and $\text{C}_6\text{H}_5\text{Cl}(\text{NO}_2)_2$ (Leymann, *B* 15, 1287)

NITRO - AMIDO - PHENYL - ISOBUTYRIC

ACID $\text{C}_6\text{H}_4\text{N}_2\text{N}_2\text{O}_6$, $\pm \text{C}_6\text{H}_4(\text{NO}_2)(\text{NH}_2) \text{CH}_2\text{CHMe CO}_2\text{H}$ [138°] Formed by reducing di-nitro isobutyric acid with ammonium sulphide (Edeleanu, *C. J* 53, 559) Bright red plates Reduced by long boiling with ammonium sulphide to the compound

$[\text{1 } 5] \text{C}_6\text{H}_4(\text{NH}_2) \text{CH}_2\text{CHMe CO}_2\text{H}$ [216°]

p NITRO - o AMIDO-PHENYL-CARBAMIC ETHER $\text{C}_6\text{H}_4(\text{NO}_2)(\text{NH}_2) \text{NH.CO}_2\text{Et}$ [4 2 1]

[162°] Formed by reduction of di-nitro phenyl-urethane with hot aqueous NH_4HS (Hager, *B* 17, 2630) Orange red needles or prisms. V sol alcohol, v sl sol water On heating above its melting point it loses EtOH , and is converted into nitro phenylene urea with the formula $\text{C}_6\text{H}_4(\text{NO}_2) \text{<NH>CO}$

NITRO - AMIDO - PHENYL - ETHANE ν

NITRO AMIDO ETHYL BENZENE

NITRO-AMIDO DI-PHENYL-ETHYLENE $\text{C}_{12}\text{H}_{12}\text{N}_2\text{O}_6$, $\pm \text{C}_6\text{H}_4(\text{NO}_2) \text{CH CH C}_6\text{H}_4\text{NH}_2$ [230°] Formed by reducing di nitro-di-phenyl-ethylene with alcoholic ammonium sulphide (Strakosch, *B* 6, 329) Purple plates (from nitrobenzene) — BHCl silky needles, decomposed by water

Nitro-amido-di-phenyl-ethylene

$[\text{2 } 1] \text{C}_6\text{H}_4(\text{NO}_2) \text{CH CH C}_6\text{H}_4(\text{NH}_2)$ [1 2] Formed by reducing di o nitro stilbene, formed by the action of alcoholic potash on o nitro benzyl chloride (Bischoff, *B* 21, 2077) Amorphous mass, sol ether and alcohol

Di-nitro-amido phenyl ethylene ν **DI NITRO-AMIDO STYRENE**

p NITRO - DI-p-AMIDO-TRI - PHENYL - METHANE $\text{C}_6\text{H}_4(\text{NO}_2) \text{CH}(\text{C}_6\text{H}_4\text{NH}_2)_2$ Prepared by heating aniline sulphate (28 pts) with *p*-nitro benzoic aldehyde (15 pts) and ZnCl_2 (20 pts) at 100° (Fischer, *B* 15, 677) Large garnet red crystals (containing C_6H_5) Yields paralucaniline on reduction with zinc and HCl — $\text{B}''\text{H}_2\text{Cl}_2$ needles

m Nitro-di-p amido-tri-phenyl-methane

$[\text{3 } 1] \text{C}_6\text{H}_4(\text{NO}_2) \text{CH}(\text{C}_6\text{H}_4\text{NH}_2)_2$ [136°] Prepared by heating *m* nitro benzoic aldehyde with aniline hydrochloride and ZnCl_2 (Fischer & Ziegler, *B* 13, 671) Light yellow crystals, sol ether Crystallises with C_6H_5 in yellow concentric crystals [81°]

NITRO AMIDO-PHENYL-(α)-NAPHTHYLAMINE $\text{C}_{16}\text{H}_{13}\text{N}_3\text{O}_6$, $\pm \text{C}_{10}\text{H}_7\text{NH C}_6\text{H}_4(\text{NO}_2) \text{NH}_2$ [1 4 2] [147°] Formed by reducing di nitro phenyl (α) naphthylamine with alcoholic ammonium sulphide (Heim, *B* 21, 2302) Dark yellow needles (from dilute alcohol) Gives a dark green solution in H_2SO_4

Nitro-amido phenyl-(β)-naphthylamine

$\text{C}_{16}\text{H}_{13}\text{NH C}_6\text{H}_4(\text{NO}_2) \text{NH}_2$ [1 4 2] [195°] Formed by reducing di nitro phenyl (β) naphthylamine (Heim, *B* 21, 590) Needles or prisms, m sol alcohol Dyes silk golden yellow Conc H_2SO_4 forms a yellow solution turned green by heating

Acetyl derivative $\text{C}_{16}\text{H}_{11}\text{AcN}_2\text{O}_6$ [200°] Orange red needles (from alcohol)

p NITRO - α AMIDO-PHENYL-PROPIONIC ACID $\text{C}_6\text{H}_4\text{N}_2\text{N}_2\text{O}_6$, $\pm \text{C}_6\text{H}_4(\text{NO}_2) \text{CH}_2\text{CH}(\text{NH}_2) \text{CO}_2\text{H}$ Formed from α amido phenyl propionic acid, H_2SO_4 , and HNO_3 (Erlenmeyer & Lipp, *A* 219, 213) Fluffy white mass (from alcohol), or prisms in stars (containing 14aq) (from water) Sl sol alcohol, m sol water, insol ether, v sol ammonia. Neutral to litmus Bitter-sweet taste Turns brown at 220°, decomposes at 240°-245° Gives, on oxidation by chromic mixture, *p*-nitro-benzoic acid Boiled with KOH it gives off NH_3 — $\text{HA}'\text{HCl}$ Needles in rosettes — CuA' , 2aq

Nitro amido- β -phenyl-propionic acid

$[\text{3.4.1}] \text{C}_6\text{H}_4(\text{NO}_2)(\text{NH}_2) \text{C}_6\text{H}_4 \text{CO}_2\text{H}$ **Nitro amido- β -phenyl-propionic acid**

hydrocinnamic acid. [145°] Red crystals
Sol water, alcohol, ether, and benzene The
acetyl derivative is formed by nitration of *p*-
amido β phenyl-propionic acid

Acetyl derivative [174°] Long yellow
needles Sol alcohol and benzene, sl sol cold
water and ether (Gabriel, *B* 15, 844)

Nitro-amido-phenyl-propionic acid
[2 4 1] $C_6H_4(NO_2)(NH_2)CH_2CH_2CO_2H$. [189°].
Prepared by reduction of di nitro phenyl propi-
onic acid with aqueous ammonium sulphide
(Gabriel & Zimmernann, *B* 12, 601) Plates
or flat needles Sol alcohol, ether, and acetic
acid, insol CS₂

Di-nitro-amido β -phenyl-propionic acid
[5 3 4 1] $C_6H_4(NO_2)_2(NH_2)CH_2CH_2CO_2H$ [194°]
Formed by heating $C_6H_4(NO_2)(OMe)CH_2CH_2CO_2H$
with ammonia in sealed tubes at 100° (Stöhr, *A*
225, 87) Yellow needles, v sl sol water
Does not form salts with acids.— NH_4A' —
BaA', 1:4aq

Methylether MeA' [102°]

Ethyl ether EtA' [95°]

DI-NITRO-AMIDO-PHENYL-TOLYL-AMINE
 $C_6H_4(NH_2)NHOC_6H_4(NO_2)_2$ [184°] Formed
from tolylene-diamine [99°] and $C_6H_4Cl(NO_2)_2$
(Leymann, *B* 15, 1287). Red tables

Formyl derivative [157°]

Acetyl derivative [164°]

***p*-NITRO-DI-*o*-AMIDO-PHENYL-DI-TOLYL-
METHANE** $C_6H_4(NO_2)CH(C_6H_4NH_2)_2$

(α)-Isomeride [172°] Formed from *p* nitro-
benzoic aldehyde, *p* toluidine, HClAq and alcohol
(Bischler, *B* 20, 3302) Crystallises from
benzene in needles (containing C_6H_6), v sl sol
cold alcohol —B'H₂PtCl₆

(β)-Isomeride [127°] Formed from *p*-nitro-
benzoic aldehyde, *p* toluidine, and conc H₂SO₄
(Bischler, *B* 20, 3304) Yellow plates, v sol
benzene and warm alcohol, sl sol ligroin —
B'H₂Cl₆—B'H₂PtCl₆

Di-acetyl derivative [136°]

Di-benzoyl derivative [152°]

***m*-Nitro-di-*o*-amido-phenyl-di-tolyl-methane**
[3.1] $C_6H_4(NO_2)CH(C_6H_4NH_2)_2$

(α)-Isomeride [128°] Formed by the action
of HCl on a mixture of *m* nitro benzoic aldehyde
and *p*-toluidine

(β)-Isomeride [86°] Formed from *m*-nitro-
benzoic aldehyde, *p* toluidine and H₂SO₄
(Bischler, *B* 21, 3207) Yellowish needles, v
sol hot alcohol —B'H₂PtCl₆

Di-acetyl derivative [104°]

Di-benzoyl derivative [148°]

***p*-Nitro-di-*m*-amido-phenyl-di-tolyl-methane**
[4 1] $C_6H_4(NO_2)CH(C_6H_4NH_2)_2$ Prepared by
heating *o*-toluidine sulphate with *p* nitro-benzoic
aldehyde and ZnCl₂ at 100° (Fischer, *B* 15,
679) Small yellow crystals (containing C_6H_6)

***m*-NITRO-DI-AMIDO-PHENYL-DI-XYLYL-
METHANE** $C_6H_4(NO_2)CH(C_6H_4MeNH_2)_2$ [92°].
Formed by condensing *m* nitro benzoic alde-
hyde with *m*-xyldine (Bischler, *B* 21, 3216).
Plates —B'H₂Cl₆, yellow plates —B'H₂PtCl₆

Acetyl derivative [132°] Needles

Benzoyl derivative [186°]

***p*-Nitro-di-*o*-amido-phenyl-di-xylyl-methane**
 $C_6H_4(NO_2)CH(C_6H_4MeNH_2)_2$ [90°] Formed
by condensing *p*-nitro-benzoic aldehyde with
m-xyldine by H₂SO₄ (B) Yellow needles.—
B'H₂Cl₆—B'H₂PtCl₆

Di-acetyl derivative. [88°]

Di-benzoyl derivative [192°] Needles

**DI-NITRO-DI-AMIDO-DIPHENYL SUL-
PHONIC ACID**

$C_6H_4(NO_2)(NH_2)C_6H_4(NO_2)(NH_2)SO_3H$ [1 3 4 5]
Obtained from di-acetyl di amido-diphenyl sul-
phonic acid by nitration and saponification
(Zehra, *B* 23, 3460) —KA' aq

Di-acetyl derivative Yellow needles

***s*-DI-NITRO-DI-AMIDO-QUINONE**

$C_6(NO_2)_2(NH_2)_2O$ [1 4 2 5 3 6] Prepared by dis-
solving *s* di amido di-amido benzene nitrate
 $C_6H_4(NH_2)(NH_2)(HNO_2)_2$ (1 pt) in conc H₂SO₄
(15 to 20 pts) at about 10° On adding lumps
of ice to the mixture, the compound crystallises
out in dark-yellow needles It is practically
insoluble in all indifferent solvents Very weak
base, whose salts are readily decomposed by
water By warming with dilute KOH, ammonia
is evolved, and the K salt of nitranilic acid
 $C_6(NO_2)_2(OK)_2O$ separates out Bystannouschlor-
ide it is reduced to tetra amido hydroquinone
 $C_6(NH_2)_4(OH)_2$ [1 2 4 5 3 6] (Nietzki, *B* 20, 2115)

NITRO-AMIDO-RESORCIN $C_6H_4N_2O_4$ *res*
 $C_6H_4(NO_2)(NH_2)(OH)_2$ [170°] Formed by re-
duction of di nitro resorcin with ammonium
sulphide (Benedikt & Hubl, *M* 2, 325) Dark-
brown crystals, sl sol water, v sol alcohol.—
B'H₂SO₄, needles

Di nitro-amido resorcin

$C_6H_4(NO_2)_2(NH_2)(OH)_2$ [190°] Obtained by re-
ducing tri nitro-resorcin (styphnic acid) with
alcoholic ammonium sulphide (B a H) Cop-
pery leaflets, insol water, sl sol alcohol

DI-NITRO-*p*-AMIDO-STYRENE

$C_6H_4(NO_2)(NH_2)CHCH(NO_2)$ Formed by ni-
trating *p* amido cinnamic acid, CO₂ being split
off (Friedländer & Lazarus, *A* 229, 247)
Slender reddish brown needles (from alcohol).
Conc H₂SO₄ gives off CO₂ forming a nitro amido-
benzoic aldehyde

Acetyl derivative [252°]

Di nitro-amido styrene

$C_6H_4(NO_2)(NH_2)C_6H_4$ *Acetyl derivative*.
[212°], needles, sl alcohol and acetic acid, sl
sol hot water, nearly insol ether, formed by
nitration of acetyl *p*-amido cinnamic acid
(Gabriel & Herzberg, *B* 16, 2041)

NITRO-AMIDO-TOLUENE *v* NITRO TOLU-
IDINE

**NITRO-AMIDO-TOLUENE *exo* SULPHONIC
ACID** $C_6H_4(NO_2)(NH_2)CH_2SO_3H$ Formed by
reducing $C_6H_4(NO_2)_2CH_2SO_3H$ by NH₃ and H₂S
(Mohr, *A* 221, 226) Needles, sol water —KA'.
—BaA', 2aq

Nitro-amido toluene sulphonic acid

$C_6H_4Me(NO_2)(NH_2)SO_3H$ [1 2 4 5] *S* 17 at
11° Obtained by sulphonating (2,1,4)-nitro-
toluidine (Foth, *A* 230, 300) Yellow needles
(from water) —KA' aq —BaA', 4aq

Nitro-amido-toluene sulphonic acid

$C_6H_4Me(NO_2)(NH_2)SO_3H$ [1 3 2 5] Formed from
acetyl-*o*-toluidine by successive sulphonation and
nitration (Nietzki & Pollini, *B* 23, 138)

NITRO-AMIDO-*p*-TOLUIC ACID

$C_6H_4Me(NO_2)(NH_2)CO_2H$ [1 2 3 4] [245°].
Formed by saponifying its acetyl derivative
(Niementowski, *J* pr [2] 40, 27) Yellow needles,
sol hot water —KA' 2aq reddish-yellow needles

Acetyl derivative [210°] Formed from

acetyl-amido toluic acid and HNO_3 in the cold. Yellow needles, insol water

Nitro-amido toluic acid

$\text{C}_6\text{H}_4\text{Me}(\text{NO}_2)(\text{NH}_2)\text{CO}_2\text{H}$ [1 2 4 5] [236^o]. Formed by heating bromo nitro-toluic acid with alcoholic NH_3 at 180° (Fileti & Cross, *G* 18, 298). Silky yellow needles (containing aq)

DI-NITRO-DI-AMIDODE-DITOLYL [3 5 4 1]

$\text{C}_6\text{H}_4\text{Me}(\text{NO}_2)(\text{NH}_2)\text{C}_6\text{H}_4\text{Me}(\text{NO}_2)(\text{NH}_2)$ [1 3 5 4] [267^o]. Formed by saponifying its acetyl derivative (Gerber, *B* 21, 746). Garnet red needles

Di-acetyl derivative

Obtained from di-amido-ditolyl Crystals, decomposing at 320°

NITRO-AMIDO-XYLENE v Nitro-XYLIDINE

NITRO-AMIDO-XYLENE SULPHONIC ACID

$\text{C}_6\text{H}_4\text{N}_2\text{SO}_3$ *vs* $\text{C}_6\text{H}_4\text{Me}_2(\text{NO}_2)(\text{NH}_2)\text{SO}_3\text{H}$ [1 3 2or5 4 6]. Formed by nitration of *m* xylidine sulphonic acid (Sartig, *A* 230, 838). Slender needles (from water), sl sol cold water, insol alcohol— $\text{KA}'1\frac{1}{2}\text{aq}$ — $\text{BaA}'1\frac{1}{2}\text{aq}$ — $\text{PbA}'2\text{aq}$

NITRO-AMYLENE $\text{C}_6\text{H}_4\text{NO}_2$ *vs*

$\text{CH}_3\text{CH}(\text{NO}_2)\text{C}_6\text{H}_4$. Formed from allyl iodide and potassium nitro ethane (Gal, *J* 1873, 833). Oil. May be reduced to $\text{C}_6\text{H}_5\text{NH}_2$ (85°)

Nitro amylene $\text{CH}_3\text{C}(\text{NO}_2)\text{CMe}_2$ [166°–170°]. Formed from di methyl ethyl carbinol and conc HNO_3 (Hattinger, *M* 2, 289). Oil, sol alcohol and ether. Dissolves in alkalis and gives a blue colour with KNO_3 and H_2SO_4 . On heating with HClAq it gives NH_3 , hydroxylamine, and acetic acid. On heating with water it yields nitro ethane and a ketone. NaOEt gives a yellow pp

NITRO ANILIC ACID v DI-NITRO DI OXYQUINONE

o NITRO ANILINE $\text{C}_6\text{H}_4\text{N}_2$ *vs*

$\text{C}_6\text{H}_4(\text{NO}_2)\text{NH}_2$ [2 1] *o* Nitraniline Mol w 138 [71 57]

Formation—1 By heating *o* bromo nitro benzene with alcoholic NH_3 (Walker & Zincke, *B* 5, 114)—2 Together with *p* nitro-aniline by nitration of acetanilide and saponification of the product (Körner)—3 By heating *o*-nitro-anisole $\text{C}_6\text{H}_4(\text{NO}_2)(\text{OMe})$ with ammonia at 200° (Salkowski, *A* 174, 278)—4 By reduction of *o* di-nitro benzene (Rinne & Zincke, *B* 7, 1374)—5 By nitration of benzanilide and saponification of the product (Lellmann, *A* 221, 6)

Preparation—1 By splitting off the HSO_3 group from *o* nitro-aniline *p*-sulphonic acid by heating it with HCl under pressure. The sulphonic acid can be very readily prepared by sulphonation and nitration of acetanilide (Nietzki & Benckiser, *B* 18, 294)—2 Twelve pts of *o*-nitro phenol are heated with 20 pts of aqueous NH_3 (35 p c) at 160°–170° for 16 hours, the product is crystallised from water, the yield being about 60 p c of the *o* nitro phenol employed (Merz & Ruz, *B* 19, 1749)

Properties—Orange needles, m sol hot water, v sol alcohol, v e sol ether. Volatile with steam. Does not combine with chlorinated quinones (Niemeyer, *A* 228, 322)

Salts— B'HOI plates. Decomposed by water into HCl and *o*-nitro aniline

Formyl derivative $\text{C}_6\text{H}_4(\text{NO}_2)(\text{NHCHO})$

[122°]. Needles (Hübner & Herff, *A* 209, 867).

Acetyl derivative $\text{C}_6\text{H}_4(\text{NO}_2)(\text{NEAc})$

[93°]. Yellow plates, m sol cold water

Propionyl derivative [65°] (Smith, *Am*

6, 179)

Benzoyl derivative [94°] Needles

Oxalyl derivative v Oxalic acid

m Nitro-aniline $\text{C}_6\text{H}_4(\text{NO}_2)\text{NH}_2$ [3 1] [114°] (285°) *S* 114 at 20°, *S* (alcohol) 705 at 20° (Carnelley & Thomson, *C* *J* 53, 786)

Formation—1 By reducing *m*-di nitro-benzene with H_2S and alcoholic ammonia (Hofmann & Muspratt, *A* 57, 204; Beilstein & Kurbatoff, *A* 176, 44)—2 Together with *p* nitro-aniline by adding HNO_3 to a solution of aniline in H_2SO_4 (Hübner, *A* 208, 299)

Preparation—A solution of SnCl_2 (3 mols) in alcohol saturated with HCl is slowly allowed to drop into a well cooled alcoholic solution of *m*-di nitro benzene (1 mol) with continual agitation (Anschutz & Heusler, *B* 19, 2161)

Properties—Long yellow needles. Colours pine wood yellow. Gives no colour with bleaching powder

Reactions—1 Cyanogen passed into its alcoholic solution forms a compound with formula $\text{C}_6\text{H}_4(\text{NO}_2)\text{NH}(\text{CN})(\text{NH})(\text{CN})\text{C}_6\text{H}_4\text{NO}_2$ (Senf, *J* pr [2] 35, 530)—2 Cyanogen iodide forms a green pp of $(\text{C}_6\text{H}_4(\text{NO}_2)\text{NH})_2\text{C}$ [286°] (Hübner, *B* 10, 1719)—3 Silver nitrate forms a compound $(\text{C}_6\text{H}_4(\text{NO}_2)(\text{NH}_2))_2\text{AgNO}_3$ [125°] when added to its alcoholic solution (Mixer, *Am* 1, 239)—4 Chlorinated quinones dissolved in benzene form dark green crystalline additive compounds (Niemeyer, *A* 228, 322)

Salts— B'HOI Pearly crystals, v e sol water— $\text{B'H}_2\text{PtCl}_6$ Yellow powder, v e sol water and alcohol— B'HB'r plates (Staedel & Bauer, *B* 19, 1940)— $\text{B'H}_2\text{C}_2\text{O}_4$ crystals

Acetyl derivative $\text{C}_6\text{H}_4(\text{NO}_2)(\text{NHAc})$ [150°] (Meldola & Salmon, *C* *J* 53, 778, [143°] (Meyer & Stuber, *A* 165, 183) Prisms

Benzoyl derivative [156°] Plates

p Nitro-aniline $\text{C}_6\text{H}_4(\text{NO}_2)(\text{NH}_2)$ [4 1] [147°] *S* 077 at 20°, *S* (alcohol) 584 at 20° (Carnelley & Thomson, *C* *J* 53, 786)

Formation—1 By nitration of the anilides of tartaric, succinic, or acetic acid, the product being saponified (Arppe, *A* 90, 147, 93, 157, Hofmann, *Fr* 10, 589, 12, 639), the *o* nitro aniline, which is formed at the same time, may be removed by steam distillation (Körner)—2 By heating [4 1] $\text{C}_6\text{H}_4(\text{NO}_2)(\text{OMe})$ with ammonia at 200° (Salkowski, *A* 174, 281)—3 By reduction of *p*-di nitro-benzene (Zincke & Rinne, *B* 7, 871)—4 By heating *p* chloro nitro-benzene with ammonia (Engelhardt & Latschinoff, *Z* 1870, 232)—5 By heating *p*-nitrophenol (6 pts) with aqueous NH_3 (20 pts) at 190°–200° for several hours, the yield being 58 p c (Merz & Ruz, *B* 19, 1753).

Preparation—1 Equal volumes of HNO_3 (*S* *G* 142) and H_2SO_4 are mixed and cooled. Acetanilide is gradually added as long as it will dissolve. The cold solution is set aside for half an hour, then poured into water, and the nitro compound crystallised from boiling water. The nitro acetanilide is saponified by boiling NaOH , and the nitraniline crystallised from water (Meldola, *C* *J* 43, 427)—2 1 kilo of acetanilide is slowly dissolved in 4 kilos of H_2SO_4 , kept cool by standing the vessel in a stream of cold water 590 grms of HNO_3 of *S* *G* 1478 (= 85 p c), or the corresponding quantity of ordinary HNO_3 (142) diluted with 1200 grms of H_2SO_4 is then very gradually run in, taking care that the tem-

perature does not rise above 20° After standing, the product is poured into cold water, and the yellow pp of nitroacetanilide which separates is filtered off and saponified by boiling with strong HCl The yield is very satisfactory (Nöling & Collin, *B* 17, 262, *B* J Friewell, *priv com*)

Properties—Long monoclinic needles (from water) May be readily sublimed Not volatile with steam Weak base, its salt being decomposed by water Does not combine with chlorinated quinones Cyanogen iodide at 120° forms $(C_6H_4(NO_2)_2NH)_2C$ (above 300°) (Hubner)

Salts— $BHCl$ — $B \cdot H_2PtCl_4$

Formyl derivative $C_6H_4(NO_2)(NHCHO)$ [194°] Formed from formanilide and fuming HNO_3 at -17° (Osborn & Mixer, *Am* 8, 346)

Acetyl derivative $C_6H_4(NO_2)(NHAc)$ [207°] Formed by nitrating acetanilide Prisms Gives *p* nitro phenol when boiled with conc KOHAq (Wagner, *B* 7, 76)

Benzoyl derivative [199°] Needles

Di nitro aniline $C_6H_3N_2O_4$, *ie* $C_6H_3(NO_2)_2(NH_2)$ [6 2 1] Mol w 188 [138°] S (95 p c alcohol) 52 at 12° Obtained by heating the methyl or ethyl ether of *c*-di-nitro phenol with aqueous ammonia (Salkowski & Rehs, *B* 7, 370, *A* 174, 273) Yellow needles Yields *m*-di nitro benzene on elimination of NH_3

Acetyl derivative $C_6H_3(NO_2)_2(NHAc)$ [197°]

Di-nitro aniline $C_6H_3(NO_2)_2(NH_2)$ [4 2 1] [176°] (Barr), [188°] (Hentschel, *J pr* [2] 34, 427) S (95 p c alcohol) 76 at 21° (S), (88 p c alcohol) 58 (Rudneff, *Z* 1871, 202)

Formation—1 By the action of alkalis on di nitro phenyl citraconimide (Gottlieb, *A* 85, 17) —2 By heating (1,2,4) chloro di nitro benzene with alcoholic ammonia (Clemm, *J pr* [2] 1, 145) —3 By heating [4 2 1] $C_6H_3(NO_2)_2(OMe)$ with NH_3 Aq at 100° (Salkowski, *B* 5, 872, 6, 139) —4 By heating (4,2,1) di-nitro phenol (3 g) with ammonia (10 c c of 27 p c) for 16 hours at 175° (Barr, *B* 21, 1542)

Properties—Light yellow prisms, v sl sol boiling water Does not form salts

Reactions—1 Elimination of NH_3 yields *m*-di nitro-benzene —2 Conc KOHAq forms di-nitro phenol [114°] (Willgerodt, *B* 9, 979) —3 Alcoholic KCy added slowly forms di nitro amido phenol [225°] (Lippmann & Fleissner, *M* 7, 95)

Acetyl derivative $C_6H_3(NO_2)_2(NHAc)$ [120°] Formed by nitration of acetanilide (Rudneff, *Z* 1871, 202, Ladenburg, *B* 17, 148)

Tri-nitro aniline $C_6H_2N_3O_6$, *ie* $C_6H_2(NO_2)_3(NH_2)$ [6 4 2 1] *Picramide* Mol w 228 [188°] Formed by the action of ammonia on (1,2,4,6)-chloro-tri nitro benzene (Pisani, *A* 92, 836) or on picric ethers (Liebemann & Palm, *B* 8, 278) Formed also by dissolving *p*-bromo aniline in cooled HNO_3 (S G 1 5) (Hager, *B* 18, 2578) Yellow plates with blue shimmer (from alcohol) or monoclinic tables (from HOAc) Tin and HCl reduce it to tri-amido phenol (Hepp, *A* 215, 350) Nitrous ether does not attack it. Boiling potash yields picric acid

Combinations— $(C_6H_3N_3O_6)C_6H_5$ Yellow prisms, which separate from its solution in benzene (Mertens, *B* 11, 843)— $B \cdot C_6H_5$ — $B \cdot C_6H_4H_2$ — $B \cdot C_6H_4NH_2$ [124°] (Hepp, *Bl* [2] 80, *A* 215, 350)

References—BROMO, CHLORO, and IODO

NITRO-ANILINE

NITRO ANILINE-SULPHONIC ACID *v*.

NITRO-AMIDO BENZENE-SULPHONIC ACID

NITRO-ANISIC ACID *v* *Methyl derivative of* NITRO OXY BENZOIC ACID

NITRO-ANISOLE *v* *Methyl ether of* NITRO-PHENOL

NITRO ANTHRAQUINONE $C_{14}H_8N_2O_4$, *ie*

$C_6H_4 \begin{smallmatrix} \diagup CO \\ \diagdown CO \end{smallmatrix} C_6H_4(NO_2)_2$ [2 3] Mol w 253

[220°] Prepared by nitrating anthraquinone dissolved in H_2SO_4 by HNO_3 in the cold (Roemer, *B* 15, 1786, Liebermann, *B* 16, 54) Yellow plates (by sublimation) or prismatic needles (from HOAc), sol benzene, aniline, and chloro form, sl sol alcohol and ether On reduction and treatment with nitrous acid it yields erythro oxy anthraquinone

Nitro anthraquinone $C_6H_4 \begin{smallmatrix} \diagup CO \\ \diagdown CO \end{smallmatrix} C_6H_4NO_2$

[1 4] [230°] Formed by boiling anthraquinone for half an hour with HNO_3 (S G 1 5) (Böttger & Petersen, *J pr* [2] 6, 367, *B* 6, 20, *A* 166, 147) Formed also by nitration of di bromo anthracene (Claus & Hertel, *B* 14, 978) Yellow needles (by sublimation), insol water, v sl sol ether and alcohol, m sol benzene and HOAc Yields alizarin on fusion with potash Conc H_2SO_4 (12 pts) at 200° forms 'imido oxy anthraquinone' $C_{14}H_7N_2O_4$, which sublimes in rose coloured needles

Di-nitro-anthraquinone $C_{14}H_6N_2O_6$, *ie*

$[3 \frac{1}{2}] C_6H_3(NO_2)_2 \begin{smallmatrix} \diagup CO \\ \diagdown CO \end{smallmatrix} C_6H_3(NO_2)_2$ [2 6] Mol w 298 [above 300°] Prepared by allowing anthraquinone (10 g) dissolved in H_2SO_4 mixed with HNO_3 (10 g of S G 1 48) to stand for several days It is also formed by nitrating *o* nitro anthraquinone (Roemer, *B* 16, 363) Yellow crystals (by sublimation), sol nitro benzene, sl sol xylene and HOAc, nearly insol alcohol and ether On reduction and treatment with nitrous acid it yields di oxy anthraquinone (anthrarufin) On heating with H_2SO_4 at 200° it yields four colouring matters, $C_{14}H_7N_2O_5$, $C_{14}H_7N_2O_6$, $C_{14}H_6N_2O_7$, and $C_{14}H_5N_2O_8$

Di nitro anthraquinone $C_{14}H_6N_2O_6$ [256°–260°] Formed by boiling anthraquinone with a mixture of equal volumes of H_2SO_4 and HNO_3 (S G 1 5), or by boiling anthracene with fuming nitric acid (Böttger & Petersen, *A* 160, 147, 166, 154) Minute monoclinic, almost colourless, crystals, insol water, sl sol alcohol, v sl sol ether H_2SO_4 converts it at 200° into violet 'di imido di oxy-anthraquinone' $C_{14}H_4N_2O_8$

Di nitro-anthraquinone $C_{14}H_6N_2O_6$, *Fritzsche's Reagent* [280°] Formed, together with anthraquinone, by heating anthracene with di lute nitric acid at 90° On crystallisation from alcohol it separates first (Fritzsche, *N Petersb Acad Bull* 22, 43, *Z* 1869, 114, *cf* Anderson, *A* 122, 302) Prepared by adding HNO_3 (30 g) to a solution of chrysene (50 g) containing anthracene in alcohol (5,000 c c), and heating on a water-bath The crystals of the chrysene compound (*v infra*) which then separate are oxidised by CrO_3 in HOAc, which attacks the chrysene and leaves the di nitro anthraquinone (Schmidt, *J pr* [2] 9, 268)

Properties—Yellow needles (from boiling HOAc), v sl sol alcohol and ether. Sublimes in colourless serrated plates. Forms very characteristic compounds with aromatic hydrocarbons. H_2SO_4 at 200° forms $\text{C}_{12}\text{H}_8\text{N}_2\text{O}_4$, a black powder.

Combinations— $\text{C}_{12}\text{H}_8\text{N}_2\text{O}_4(\text{PhCH CHPh})$: orange red plates— $\text{C}_{12}\text{H}_8\text{N}_2\text{O}_4(\text{C}_{10}\text{H}_8)$ violet monoclinic laminæ, obtained by dissolving di-nitro anthraquinone (9 pts) and anthracene (10 pts) in crude xylene (100 pts)—With chrysene $\text{C}_{18}\text{H}_{12}\text{N}_2\text{O}_4(\text{C}_{18}\text{H}_{12})$ Slender red needles [294°], sl sol boiling HOAc

NITRO ANTHRAQUINONE CARBOXYLIC ACID $\text{C}_{14}\text{H}_6\text{O}_4(\text{NO}_2)_2\text{CO}_2\text{H}$ [above 300°] Formed by nitration of anthraquinone carboxylic acid (Liebemann a Glock, B 17, 891) Small needles. Dissolves in H_2SO_4 with a violet colour

(a) **NITRO ANTHRAQUINONE SULPHONIC ACID** $\text{C}_{14}\text{H}_6\text{NSO}_6$, H_2NSO_6

$\text{C}_6\text{H}_4 \begin{array}{c} \text{CO} \\ \diagup \quad \diagdown \\ \text{CO} \end{array} \text{C}_6\text{H}_4(\text{NO}_2)(\text{SO}_3\text{H}) \left[\begin{array}{c} 1 \\ 6 \end{array} \begin{array}{c} 2 \\ 3 \end{array} \right]$ [255° uncor] Prepared by nitration of anthraquinone sulphonic acid with a mixture of HNO_3 (15) and H_2SO_4 , the (β) isomeric acid which is formed simultaneously remains dissolved whilst the α acid separates out (Claus, B 15, 1514, 17, 1276, Lufschütz, B 17, 899, cf Liebemann, B 16, 55) Small white plates (from dilute HNO_3) or very fine silky needles (from hot water) Strong acid. On fusion with KOH it gives alizarin

Salts—A'Na aq long needles, sol hot water, nearly insol cold water and alcohol—A'K small needles—A'NH₄ aq felted needles—A'Ca microscopic needles, sl sol water—A'Ba needles

Chloride [194° uncor] Yellow concentric needles. Nearly insol alcohol and ether

(β) **Nitro-anthraquinone sulphonic acid** $\text{C}_{14}\text{H}_6\text{O}_4(\text{NO}_2)(\text{SO}_3\text{H})$ [250° uncor] Crystalline powder. V sol water and alcohol. Strong acid. Formed as above. Fusion with KOH gives no alizarin

Salts—K, Na, and NH₄ salts are extremely soluble—A'Ba 3½ aq needles—A'Pb 2 aq white needles (Claus, B 15, 1516)

Nitro anthraquinone (α) di sulphonic acid [182°] Formed by nitration of the lead salt of anthraquinone-(α) di sulphonic acid with HNO_3 and H_2SO_4 (Claus a Schneider, B 16, 907) Yellow prisms. Sol water, alcohol, and acetic acid, insol ether, chloroform, and ligroin

DI NITRO-ANTHERONE $\text{C}_{14}\text{H}_8\text{N}_2\text{O}_4$ [116°] Formed as a by-product in the preparation of hydroanthracene-nitrite by the action of HNO_3 on an acetic acid solution of anthracene-dihydride (Liebemann a Landshoff, B 14, 472) Insol alkalis, sol benzene

DI NITRO DIANTHRYL $\text{C}_{22}\text{H}_{12}\text{N}_2\text{O}_4$, $\text{H}_2\text{N}_2\text{O}_4$
 $\text{NO}_2 \cdot \text{O} \begin{array}{c} \diagup \quad \diagdown \\ \text{C}_6\text{H}_4 \end{array} \text{C} \begin{array}{c} \diagup \quad \diagdown \\ \text{C}_6\text{H}_4 \end{array} \text{CNO}_2$ [337°]

Formed by nitration of dianthryl in acetic acid solution (Gumbel, B 20, 2433) Yellow stellate needles. V sol benzene and chloroform, sl sol alcohol and acetic acid. On reduction it gives di-amido-dianthryl [309°] By CrO_3 and acetic acid it is oxidised readily to anthraquinone. Bromine forms $\text{C}_{22}\text{H}_{10}\text{Br}_2$ [above 300°] (Sechse, B 21, 2512)

NITRO-ARACHIC ACID $\text{C}_{22}\text{H}_{40}(\text{NO}_2)_2\text{O}_2$ [70°] Formed by mixing arachic acid with HNO_3 and H_2SO_4 (Tassinari, B 11, 2031) Sl sol cold alcohol, v sol ether

NITRO-ARBUTIN v ARBUTIN

TETRA-NITRO-AURINE $\text{C}_{11}\text{H}_8(\text{NO}_2)_4\text{O}_8$ [c 140°] Formed by nitration of aurine (Acker mann, B 17, 1625) Brownish-yellow microscopic needles. V sol alcohol, nearly insol water, benzene, chloroform, and ether. Dissolves in alkalis with a dark red colour

Salts—A'Ag, brown pp—A'Ba black powder

Ethyl ether A'Et₂ [c 105°], yellow crystals, v sol alcohol and benzene, insol water and carbonated alkalis

NITRO-AZO- compounds v Azo compounds

Nitro-diazo- compounds v Di-azo compounds

NITRO-AZOXY- compounds v Azoxy compounds

NITRO-BARBITURIC ACID $\text{C}_4\text{H}_4\text{N}_2\text{O}_4$, $\text{H}_4\text{N}_2\text{O}_4$
 $\text{CO} \begin{array}{c} \text{NH CO} \\ \diagup \quad \diagdown \\ \text{NH CO} \end{array} \text{CHNO}_2$ *Dihydruric acid* Formed by the action of nitric acid on hydriuric acid and on barbituric acid (Schlieper, A 56, 23, Baeyer, A 127, 211, 130, 140) Colourless dimetric efflorescent prisms (containing 3 aq), v sol hot water forming an intense yellow solution, m sol alcohol, insol ether. Bromine and water at 100° decompose it into di-bromo barbituric acid and HNO_3 . HIAq reduces it to amido barbituric acid. Its solution gives a white pp with ammonium salts

Salts—The salts are very stable, the acid not being separated by mineral acids— $\text{NH}_4\text{H}_2\text{A}'''$ crystalline pp, v sl sol cold water— $\text{NaH}_2\text{A}'''$ 2 aq silky needles— $\text{KH}_2\text{A}'''$ Ppd by adding HCl to a solution of the acid in potash— $\text{K}_2\text{HA}'''$ yellow needles, insol alcohol and conc KOHAq. Explodes when heated— $\text{BaH}_2\text{A}'''$ Cl aq— $\text{Ca}(\text{H}_2\text{A}')_2$ 4 aq— $\text{Cu}(\text{H}_2\text{A}')_2$ 6 aq— $\text{Fe}(\text{H}_2\text{A}')_2$ 8 aq— $\text{Fe}(\text{H}_2\text{A}')_2$ 9 aq— $\text{AgH}_2\text{A}'''$ aq— $\text{Ag}_2\text{A}'''$

NITRO-BENZALDOXIM v Oxim of Nitrobenzoic aldehyde

NITRO-BENZAMIDE v Amide of Nitrobenzoic acid

m-NITRO BENZAMIDINE

$\text{C}_7\text{H}_7(\text{NO}_2)\text{C}(\text{NH})\text{NH}_2$ Formed from nitrobenzoic imido ethyl ether (Tafel a Enoch, B 23, 1552) Colourless mass (from ether), v sol water—B'HCl [240°] Tables, v sol water

m-NITROBENZAMIDOXIM $\text{C}_7\text{H}_7\text{N}_2\text{O}_4$, $\text{H}_2\text{N}_2\text{O}_4$
 $\text{C}_6\text{H}_4(\text{NO}_2)\text{C}(\text{NOH})\text{NH}_2$ [174°] Formed from m nitro benzonitrile and hydroxylamine (Schopff, B 18, 1063) Orange needles, v sol warm water. ClCO₂Et forms $\text{C}_7\text{H}_7(\text{NO})\text{C}(\text{NH}_2)\text{NO CO}_2\text{Et}$ [158°] Acetic anhydride produces the azoxim

$\text{C}_7\text{H}_7(\text{NO}_2)\text{C} \begin{array}{c} \diagup \quad \diagdown \\ \text{N} \end{array} \text{CMe}$ [109°]—B'HCl—B'H₂PtCl₄

Ethyl ether $\text{C}_7\text{H}_7\text{EtN}_2\text{O}_4$ Prisms—B'HCl **Benzyl ether** $\text{C}_7\text{H}_7(\text{OH}(\text{Ph})\text{N}_2\text{O}_4$ [58°]

p Nitro-benzamidoxim

$\text{C}_7\text{H}_7(\text{NO}_2)\text{C}(\text{NH}_2)\text{NOH}$ [169°] Formed from p-nitro-benzonitrile and hydroxylamine (Weise, B 22, 2418) Yellow needles, sol acids and alkalis. Reduces Fehling's solution and ammoniacal AgNO₃. M sol hot water and alco-

hol Can be distilled With Ac_2O it yields $\text{C}_6\text{H}_4(\text{NO}_2)\text{O} \left\langle \begin{smallmatrix} \text{N} \\ \text{O} \end{smallmatrix} \right\rangle \text{CMe}$ [144°], while aldehyde

forms $\text{C}_6\text{H}_4(\text{NO}_2)\text{C} \left\langle \begin{smallmatrix} \text{N} \\ \text{NH} \end{smallmatrix} \right\rangle \text{O} \text{CH}_2\text{CH}_3$ [158°]

ClCO_2Et produces $\text{C}_6\text{H}_4(\text{NO}_2)\text{C}(\text{NH}_2)\text{NOCO}_2\text{Et}$ [169°], which on heating yields the compound

$\text{C}_6\text{H}_4(\text{NO}_2)\text{C} \left\langle \begin{smallmatrix} \text{N} \\ \text{NH} \end{smallmatrix} \right\rangle \text{CO}$ [286°] Sodium diazo

benzene sulphonate produces the compound

$\text{C}_6\text{H}_4(\text{NO}_2)\text{C} \left\langle \begin{smallmatrix} \text{N} \\ \text{NH} \end{smallmatrix} \right\rangle \text{C}(\text{NH}_2)\text{C}_6\text{H}_4\text{NO}_2$ [151°]

(Stieglitz, *B* 22, 3157) COCl_2 reacts in benzene solution forming $\text{C}_6\text{H}_4(\text{NO}_2)\text{C}(\text{NH}_2)\text{NO}_2\text{CO}$ [283°]— B^*HCl [185°]

Ethyl ether $\text{C}_6\text{H}_4(\text{NO}_2)\text{C}(\text{NH}_2)\text{NOEt}$, [60°] Formed from the Na salt and EtI With nitrous acid it yields $\text{C}_6\text{H}_4(\text{NO}_2)\text{C}(\text{O NO})\text{NOEt}$ [55°]— B^*HCl

NITRO BENZENE $\text{C}_6\text{H}_5\text{NO}_2$. Mol w 123 [8°] (209°) at 745 mm (Brühl, *A* 200, 188) SG ρ 1.2039 (*B*) SV 121.9 (Lossen, *A* 254, 78), 121.5 (Ramsay) $\mu_s = 1.5712$ $R_\infty = 52.64$ Dispersive power Barbier & Roux, *C* R 108, 1249) Formed by nitration of benzene (Mitscherlich, *P* 31, 625) The rate of nitration has been studied by Lothar Meyer (*B* 22, 18) In small quantity by the action of ozonised air on a mixture of sulphuric acid and benzene (*L* Maquenne, *Bl* [2] 37, 298) Formed also by the action of ppd . Cu_2O (1 mol) in the cold upon an aqueous solution of diazo benzene nitrite (1 mol), obtained by slowly adding a solution of 15 g NaNO_2 in 50 cc of water to a mixture of 9 g of aniline, 20 g HNO_3 (1.4), and 50 cc of water When the evolution of nitrogen has ceased the nitro benzene is distilled off with steam, the yield is 42 p.c. of the theoretical (Sandmeyer, *B* 20, 1494)

Preparation—A mixture of nitric acid (100 pts) and H_2SO_4 (115 pts) is run into benzene The product is washed with alkali and distilled

Properties—Oil, v sol alcohol and ether Not attacked by chlorine or bromine in the cold

Reactions—1 For bromination the presence of carriers (FeBr_3 or FeCl_3) are necessary Thus nitrobenzene (10 g) heated with FeBr_3 (3 g) and bromine (4.3 cc) in sealed tubes for 10 hours at 105° gives 65 p.c. of the theoretical amount of *m*-bromo nitro benzene When the same mixture is heated for 30 hours at 120° the product is tetra bromo nitro-benzene (Scheufelen, *A* 231, 158) Bromine at 250° forms $\text{C}_6\text{H}_4\text{Br}_2$ and a little $\text{C}_6\text{H}_3\text{Br}_3$ (Kekulé, *A* 187, 169)—2 *Chlorine* in presence of FeCl_3 forms *m* chloro-nitro benzene and (5,2,1) di chloro-nitro-benzene—3 Not attacked by boiling dilute potash or ammonia. Boiling alcoholic potash forms azoxybenzene—4 Readily reduced to aniline—5 *Chromic oxychloride* forms a powder $\text{C}_6\text{H}_4(\text{NO}_2)(\text{CrO}_2\text{Cl})_2$ decomposed by water with reproduction of nitro benzene (Henderson & Campbell, *C* J 57, 253, cf Étard, *A* Ch [5] 28, 272)—6 Exposed to sunlight in alcoholic solution it is reduced to aniline, aldehyde being formed (Giamman & Silber, *B* 19, 2899, *G*. 16, 536)—7 Conc HClAq at 245° forms di-chloro-aniline (Baumbauer, *A* Suppl 7, 204)—8 Reduced in alcoholic solution by sodium-amalgam

to azo benzene (Werigo, *A* 185, 176, Alexieff, *Bl* [2] 1, 324)

o Di-nitro-benzene $\text{C}_6\text{H}_3(\text{NO}_2)_2$ [1 2] Mol w 168 [118°] S (alcohol) 3.8 at 24.8°, 3.3 at 78°. Formed in small quantity in the preparation of the *m* isomeride, and purified by successive crystallisations from alcohol and HOAc (Rinne & Zincke, *B* 7, 869, Körner, *G* 4, 354, Lobry, *R T C* 2, 239) Long colourless needles (from hot water) or monoclinic tables (from alcohol) (Bodewig, *J* 1884, 464) May be sublimed. Yields on reduction *o* nitro aniline [71°] and *o*-phenylene diamine [99°]

m Di-nitro-benzene $\text{C}_6\text{H}_3(\text{NO}_2)_2$ [1 3] [90°] (Reissert, *B* 23, 2243) (297° cor) (Meyer & Stadler, *B* 17, 2649 note) S (alcohol) 5.9 at 24.8° The chief product of the action of boiling fuming HNO_3 on benzene or nitrobenzene (Dewille, *A* Ch [3] 3, 187, Muspratt & Hofmann, *A* 57, 214) Formed also from (4,2,1)-di nitro aniline by elimination of NH_3 (Rudneff, *Z* 1871, 203) Prepared by adding benzene to a mixture of equal volumes of H_2SO_4 and fuming HNO_3 , and heating until a sample of the oily layer solidifies on cooling The product is poured into water, and the solid crystallised from alcohol (Körner, Beilstein & Kurbatoff, *A* 176, 43)

Properties—Colourless flexible needles, v e sol boiling alcohol Detonates when projected into a red hot tube filled with nitrogen (Berthelot, *A* Ch [6] 16, 24) A mixture with KClO_3 is a powerful explosive (*rackarock*)

Reactions—1 On reduction it yields *m*-nitro aniline [114°] and *m* phenylene diamine (Hofmann, *Pr* 11, 518)—2 Alcoholic KCy forms $\text{C}_6\text{H}_3(\text{NO})_2(\text{OEt})\text{CN}$ (Lobry de Bruyn, *R T C* 2, 205)—3 Alkaline K_2FeCy_4 forms (4,2,1)- and (6,2,1) di nitro phenols (Hepp, *B* 18, 2347, *A* 215, 355)

p-Di-nitro-benzene $\text{C}_6\text{H}_3(\text{NO}_2)_2$ [1 4] [172°] Deposited from the alcoholic mother liquor from which the *m* isomeride has crystallised (Körner) Flat monoclinic needles, sl sol cold alcohol May be sublimed Yields *p*-nitro aniline [146°] and *p* phenylene diamine [140°] on reduction Forms a sparingly soluble compound with naphthalene

o-Tri-nitro-benzene $\text{C}_6\text{H}_2(\text{NO}_2)_3$ [1 2 4] [57.5°] SG ρ 1.173 S (alcohol) 5.4 at 15.5°, S (benzene) 141 at 15.5° Formed by heating *p* di nitro benzene with a mixture of HNO_3 and H_2SO_4 (Hepp, *A* 215, 362, Lobry de Bruyn, *R T C* 9, 190) Yellow crystals Forms with aniline a compound $\text{C}_6\text{H}_4(\text{NO}_2)_3\text{C}_6\text{H}_4\text{NH}_2$ [84°]

Reactions—1 NaOMe in HOMe forms $\text{C}_6\text{H}_3(\text{NO}_2)_2(\text{OMe})$ [4 2 1] [88°]—2 NaOEt forms $\text{C}_6\text{H}_3(\text{NO}_2)_2(\text{OEt})$ [4 2 1] [86°]—3 Boiling aqueous Na_2CO_3 forms (4,2,1) di nitro phenol [112°] 4 Alcoholic NH_3 forms di nitro aniline [175°]

s-Tri-nitro-benzene $\text{C}_6\text{H}_2(\text{NO}_2)_3$ [1 3 5] [122°] Prepared by heating *m* di nitro benzene (40 g) with HNO_3 (120 g) and fuming H_2SO_4 (300 g) for one day at 80° and then for two days at 120°, the yield being 50 p.c (Hepp, *A* 215, 347, Claus, *B* 16, 1597) Trimetric plates, $a b c = 954.1 : 758.1$ sl sol. cold alcohol, v e sol benzene (forming a compound with C_6H_5) Not volatile with steam With aniline it forms $\text{C}_6\text{H}_3(\text{NO}_2)_3\text{NH}_2\text{Ph}$ crystallising from benzene in red plates [124°] With naphthalene it forms

$C_6H_5(NO_2)_2C_6H_5$ [158°], and with di methyl-aniline $C_6H_5(NO_2)_2NMe_2Ph$ [108°]

Reactions—1 Alkaline K_2FeO_4 oxidises it to picric acid—2 $NaOMe$ dissolved in $HOME$ forms, in the cold, $C_6H_5(NO_2)_2(OMe)$ [105°] (De Bruyn, *R T C* 9, 208)—3 Reduced by tin and $HClAq$ to tri amido benzene

References—Bromo, Chloro, Chlorotodo- and Iodo Nitro Benzene

DI NITRO-BENZENETETRA-CARBOXYLIC ACID $C_6(NO_2)_2(CO_2H)_4$ [1 4 2 3 5 6] *Di nitro-pyromellitic acid* Formed by oxidising di nitro-tri methyl benzoic acid with alkaline $KMnO_4$ (Nef, *A* 287, 19) Silky needles (from ether)

Ethyl ether Et_4A'' [180°] Needles

NITRO-BENZENE PHOSPHONIC ACID $C_6H_5(NO_2)PO(OH)_2$ *Nitrophosphenylic acid* [132°] *S* 98 at 22°, 92 at 98° Obtained by nitrating benzene phosphonic acid (Michaelis & Benziger, *B* 8, 1810, *A* 188, 275) Deliquescent crystals exploding above 200°— $BaA''2aq$ — $Ba(HA'')_22aq$ — $CaA''4aq$ — PbA'' — AgA''

m NITRO-BENZENE-SULPHINIC ACID $C_6H_5(NO_2)SO_2H$ [1 3] [95°] Formed, together with nitrobenzene and N_2 , by boiling the compound $C_6H_5(NO_2)NHNH_2SO_2C_6H_5(NO_2)$ with baryta water Long silky needles *V* e sol ether, sl sol alcohol

Salts— KA' small e sol prisms— AgA' long silky needles, sl sol water— BaA' , $1\frac{1}{2}aq$ yellowish prisms (Limpricht, *B* 20, 1240)

p Nitro-benzene sulphonic acid $C_6H_5(NO_2)_2SO_2H$ [1 4] [120°] Formed in the same way as the preceding acid from the corresponding *p*-compound Plates Less soluble in ether than the *m* isomeride— BaA' , *aq* yellowish prisms (Limpricht, *B* 20, 1241)

o-NITRO-BENZENE SULPHONIC ACID $C_6H_5(NO_2)SO_2H$ [1 2] Formed in small quantity in the nitration of benzene sulphonic acid (Limpricht, *A* 177, 60)— NH_4A' long needles— KA' sl sol water— BaA' , *aq* v e sol water— PbA' , *3aq*

Chloride $C_6H_5(NO_2)SO_2Cl$ [67°] **Amide** $C_6H_5(NO_2)SO_2NH_2$ [186°] Reduced by HI in $HOAc$ it yields $C_6H_5<\frac{NH}{SO_2}>$ [198°] (Cleve, *B* 20, 1534)

m Nitro benzene sulphonic acid $C_6H_5(NO_2)(SO_2H)$ [1 3] Formed by sulphonating nitro-benzene, or by nitrating benzene sulphonic acid (Schmidt, *A* 120, 163, Meyer & Stuber, *A* 165, 164, Rose, *Z* 1871, 224, Limpricht, *A* 177, 60) Formed also by the action of $ClSO_3H$ on nitro benzene in CS_2 (Armstrong, *Z* 1871, 321, Limpricht, *B* 18, 2175) Deliquescent laminae— NH_4A' Prisms— KA' *S* 17 to 19 at 7°— NaA' — BaA' , *aq* *S* (of BaA'), 4 at 21° (Goslich, *A* 180, 104), 2 at 7° (*L*)— CaA' , *2aq* *S* (of CaA'), 6 at 6°— MgA' , *4aq*— ZnA' , *3aq*— PbA' , *2aq* *S* (of PbA'), 4 at 10°

Chloride $C_6H_5(NO_2)SO_2Cl$ [61°] **Amide** $C_6H_5(NO_2)SO_2NH_2$ [161°] Reduced by HI and $HOAc$ to $C_6H_5<\frac{NH}{SO_2}>$ [88°]

p-NITRO-BENZENE SULPHONIC ACID $C_6H_5(NO_2)_2SO_2H$ [1 4] Formed in small quantity

in the nitration of benzoic acid (Limpricht)— NH_4A' Plates *S* 85 at 7°— KA' Prisms *S* 37 at 7°— BaA' , *3aq* *S* (of BaA'), 46 at 6°— CaA' , *2aq*— PbA' , *2aq* *S* (of PbA'), 118 at 55°. [The solubilities of salts here given are the weights dissolved in 100 c.c. of the solution.]

Chloride $C_6H_5(NO_2)SO_2Cl$ Oil **Amide** $C_6H_5(NO_2)SO_2NH_2$ [131°]

(a) Nitro-benzene *m*-disulphonic acid $C_6H_5(NO_2)(SO_2H)_2$ Formed, together with the (8) isomeride, by nitration of benzene *m*-disulphonic acid (Heinzelmann, *A* 188, 160, 190, 222) Slender deliquescent needles (containing *2aq*)— $(NH_4)_2A'$ flat prisms— K_2A'' — $BaA''4aq$ — $BaA''6aq$ — $BaA''6aq$ — $Ba_2A''(OH)_2$, *15aq*— $PbA''4aq$ — $PbA''O2aq$ — AgA''

Chloride $C_6H_5(NO_2)(SO_2Cl)_2$ [96°] **Amide** $C_6H_5(NO_2)(SO_2NH_2)_2$ [242°]

(8) Nitro benzene *m*-disulphonic acid $C_6H_5(NO_2)(SO_2H)_2$ [4 13] Formed as above. Very hygroscopic crystals Its salts are more soluble than those of the (a) isomeride— $(NH_4)_2A''$ — $K_2A''4aq$ (?)— $BaA''5aq$ — $PbA''4aq$

Chloride $C_6H_5(NO_2)(SO_2Cl)_2$ Oil. **Nitro-benzene disulphonic acid** $C_6H_5(NO_2)(SO_2H)_2$ Formed from nitro-amido-benzene disulphonic acid by the diazo-reaction (Limpricht, *B* 8, 289)— $PbA''aq$ needles

Di nitro-benzene sulphonic acid $C_6H_5(SO_2H)(NO_2)_2$ [1 2 4] [108°] Formed from ($C_6H_5(NO_2)_2$) $_2S_2$ and fuming HNO_3 (Willgerodt & P Mohr, *J pr* [2] 34, 117) Very hygroscopic yellow prisms (containing *3aq*), v sol water, sl sol ether, insol benzene Not attacked by fuming HNO_3 at 200°

Reactions—1 *Aniline* forms, on boiling, $C_6H_5(NO_2)(NPhH)$ [156°]—2 Boiling alcoholic ammonia forms $C_6H_5(NO_2)(NH_2)$ [178°]—3 *KHS* forms, in the cold, $C_6H_5(NO_2)_2SH$ —4 Rapidly decomposed by cold *potash*, becoming di nitro phenol [114°]

Salts— KA' — NaA' , *aq*— BaA' , *aq*— CaA' , *2aq*— ZnA' , *6aq*— PbA' , *3aq*

Chloride $C_6H_5(SO_2Cl)(NO_2)_2$ [102°] **Amide** $C_6H_5(SO_2NH_2)(NO_2)_2$ [154°]

Di-nitro-benzene sulphonic acid $C_6H_5(NO_2)_2SO_2H$ [3 2 1] Formed by warming nitro-benzene *m*-sulphonic acid with H_2SO_4 (1 vol) and HNO_3 (3 vols) (Limpricht, *B* 9, 554, Sachse, *A* 188, 143) Deliquescent crystals. NH_4A' — KA' , $1\frac{1}{2}aq$ — BaA' , *aq*— PbA' , *3aq*

Chloride $C_6H_5(NO_2)_2SO_2Cl$ [89°] **Amide** $C_6H_5(NO_2)_2SO_2NH_2$ [238°]

Di-nitro-benzene disulphonic acid $C_6H_5(NO_2)_2(SO_2H)_2$ Formed by boiling nitro-benzene *m* sulphonic acid with H_2SO_4 (1 vol) and fuming HNO_3 (6 vols) (Limpricht, *B* 8, 289) Crystalline mass Its chloride and amide are crystalline and decompose without melting— $K_2A''aq$ — $NaA''3aq$ — $BaA''2aq$ — $CaA''aq$ — $PbA''8aq$ — $CuA''3aq$

Tri-nitro-benzene sulphonic acid $C_6H_5(NO_2)_3SO_2H$ [185°] Prepared by boiling chloro-tri nitro phenol (picryl chloride) with alcohol and dry H_2SO_4 (Willgerodt, *J pr* [2] 32, 117) Large crystals (containing *2aq*), melting at 100° when hydrated Decomposed by alkalis in the cold into SO_3 and picric acid— $NaA''2aq$

NITRO-BENZENYL-AMIDO-OXIM v Nitro-benzamidoxime.

NITRO-BENZIDINE v **NITRO DI-p-AMIDODIPHENYL**

NITRO-BENZIL $C_6H_5(NO_2)O_2$. [142°]. Formed by nitration of benzoin or benzil (Zinnin, *A Suppl* 3, 153, Hausmann, *B* 23, 531) Yellow crystals, sl sol alcohol

(a)-*Dioxim* $C_6H_5N_2O_2$ [225°] Formed by heating nitrobenzil with hydroxylamine hydrochloride at 100°. Crystalline body, v. sl sol. alcohol.

(B)-*Dioxim* [185°] Formed by heating the (a)-isomeride with alcohol at 165° for several hours White needles, v sol alcohol Like the (a)-isomeride it is split up by conc $HClAq$ at 100° into hydroxylamine and nitro benzil

Di-nitro-benzil $C_6H_5(NO_2)_2O_2$ [131°] S (alcohol) 78 in the cold, 24 at 78° Formed, together with the following isomeride by boiling benzil with fuming HNO_3 (Zagumenny, *J R* 4, 278). Octahedra or moss like forms

Di-nitro-benzil [147°] S (alcohol) 34 in the cold, 19 at 78° Formed as above Plates Iso-di-nitro-benzil $C_6H_5(NO_2)_2O_2$ [205°] S (95 p c alcohol) 042 in the cold, 9 on boiling Formed by oxidation of (a)- or (γ) di-nitro-deoxybenzoin by CrO_3 in $HOAc$ (Golubeff, *J. R* 13, 29, *B* 17, 581) Yellow needles

o-NITRO-BENZOIC ACID $C_6H_5(NO_2)CO_2H$ [12] Mol w 167 [147 7°] (Reissert, *B* 23, 2244) S 61 at 16.5° Formed in small quantity in the preparation of the *m* isomeride by nitration of benzoic acid (Griess, *B* 8, 526, *A*, 166, 129, L Liebermann, *B* 10, 862, Widmann, *A* 193, 204) Obtained also by saponifying its nitrile Prepared by oxidising *o* nitro cinnamic acid with chromic acid mixture (Beilstein *A*, Kuhlberg, *A* 163, 134, Widmann, *B* 8, 393) or, better, by oxidising *o* nitro toluene (Weith, *B* 7, 1058, Widmann, *A* 193, 225, Noyes, *B* 16, 53, Monnet, Reverdin, a Nolting, *B* 12, 443) or *o*-nitro-benzyl chloride (Nolting, *B* 17, 385)

Properties — Small triclinic needles (from water), v sol alcohol and ether, v sl sol water Has a sweet taste. Very slightly volatile with steam

Salts. — BaA' , 3aq Triclinic crystals, v. sol. water — CaA' , 2aq needles — PbA' , aq — AgA' Crystals, v sol hot water

Ethyl ether EtA' [30°] Triclinic crystals.

Chloride $C_6H_5(NO_2)COCl$ Oil

Cyanide $C_6H_5(NO_2)CO CN$ [54°] Formed from the chloride and $AgCy$ at 100° (Claisen a Shadwell, *B* 12, 851) White prisms

Anhydride $(C_6H_5(NO_2)CO)_2O$ [135°] Needles (Bischoff a Rach, *B* 17, 2789)

Amide $C_6H_5(NO_2)CONH_2$ [176°] (Bischoff, *A* 239, 109) With KOH and bromine it yields $C_6H_5(NO_2)(CONHBr)$ converted by boiling potash into *o*-nitro-aniline (Hoogewerf a Van Dorp, *R T C* 8, 178)

Di-nitro anilside

$C_6H_5(NO_2)CONH(C_6H_5NO_2)$. [178°] Formed by nitrating benzoyl *m*-nitro-aniline (Schwartz, *B* 10, 1708)

Nitrile $C_6H_5(NO_2)CN$ *o*-Nitro-benzonitrile Mol w 148 [110°] Obtained by heating the amide with P_2O_5 at 100° (Hubner a Bartlein, *B* 10, 1718). Formed also by the action of hot cuprous potassium cyanide on *o*-nitro diazobenzene chloride (Sandmeyer, *B* 18, 1494) and by treating the oxim of *o*-nitro-benzoic aldehyde

with Ac_2O (Gabriel a Meyer, *B* 14, 2389) Needles, v sol water and alcohol

m-Nitro-benzoic acid $C_6H_5(NO_2)CO_2H$ [13]. [141°]. S 25 at 10°, 10 at 100° (Mulder); 235 at 16.5° (Beilstein) Formed by nitration of benzoic acid (Mulder, *A* 34, 297, Gerland, *A* 91, 185, Hübner, *A* 222, 73) Formed also by boiling nitro-hippuric acid with $HClAq$ (Bertagnini, *A* 78, 104, 79, 259) and by the oxidation of *m*-nitro toluene (Beilstein, *A* 132, 137, 155, 25, 163, 136) Obtained also by the action of hot cuprous potassium cyanide solution upon *m* nitro-diazo benzene chloride, and saponification of the crude nitrile, the yield being 72 p c (Sandmeyer, *B* 18, 1494)

Properties — Colourless laminæ (from water), v e sol alcohol and ether May be sublimed Crystallises in three monoclinic modifications (Bodewig, *J* 1879, 677) Yields amido benzoic acid on reduction and azoxybenzoic acid on heating with alcoholic potash (Griess, *A* 131, 92)

Salts — NH_4A' , — NaA' 3aq colourless tables — KA' aq Needles S 14 in the cold, 200 at 100° (Sokoloff, *J* 1864, 343) — MgA' , 7aq — CaA' , 2aq S 33 in the cold, 55 at 100° — $Ca(OBz)A'$ 3aq (Salkowsky, *B* 10, 1258) — SrA' , 2aq — SrA' , 4aq — BaA' , 4aq Needles S 38 in the cold, 53 at 100° (Sokoloff) S (of BaA') 22 at 9° (Mills, *C J* 19, 363) — ZnA' , 5aq — ZnA' , 4aq S 16 in the cold 77 at 100° — CdA' , 4aq (Schiff, *A* 104, 326) — PbA' , — MnA' , 4aq — FeA' , — CuA' , aq — AgA'

Methyl ether MeA' [70°] (279°) Prisms (Chancel, *Compt Chim* 1849, 179, *A*, 72, 275)

Ethyl ether EtA' [43°] (Tafel a Enoch, *B* 23, 1551) (296°) Monoclinic prisms Decomposed by bromine at 170°-200° into nitrobenzoic acid and ethylene bromide (Naumann, *A* 133, 202)

s-Tri-chloro-phenyl ether $C_6H_2Cl_3A'$. [182°] Formed by nitrating the benzoyl derivative of (6,4,2,1) tri chloro phenol (Daccomo, *B* 18, 1165)

Di bromo phenyl ether $C_6H_3Br_2A'$ v. vol i p 607

Nitro phenyl ethers v Nitro benzoyl derivatives of NITRO PHENOLS

Chloride $C_6H_5(NO_2)COCl$ [34°] (184° at 50 mm.), (275°-278°) Prisms (Cahours, *A Ch* [3] 23, 339, Hugh, *B* 7, 1267, Claisen a Thompson, *B* 12, 1942)

Cyanide $C_6H_5(NO_2)CO CN$ (231° at 145 mm) Formed from the chloride and $AgCy$ (*C. a T*) Heavy oil

Anhydride $(C_6H_5(NO_2)CO)_2O$ Solid (Gerhardt, *A* 87, 158)

Acetic m-nitro-benzoic anhydride $C_6H_5(NO_2)CO OAc$ [45°] Formed from the Ag salt and $AcCl$ (L Liebermann, *B* 10, 863, Beilstein, *Bn* 2, 786, Greene, *Am* 11, 414)

Benzoic m-nitro-benzoic anhydride $C_6H_5(NO_2)CO OBz$ Crystalline (Gerhardt)

Amide $C_6H_5(NO_2)CONH_2$ [142°] Needles (Field, *A* 55, 45, Chancel, *Compt Chim* 1849, 180, Beilstein, *A* 132, 137, Schiff, *A* 213, 185) Its alcoholic solution mixed with $AgNO_3$ and $NaOH$ gives a gelatinous pp of $C_6H_5(NO_2)CONHAg$ (Tafel a Enoch, *B* 23, 1550) With bromine and potash it gives *m*-nitro-aniline (Hoogewerf a Van Dorp, *R. T. C.*

8, 173) With *m* nitro benzoyl chloride it is converted into its *m*-nitro benzoyl derivative [195°] (W Schulze, *A* 251, 158)

Anilide $C_6H_4(NO_2)CONHPh$ [144°]. Plates (Engler a Volkhausen, *B* 8, 34, Hubner, *B* 9, 774)

m-Nitro-anilide
 $C_6H_4(NO_2)CONHC_2H_5$ [187°] Needles (from amyl alcohol) (McHugh, *B* 7, 1268)

Di nitro-anilide
 $C_6H_3(NO_2)_2CONHC_2H_5$ [124] [165°] Formed by nitration of the benzoyl derivatives of *o* and *p* nitro-aniline (Schwartz, *B* 10, 1703
p Toluide $C_6H_4(NO_2)CONHC_2H_5$ [162°]. Needles (from alcohol) (Hubner, *A* 210, 335)

Nitro p-toluide
 $C_6H_4(NO_2)CONHC_2H_5$ Me NO_2 [142] [183 5°]. Yellow silky needles (from alcohol) Formed by nitrating the *p* toluid

Mesidide $C_6H_4(NO_2)CONHC_2H_5$ Me, [205°]
Nitro mesidide
 $C_6H_4(NO_2)CONHC_2H_5$ Me, [207°] Formed, together with the following, by nitrating the mesidide (Schack, *B* 10, 1711)

Di-nitro-mesidide
 $C_6H_3(NO_2)_2CONHC_2H_5$ Me, [307°] Needles
Nitrile $C_6H_4(NO_2)CN$ [117°] Formed by nitrating benzonitrile, or by dehydrating *m*-nitro benzoic amide (Beilstein a Kuhlberg, *A* 146, 336, Engler, *Z* [2] 4, 613, *A* 149, 297, Fricke, *B* 7, 1321) Formed also by the action of hot cuprous potassium cyanide solution upon *m* nitro-diazo benzene chloride (Sandmeyer, *B* 13, 1494) Prepared by adding benzonitrile (10 mols) to KNO_3 (11 mols) dissolved in H_2SO_4 below 25° (Schöpf, *B* 18, 1063) Needles (from water), sl sol water, v sol alcohol and ether

p Nitro benzoic acid $C_6H_4(NO_2)CO_2H$ [14] [238°] *S* 075 at 16° Formed by the action of fuming HNO_3 on toluene (Glenard a Boudault, *A* 48, 344, G Fischer, *A* 127, 137, 130, 128, Beilstein a Wilbrand, *A* 126, 255, 128, 257), and by oxidising *p* nitro toluene with chromic acid (Beilstein a Geitner, *A* 139, 335, Korner, *Z* [2] 5, 636, Rosenstiel, *Z* [2] 5, 701) Produced also by the oxidation of *p* nitro cinnamic acid, and, in small quantity, by the nitration of benzoic acid (Griess, *B* 8, 528, Ladenburg, *B* 8, 536) Obtained also by the action of a hot cuprous potassium cyanide solution upon *p* nitro-diazo-benzene chloride, and saponification of the crude nitrile thus got (Sandmeyer, *B* 13, 1492) Prepared by oxidising *p* nitro toluene (50 g) with CrO_3 (250 g) and H_2SO_4 (110 g) diluted with water (460 g) (Schlosser a Skraup, *M* 2, 519, cf Michael a Norton, *B* 10, 580)

Properties—Yellowish laminae (from water) or needles (by sublimation), v sol alcohol and ether Less soluble in water than the *m* and *o*-isomerides Reduced by tin and HCl to *p*-amido-benzoic acid, and by sodium amalgam to *p*-azo-benzoic acid

Salts— NH_4A' 2aq efflorescent laminae— NaA' 3aq triclinic crystals (Bilfinger, *A* 135, 154)— KA' 2aq *S* 83 in the cold, 200 at 100° (Sokoloff, *J* 1864, 348)— BaA' 5aq monoclinic crystals (Bücking a Haushofer, *A* 193, 212) *S* 4 in the cold, 125 at 100°— BaA' (OBz) (Salkowsky, *B* 9, 24)— CaA' 8aq efflorescent tables *S* 3 in the cold, 83 at 100°— CaA' 9aq— CaA' (OBz) 3aq (Salkowski, *B* 10, 1259)—

SrA' (OBz) aq— ZnA' 2aq *S* (of ZnA') 7 at 17° (Mills, *C J* 19, 363), 125 at 100°— PbA' , *Methyl ether* MeA' [96°]

Ethylether EtA' [57°]
Chloride $C_6H_4(NO_2)COCl$ [75°] (c. 204° at 105 mm) Slender needles (from ligroin) (Gevekoht, *A* 221, 335)

Amide $C_6H_4(NO_2)CONH_2$ [198°] Needles (Beilstein a Reichenbach, *A* 132, 143) Treatment with bromine and KOH aq converts it into *p*-nitro-aniline

Anilide $C_6H_4(NO_2)CONHPh$ [204°] (Leo, *K* 3, 552)

Nitrile $C_6H_4(NO_2)CN$ [147°] Formed from the amide and P_2O_5 (Engler, *A* 149, 298, Fricke, *B* 7, 1321), or by the action of hot cuprous potassium cyanide solution on *p* nitro diazo benzene chloride (Sandmeyer, *B* 13, 1492) Laminae (from alcohol), v sol hot alcohol

Fourth and fifth nitro-benzoic acids have been described by Fitcka (*B* 8, 252, 710, 741, 9, 788, 10, 431, *J pr* [2] 17, 183), but their existence has been contested by other chemists (Leo Liebermann, *B* 10, 1033, Widmann, *B* 10, 1159, Claus, *B* 13, 891)

(4,3,1) Di-nitro-benzoic acid $C_6H_3(NO_2)_2CO_2H$ [161°] *S* 675 at 25° Prepared by heating *p* nitro benzoic acid with nitric and sulphuric acids in sealed tubes, and separated from the (4,2,1) isomeride, simultaneously formed, by the greater solubility of the latter in water (Claus a Halberstadt, *B* 13, 915) Colourless crystals Sol alcohol, ether, and hot water, sl sol cold water Very bitter taste Sublimes undecomposed

Salts— $A'Ba$ 4aq white crystals— $A'Ca$ 3aq plates The potassium, sodium, and ammonium salts are easily soluble

Di-nitro-benzoic acid $C_6H_3(NO_2)_2(CO_2H)$ [521] [177°] Formed, together with the (4,2,1) and (6,2,1) isomerides by boiling *o*-nitro-benzoic acid with a mixture of fuming HNO_3 (1 pt) and H_2SO_4 (1 pt) for 15 minutes (Griess, *B* 7, 1223) Needles or prisms, sl sol cold water, m sol hot water The di amido benzoic acid, obtained by reduction, yields *p* phenylene diamine on distillation— BaA' 4aq six sided plates, sl sol hot water

Di nitro-benzoic acid $C_6H_3(NO_2)_2CO_2H$ [421] [179°] *S* 1849 at 25° Formed in the preparation of each of the two preceding acids (Griess, *B* 7, 1225, Claus a Halberstadt, *B* 13, 816, Hubner a Stromeyer, *B* 13, 461, *A* 222, 79) Obtained also by heating di-nitro toluene with fuming HNO_3 at 100° for a fortnight (Tiemann a Judson, *B* 3, 223) White needles or tables May be sublimed Tastes bitter On reduction with tin and HCl aq it at once yields *m* phenylenediamine— BaA' 3aq m sol cold water— CaA' 2aq— MgA' 9aq

Di-nitro-benzoic acid $C_6H_3(NO_2)_2CO_2H$ [621] [202°] Formed, together with styphnic acid $C_6H_3(NO_2)_3(OH)$, and the (4,2,1)- and (5,2,1)-di-nitro benzoic acids, by heating *o*-nitro-benzoic acid with HNO_3 and H_2SO_4 (Griess) Felted needles (from boiling water), v sol boiling water Tastes intensely bitter Split up on distillation into CO_2 and *m*-di-nitro-benzene On treatment with tin and HCl aq it yields *m*-phenylenediamine— BaA' 2aq v e sol cold water.

Di-nitro-benzoic acid $C_6H_3(NO_2)_2CO_2H$ [5 8 1] [204°]. S 19 at 100°. Formed by nitration of benzoic acid or of *m*-nitro benzoic acid with a mixture of HNO_3 and H_2SO_4 (Cahours, *A Ch* [3] 25, 30, Voit, *A* 99, 100, Tiemann a Judson, *B* 3, 223, Muretoff, *Z* [2] 6, 641, Michler, *A* 175, 152). Obtained also by heating di-nitro-toluene [93°] with fuming HNO_3 at 150°, or by oxidising it with chromic acid mixture (Staedel, *B* 14, 902, *A* 217, 194, Hubner, *A* 222, 73), and in small quantity by the oxidation of β' -di-nitro naphthalene with dilute HNO_3 (S G 1 15) at 150° (Beilstein a Kurbatov, *B* 13, 355).

Preparation—1 By heating benzoic acid (20 g) with H_2SO_4 (180 g) and fuming HNO_3 (50 g) for 4 hours nearly to boiling (Hübner) — 2 By heating *m*-nitro benzoic acid (100 g) with fuming nitric acid (500 g) and H_2SO_4 (600 g) for 12 hours (H).

Properties—Thin tables (from dilute HNO_3) or monoclinic crystals (Henniges, *J* 1882, 902), v sl sol cold water, sl sol dilute HNO_3 , v sol alcohol and HOAc. Reduced by tin and HCl to di-amido-benzoic acid, which yields *m* phenylenediamine on distillation with baryta.

Salts— NaA' — KA' — BaA' aq (Hubner) m sol hot water— BaA' , 5aq (Muretoff)— CaA' , aq— MgA' , 8aq— MnA' , 2aq— PbA' , aq— AgA' , needles (from hot water).

Ethylether EtA' [94°] (H), [91°] (B a K) S (90 p.c. alcohol) 562 at 13°.

Amide $C_6H_3(NO_2)_2CONH_2$ [183°] (Voit, *A* 99, 105), [177°] (M). Plates (from water).

Tri-nitro-benzoic acid $C_6H_2(NO_2)_3CO_2H$ [190°]. Obtained by heating tri nitro toluene with fuming HNO_3 for a fortnight at 100° (T a J). Trimetric crystals, $abc = 887.1$ 572 (Friedlander, *Z K* 1, 623). May be sublimed— AgA' plates, sl sol water.

References—Bromo, Chloro, and Iodo, NITROBENZOIC ACIDS.

***o* NITRO-BENZOIC ALDEHYDE**

$C_6H_4(NO_2)CHO$ Mol w 151 [44°] (G a M), [46°] (F a H).

Formation—1 In small quantity, together with the *m*-isomeride, by adding benzoic aldehyde to a mixture of HNO_3 and H_2SO_4 (Rudolph, *B* 13, 810, cf Fittica, *B* 10, 1630)—2 By treatment of its oxim with chromic acid mixture (Gabriel a Meyer, *B* 14, 829)—3 By oxidising *o*-nitro-cinnamic acid with dilute $KMnO_4$ (Friedlander a Henriques, *B* 14, 2801)—4 By adding $NaNO_2$ to a cold solution of *o*-nitro-cinnamic ether in fuming nitric acid (F a H)—5 In small quantity by the action of water on the compound of *o*-nitro-toluene with CrO_2Cl_2 (Richter, *B* 19, 1062).

Preparation—50 grms of crude *o*-nitro-cinnamic acid are suspended in $2\frac{1}{2}$ litres of water, neutralised with Na_2CO_3 and filtered. The clear solution is put into a large stoppered bottle, 1 litre of benzene added, and kept cold during the reaction by the addition of ice 1225 c.c. of a 6 p.c. solution of $KMnO_4$ is added by degrees, shaking continuously, in order that the nitro-benzaldehyde, as it is formed, may be removed by the benzene from the action of the oxidising agent. The emulsion which is produced is now treated with a warm solution of 150 grms of sodium sulphite and HCl added, which dissolves the MnO_2 . The benzene layer,

which contains the whole of the nitrobenzaldehyde is removed, and the latter obtained by distilling off the benzene. The yield is 50 p.c. to 60 p.c. of the theoretical (Einhorn, *B* 17, 119).

Properties—Long yellow needles (from water), sl sol water, v sol alcohol and ether. May be distilled. Volatile with steam. With $NaHSO_3$ it forms a compound crystallising in plates.

Reactions—1 On reduction with tin and HOAc it yields anthranil $C_6H_3\left(\begin{smallmatrix} CO \\ NH \end{smallmatrix}\right)$, the lactam of *o*-amido benzoic acid (Friedlander a Henriques, *B* 15, 2105, cf Rudolph, *B* 13, 310). Reduced by $FeSO_4$ and NH_3 to amido benzoic aldehyde (Friedlander, *B* 15, 2572, 17, 456)—2 Yields *o*-nitro benzoic acid on oxidation with dilute aqueous $KMnO_4$. It also undergoes this oxidation when administered to dogs (Sieber a Smirnoff, *M* 8, 88)—3 Conc $NaOHAq$ converts it into *o*-nitro benzoic acid and *o*-nitro-benzyl alcohol—4 $NaOAc$ and Ac_2O yield *o*-nitro cinnamic acid by Perkin's reaction—5 On warming with a dilute alcoholic solution of urea a compound $C_6H_3(NO_2)CH(NHCO NH_2)_2$ [200°] is formed (Ludy, *M* 10, 295). When a few drops of H_2SO_4 are added to an alcoholic solution of *o*-nitro benzoic aldehyde and urea there is formed a different compound $C_{10}H_8N_2O_2$ [170°]—6 With di-methyl-aniline it forms nitro tetra-methyl di-amido tri phenyl-methane $C_6H_3(NO_2)CH(C_6H_4NMe_2)_2$ —7 Aceto-acetic ether (2 mols) and NH_3 form *o*-nitro phenyl di-methyl pyridine dihydride dicarboxylic ether [120°] and a compound $C_{15}H_{12}N_2O_5$ [189°], forming a salt $B'HCl$, converted by nitrous acid into an indifferent isomeride [192°] (Lepetit, *B* 20, 1838)—8 Boiling conc aqueous $KClO_4$ forms *o*-azoxy benzoic acid—9 Aldehyde and a little baryta water forms $C_6H_3NO_4$ [120°], converted by further treatment with baryta water into $C_6H_3(NO_2)CH(OH)CH_2CH(OH)$ [109°], and by $NaOHAq$ into indigo (Baeyer a Drewson, *B* 15, 2861)—10 Acetone and $NaOH$ forms *o*-nitro-styryl methyl ketone, which on warming with more alkali yields indigo.

Oxim $C_6H_3(NO_2)CHNOH$ *o*-Nitro-*o*-nitroso toluene [96°]. Formed by the action of hydroxylamine on the aldehyde in alcoholic solution, or by treating (2,4,1) nitro-amidophenyl acetic acid with nitrous acid (Gabriel a Meyer, *B* 14, 826, 15, 3057, 16, 520). Slender needles (from hot water), v sol alcohol and ether. Tastes sweet. Dissolves in alkalis. Conc $HClAq$ at 160° decomposes it into *o*-nitro-benzoic acid and NH_3 . Boiling with Ac_2O and $NaOAc$ forms the nitrile of *o*-nitro benzoic acid.

Methyl derivative of the oxim
 $C_6H_3(NO_2)CHNOMe$ [58°].

Phenyl hydrazide $C_6H_3(NO_2)CHN_2HPH$ [158°] (F), [148°] (L). Formed by adding phenyl-hydrazine to an alcoholic solution of the base (Pickel, *A* 282, 232, Ludy, *M* 10, 314). Scarlet needles, sl sol hot water, forming a dark blue solution in conc H_2SO_4 .

***m*-Nitro-benzoic aldehyde** $C_6H_4(NO_2)CHO$ [8 1] [58°]. Obtained by dissolving benzoic aldehyde (1 vol) in a mixture of fuming HNO_3 (1 vol) and H_2SO_4 (10 vols) in the cold (Bertagnini, *A* 79, 259, 86, 190; Lippmann a Hawkeczek, *B* 9, 146, Friedlander a Henriques,

B 14, 2802, Ehrlich, B 15, 2010) Needles (from water), m sol hot water, v sol alcohol

Reactions—1 *Chromic acid* oxidises it to *m* nitro benzoic acid—2 *Tin* and *HOAc* reduce it to *m*-amido-benzoic aldehyde—3 *Ammonia* forms $(C_6H_4(NO_2)CH_2)_N$, which on heating with aqueous *KOH* forms tri-nitro-amarin $C_{21}H_{14}N_4O_8$ —4 *Ammonia* and *acetoacetic ether* form $C_6H_4(NO_2)C_2NH_2Me (CO_2Et)_2$ [65°] (Lepetit, B 20, 1838, 2397)—5 *Sodium succinate* and acetic anhydride form nitro phenyl paraconic acid $C_6H_4(NO_2)CHCH(CO_2H)CH_2COO$ (Salomon-

son, R T C 6, 1)—6 When its benzene solution is shaken with H_2SO_4 , there is formed $C_6H_4(NO_2)CHPh$ [90°], while toluene, by similar condensation, yields $C_6H_4(NO_2)CH(C_2H_5)_2$ [85°] (Tschacher, B 21, 188)—7 *Phenyl acetonitrile* and alcoholic *NaOEt* yields the nitrile of nitro-*a* phenyl cinnamic acid (Frost, A 250, 156)—8 After administration to a dog it is excreted as *m* nitro hippuric acid (Sieber, M 8, 88)

Combinations— $(C_6H_4NO_2)NH_2SO_3H$ 4aq colourless prisms— $(C_6H_4NO_2)NaSO_3H$ 8aq yellowish crystalline scales (from hot water)— $(C_6H_4NO_2)NPhH_2SO_3H$ needles (Schiff, A 195, 301)— $(C_6H_4NO_2)PH_3$ powder, insol alcohol Formed from the aldehyde, PH_3 , and *HCl* (Messinger a Engels, B 21, 333)

Oxim $C_6H_4(NO_2)CHNOH$ [119°] Needles (from water) (Gabriel, B 15, 3060) *PCl*, yields *m* nitro benzomitrile (Gabriel, B 16, 520)

Iso-oxim [118°] Formed by passing *HCl* into an ethereal solution of the oxim, and decomposing the hydrochloride by *NaCO*. Needles (from ether) Combines with phenyl cyanate in ethereal solution with formation of $C_6H_4(NO_2)CHNOCONPhH$ [75°], which readily changes into an isomeride [105°] By treatment with *NaOMe* and *MeI* it is converted into a mixture of two isomeric methyl derivatives $C_6H_4(NO_2)CHNOMe$ melting at 69° and at 117° (Goldschmidt a Ernst, B 23, 2170) *MeI* acting on its silver salt gives the methyl ether, melting at 69° *NaOEt* and benzyl chloride yield a benzyl ether [148°] Phenyl cyanate in ethereal solution yields $C_6H_4(NO_2)CHNOCONHPh$ [105°], crystallising in yellow needles

Phenyl-hydrazide

$C_6H_4(NO_2)CHN_2HPh$ [121°] (Pickel, A 232, 232, Ludy, M 10, 316) Orange tables Yields an acetyl derivative $C_6H_4(NO_2)CHN_2Ac$ [170°] (Schroeder, B 17, 2097) Nitrous acid converts it into $(C_6H_4(NO_2)CHN_2NPh)NOH$, which crystallises in needles, forming a deep blue pp in H_2SO_4

p Nitro-benzoic aldehyde

$C_6H_4(NO_2)CHO$ [41] [106°]

Formation—1 By boiling *p*-nitro-benzyl chloride (10 pts) with $Pb(NO_2)_2$ (14 pts), water (60 pts), and HNO_3 (8 G 13) (Fischer a Greiff, B 13, 670)—2 By oxidising *p*-nitro-cinnamic ether (Friedlander a Henriques, B 14, 2803) or *ap* di nitro cinnamic ether (Friedlander a Maly, A 229, 212, cf Baeyer, B 14, 2317)

Preparation—1 By adding *KNO*₃ to a cooled solution of *p* nitro cinnamic acid, or its methyl or ethyl ether, in strong H_2SO_4 , the yield is 60 p.c to 95 p.c (Basler, B 16, 2714)—2 45 pts of chromyl chloride (CrO_2Cl_2) are slowly added to 20 pts. *p* nitro-toluene, dissolved in 80 to 100 pts of CS_2 . After standing for two days,

the pp $(C_6H_4(NO_2)CH_2)_2Cr_2O_2Cl_2$ is separated, washed with CS_2 , and treated with water The CS_2 is driven off with steam, and the product recrystallised from water, yield, 60 p.c to 70 p.c. of the nitro toluene (Reichter, B 19, 1060)

Properties—Long colourless prisms (from hot water), sl sol water and ether, m sol alcohol May be sublimed Volatile with steam. Forms with $NaHSO_4$ a compound crystallising in plates

Reactions—1 *Chromic acid mixture* oxidises it to *p* nitro benzoic acid.—2 *Aniline* forms $C_6H_4(NO_2)CHNPh$ [93°]—3 *Dimethylaniline* condenses with it to *p* nitro tetra-methyl-di-*p*-amido-tri-phenyl-methane—4 When administered to dogs it is excreted as *p*-nitro-hippuric acid.—5 With *p* toluidine and conc *HClAq* it forms $C_6H_4(NO_2)CH(C_2H_5MeNH_2)_2$ [172°] (Bischler, B 20, 3302)—6 *Ammonia* and *acetoacetic ether* form the compound $C_6H_4(NO_2)C_2NH_2Me(CO_2Et)_2$ [118°-122°]—7 *Indoxyzyl* with *HClAq* and *HOAc* forms the indogemide $C_6H_4<\underset{NH}{C}>CCHC_6H_4NO_2$, crystallising in red needles [273°]

Oxim $C_6H_4(NO_2)CHNOH$ [129°] Reddish-yellow scales (Gabriel a Herzberg, B 16, 2000)

Iso-oxim [175°] (Behrend, A 263, 849)

Benzyl ether of the iso-oxim

$C_6H_4(NO_2)CH<\underset{O}{N(C_6H_5)}>$ [118°] Formed by oxidising (8) benzyl *p* nitro benzyl hydroxylamine with K_2FeCy_6 (Behrend a König, B 23, 2750) Needles (from alcohol), split up by hot *HClAq* into *p* nitro benzoic aldehyde and (8)-benzyl-hydroxylamine

Phenyl hydrazide $C_6H_4(NO_2)CHN_2HPh$ [125°] Red needles (Pickel, A 232, 232). Forms a red solution in conc H_2SO_4 (Ludy, M 10, 315)

NITROBENZOIC ANHYDRIDE v Anhydride of Nitrobenzoic acid

m NITRO-BENZOIC IMIDO-ETHYL ETHER $C_6H_4NO_2$, i.e. $C_6H_4(NO_2)C(NH)OEt$ Formed by treatment of $C_6H_4(NO_2)CONHAg$ with *EtI*, followed by ethereal *HCl* (Tafel a Enoch, B 23, 1550) Yellow oil—*BHCl* White mass, v sol water and alcohol, converted by hot water into *m*-nitro benzoic ether—*BHCl*, [132°]

NITRO-BENZONITRILE v Nitrile of Nitro benzoic acid

o NITRO-BENZOPHENONE $C_{12}H_8NO_2$, i.e. $C_6H_5CO C_6H_4(NO_2)$ *o*-Nitro di phenyl ketone [105°] Formed by oxidation of *o* nitro-di-phenyl methane with CrO_3 in acetic acid (Geigy a Koenigs, B 18, 2403) Colourless crystals

m Nitro-benzophenone $C_6H_5CO C_6H_4NO_2$ [95°] Formed by the action of *m* nitro-benzoyl chloride upon benzene in presence of $AlCl_3$ (Geigy a Koenigs, B 18, 2401, cf Becker, B 15, 2090) Yellowish needles

p-Nitro-benzophenone $C_6H_5CO C_6H_4$ [138°] Formed by oxidation of *p* nitro-di-phenyl-methane with CrO_3 in acetic acid (Basler, B 16, 2717) Small white plates or needles. Sol benzene, hot alcohol, and hot water, sl sol. cold water, cold alcohol, ligroin, and CS_2 .

(a) Di-nitro-benzophenone $(C_6H_4(NO_2))_2CO$ [190°] Formed, together with a larger quantity of the (8)-isomeride, by heating benzophenone with fuming HNO_3 at 60° (Prätorius, B 10,

1855, 11, 744, Stadel, A 194, 349, 218, 344) Formed also by oxidation of the corresponding di-nitro di-phenyl-methane [183°] by CrO_3 in HOAc (Stadel & Sauer, B 11, 1747) Long needles (from HOAc) Yields on reduction di-amido-benzophenone [172°]

(β)-Di-nitro-benzophenone $\text{C}_{12}\text{H}_8\text{N}_2\text{O}_5$ [149°] Formed as above Laminæ (from benzene or HOAc) Yields on reduction di-amido-benzophenone [165°]

Oasm ($\text{C}_6\text{H}_5\text{NO}_2$), CNOH [207°], small yellow needles (from hot alcohol).

Phenyl hydrazide

($\text{C}_6\text{H}_5\text{NO}_2$), $\text{C}_6\text{H}_5\text{N}_2\text{H}_3$, [220°], red powder, sol. acetic acid, sl sol. alcohol, insol water (Münchmeyer, B 20, 510)

(γ)-Di-nitro-benzophenone $\text{C}_{12}\text{H}_8\text{N}_2\text{O}_5$ [190°] Formed by oxidation of the di nitro di phenyl-methane [118°] Crystals Yields on reduction di-amido-benzophenone [181°].

Tetra-nitro-benzophenone $\text{C}_{12}\text{H}_4(\text{NO}_2)_4\text{O}$ [235°] Formed by oxidising tetra-nitro di-phenyl-methane (Stadel, A 218, 341) Needles (from HOAc).

p-NITRO-BENZOYL-ACETIC ACID $\text{C}_8\text{H}_7\text{NO}_5$, *s.* $\text{C}_6\text{H}_4(\text{NO}_2)\text{COCH}_2\text{CO}_2\text{H}$ Nitro phenyl methyl ketone carboxylic acid [135°] Formed by digesting *p* nitro phenyl propionic ether with H_2SO_4 (85 p c) at 35° till it is completely soluble in aqueous NaOH (Perkin & Bellenot, B 17, 386, 18, 952, C J 49, 444) Needles, v sol alcohol and ether, sol water FeCl_3 colours its alcoholic or hot aqueous solution reddish brown On heating by itself or with dilute acids or alkalis it splits up into CO_2 and *p* nitro-acetophenone

Methyl ether MeA' [107°] Monoclinic crystals, v sol hot alcohol NaOMe forms yellow crystals of $\text{C}_6\text{H}_4(\text{NO}_2)\text{COCHNMeCO}_2\text{Me}$, a body from which benzyl chloride produces $\text{C}_6\text{H}_4(\text{NO}_2)\text{COCH}(\text{C}_6\text{H}_5)\text{CO}_2\text{Me}$ [57°]

Ethyl ether EtA' [76°] Monoclinic crystals, $a, b, c = 358, 11, 238$, $\beta = 72^\circ 22'$ Its alcoholic solution is coloured brownish violet by FeCl_3 Nitrous acid acting on its ethereal solution forms $\text{C}_6\text{H}_4(\text{NO}_2)\text{COC}(\text{NOH})\text{CO}_2\text{Et}$ [220°] Yields $\text{C}_6\text{H}_4(\text{NO}_2)\text{COCHNMeCO}_2\text{Et}$, crystallising in orange needles, whence aqueous AgNO_3 forms an explosive amorphous Ag salt The sodium salt is converted by ethyl iodide into the ether $\text{C}_6\text{H}_4(\text{NO}_2)\text{COCHEtCO}_2\text{Et}$ [40°]

NITRO-BENZOYL-ACETOACETIC ETHER *c.* ACETOACETIC ETHER

o-NITRO-BENZOYL-ACETONE

$\text{C}_{10}\text{H}_7\text{NO}_5$, *s.* $\text{NO}_2\text{C}_6\text{H}_4\text{COCH}_2\text{COCH}_3$ [55°]. Got by boiling *o*-nitro benzoyl aceto acetic ether with H_2SO_4 (1 pt) and water (2 pts) for 4 hours (Gevekoht, A 221, 332) Crystallised from benzoline Insol. water, v sol alcohol and ether Gives with phenyl hydrazine a compound melting at 120°, crystallising from alcohol in slender needles, possibly nitro di phenyl methyl-pyrazole (Fischer & Bulow, B 18, 2136)

p-NITRO-BENZOYL-ANGELIC ETHER

$\text{C}_{12}\text{H}_9\text{NO}_5$, $\text{COCH}(\text{C}_6\text{H}_5)\text{CO}_2\text{Et}$ [46°] Formed by the action of allyl iodide upon the sodium-derivative of *p*-nitro-benzoyl-acetic ether (Perkin & Bellenot, B 18, 957) Colourless plates

(α)-DI-NITRO-BENZOYL-BENZOIC ACID $\text{C}_{14}\text{H}_8\text{N}_2\text{O}_7$, [240°] Formed from benzoyl

benzoic acid, HNO_3 , and H_2SO_4 (Plaskuda, B 7, 988). Plates — BA' , aq — CA' , 2aq

(β)-Di-nitro-benzoyl-benzoic acid

$\text{C}_{12}\text{H}_7(\text{NO}_2)_2\text{CO}_2\text{C}_6\text{H}_4(\text{NO}_2)\text{CO}_2\text{H}$ [212°] Formed by boiling di-nitro phenyl-*p* tolyl ketone with CrO_3 and HOAc (Plaskuda & Zinke, B 7, 984). Plates (from hot water)

o-NITRO-BENZOYL-BENZYL-MALONIC ETHER

$\text{C}_8\text{H}_7(\text{NO}_2)\text{OCH}(\text{C}_6\text{H}_5)(\text{CO}_2\text{Et})_2$ [94°] Formed from sodium benzyl malonic ether and *o*-nitro benzoyl chloride, or from benzyl chloride and sodium *o* nitro benzoyl malonic ether (Bischoff & Siebert, A 239, 103) Prisms (from dilute alcohol) V sol ether and hot alcohol, sl sol ligroin Gives no colour with FeCl_3 , Alcoholic KOH produces benzyl malonic acid and *o* nitro benzoic acid Ammonia forms *o*-nitro-benzamide and benzyl-malonic ether

NITRO-BENZOYL-CHLORIDE *v* Chloride of

NITRO-BENZOIC ACID

NITRO-BENZOYL CYANIDE *v* Cyanide of

NITRO-BENZOIC ACID

NITRO-BENZOYL-FORMIC ACID *v* Nitro-

PHENYL GLYOXYLIC ACID

o-NITRO-BENZOYL MALONIC ETHER

$\text{C}_8\text{H}_7(\text{NO}_2)\text{COCH}(\text{CO}_2\text{Et})_2$ [54°] The sodium-derivative $\text{C}_8\text{H}_6(\text{NO}_2)\text{COONa}(\text{CO}_2\text{Et})_2$ is formed by the action of NaOEt on di-nitro di benzoyl-malonic ether, or of *o* nitro benzoyl chloride (1 mol) on di sodio malonic ether (1 mol) (Bischoff, B 16, 1044, 17, 2791, 22, 387) Needles or prisms (from alcohol) FeCl_3 colours its alcoholic solution dark red Bromine acting on its sodium derivative forms the bromo derivative $\text{C}_8\text{H}_6(\text{NO}_2)\text{COCB}(\text{CO}_2\text{Et})_2$ [72°] On reduction by zinc-dust and HCl it yields (*Py* 1,3) di oxyquinoline (*Py* 2) carboxylic acid, and other bodies

o-Di-nitro-di-benzoyl-malonic ether

($\text{C}_6\text{H}_4(\text{NO}_2)_2\text{CO}$), $\text{C}(\text{CO}_2\text{Et})_2$ [93°] Colourless tables or prisms Obtained by the action of *o*-nitro benzoyl chloride (2 mols) on di sodio malonic ether (1 mol) in alcoholic solution By treatment with sodium ethylate one of the nitro benzoyl groups is removed with formation of sodio nitro benzoyl malonic ether and nitro benzoic ether By alcoholic NH_3 both benzoyl groups are removed with production of malonic ether and nitro benzamide (2 mols) (Bischoff & Raab, B 17, 2789)

m-NITRO BENZOYL PEROXIDE

($\text{C}_6\text{H}_4(\text{NO}_2)\text{CO}$), O_2 , Oil, ppd by adding water to a solution of benzoyl peroxide in fuming HNO_3 (Brodie, *Pr* 12, 655)

DI - *p* - NITRO - DI - BENZOYL - SUCCINIC ETHER

$\text{C}_{12}\text{H}_9\text{NO}_5$, $\text{COCH}(\text{CO}_2\text{Et})\text{CH}(\text{CO}_2\text{Et})\text{CO}_2\text{C}_6\text{H}_4(\text{NO}_2)$ [180°] Formed by the action of iodine on an ethereal solution of the sodium derivative of *p* nitro-benzoyl acetic ether (Perkin & Bellenot, C J 49, 452, B 18, 953) Needles Forms an amorphous di-sodium derivative

o NITRO-BENZYL ALCOHOL

$\text{C}_8\text{H}_7\text{NO}_3$, CH_2OH [74°] Prepared by the action of aqueous NaOH on *o* nitrobenzoic aldehyde (Friedlander & Henriques, B 14, 2804, Gabriel & Borgmann, B 16, 2065, Geigy & Koenigs, B 18, 2403) Yellow needles, sl sol water Yields on reduction by zinc and HCl *o*-amido-benzyl alcohol [82°] Chromic acid oxidises it to *o*-nitro benzoic acid.

NITRO-BENZOPHENONE.

***m*-Nitro-benzyl alcohol** $C_6H_4(NO_2)CH_2OH$ (175°-180° at 8 mm) Formed by heating *m*-nitro-benzaldehyde with alcoholic potash, and ppg by water (Grimaux, *B* [2] 8, 433)

Preparation—2 pts of *m*-nitro benzaldehyde are mixed with a cooled solution of 1 pt of KOH in 6 pts of water. After standing overnight the product is extracted with ether, the yield is nearly the theoretical (Becker, *B* 15, 2091)

Oil, decomposed by distillation under atmospheric pressure

***p*-Nitro-benzyl alcohol** $C_6H_4(NO_2)CH_2OH$ [92°] Formed by heating its acetyl derivative with aqueous NH_3 at 100° (Beilstein a Kuhlberg, *Z* [2] 3, 467, *A* 147, 943) Formed also, together with di nitro *p*-toluidine, by warming the *p* nitro benzyl ether of di nitro-*o*-cresol with alcoholic NH_3 (Staedel, *A* 217, 183)

Preparation—1 Finely powdered *p*-nitro-benzaldehyde (1 pt) is added to 5 or 6 pts of 15 p aqueous NaOH, and allowed to stand for 12 hours, it is then diluted with a little water and extracted with ether, the yield is 80 p c to 90 p c of the theoretical—2 20 pts of *p* nitro benzyl acetate (obtained by nitration of benzyl acetate) in 40 pts of boiling alcohol is treated with 35 pts of 15 p aqueous NaOH, quickly cooled and poured into 200 pts of iced water, and the pp collected, the yield is about 75 p c (Basler, *B* 16, 2715)

Properties—Yellowish needles Yields *p* nitro benzoic acid on oxidation Concentrated nitric acid converts it into the nitrate $C_6H_4(NO_2)CH_2ONO_2$ [71°] (Staedel, *B* 14, 90)

Acetyl derivative $C_6H_4(NO_2)CH_2OAc$ [78°] Formed by dropping benzyl acetate into fuming HNO_3 Pale yellow needles

***o*-NITRO-BENZYLAMINE** $C_6H_4NO_2$ *te* $C_6H_4(NO_2)CH_2NH_2$ Formed by heating *o*-nitro benzyl phthalimide with $HClAq$ at 200° (Gabriel, *B* 20, 2228) Liquid, v sol water— $B'HCl$ Needles, v sol water— $B'H.PtCl_2$ 2aq

Formyl derivative $C_6H_4AcNO_2$ [90°] Formed by heating the hydrochloride with dry sodium formate and formic acid (Gabriel a Jansen, *B* 23, 2813) Crystals Yields quinoxaline dihydride on reduction by zinc and HCl

Acetyl derivative [99°] Needles Yields on reduction $C_6H_4(NH_2)CH_2NHAc$ [113 5°]

Benzoyl derivative [112°] Needles (from hot alcohol) Yields on reduction $C_6H_4(NH_2)CH_2NHBz$ [109°]

***m*-Nitro-benzyl-amine** $C_6H_4(NO_2)CH_2NH_2$ Formed by heating *m* nitro benzyl phthalimide with $HClAq$ (Gabriel a Hendess, *B* 20, 2869) Formed also from *m* nitro benzyl chloride and alcoholic NH_3 (Borgmann, *C* 1885, 456) Needles— $B'H.PtCl_2$ plates

Acetyl derivative $C_6H_4(NO_2)CH_2NHAc$ [91°] Needles, sol hot water

***p*-Nitro-benzyl amine** $C_6H_4(NO_2)CH_2NH_2$ Prepared from *p*-nitro benzyl chloride by treatment with potassium phthalimide and decomposition of the *p*-nitro-benzyl phthalimide (Hafner, *B* 23, 387) Strongly alkaline oil, absorbing CO_2 from the air Converted by nitrous acid into *p* nitro benzyl alcohol OS_2 forms $C_6H_4(NO_2)CH_2NHCSNH_2$, $CH_2.C_6H_4.NO_2$ [198°].— $B'HCl$ plates, m sol. water— $B'H.PtCl_2$.— $BHNO_2$, needles, sl sol water

Acetyl derivative $C_6H_4(NO_2)CH_2NHAc$ [138°] Needles, sol water Formed by heating the base with Ac_2O and $NaOAc$, or by nitration of the acetyl derivative of benzylamine (Amsel a Hofmann, *B* 19, 1286)

Benzoyl derivative [156°] Needles **Di-*p*-nitro-di-benzyl-amine** $C_{11}H_{12}N_2O_4$ *te* $(C_6H_4(NO_2)CH_2)_2NH$ [93°] Obtained, together with the following isomeride and tri nitro-tri-benzylamine, by heating nitro benzyl chloride with aqueous NH_3 at 100° (Strakosch, *B* 6, 1056) Yellow plates (from alcohol)— $B'HCl$ [212°].— $B'H.PtCl_2$

Di nitro-di-benzyl-amine [above 100°] Formed as above— $B'HCl$ [173°]

Tri-*o* nitro-tri-benzyl-amine $(C_6H_4(NO_2)CH_2)_3N$ [157°] Formed almost exclusively by heating *o* nitro-benzyl chloride with aqueous NH_3 Long yellowish needles. Sol benzene, sl sol alcohol Its salts are decomposed by water (Lellmann a Stuckel, *B* 19, 1605)

Tri *p* nitro-tri benzyl-amine $(C_6H_4(NO_2)CH_2)_3N$ [163°] Formed by heating *p*-nitro benzyl chloride with aqueous NH_3 (Strakosch) Needles (from $HOAc$)

Tri nitro-benzyl-amine $N(CH_2.C_6H_4.NO_2)_3$ [159°] Formed by nitration of tri benzyl amine with a mixture of conc HNO_3 and conc H_2SO_4 Colourless crystals Sol hot acetic acid, insol alcohol and ether (Marquardt, *B* 19, 1030)

***o*-NITRO-BENZYL-ANILINE** $C_6H_4(NO_2)CH_2.NHC_6H_5$ Prepared by heating 2 mols of aniline with 1 mol of *o*-nitro benzyl chloride in alcoholic solution for 2 hours on the water bath It crystallises in two allotropic forms, of which the unstable form changes into the stable by fusion or by long keeping The unstable form crystallises in reddish-yellow monoclinic needles, $a b c = 8585 \ 111587$, $\beta = 87^\circ 42' 52''$, and melts at [44°] The stable form crystallises in glistening brown triclinic prisms, $a b c = 1 \ 6764 \ 1^\circ$, $\alpha = 117^\circ$, $\beta = 137^\circ 40' 6''$, $\gamma = 69^\circ 38' 44''$, it melts at [57°] V sol alcohol, ether, and benzene, sparingly in petroleum-ether Reduced by tin and HCl to $C_6H_4NO_2$ [83°]— $B'HCl$ 3aq white needles, basified by much water

Acetyl derivative $C_6H_4(NO_2)CH_2.NPhAc$ [75°] (Paal a Krecke, *B* 23, 2637)

Benzoyl derivative $C_6H_4(NO_2)CH_2.NPhBz$ [101°] Well formed crystals, sol alcohol, ether, and acetic acid, v sol chloroform, sl sol petroleum-ether By reduction with tin and HCl it is converted into $C_6H_4(NH_2)CH_2.NPhBz$ [115°] (Lellmann a Stuckel, *B* 19, 1605, 24, 718, Söderbaum a Widman, *B* 23, 2198)

Formyl derivative $C_6H_4(NO_2)CH_2.NC_6H_5.CHO$ [77°] Yellow monoclinic plates, $a b c = 548 \ 1 \ 1085$, $\beta = 69^\circ 7'$ Yields phenyl-quinoxaline dihydride on reduction (Paal a Busch, *B* 22, 2683)

***m*-Nitro benzyl-aniline** $C_6H_4(NO_2)CH_2.NHC_6H_5$ [86°] From *m*-nitro-benzyl chloride and aniline (Borgmann, *C* 1885, 456) Orange-red needles— $B'HCl$ plates.

***p*-Nitro-benzyl-aniline** $C_6H_4(NO_2)CH_2.NHC_6H_5$ [68°] Formed from *p*-nitro-benzyl chloride and aniline (Strakosch,

B 6, 1062 Golden yellow needles, sol hot alcohol—B'HCl Plates

Di-nitro-di-benzyl-aniline

$(C_6H_4(NO_2)CH_2)_2NC_6H_5$ [206°] Formed in small quantity as a by product of the action of *o*-nitro benzyl chloride upon aniline Greenish-yellow needles Sparingly soluble in acetic acid (Lellmann a Stuckel, B 19, 1608)

***m* Nitro benzyl-aniline** $C_6H_4(NO_2)NHCH_2C_6H_5$ [107°] From *m* diazo nitro benzene *m* nitro-benzyl anilide by heating with conc HCl at 100° (Meldola a Streatfield, C J 51, 114)

The Nitrosamine is an oil

***p*-Nitro-benzyl-aniline** $C_6H_4(NO_2)NHCH_2C_6H_5$

[148°] From *p*-diazo-nitro benzene *p*-nitro-benzyl-anilide by heating with conc HCl at 100° (Meldola a Streatfield, C J 51, 113, Meldola a Salmon, C J 53, 779) Golden scales

Nitrosamine $C_6H_4(NO_2)N(NO)C_6H_5$ [108°]

Acetyl derivative [109°]

Benzoyl derivative

$C_6H_4(NO_2)NBzCH_2Ph$ [194°] Needles

***p*-Nitro-di-benzyl-aniline**

$C_6H_4(NO_2)N(CH_2C_6H_5)_2$ [130°] Formed by nitration of di benzyl aniline dissolved in acetic acid Yellow needles Sol hot alcohol and acetic acid, sl sol cold alcohol, v sol ether and benzene (Matzudaira, B 20, 1613)

NITRO-BENZYL-BENZENE *v* **NITRO-DIPHENYL METHANE**

Di-*m* nitro di-benzyl-benzene $C_{12}H_{10}N_2O_4$ *z* $C_6H_4(CH_2C_6H_4NO_2)_2$ [165°] Formed by the action of H_2SO_4 on a mixture of *m* nitro diphenyl methane and *m*-nitro benzyl alcohol (Becker, B 15, 2091)

Di-*p* nitro di-benzyl-benzene

$C_6H_4(NO_2)CH_2C_6H_4CH_2C_6H_4(NO_2)$ [c 146°] Formed as a by product in the preparation of *p*-nitro-di phenyl methane by the action of H_2SO_4 on a mixture of *p* nitro benzyl alcohol and benzene (Basler, B 16, 2716) Small white concentric needles Sol benzene and hot acetic acid, v sl sol other solvents

***m*-NITRO-BENZYL BROMIDE** $C_6H_4BrNO_2$ *z* $C_6H_4(NO_2)CH_2Br$ [58°] Formed by heating *m*-nitro toluene with bromine at 130° (Wachendorff, A 185, 266)

***p*-Nitro-benzyl bromide** [100°] Formed from *p*-nitro toluene and Br (W) Needles

***p*-NITRO-BENZYL-CARBAMIC ETHER**

$C_6H_4(NO_2)CH_2NHCO_2Et$ [117°] Formed from *p*-nitro benzylamine and $ClCO_2Et$ (Hafner, B 23, 840) Silky needles, v sol ether

***o*-NITRO-BENZYL CHLORIDE** $C_6H_4ClNO_2$ *z* $C_6H_4(NO_2)CH_2Cl$ [49°] Formed, together with the *p*-isomeride, by nitration of benzyl chloride in the cold (Beilstein a Gaitner, A 139, 337, Abelli, G 13, 97, Nöbling, B 17, 385, Kumpf (A 224, 100) Formed also by treating *o*-nitro benzyl alcohol with PCl_5 in the cold (Gabriel a Borgmann, B 16, 2066, Geigy a Königs, B 18, 2401) Thick crystals Reduced by $SnCl_4$ to *o*-'benzylene imide' C_6H_5N , an amorphous base (Lellmann a Stuckel, B 19, 1611) Aniline yields only $C_6H_4(NO_2)CH_2NHPh$ reduced by zinc-dust in $HOAc$ to the amido-compound $C_6H_4(NH_2)CH_2NHPh$ [82°] (Söderbaum a Widman, B 23, 2198)

***m*-Nitro benzyl-chloride** $C_6H_4(NO_2)CH_2Cl$ [47°] (c. 178° at 85 mm). Long yellow needles

V sol alcohol, ether, and benzene Formed by the action of PCl_5 on the alcohol (Gabriel a Borgmann, B 16, 2064)

***p*-Nitro-benzyl chloride**

[4 1] $C_6H_4(NO_2)CH_2Cl$ [71°] Formed by treating benzyl chloride with HNO_3 (S G 1 48) at -10° (Elbs a Bauer, J pr [2] 34, 343, cf Beilstein a Gaitner, A 139, 337, Strakosch, B 6, 1056, Grimaux, Bl [2] 8, 433) Formed also by passing chlorine into *p* nitro toluene at 190° (Wachendorff, B 8, 1101, A 185, 271) Crystals

Reactions—1 Ammonium sulphide gives

p-nitro benzyl mercaptan (Strakosch, B 5, 697)

2 Alcoholic potash gives an azo derivative of di nitro stilbene—3 An alkaline solution of SnO forms *p* dinitro dibenzyl (W Roser, A 238, 363)—4 Chromic acid mixture oxidises it to

p nitro benzene acid—5 A solution of $SnCl_4$ in $HClAq$ reduces it to *p* 'benzylene imide' C_6H_5N , an amorphous base (L a S)

NITRO BENZYL CYANIDE *v* **Nitrile of**

NITRO PHENYL ACETIC ACID

***o* - NITRO - BENZYL - ETHYL - MALONIC**

ETHER $C_{12}H_{13}NO_6$ *z* $C_6H_4(NO_2)CH_2CEt(CO_2Et)_2$

Formed from ethyl malonic ether, $NaOEt$, and *o* nitro benzylchloride (Lellmann a Schleich, B 20, 440) Reduced by zinc and $HOAc$ to $C_6H_4NO_2$ [114°]

***p* Nitro benzyl ethyl-malonic ether** [52°] Formed in like manner Needles

***o* NITRO-BENZYL ETHYL OXIDE**

$C_6H_4(NO_2)OC_2H_5$ Formed by heating *o*-nitro benzyl chloride with alcohol in a boiling brine bath (Errera, G 18, 232) Oil

***m* Nitro-benzyl ethyl oxide** Prepared by heating *m* nitro benzyl chloride with alcoholic potash (E) Oil, solidifying in a freezing mixture

***p* Nitro benzyl ethyl oxide** [24°] Prepared by heating *p* nitro benzyl chloride with alcohol (E) Trimetric crystals

NITRO BENZYLIDENE ACETONE *v* **NITRO-ETHYL METHYL KETONE**

NITRO BENZYLIDENE ACETONAMINE *v* **ACETONAMINE**

***m* DI - NITRO - DI BENZYLIDENE - DI -**

AMIDO DIPHENYL

$C_6H_4(NO_2)CHNCH_2C_6H_4NCHC_6H_4(NO_2)$ Formed by heating *op* di amido diphenyl with *m*-nitro benzoic aldehyde and alcohol at 100° (Reuland, B 22, 3011) Yellow crystalline powder, m sol alcohol The isomeric compound from *p* nitro benzoic aldehyde and *op* di amido diphenyl melts at 208°, while that from di *p*-amido-diphenyl and *m* nitro benzoic aldehyde melts at 234° (Schiff a Vanni, A 258, 375)

***m* NITRO-BENZYLIDENE ANILINE**

$C_{11}H_9N_2O_2$ *z* $[3 1]C_6H_4(NO_2)CHNPh$ [61°] Formed from *m*-nitro-benzoic aldehyde and aniline (Lazorenko, J 1870, 760) Needles

***p*-Nitro-benzylidene aniline**

[4 1] $C_6H_4(NO_2)CHNPh$ [93°] Formed by heating aniline with *p* nitro benzoic aldehyde at 100° (Fischer, B 14, 2524)

Di-*m*-nitro-benzylidene-aniline

[3 1] $C_6H_4(NO_2)CHNCH_2C_6H_4(NO_2)$ [1 3] [158°] Formed by warming the alcoholic solution of *m* nitro-benzoic aldehyde with *m* nitro aniline (Hantzsch, B 23, 2775).

***m*-NITRO-BENZYLIDENE BROMIDE**

$C_6H_4(NO_2)CHBr$ [1.3] [102°] Formed by

NITRO-BENZOPHENONE.

heating *m*-nitro toluene (1 mol) with bromine (2 mols) at 140° (Wachendorff, *A* 185, 278) Minute needles (from alcohol)

p-Nitro-benzylidene bromide

$C_6H_4(NO_2)CHBr_2$ [14] [82°] Formed by heating *p*-nitro toluene (1 mol) with bromine (2 mols) at 140° (W) Needles or rectangular plates (from alcohol) By heating with aniline it yields *p*-rosaniline (Zimmermann & Muller, *B* 17, 2936)

m-NITRO BENZYLIDENE CHLORIDE

$C_6H_4(NO_2)CHCl$ [65°] Formed from *m*-nitro benzoic aldehyde and PCl_5 (Widmann, *B* 13, 676, Erlich, *B* 15, 2010) Thin monoclinic plates or needles (from alcohol), ν sol ether

p-Nitro-benzylidene chloride

$C_6H_4(NO_2)CHCl_2$ [46°] Formed from *p*-nitro benzoic aldehyde and PCl_5 (Zimmermann & Muller, *B* 17, 2937, 18, 997), and by nitration of benzylidene chloride (Hubner & Beute, *B* 6, 803) Prisms (from alcohol) Yields *p*-rosaniline on heating with aniline

o NITRO-BENZYLIDENE HYDRAZINE

$(C_6H_4(NO_2)CH)_2N_2$ [181°] Formed from *o*-nitrobenzoic aldehyde and hydrazine salts (Curtaub & Jay, *J pr* [2] 39, 43) Yellow needles

p-NITRO-BENZYLIDENE INDOXYL *v* Indoxide of *p*-NITRO BENZOIC ALDEHYDE

o-NITRO BENZYLIDENE MALONIC ACID

$C_6H_4(NO_2)CH(CO_2H)_2$ [2] $C_6H_4(NO_2)CH(CO_2H)_2$ [161°] Formed by heating *o*-nitro benzoic aldehyde with malonic acid and HOAc at 60° (Stuart, *O J* 47, 158, 49, 365) Needles (from water), ν sol ether, ν a. sol ether, sl sol $CHCl_3$ With HBr it yields a yellow compound melting at 227° Boiling water decomposes it slowly, forming *o*-nitro benzoic aldehyde, malonic acid, and a little *o*-nitro cinnamic acid — $BaA''2'$ feathery tufts, converted by warm water into insoluble $BaA''aq$ — AgA''

Ethyl ether EtA'' [53°]

m-Nitro-benzylidene malonic acid

$[3] C_6H_4(NO_2)CH(CO_2H)_2$ [205°] Formed from *m*-nitro benzoic aldehyde, malonic acid, and HOAc (Stuart, *O J* 47, 155, 49, 361) Crystals, sl sol cold water and ether Partially decomposed by hot water into *m*-nitro benzoic aldehyde and malonic acid Split up on fusion into CO_2 and *m*-nitro-cinnamic acid [196°] HBr forms $C_6H_4(NO_2)CHBrCH(CO_2H)_2$ Bromine combines with it, yielding the dibromide $C_6H_4(NO_2)CHBrCBr(CO_2H)_2$

Ethyl ether EtA'' [73°]

p-Nitro-benzylidene-malonic acid

$C_6H_4(NO_2)CH(CO_2H)_2$ [227°] Formed from *p*-nitro-benzoic aldehyde, malonic acid, and HOAc at 60° (Stuart, *O J* 49, 408) Formed also, together with a small quantity of the *ortho*-acid from benzylidene malonic ether by nitration and saponification (Stuart, *O J* 47, 155) Crystals, split up on fusion into CO_2 and *p*-nitro-cinnamic acid Decomposed by hot water into *p*-nitro-benzoic aldehyde and malonic acid Bromine forms $C_6H_4(NO_2)CHBrCBr(CO_2H)_2$, which gives off HBr at 100°, leaving a residue [188°], and is decomposed by water yielding $C_6H_4(NO_2)CHBrCO_2H$ [208°]

Ethyl ether EtA'' [93°] Prisms Converted by HBr into $C_6H_4(NO_2)CHBrCH(CO_2H)_2$, [99°] (Stuart, *O J* 49, 362).

m-NITRO-BENZYLIDENE DI-METHYL

DISULPHONE $C_6H_4(NO_2)CH(SO_2CH_3)_2$ [179°] Formed by oxidising *m*-nitro benzylidene di-thio di-glycolic acid (Bongartz, *B* 21, 487) Slender needles (from dilute HOAc)

p-Nitro-benzylidene di-methyl disulphone $[14] C_6H_4(NO_2)CH(SO_2CH_3)_2$ [248°] Formed by oxidising *p*-nitro benzylidene di-thio di-glycolic acid with $KMnO_4$ (B) Yellowish needles (from hot water)

NITRO-BENZYLIDENE PHTHALIDE

Preparation—10 pts of crude di-nitro-benzyl phthalide are dissolved in 20 pts of hot alcohol, diluted with 10 pts of hot water, and heated for half an hour on the water bath, the yield is 46 p c of theoretical, but when pure di-nitro compound is used, nearly 100 p c (Gabriel, *B* 18, 1251, 3471)

Properties—Glistening crystals Split up on dry distillation into phenyl cyanate and phthalic anhydride Alcoholic NaOH converts it into the salt $C_6H_4NO_2Na_2$ which crystallises in colourless prisms and is decomposed by acids into *o*-nitro toluene $C_6H_4(NO_2)CH_3$ and phthalic anhydride Reduced by HI and P to isobenzylidene phthalide $C_6H_4 \begin{array}{l} \diagup CHCPh \\ \diagdown COO \end{array}$

[91°] and a compound $C_6H_4NO_2$ [121°] whence KOH and MeI yield two isomeric bodies $C_6H_4NO_2$, melting at 237° and 121° (Gabriel, *B* 20, 2863)

NITRO-BENZYLIDENE-PHTHALIMIDINE

Phthalimidylnitrobenzyl Formed together with oxy-nitrobenzyl-phthalimidine by leading N_2O_4 or N_2O_5 into a benzene solution of benzyl-phthalimidine or of deoxybenzoin-*o*-carboxylamide $C_6H_4(CO NH_2)COCH_2C_6H_5$ (Gabriel, *B* 18, 2439)

Nitro-benzylidene-phthalimidic acid $C_6H_4NO_2 \text{ } \nu \text{ } C_6H_4(CO_2H)(C NH_2)C(NO_2)C_6H_5$ [145°-150°] Formed by dissolving nitro-benzylidene phthalimidine in hot dilute NaOH and precipitating with an acid (Gabriel, *B* 18, 2440) Acetyl chloride reconverts it into the anhydride Nitrous acid passed into the solution in benzene converts it into nitro-benzylidene phthalide

Salts — $A''Ag$ microcrystalline powder — $A''Ba7aq$ long yellow needles or short prisms Ethyl ether $A''Et$ [155°], yellow crystals.

Nitro-iso benzylidene-phthalimidine ν

(*Py* 142)-NITRO-OXY PHENYL ISOQUINOLINE

NITRO-BENZYLIDENE-DI-THIO-DI-GLY.

COLLIC ACID $C_6H_4NSO_2 \text{ } \nu \text{ } C_6H_4(NO_2)CH(SCH_2CO_2H)_2$ The *o*-, *m*-, and *p*-varieties of this acid are formed by the action of thioglycolic acid on the three nitro-benzoic aldehydes (Bongartz, *B* 21, 479)

o-Acid [123°] Needles (from HOAc)

m-Acid [180°] Needles (from dil HOAc)

p-Acid [162°] Needles (from dil HOAc)

o-NITRO-BENZYLIDENE-DI-UREA

$C_6H_4NO_2 \text{ } \nu \text{ } C_6H_4(NO_2)CH(NHCO NH_2)_2$ [200°] Formed by warming an alcoholic solution of urea with *o*-nitro-benzoic aldehyde (Schiff,

A. 251, 186, Ludy, M 10, 804) Needles (containing aq), sl sol water and alcohol

o-NITRO-BENZYL IODIDE $C_6H_4(NO_2)CH_2I$ [75°]

Formed from *o*-nitro benzyl chloride, KI, and alcohol (Kumpf, A 224, 103)

p Nitro-benzyl iodide $C_6H_4(NO_2)CH_2I$ [127°]

Formed in like manner Needles

p-NITRO-BENZYL-MALONIC ACID

$C_6H_4(NO_2)CH_2CH(CO_2H)_2$ Formed by saponification of the ether which is obtained in small quantity, together with di nitro di benzyl malonic ether, by the action of *p* nitro benzyl chloride upon sodio malonic ether (Lellmann a Schleich, B 20, 434) Yellow powder Carbonises at 240° without melting CaA" and BaA" yellow pps

Ethyl ether Et.A" [63°], yellowish prisms, sol ordinary solvents

Di o nitro di benzyl malonic ether

$(C_6H_4(NO_2)CH_2)_2C(CO_2Et)_2$ [97°] Obtained by the action of *o* nitro benzyl chloride upon sodio-malonic ether Yellow crystals Sol alcohol and ether (Lellmann a Schleich, B 20, 438)

Di p nitro di benzyl malonic ether

$(C_6H_4(NO_2)CH_2)_2C(CO_2Et)_2$ [170°] Formed by the action of *p* nitro benzyl chloride upon sodio malonic ether Colourless silky needles Sol acetic acid, sl sol alcohol, and chloroform

p-NITRO BENZYL MERCAPTAN $C_6H_4NSO_2$

$\epsilon \epsilon C_6H_4(NO_2)CH_2SH$ [140°] Formed from *p*-nitro-benzyl chloride and alcoholic ammonium sulphide (Strakosch, B 5, 698) Lamine

TRI-NITRO-BENZYL-MESITYLENE

$C_6H_3(NO_2)_3$, [185°] Formed by nitration of benzyl-mesitylene at 0° (Louise, A Ch [6] 6, 182) Prisms (from alcohol chloroform)

TRI-NITRO-BENZYL METHYL KETONE

$C_6H_4(NO_2)_3CH_2COCH_3$ [89°] Obtained by boiling tri nitro phenyl acetoacetic ether (10 g) dissolved in HOAc (100 g) with H_2SO_4 (20 g) and water (30 g) for 8 hours (Dittreich, B 23, 2723) Long yellowish white needles, sol alkalis

Phenyl hydrazide $C_6H_3N_2O_5$ [125°]

NITRO p-BENZYL-PHENOL $C_6H_4NO_2$, $\epsilon \epsilon$

$PhCH_2C_6H_4(NO_2)OH$ [134] [75°] From benzyl phenol and HNO_3 (S G 14) Prisms Volatile with steam—KA' brick-red needles (Rennie, C J 41, 221)

Di nitro p benzyl phenol

$PhCH_2C_6H_3(NO_2)_2OH$ [135? 4] [88°] From the above, HOAc, and HNO_3 Formed also by the action of HNO_3 on *p* benzyl phenol sulphonic acid (Rennie, C J 49, 408) Oxidised by CrO_3 it gives benzoic acid—KA', orange needles—BaA'.

Di-nitro o benzyl phenol [82°] Obtained by warming *o*-benzyl phenol sulphonic acid with dilute HNO_3 (Rennie)—KA' aq—BaA'.

Tri - nitro - benzyl phenol $C_6H_3(NO_2)_3OH$ [148°] Got by dissolving potassic benzyl-phenol sulphonic acid in HNO_3 (S G 14) and evaporating (Rennie, C J 41, 36, 223) Silky pale yellow needles Yields *p* nitro-benzoic acid on oxidation with chromic acid mixture— $C_{12}H_7(NO_2)_3OK$

NITRO - p - BENZYL - PHENOL SULPHONIC

ACID $C_6H_4C_6H_4(OH)(NO_2)SO_3H$ —KA' Formed by action of HNO_3 (S G 12) and potassic benzyl-phenol sulphate (Rennie, C J 41, 85)

Nitro - o - benzyl - phenol sulphonic acid Formed in like manner—KA' yellow scales

DI-NITRO BENZYL PHTHALIDE $C_{12}H_8N_2O_5$

$\epsilon \epsilon C_6H_4 \begin{matrix} \diagup C(NO_2)CH(NO_2)C_6H_4 \\ \diagdown COO \end{matrix} (?)$ [113°]

Formed by passing nitrous acid gas into a solution of benzylidene phthalide in benzene (Gabriel, B 18, 1251) Colourless crystals Readily converted into nitro-benzylidene phthalide (q v)

o-NITRO-BENZYL-PHTHALIMIDE

$C_6H_4 \begin{matrix} \diagup CO \\ \diagdown NCH_2C_6H_4(NO_2) \end{matrix}$ [12] [219°]

Formed from potassium phthalimide and *o* nitro-benzyl chloride at 100°-130° (Gabriel, B 20, 2227) Prisms

m Nitro benzyl phthalimide [155°] Formed in like manner Needles

p Nitro benzyl-phthalimide [175°] (S), [172°] (Hafner, C C 1889, 671) Prisms (from HOAc) (Salkowski B 22, 2142)

p NITRO BENZYL-PIPERIDEIN

$C_6H_4(NO_2)CH_2NC_4H_8$ [35°-40°] Formed by dissolving its polymeride in HClAq and ppg by ammonia (Lellmann a Schwaderer, B 22, 1333) Readily polymerises to $C_6H_4(NO_2)CH_2NC_4H_8$, [120 5°], which is also obtained by treating di-piperidein with *p* nitro benzyl chloride and NaOHaq

NITRO BENZYL-PIPERIDINE

$C_6H_4(NO_2)CH_2NC_4H_8$. The *o*, *m*, and *p*-isomerides are formed by the action of *o*, *m*, and *p*-nitro benzyl chloride on piperidine in hot alcoholic solution (Lellmann a Pekrun, A 259, 40)

o Isomeride Oil Reduced by $SnCl_2$ to *o*-amido benzyl piperidine [82 5°]—B'HCl—B'H₂PtCl₆

m Isomeride Oil Reduced by $SnCl_2$ to *m*-amido benzyl piperidine [112°]—B'HCl

p Isomeride [34°] B'HCl—B'H₂PtCl₆

NITRO - BENZYL QUINOLINE TETRA

HYDRIDE $C_6H_4(NO_2)CH_2NC_8H_6N_2$. The three isomerides are formed by heating *o*, *m*, and *p*-nitro benzyl chloride (1 mol) with quinoline tetrahydride (2 mols) in hot alcoholic solution (Lellmann a Pekrun, A 259, 50)

o Isomeride [111°] Brownish red tables—B'H₂PtCl₆, yellow amorphous pp

m Isomeride [99°] Red prisms, reduced by $SnCl_2$ to *m*-amido benzyl-quinoline tetrahydride [82°]

p Isomeride [102°] Red prisms—B'H₂PtCl₆

NITRO BENZYL SELENOCYANIDE

$C_6H_4N_3SeO_4$, $\epsilon \epsilon C_6H_4(NO_2)CH_2SeCN$ [122 5°]

Formed by nitration of benzyl selenocyanide at -4° (C L Jackson B 8, 321, A 179, 16)

Needles (from alcohol)

o NITRO BENZYL SULPHIDE

$(C_6H_4(NO_2)CH_2)_2S$ [124°] Formed, together with a little of the disulphide, by passing NH_3 and H_2S into an alcoholic solution of *o* nitro-benzyl chloride (Jahoda, M 10, 880) White plates Yields on oxidation by HNO_3 the sulphoxide $(C_6H_4(NO_2)CH_2)_2SO$ [163°] and the sulphone $(C_6H_4(NO_2)CH_2)_2SO_2$ [200°].

o Nitro-benzyl disulphide

$(C_6H_4(NO_2)CH_2)_2S_2$ [47°] Formed as above (J)

p-Nitro-benzyl disulphide [89°] Yellow crystals (Strakosch, B 5, 698)

p-NITRO-BENZYL SULPHOCYANIDE

$C_6H_4(NO_2)CH_2SCN$. Formed from *p* nitro-

NITRO-BENZOPHENONE.

benzyl chloride and alcoholic potassium sulphocyanide (Henry, *B* 2, 638) Small needles

***p* NITRO-BENZYL-DI-THIO-CARBAMIC ACID** $\text{NO}_2\text{C}_6\text{H}_4\text{CH}_2\text{NHCS}_2\text{SH}$ The *p* nitro benzyl ammonium salt [193°] of this acid is formed by treating *p* nitro benzylamine with CS_2 in ether (Hafner, *B* 23, 339)

***Di-p*-NITRO-DI-BENZYL-THIO-UREA** $\text{OS}(\text{NHCH}_2\text{C}_6\text{H}_4\text{NO}_2)_2$ [202°] Formed by boiling *p*-nitro benzyl ammonium *p* nitro-benzyl di thio carbamate with HgO and alcohol (Hafner, *B* 23, 340) Needles, sl sol alcohol

***o* NITRO-BENZYL-*p* TOLUIDINE** $\text{C}_6\text{H}_4(\text{NO}_2)\text{CH}_2\text{NHCH}_2\text{Me}$ [72°] Obtained by heating 4 pts of *p* toluidine with 1 pt of *o*-nitro benzyl chloride for $\frac{1}{2}$ hr on the water bath Yellow crystals V sol most ordinary solvents Salts — B^+HCl colourless needles — $\text{B}^+\text{H}_2\text{PtCl}_6$ sparingly soluble pp — $\text{B}^+\text{H}_2\text{SO}_4$ thin glistening plates

Acetyl derivative

$\text{C}_6\text{H}_4(\text{NO}_2)\text{CH}_2\text{N}(\text{Ac})\text{CH}_2\text{Me}$ [65°], stout crystals, on reduction with tin and HCl it is converted into *o* amido benzyl toluidine [79°] (Lellmann a Stuckel, *B* 19, 1609, 24, 718)

Formyl derivative [79°] Formed by heating a solution of formyl *p* toluidine in benzene with sodium till dissolved, and then adding *p* nitro benzyl chloride (Paal a Busch, *B* 22, 2695) Needles

***o* Nitro benzyl *o* toluidine** **Formyl derivative** $\text{C}_6\text{H}_4(\text{NO}_2)\text{CH}_2\text{N}(\text{C}_6\text{H}_4)\text{CHO}$ [76°] Formed from *o* nitro benzyl chloride and sodium formyl *o*-toluidine (Paal a Busch, *B* 22, 2701) Yellow needles grouped in spheres

***p* NITRO BENZYL UREA** $\text{C}_6\text{H}_4\text{N}_2\text{O}_3$ $\text{NH}_2\text{CO NHCH}_2\text{C}_6\text{H}_4\text{NO}_2$ [197°] Formed by heating *p* nitro benzylamine hydrochloride with silver cyanate at 100° (Hafner, *B* 23, 339) Pale yellow needles, v sol HOAc and alcohol

***Di-p*-NITRO-DI-BENZYL UREA** $\text{CO}(\text{NHCH}_2\text{C}_6\text{H}_4\text{NO}_2)_2$ [234°] Formed by boiling the corresponding thio urea with H_2O , or by adding a solution of COCl_2 in benzene to one of *p* nitro benzylamine in ether (Hafner, *B* 23, 340) Silvery needles (from HOAc)

NITRO BROMO compounds v BROMO NITRO COMPOUNDS

NITRO BRUCINE v BRUCINE

***o* NITRO-*n* BUTANE** $\text{C}_4\text{H}_9\text{NO}_2$ $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{NO}_2$ (152° cor) *S* G Σ 9945 Formed from *n* butyl iodide and AgNO_2 (Zublin, *B* 10, 2083, Pribram a Handl, *M* 2, 656) Reduced by tin and HCl to butylamine HClAq at 140° forms hydroxylamine and *n* butyric acid

***o* Nitro butane** $\text{CH}_3\text{CH}_2\text{CH}(\text{NO}_2)\text{CH}_3$ (139°) Formed from *sec* butyl iodide (120 pts) and silver nitrite (150 pts) (V Meyer a Locher, *B* 7, 1506, *A* 180, 134) Formed also from $\text{CH}_3\text{CHBrNO}_2$ and ZnEt_2 (Bevad, *J* R 20, 125)

***o*-NITRO ISOBUTANE** $(\text{CH}_3)_2\text{CHCH}_2\text{NO}_2$ (137°-144°) *S* G Σ 1 0088 Formed from *sec* isobutyl iodide and AgNO_2 (Demole, *B* 7, 709, 790, *A* 175, 142, *P* a *H*) Unlike *o* nitro *n* butane, it does not give a crystalline pp with NaOEt , although it dissolves in alkalis

Nitro *tert*-butane $(\text{CH}_3)_3\text{CNO}_2$ (110°-180°) Formed, in small quantity, together with *tert* butyl nitrite, by the action of AgNO_2 on *tert* butyl iodide (Tscherniak, *A* 180, 155) Oil, smelling like peppermint Does not dissolve in

Vol. III

alkalis May be reduced to *tert* butylamine (*cf* V Meyer, *A* 244, 222)

***Di*-nitro-butane** $\text{C}_4\text{H}_8\text{N}_2\text{O}_4$ Formed from bromo *o* nitro *n* butane, aqueous KNO_2 and dilute H_2SO_4 (Zublin, *B* 10, 2085) Oil, decomposed at 190° by distillation — $\text{KC}_4\text{H}_7\text{N}_2\text{O}_4$ golden scales, sol water and alcohol — $\text{AgC}_4\text{H}_7\text{N}_2\text{O}_4$ yellow scales with blue reflex

***Di* nitro butane** $\text{C}_4\text{H}_8(\text{NO}_2)_2$ (197°) *S* G Σ 1 205 Formed by the action of HNO_3 on di isoamyl ketone or on propyl acetoacetic ether (Chancel, *C* R 94, 399, 96, 1466) Heavy oil, forming crystalline *K* and *Ag* salts Decomposed on distillation

***Di*-(*o*)-nitro-butane** $\text{CH}_3\text{CH}_2\text{C}(\text{NO}_2)_2\text{CH}_3$ (199° cor) Formed by oxidising butyl ψ nitrole with nitric acid (V Meyer, *B* 9, 701), or by boiling isovaleric acid with HNO_3 (Bredt, *B* 15, 2324) Oil, not soluble in alkalis Tin and HCl convert it into hydroxylamine and methyl ethyl ketone

***Di*-nitro-isobutane** $(\text{CH}_3)_2\text{CHCH}(\text{NO}_2)_2$ Formed from bromo nitro-isobutane, KNO_2 and dilute H_2SO_4 (*Z*) Oil — $\text{KC}_4\text{H}_7(\text{NO}_2)_2$ — $\text{AgC}_4\text{H}_7(\text{NO}_2)_2$ *saq*

***Di*-NITRO-ISOBUTYL-ANILINE** $\text{C}_6\text{H}_4\text{N}_2\text{O}_4$ $\text{C}_6\text{H}_4\text{NHCH}_2\text{C}_4\text{H}_8(\text{NO}_2)_2$ [80°] Formed from bromo *m* di nitro benzene and isobutylamine (Romburgh, *R* T C 4, 192) Yellow needles

***Tri* nitro isobutyl aniline** $\text{C}_6\text{H}_4(\text{NO}_2)_3\text{NHCH}_2\text{C}_4\text{H}_8$ [95°] Formed from chloro tri nitro benzene (picryl chloride) and isobutylamine (*li*) Converted by fuming HNO_3 into the nitramine $\text{C}_6\text{H}_4(\text{NO}_2)_3\text{N}(\text{NO}_2)\text{C}_4\text{H}_8$ [110°]

***m* NITRO ISOBUTYL BENZENE** $\text{C}_6\text{H}_4\text{H}_2\text{NO}_2$ $\text{C}_6\text{H}_4\text{CH}_2\text{CH}_2\text{CH}_2\text{NO}_2$ (251°) at 740 mm Formed from nitro amido isobutyl benzene by elimination of NH_2 (Gelzer, *B* 21, 2941) Oil Yields *m* nitro benzoic acid on oxidation

***o* Nitro-*tert* butyl benzene** $\text{C}_6\text{H}_4(\text{NO})\text{CMe}_3$ [12] (249°) *S* G Σ 1 074 Formed from *tert* butyl benzene and fuming HNO_3 (Senkowsky, *B* 23, 2416) Yellow oil, smelling like cymene Reduced by tin and HCl to $\text{C}_6\text{H}_4(\text{NH}_2)\text{CMe}_3$ (*c* 235°), *S* G Σ 977, which yields an acetyl derivative [159°]

***p*-Nitro-*tert*-butyl benzene** $\text{C}_6\text{H}_4(\text{NO}_2)\text{CMe}_3$ [14] (30°) (276°) Formed at the same time as the preceding (*S*) Yellow needles (from alcohol) Yields, on reduction, $\text{C}_6\text{H}_4(\text{NH}_2)\text{CMe}_3$, *S* G Σ 953

NITRO *m* ISOBUTYL BENZOIC ACID $\text{C}_6\text{H}_4(\text{C}_4\text{H}_8)(\text{NO})\text{CO}_2\text{H}$ [140°] Formed by nitration of *m* isobutyl benzoic acid (Kelbe a Pfeiffer, *B* 19, 1727) Small needles (from petroleum ether) — AgA' somewhat soluble pp — MeA' liquid

Nitro *p* isobutyl benzoic acid $\text{C}_6\text{H}_4(\text{C}_4\text{H}_8)(\text{NO}_2)\text{CO}_2\text{H}$ [161°] Long fine needles (from water) Formed by nitration of *p* isobutyl benzoic acid — AgA' white pp

Methyl ether MeA' fluid (Kelbe a Pfeiffer, *B* 19, 1726)

NITRO-BUTYLENE $\text{C}_4\text{H}_7\text{NO}_2$ (154°-158°) Formed by allowing HNO_3 (*S* G 1 52) to drop into *tert* butyl alcohol (Hastinger, *Sitz* W 77 [2] 428, *A* 193, 366, *M* 2, 286) Formed also in small quantity by saturating HNO_3 with iso butylene (*H*) Pale yellow oil, heavier than water Dissolves in alkalis, and is reppd by acids, Excess of water at 100° splits it up into

N N

acetone and nitro methane Br unites, forming only $C_2H_5Br_2NO_2$ — $NaC_2H_5NO_2$ powder, v sol water

NITRO ISOBUTYL-PHENOL

$C_6H_5C_3H_7(NO_2)(OH)$ [1 3 4] [95°] (290°) at 711 mm Formed by boiling nitro amido isobutyl benzene with dilute potash (Gelzer, *B* 21, 2947) Red needles (from alcohol), v sol hot water

Di-nitro isobutyl-phenol $C_6H_5C_3H_7(NO_2)_2OH$ [98°] Formed from isobutyl phenol [99°], HOAc, and HNO_3 (Studer, *A* 211, 244, *B* 14, 1474, Liebmann, *B* 14, 1842) Sulphur yellow needles (from alcohol) Yields di nitro amido isobutyl benzene on heating with NH_3Aq

TRI-NITRO-ISOBUTYL-TOLUENE

$C_9H_7Me_2(NO_2)_3$ Artificial musk [97°] Formed by heating isobutyl toluene with HNO_3 and H_2SO_4 for 24 hours on a water-bath (Baur, *J* R 111, 238) White needles, sol alcohol and ether Its solutions smell like musk Forms a crystalline compound with naphthalene [90°]

TRI NITRO ISOBUTYL XYLENE

$C_{10}Me_2(C_6H_4)(NO_2)_3$ [110°] Formed by nitration of isobutyl xylene (Baur, *C* R 111, 238) White needles Its alcoholic solution smells like musk

NITRO-CAMPHOLENIC ACID v CAMPHOLENIC ACID

NITRO-CAMPHOR v CAMPHOR

TETRA NITRO CARBAZOLE

$C_{12}H_6(NO_2)_4NH$ Formed by nitrating carbazole (Graebe, *A* 202, 26) Lemon yellow crystals (from HOAc), insoluble in alcohol and ether— $C_{12}H_6(NO_2)_4NK$ insol water

Four tetra-nitro carbazoles have been described by Ciamician and Silber (*G* 12, 277) as formed by the nitration of carbazole The melting points of three of them are 308°, above 320°, and about 285°, while the fourth decomposes before melting

NITRO CARBOXY CINNAMIC ACID

$C_9H_7(OH\ CH\ CO_2H)(NO_2)(CO_2H)$ [2 4] [287°] (Löw, *A* 231, 371) Formed by nitrating carboxy cinnamic acid Hemispherical aggregates or regular tablets (from water) That the NO_2 is in the *o* position is shown by the fact that, by Baeyer's synthesis, it gives rise to indigo di carboxylic acid Heated with conc H_2SO_4 it does not turn blue It yields a dibromide, which is converted by aqueous NaOH into nitro carboxy phenyl-propionic acid

NITRO-CARBOXY-PHENYL-PROPIONIC

ACID $C_9H_7(NO_2)(CO_2H)CH\ CH\ CO_2H$ [3 1 4] ? [192°] Got by nitration (Widman, *B* 22, 2273)

NITRO-CARVACROL

$C_{10}H_{14}(C_6H_5)Me(NO_2)(OH)$ [78°] Formed from nitroso carvacrol, KOH, and K_2FeC_4 (Paterno a Canzoneri, *G* 10, 235) Needles, almost insol water

NITRO-CHLORO-derivatives v CHLORO-NITRO-derivatives

NITRO-CHLOROFORM v TRI-CHLORO-NITRO-METHANE

DI-NITRO-CHOLESTERIN $C_{26}H_{42}(NO_2)_2O$ [121°] Obtained by nitration of cholesterol (Preis a Raymann, *B* 12, 224) Colourless needles, sl sol cold alcohol. By boiling a hot saturated solution of cholesterol in HOAc with HNO_3 (S G 1 54), Reinitzer (*M* 9, 440) obtained a nitro compound melting at 94° By adding cholesterol (1 pt) to a mixture of HOAc (10

pts) and fuming HNO_3 (3 pts), Latschnoff (*J* R 10, 360) obtained a compound crystallising in plates, decomposing at 180° without melting

NITRO CHOLESTERYL CHLORIDE

$C_{26}H_{42}(NO_2)Cl$ [148°–149°] Colourless needles Prepared by nitration of cholesteryl chloride (Preis a Raymann, *B* 12, 225)

NITRO CHRYSENE v CHRYSENE

NITRO-CHRYSOQUINONE v CHRYSOQUINONE

NITRO-CINCHONAMINE v CINCHONA BASES

o-NITRO CINNAMIC ACID $C_9H_7NO_2$

ve [2 1] $C_9H_7(NO_2)CH\ CH\ CO_2H$ Mol w 193 [232°] (M), [237°] (T a O), [240°] (Baeyer, *B* 13, 2257) Formed, together with the *p* isomeride, by nitrating cinnamic acid (Beilstein a Kuhlberg, *A* 163, 126, Muller, *A* 212, 124) Formed also from *o* nitro benzaldehyde, Ac_2O , and NaOAc (Gabriel a Meyer, *B* 14, 830)

Preparation—1 Cinnamic acid (1 pt) is dissolved in nitric acid (5 pts), the mixture is poured upon snow, and the *ppd* acids separated by means of alcohol (B a K)—2 Cinnamic ether (10 g) is dropped into fuming HNO_3 at 0° The solution is poured at once into water at 0° The solid *pp* is washed with water, and treated with alcohol, which dissolves the *o*, leaving the *p* compound (Stuart, *C* J 43, 408) Fair yield (4 g)—3 The product of nitration of cinnamic acid is etherified, and the *o* nitro cinnamic ether is separated from the *p* isomeride by means of its greater solubility in ether (Tiemann a Oppermann, *B* 13, 2060) The acid may then be obtained from its ether by hydrolysis with H_2SO_4 (Fischer a Kuzel, *A* 221, 265)

Properties—Needles, insol water, sl sol cold alcohol Yields *o* nitro benzoic acid on oxidation by chromic acid mixture Its solution in H_2SO_4 becomes blue on warming or on standing

Salts— CaA' , 2aq yellow needles— BaA' , 2aq minute yellow needles

Methyl ether MeA' [73°]

Ethyl ether EtA' [42°] (M), [44°] (B)

Trimetric crystals, $a\ b\ c = 927\ 1\ 517$ Readily combines with bromine Reduced by aqueous ammonium sulphide to carbostyryl In hot alcoholic solution tin and HCl reduce it to *o* amido cinnamic ether

Chloride $C_9H_7(NO_2)CH\ CH\ COCl$ [65°]

Crystalline solid (Fischer a Kuzel, *B* 16, 34)

m Nitro cinnamic acid

[3 1] $C_9H_7(NO_2)CH\ CH\ CO_2H$ [197°] Prepared by heating *m*-nitro benzoic aldehyde with Ac_2O and NaOAc (Schiff, *B* 11, 1783, Tiemann a Oppermann, *B* 13, 2060) Yellow needles Yields *m* nitro benzoic acid on oxidation A mixture of HNO_3 (2 pts of S G 1 5) and conc H_2SO_4 (5 pts) converts it at 0° into *mm* di nitro styrene (Friedlander a Lazarus, *A* 229, 233) Reduced by tin and HCl to *m* amido cinnamic acid— AgA' insoluble *pp*

Ethyl ether EtA' [79°]

p-Nitro cinnamic acid

[4 1] $C_9H_7(NO_2)CH\ CH\ CO_2H$ [286°] (T a O), [288°] (D) Formed by nitration of cinnamic acid (Mitscherlich, *A* Oh. [3] 4, 78, E Kopp, *C* R 53, 634, Tiemann a. Oppermann, *B* 13, 2059)

Preparation—From cinnamic acid (1 pt) and cold HNO_3 (5 pts) The acids produced are etherified, the *p* ether, [189°], crystallising from

alcohol It is saponified by H_2SO_4 (1 pt), HOAc (1 pt), and water (1 pt) (Drewson, *A* 212, 150)

Properties—Prisms, ν sl sol boiling alcohol Yields *p*-oxy-benzoic acid on oxidation

Salts— KA' very soluble crystals— CaA' , 8aq— CaA' , 2aq— SrA' , 5aq— BaA' , 3aq minute needles— MgA' , 6aq nodules— HgA' , ν — $\text{Hg}_2\text{A'}$, Cl_2 , 8aq— AgA' insoluble pp

Methyl ether MeA' [161°] (286°)

Ethyl ether EtA' [139°] (B & K), [137°] (Muller, *A* 212, 125) Combines with bromine forming a dibromide whence alcoholic potash produces two bromo nitro cinnamic ethers, melting at 63° and 93° Reduced by tin and HCl to *p* amido cinnamic acid and *p*-amido-styrene (Bender, *B* 14, 2359)

Anhydride ($\text{C}_6\text{H}_4(\text{NO}_2)\text{CH}(\text{CH})\text{CO}_2\text{O}$)

Formed from the K salt and POCl_3 (Chiozza, *A* *Ch* [2] 39, 231) Melts under boiling water

Amide $\text{C}_6\text{H}_4(\text{NO}_2)\text{CH}(\text{CH})\text{CONH}_2$ [155°–160°] (Cahours, *A* *Ch* [3] 27, 452)

***a m* Di-nitro-cinnamic ether**

$\text{C}_6\text{H}_4(\text{NO}_2)_2\text{CH}(\text{C}(\text{NO}_2)\text{CO}_2\text{Et})$ Formed from *m* nitro cinnamic ether, HNO_3 (1 pt) and H_2SO_4 (2 pts) below 20° (Friedlander & Lazarus, *A* 229, 235) Thick plates (from ether) Insol water and light petroleum

Reactions—1 With alcohol, on warming, it forms $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{CH}(\text{OEt})\text{CH}(\text{NO}_2)\text{CO}_2\text{Et}$, a colourless oil When this is dissolved in ether and ammonia is passed in, a pp of $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{CH}(\text{OEt})\text{C}(\text{NH}_2)(\text{NO}_2)\text{CO}_2\text{Et}$ is formed This is soluble in water and gives pps with many metallic salts The compound $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{CH}(\text{OEt})\text{CH}(\text{NO}_2)\text{CO}_2\text{Et}$ is converted by the simultaneous action of bromine and NaOH into the ethyl derivative of di bromo di nitro *a* phenyl methyl carbinol—2 Boiled with water it forms alcohol, nitro methane, CO_2 , and *m* nitro benzoic aldehyde

***ap* Di nitro cinnamic acid**

[4] $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{CH}(\text{C}(\text{NO}_2)\text{CO}_2\text{H})$ Formed from *p* nitro cinnamic acid, HNO_3 , and H_2SO_4 at –10° to –20° White plates* At 0° it decomposes into CO_2 and *ap* di nitro styrene

Methyl ether MeA' [127°]

Ethyl ether EtA' [110°] Formed from *p* nitro cinnamic ether (1 pt), HNO_3 (2 pts of $\text{S.G. } 1.5$), and H_2SO_4 (4 pts) (Friedlander & Mahly, *A* 229, 210) Thin plates (from benzene ligroun), ν sol benzene, nearly insol ligroun

Reactions—1 CrO_3 in HOAc oxidises it to *p* nitro benzoic acid—2 $\text{K}_2\text{Cr}_2\text{O}_7$ and HOAc forms *p* nitro benzoic aldehyde—3 Boiling water decomposes it into alcohol, CO_2 , *p* nitro benzoic aldehyde, and nitro methane Boiling dilute acids behave in the same way, only the nitro-methane appears as hydroxylamine—4 A solution in conc H_2SO_4 at 100° poured into water gives a pp of *p* nitro benzaloxim—5 Boiling dilute (5 p c) Na_2CO_3 forms bright yellow plates of $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{CH}(\text{OEt})\text{CH}(\text{NO}_2)\text{CO}_2\text{Et}$ [52°], whence the alcohol cannot be removed by heating at 110°, or even with dilute HCl at 90° Methyl alcohol forms the corresponding $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{CH}(\text{OMe})\text{CH}(\text{NO}_2)\text{CO}_2\text{Et}$ [77°]—7 Tin and HCl reduce it to *ap*-diamido-phenyl-propionic ether and *p*-amido phenyl-acetomitrile

***o* NITRO CINNAMIC ALDEHYDE** $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{CH}(\text{CH})\text{CHO}$ [127°] Formed by boiling *o* nitro oxy phenyl propionic aldehyde with Ac_2O (Baeyer & Drewson, *B* 16, 2207) Formed also by condensation of *o* nitro benzoic aldehyde with aldehyde by means of dilute NaOH , the yield being 40 p c of the theoretical (Diehl & Einhorn, *B* 20, 2335)

Preparation—25 g of cinnamic aldehyde are slowly added to 500 g of conc H_2SO_4 containing 20 g of KNO_3 . The solution is precipitated in water, and the mixture of *o*- and *p* nitro cinnamic aldehydes is crystallised from alcohol with animal charcoal The product is dissolved in absolute alcohol and the boiling solution mixed with an equal volume of sodium bisulphite solution, the solution is quickly cooled and separates the greater part of the bisulphite compound of the *p* isomeride, the remaining portion being salted out by the addition of NaCl , the filtrate contains the bisulphite of the *o*-isomeride The two isomerides are obtained from their bisulphites by decomposing the latter in aqueous solution with H_2SO_4 (Diehl & Einhorn)

Properties—Colourless needles, ν sol boiling water and CHCl_3 , sl sol alcohol and ether Combines with bisulphites Yields quinoline on reduction On heating with malonic acid in HOAc it yields $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{CH}(\text{CH})\text{CH}(\text{OH})\text{CH}(\text{CO}_2\text{H})_2$ [269°] and *o* nitro phenyl butinene dicarboxylic acid $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{CH}(\text{CH})\text{CH}(\text{CO}_2\text{H})_2$ [213°] (Einhorn & Gehrenbeck, *A* 253, 374)

Phenyl hydrazide

$\text{C}_6\text{H}_4(\text{NO}_2)_2\text{CH}(\text{CH})\text{CH}(\text{N}(\text{HPh}))\text{CONHPh}$ [158°] Needles

Di phenyl hydrazide

$\text{C}_6\text{H}_4(\text{NO}_2)_2\text{CH}(\text{CH})\text{CH}(\text{N}(\text{Ph}))\text{CONHPh}$ [69°] Yellow crystals (Cornelius & Homolka, *B* 19, 2240)

***m* Nitro cinnamic aldehyde**

$\text{C}_6\text{H}_4(\text{NO}_2)_2\text{CH}(\text{CH})\text{COH}$ [116°] Formed by eliminating H_2O from *m* nitro β oxy β phenyl-propionic aldehyde (Göhring, *B* 18, 720) Prepared by dissolving 100 pts of *m*-nitro benzaldehyde in 2,000 pts of alcohol, diluting with 4,000 pts of water, and adding at once to the milky liquid 35 pts of conc acetic aldehyde and 70 pts of 10 p c aqueous NaOH After 12 hours' standing the pp is separated, pressed, washed, and crystallised, the yield is 50 p c of the theoretical (Kunkeln, *B* 18, 483) Long thin prisms, ν sol benzene and acetic acid, sl sol cold alcohol, ether, and hot water Unites with Br forming $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{CHBrCHBrCHO}$ [c 90°]

Phenyl hydrazide

$\text{C}_6\text{H}_4(\text{NO}_2)_2\text{CH}(\text{CH})\text{CH}(\text{N}(\text{HPh}))\text{CONHPh}$ [160°], red tables.

***p*-Nitro-cinnamic aldehyde**

[4] $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{CH}(\text{CH})\text{CHO}$ [142°] Formed from *p*-nitro benzoic aldehyde, aldehyde, and dilute NaOH , the resulting *p* nitro β oxy- β -phenyl propionic acid being boiled with HOAc (Göhring, *B* 18, 372, Einhorn, *A* 253, 348) Formed also, together with the *o* isomeride, by nitration of cinnamic aldehyde (*supra*) Colourless needles Combines with bisulphites Condenses with acetone in presence of NaOH to $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{CH}(\text{CH})\text{CH}(\text{CH})\text{CO}$ [218°] and $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{CH}(\text{CH})\text{CH}(\text{CH})\text{COCH}_3$ [132°], the last compound forming a phenyl-hydrazide melting at 210°

Oxim $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{CH}(\text{CH})\text{CH}(\text{NOH})$ [179°]

Phenyl-hydrazide

$\text{C}_6\text{H}_4(\text{NO}_2)_2\text{CH}(\text{CH})\text{CH}(\text{N}(\text{HPh}))\text{CONHPh}$ [181°] Orange

red crystals, forming a red solution in conc H_2SO_4 .

Anhydride $\text{C}_6\text{H}_5(\text{NO}_2)\text{C}_6\text{H}_4\text{NPh}$ [183°]

***o*-NITRO-CINNAMOYL-ACETO ACETIC ETHER** $\text{C}_6\text{H}_5(\text{NO}_2)\text{CH}(\text{CH}_3)\text{COCH}_3$ [120°] Prepared by the action of *o* nitro cinnamoyl chloride on sodio-acetacetic ether (Fischer & Kuzel, *B* 16, 84) Yellow prisms Sol chloroform, sl sol alcohol and ether It forms stable salts with alkalis, soluble in water with a reddish-yellow colour Gives a dark red colouration in alcoholic solution with Fe_2Cl_6 Boiled with 30 p.c dilute H_2SO_4 , it gives nitro cinnamoyl acetone

***o*-NITRO-CINNAMOYL ACETONE**

$\text{C}_6\text{H}_5(\text{NO}_2)\text{CH}(\text{CH}_3)\text{COCH}_3$ [118°] Prepared by boiling *o* nitro cinnamoyl-aceto acetic ether with dilute H_2SO_4 (30 p.c) By longer boiling with dilute H_2SO_4 , it converted into *o* nitro-styryl-methyl ketone (*o*-nitro benzylidene acetone) (Fischer & Kuzel, *B* 16, 85) Fine yellow prisms Sol hot alcohol, sl sol cold alcohol, ether and CS_2 Gives a red colouration with Fe_2Cl_6 Dissolves in alkalis with a yellow colour

NITRO-COCCUSIC ACID *v* **TRI-NITRO OXY-M-TOLUIC ACID**

NITRO-CODEINE *v* **CODEINE**

NITRO-COMENIC ACID *v* **COMENIC ACID**

NITRO-COMPOUNDS Compounds containing the group nitroxyl (NO_2) directly united, by means of its nitrogen, to carbon Their most general characteristic is that they yield amido compounds on reduction (*v* **AMINES** and **AMIDO ACIDS**)

Formation—1 Fatty nitro compounds are formed by the action of silver nitrite on alkyl iodides The isomeric nitrites are also formed in this reaction—2 Aromatic nitro compounds are formed by the direct action of nitric acid The nitric acid must usually be concentrated, and its action is intensified by mixture with H_2SO_4 Phenols and oxy acids may be nitrated by dilute nitric acid Various anilides, boiled with dilute nitric acid (S.G. 1.029), are converted into di-nitro derivatives of the base Thus acetyl methyl-aniline becomes di-nitro methyl aniline (Norton & Allen, *B* 18, 1995)—3 Aromatic amido compounds may be converted into the corresponding nitro compounds by the cuprous reaction (Sandmeyer, *B* 20, 1495) For this purpose cupric sulphate (50 g) is dissolved, together with glucose (15 g), in boiling water (100 c.c.), and at once treated with soda (20 g) dissolved in water (60 c.c.) After cooling, the mixture is neutralised with acetic acid To this mixture the nitrate of the diazotised base (prepared from the base, HNO_3 , and NaNO_2) is added in the cold—4 Fatty compounds of the form X CHBrNO_2 are converted by KNO_3 in alkaline solution into salts of di-nitro compounds of the form $\text{X CK}(\text{NO}_2)_2$.

Reactions—1 Acid reducing agents yield amido compounds directly, but alkaline reducing agents (*eg* sodium amalgam, zinc-dust and NaOH) acting upon aromatic nitro compounds yield in the first place intermediate bodies, *v* **Azo-** and **Azoxy-** compounds In some cases where reduction is effected by tin and HClAq chlorination may take place, thus *m*-nitro-toluene gives a chloro-toluidine The best

general reducing agent is a solution of SnCl_2 in HClAq —2 In the groups CH_2NO_2 and CHNO_2 hydrogen is displaceable by metals, and hence bodies containing these groups dissolve in alkalis Such solutions yield, on addition of bromine, compounds containing the groups CHBrNO_2 and CBrNO_2 The compounds X CHBrNO_2 can further give rise to X CNaBrNO_2 and $\text{X CBr}_2\text{NO}_2$ —3 Primary fatty nitro compounds yield hydroxylamine on heating with HClAq at 140° , *eg* $\text{CH}_3\text{CH}_2\text{NO}_2 + \text{H}_2\text{O} = \text{CH}_3\text{COOH} + \text{H}_2\text{NOH}$ (V Meyer & Locker, *A* 180, 163)—4 Nitrous acid converts primary fatty nitro compounds into nitrolic acids, containing the group $\text{CH}(\text{NO})(\text{NO}_2)$ or $\text{C}(\text{NOH})(\text{NO}_2)$, which form red solutions with alkalis Nitrous acid converts secondary fatty nitro compounds into nitroles, containing the group $\text{C}(\text{NO})(\text{NO}_2)$, which are blue when in the liquid state or in solution—5 Aromatic nitro compounds may be reduced by heating with halogen acids Thus nitro benzene is reduced to aniline by heating with HIAq at 104° , by HBrAq at 185° , and by HClAq at 245° (Baumhauser, *A Suppl* 7, 212)—6 Boiling aqueous alkalis can in some cases displace NO_2 by hydroxyl In this way *o*-di-nitro benzene is converted into *o* nitro phenol—7 When aromatic compounds containing two or more nitroxyls in one benzene nucleus are treated with alcoholic NH_3 and H_2S it is usual for one nitroxyl only to be reduced to amidogen—8 Aromatic di and tri nitro compounds frequently form molecular compounds with one another and with aromatic hydrocarbons—9 The acetyl derivatives of nitrated aromatic amines, in which the NO_2 group is in the *o*- or *p*-position to the NHAc group (*eg* acetyl *o* and *p* nitro aniline, diacetyl nitro *p* phenylene diamine, diacetyl nitro *p* naphthylene diamine, acetyl *o* nitro β naphthylamine, &c.), are readily soluble in cold aqueous KOH (1.2) with a deep-yellow colour On standing saponification takes place, and the nitro compound crystallises out When the NO_2 group is in the *m*-position to the NHAc group, *eg* acetyl *m* nitraniline, acetyl *m* nitro *p* toluidine, &c., the substance is not soluble in aqueous KOH (Kleemann, *B* 19, 836)

NITRO-*o*-COUMARIC ACID *Methyl derivative* $\text{C}_6\text{H}_5(\text{NO}_2)\text{CH}(\text{OMe})\text{CHCO}_2\text{H}$ [298°] Formed by heating $\text{C}_6\text{H}_5(\text{NO}_2)(\text{OMe})\text{CHO}$ with NaOAc and Ac_2O (Schnell, *B* 17, 1833) White needles, sl sol cold water, *v* sol alcohol and ether— $-\text{CaA}_2$,— BaA_2 ,— AgA

Anhydride $\text{C}_6\text{H}_5(\text{NO}_2)\text{CH}(\text{CH})\text{COCH}(\text{CH})\text{CO}$ **Nitro-coumarin** [188°] Formed by dissolving coumarin in cold fuming HNO_3 (Delalande, *A Ch* [3] 6, 343, Bleibtreu, *A* 59, 191) Formed also by heating nitro salicylic aldehyde [125°] with Ac_2O and NaOAc (Taegge, *B* 20, 2110) Needles Oxidised by KMnO_4 to nitro *o*-oxy benzoic acid [228°] Reduced by FeSO_4 and NH_3 to amido coumarin [161°] Bromine vapour gives a di-bromide [271°]

Nitro-*o*-coumaric acid $\text{C}_6\text{H}_5(\text{NO}_2)\text{CH}(\text{OH})\text{CHCO}_2\text{H}$ [242°] Formed by heating its methyl derivative with NaOHAq Yellow crystals (from alcohol) Not converted into nitro-coumarin by boiling water or by HBrAq .

Methyl derivative

$C_6H_3(NO_2)(OMe)CHCHCO_2H$ [198°] Formed from the methyl derivative of (3,2,1)-nitro salicylic aldehyde by Perkin's reaction (Miller & Kinkelin, *B* 22, 1709) Prisms (from alcohol) With methyl iodide it gives the ether $C_6H_3(NO_2)(OMe)CHCHCO_2H$ [89°]

Nitro-o coumarinic acid

[3 2 1] $C_6H_3(NO_2)(OH)CHCHCO_2H$ [150°] Formed by dissolving nitro coumarin in boiling aqueous alkalis, and ppg the cold solution by HCl (Miller & Kinkelin, *B* 22, 1706) Yellow prisms (from warm alcohol) On warming with water or alcohol it changes to its anhydride, nitro coumarin Its salts are explosive — $Na_2C_6H_3NO_2$, — $BaC_6H_3NO_2$, 3:1aq — $AgC_6H_3NO_2$

Methyl derivative

$C_6H_3(NO_2)(OMe)CHCHCO_2H$ [186°] Tables
Methyl derivative of the methyl ether $MeC_6H_3NO_2$ [89°] Formed from the Ag salt and MeI Prisms Readily reconverted into the acid, even by aqueous Na_2CO_3

Anhydride $C_6H_3(NO_2) < \begin{smallmatrix} CH \\ CO \end{smallmatrix}$ *Nitro*

coumarin [191°] Formed from (3,2,1) nitro salicylic aldehyde (60 g), NaOAc (90 g), and Ac_2O (130 g) Prisms (from benzene), or needles (from alcohol)

Nitro m coumaric acid

[2 3 1] $C_6H_3(NO_2)(OH)CHCHCO_2H$ [218°] Formed from *m* amido cinnamic acid by nitration and displacement of NH by OH through the diazo reaction (Luff, *B* 22, 293) Needles (from water or alcohol)

Nitro m coumaric acid

[4 3 1] $C_6H_3(NO_2)(OH)CHCHCO_2H$ [248°] Formed by nitrating *m* coumaric acid (Luff, *B* 22, 296) Golden yellow needles (from alcohol)

Methyl derivative

$C_6H_3(NO_2)(OMe)CHCHCO_2H$ [218°] Formed from [4,3,1] $C_6H_3(NO_2)(OMe)CHO$ by Perkin's reaction (Landsberg, *D P J* 262, 139)

Methyl ether of the methyl derivative $C_6H_3(NO_2)(OMe)CHCHCO_2Me$ [143°] Plates (Rieche, *B* 22, 2359) Formed by nitration of $C_6H_3(OMe)CHCHCO_2Me$

Ethyl ether of the methyl derivative $C_6H_3(NO_2)(OMe)CHCHCO_2Et$ [163°] Needles (from alcohol) (Ulrich, *B* 18, 2572)

s-Nitro m coumaric acid

[5 3 1] $C_6H_3(NO_2)(OH)CHCHCO_2H$ Accompanies the (2,3,1) acid (*supra*) Crystals

Nitro m coumaric acid

[6 3 1] $C_6H_3(NO_2)(OH)CHCHCO_2H$ [216°] Formed from acetyl *m* amido cinnamic acid by nitration and displacement of $NHAc$ by hydroxyl (Luff, *B* 22, 292) Yellow powder

Nitro p coumaric acid

[3 4 1] $C_6H_3(NO_2)(OH)CHCHCO_2H$ [198°] Formed from its methyl derivative by heating with $HOAc$ saturated with HBr (Einhorn & Grabfield, *A* 243, 374) Yellow needles (from alcohol) Forms a dibromide [72°]

Ethyl ether EtA' [109°]*Methyl derivative*

$C_6H_3(NO_2)(OMe)CHCHCO_2H$ [140°] Formed from [3 4 1] $C_6H_3(NO_2)(OMe)CHO$, NaOAc, and Ac_2O White needles Yields a dibromide [178°], from which alkalis form the acid $C_6H_3(NO_2)(OMe)C_2HBr.CO_2H$ [205°]

Methyl ether of the methyl derivative $C_6H_3(NO_2)(OMe)CHCHCO_2Me$ [125°]*Ethyl ether of the methyl derivative* $C_6H_3(NO_2)(OMe)CHCHCO_2Et$ [100°]*Di-nitro-o-coumaric acid* *Methyl derivative* $C_6H_3(NO_2)_2(OMe)CHCHCO_2H$ [198°]

Formed by nitrating the methyl derivative of *o*-coumaric acid (Perkin, *O J* 89, 416) Orange-brown needles (from alcohol)

Di nitro-m-coumaric acid *Methyl derivative of the methyl ether*

$C_6H_3(NO_2)_2(OMe)CHCHCO_2Me$ [178°] Formed by nitration (Rieche, *B* 22, 2359) Yellowish needles (from alcohol) Yields on saponification $C_6H_3(NO_2)_2(OMe)CHCHCO_2H$, which decomposes at 215°

NITRO-o COUMARIC ALDEHYDE

$C_6H_3(NO_2)(OH)CHCHCHO$ [200°] Formed from $C_6H_3(NO_2)(OH)CHO$ [126°], aldehyde, and aqueous NaOH (Von Miller & Kinkelin, *B* 20, 1931, 22, 1716) Yellow needles Form a sodium derivative, crystallising in red tables, and a phenyl hydrazide [235°]

Nitro-o coumaric aldehyde

[3 2 1] $C_6H_3(NO_2)(OH)CHCHCHO$ [133°] Formed in the same way from the aldehyde $C_6H_3(NO_2)(OH)CHO$ [109°] (M & K) Golden needles, v sol alcohol Forms a sodium derivative, crystallising in red needles, a phenyl hydrazide [157°], and a methyl derivative [115°]

*NITRO COUMARIN v Anhydride of Nitro coumaric acid**NITRO-o-CRESOL* $C_6H_3NO_2$, 1:6

$C_6H_3Me(OH)(NO_2)$ [1 2 3] [70°] Obtained, together with the (1,2,5) isomeride, by nitrating *o* cresol (Hofmann & Miller, *B* 14, 567, Staedel, *A* 217, 50, 203, Rapp, *A* 224, 175, Hirsch, *B* 18, 1512) Formed also by boiling a dilute acid solution of *o* diazotoluene sulphate (1 mol) with HNO_3 (1 mol) (Nöling & Wild, *B* 18, 1839, Deninger, *J pr* [2] 40, 299) Yellow prisms (from dilute alcohol), insol water, v sol alcohol and ether, volatile with steam — $KC_6H_3NO_2$, garnet red trimetric tables — AgA' red needles

Methyl ether MeA' Oil*Ethyl ether EtA'* Oil

Nitro-o cresol $C_6H_3Me(OH)(NO_2)$ [1 2 4] [108°] Formed by boiling diazotised nitro *o*-toluidine [107°] with water (Nöling & Collin, *B* 17, 269) Yellow needles (from ligroin) Its K , Ag , and NH_4 salts form yellow crystals

Methyl ether [74°] (Witt, *B* 23, 8638)

Nitro-o-cresol $C_6H_3Me(OH)(NO_2)$ [1 2 5] [95°] (N & W), [80°–85°] (H) Formed from nitro *o*-toluidine [128°] by the diazo-reaction, or by merely boiling with conc $NaOHAq$ (Neville & Winther, *O J* 41, 423) Formed also by nitrating *o* cresol (Hirsch, *B* 18, 1512) Needles (from water), not volatile with steam When crystallised from water it melts at 30°–34°, but it melts at 95° after crystallisation from ether

Ethyl ether EtA' [71°]

Formed by nitrating the ethyl derivative of *o* cresol (Staedel, *A* 217, 155, 203, Kayser, *B* 15, 1133) Needles

Nitro-o-cresol $C_6H_3Me(OH)(NO_2)$ [1 2 6]

[148°] Formed from nitro *o*-toluidine [92°] by the diazo reaction (Ullmann, *B* 17, 1961) Yellow needles (from water) Has an intensely sweet taste

o-Nitro-m-cresol $C_6H_3Me(OH)(NO_2)$ [1 8 4]

[56°] Formed, together with the (1,3,6) iso-

meride from *m* cresol, HOAc, and HNO₃ (Staedel, *A* 217, 51, *A* 259, 223, Claus, *J pr* [2] 39, 63) Yellow monoclinic plates (from benzene), volatile with steam Gives di bromo nitro cresol [93°] Its K salt forms red plates
Ethyl ether EtA' [51°] White needles (from dilute alcohol)

s-Nitro-*m*-cresol C₆H₄Me(OH)(NO₂) [1 3 5] [91°] Formed from nitro *m* toluidine by the diazo-reaction (Neville a Winther, *C J* 41, 417) Yellow crystals, not volatile with steam Crystal lises from water in a hydrated condition, and then melts at 62°

Nitro *m* cresol C₆H₄Me(OH)(NO₂) [1 3 6] [129°] Formed, together with the (1,3,4) iso meride from *m* cresol, HNO₃, and HOAc below 0° (Staedel, *A* 259, 210, Claus, *J pr* [2] 39, 63) Formed also by oxidising nitroso *m* cresol with alkaline K₂FeCy₄ (Bertoni, *G* 12, 304) Colourless crystals, not volatile with steam Gives di-bromo nitro cresol [143°] Reduces to amido cresol [174°]—KA' 2aq yellow plates —NaA' 2aq

Ethyl ether EtA' [54°]

Nitro *p* cresol C₆H₄Me(OH)(NO₂) [1 4 3] [84°] Formed from acetyl *p* toluidine by nitrating and boiling the product with conc NaOHaq (Wagner, *B* 7, 537, Neville a Winther, *C J* 41, 426), by the action of nascent nitrous acid on *p* toluidine (Deninger, *J pr* [2] 40, 299), or by boiling *p* diazotoluene sulphate (1 mol) with HNO₃ (1 mol) (Nölting a Wild, *B* 18, 1339) Formed also by nitrating *p* cresol (Armstrong a Thorpe, *B* *A* 1875, 112, Hofmann a Miller, *B* 14, 572, Staedel, *A* 217, 54) Yellow crystals (from benzene), volatile with steam —NaA'—AgA'

Methyl ether MeA' (274°)

Ethyl ether EtA' (275°-285°)

Benzylether C₆H₅A' [54°] Formed from benzyl chloride and the Ag salt (Frische, *A* 224, 142)

o Nitro-*benzyl ether* [163°]

Nitro-*p* cresol C₆H₄Me(OH)(NO₂) [1 4 2] [77°] Formed from the corresponding nitro *p*-toluidine by the diazo reaction (Neville a Winther, *C J* 41, 422, Knecht, *A* 215, 87) Yellow needles (from ligroin)

Methyl ether MeA' (267°) Oil

Di nitro *o* cresol C₆H₃Me(OH)(NO₂)₂ [1 2 3 5] [86°] S (alcohol) 7.8 at 15° Formed by heating (1,2,5)-*o*-cresol sulphonic acid with dilute HNO₃ (Neville a Winther, *C J* 37, 631, 41, 422) Formed also by boiling *o* diazo toluene disulphonic acid with dilute HNO₃ (N a W), or from *o* diazo toluene nitrate and HNO₃ (Nölting a De Salis, *B* 14, 987, *A Ch* [6] 4, 105) Obtained also from the corresponding di nitro toluidine (N a S), and by nitrating *o* cresol and the (3,1,2)- and (5,1,2) nitro *o* cresols (Hirsch, *B* 13, 1512, Barr, *B* 21, 1543) Formed also from C₆H₄Me(OH)Br₂ and fuming HNO₃ (Claus, *J pr* [2] 38, 327) Yellow needles, slightly volatile with steam. Yellow dye —KA' 2aq. yellow crystals

Salts —BaA'₂—BaA'₂·3½aq —AgA'

Ethyl ether EtA' [51°] Obtained by nitrating C₆H₄Me(OEt) [1 2] (Staedel, *B* 14, 899, *A* 217, 153, 259, 219), or from the Ag salt and EtBr (N a S). Yields di nitro-*o* toluidine

[210°] on heating with alcoholic NH₃ at 130° (Van Romburgh, *R T O* 8, 397)

p-Nitro-*benzylether* C₆H₄(NO₂)CH₂A' [145°] Obtained by nitrating the benzyl ether of *o* cresol (Staedel) Needles

Di-nitro-*m*-cresol

C₆H₃Me(OH)(NO₂)₂ [1 3 4 5or2] [99°] Formed from di-nitro-amido cresol by elimination of NH₃ (Nietzki a Ruppert, *B* 23, 3479) Needles.

Ethyl ether EtA' [22°]

Di-nitro-*m*-cresol

C₆H₃Me(OH)(NO₂)₂ [1 3 4 6]

Ethyl ether EtA' [97°] Formed by nitrating ethyl-nitro-cresol [51°] (Staedel, *A* 259, 226)

Di-nitro *p* cresol C₆H₄Me(OH)(NO₂)₂ [1 4 3 5] [85°] A product of the action of nitrous acid on *p* toluidine nitrate, on amido toluic acid [167°], and on *p* toluidine disulphonic acid (Beilstein a Kreusler, *A* 144, 183, Martius a Wichelhaus, *Z* [2] 5, 440, *B* 2, 207, Richter, *A* 230, 323) Formed also by boiling di-nitro *p* toluidine with aqueous NaOH (Wagner, *B* 7, 536), by nitrating *p* cresol and (3,1,4) nitro *p* cresol (Armstrong a Field, *B* 6, 974, Frische, *A* 224, 139), or boiling diazo *p* toluene sulphonate with dilute HNO₃ (Neville a Winther, *C J* 37, 631) Yellow needles (from dilute alcohol)—NaA' red needles S 2.3 at 17°—KA' S 1.5 at 16° (M a W), 99 at 17° (Staedel) Used as a dye (gold-yellow) A sample of 'Victoria yellow' was found by Martius and Wichelhaus to consist of a salt of a dimnitrocresol [110°] Victoria yellow is poisonous (Weyl, *B* 20, 2835)—BaA'₂—AgA' S 29 at 17°

Methyl ether MeA' [122°]

Ethyl ether EtA' [73°] Formed by nitrating ethyl *p* cresol (Staedel, *A* 217, 161) When heated with alcoholic NH₃ it yields di nitro *p* toluidine [168°] (Romburgh, *R T O* 3, 405)

Benzoyl ether C₆H₅A' [109°]

p Nitro-*benzyl ether* [186°]

Di nitro *p* cresol C₆H₃Me(OH)(NO₂)₂ Obtained by the action of excess of nitrous acid on C₆H₄Me(OH)(NO₂) [1 4 2] (Knecht, *A* 215, 90) Yellow needles (from water) Does not melt when heated but forms a violet sublimate

Tri nitro *o* cresol C₆H₂Me(OH)(NO₂)₃ [102°] Formed by heating nitro *o* diazo toluene nitrate with nitric acid (S G 133) (Nölting a Collin, *B* 17, 270) Orange prisms (from acetone) Yields NaNO₂ when heated with NaOHaq With naphthalene it forms (C₆H₃N₃O₂)C₁₀H₆ [106°]

Tri nitro *m*-cresol

C₆H₃Me(OH)(NO₂)₃ [1 3 2 4 6] [106°] S 2.2 at 20°, 8 at 100° (Duclos) Formed by nitration of *m* cresol or its sulphonic acid (Duclos, *A* 109, 141, Nölting a De Salis, *B* 14, 987, 15, 1861, *A Ch* [6] 4, 118, Beilstein a Kellner, *A* 128, 165) Formed also by the action of HNO₃ on nitroso *m*-cresol (Wurster a Riedel, *B* 12, 1799), by heating nitro coccine acid with water at 180° (Luebermann a Dorp, *A* 163, 101, Kosta-necki a Niemientowski, *B* 18, 251), and by the action of cold conc HNO₃ on (2,6,3,4,1) di-iodo-toluquinone (Kehrmann, *J pr* [2] 39, 392) Yellow needles (from water) Forms with naphthalene a compound (C₆H₃N₃O₂)C₁₀H₆ [127°]—NH₃A' Converted by warm aqueous KOy into

purple crystals of potassium 'eresyl purpurate' $\text{KC}_6\text{H}_4\text{N}_2\text{O}_6$ (Sommaruga, *Z* 1870, 557) — KA' yellow needles — $\text{Pb}(\text{OH})\text{A}'$ — AgA' prisms

Ethyl ether EtA' [72°] (N & S), [75°] (Staedel, *A* 259, 221, 227) Converted by cold alcoholic NH_3 into tri nitro toluidine [126°]

NITRO ψ CRESOL SULPHONIC ACID

$\text{C}_6\text{H}_4\text{NSO}_3$, *ee* $\text{C}_6\text{H}_4\text{Me}(\text{OH})(\text{NO}_2)\text{SO}_3\text{H}$ Formed from (1,2,5) *o* toluidine sulphonic acid by dissolving in fuming HNO_3 and boiling the resulting nitro diazo toluene sulphonic anhydride with water (Hayduck, *A* 172, 218) Deliquescent — $\text{BaC}_6\text{H}_4\text{NSO}_3 \cdot 3\frac{1}{2}\text{aq}$ — $\text{Ba}(\text{C}_6\text{H}_4\text{NSO}_3)_2 \cdot 5\text{aq}$

Nitro ψ cresol sulphonic acid *Ethyl*

derivative $\text{C}_6\text{H}_4\text{Me}(\text{OH})(\text{NO}_2)\text{SO}_3\text{H}$ [142.5] Formed by heating nitro diazo toluene sulphonic acid with NaOEt (Foth, *A* 230, 306) Needles — BaA' , 4aq yellow plates

NITRO CRYPTOPINE ψ CRYPTOPINE

NITRO CUMENE $\text{C}_6\text{H}_4\text{NO}_2$, *ee* $\text{C}_6\text{H}_4\text{Pr}(\text{NO}_2)$ [—35°] Formed from cumene and fuming HNO_3 at 0° (Pospeckhoff, *J R* 18, 52, *Bl* [2] 45, 178, *cf* Cahours, *C R* 25, 552, 26, 315, Nicholson, *C J* 1, 2, Rutthausen, *J pr* 61, 79) Oil, volatile with steam

Nitro ψ cumene $\text{C}_6\text{H}_4\text{Me}_3(\text{NO}_2)$ [134.5] [20°] Formed by eliminating NH_3 from nitro ψ -cumidine (Edler, *B* 18, 629) Large thick prisms, volatile with steam

Nitro ψ cumene $\text{C}_6\text{H}_4\text{Me}_3(\text{NO}_2)$ [71°] (265°) Formed from ψ cumene and cold fuming HNO_3 (Schaper, *Z* [2] 3, 12, Fittig & Laubinger, *Z* [2] 4, 577) Colourless needles (from alcohol), volatile with steam Yields on oxidation $\text{C}_6\text{H}_4\text{Me}(\text{NO}_2)\text{CO}_2\text{H}$ [195°]

Tri nitro cumene $\text{C}_6\text{H}_3\text{N}_3\text{O}_6$, *ee* $\text{C}_6\text{H}_3\text{Pr}(\text{NO}_2)_3$ [124.6] [109°] Formed from cumene, HNO_3 , and H_2SO_4 (Fittig, *A* 149, 328) Needles, sl sol cold alcohol

Tri nitro ψ -cumene $\text{C}_6\text{Me}_3(\text{NO}_2)_3$ [185°] Formed by nitrating ψ cumene (Fittig & Laubinger, *A* 151, 261) Prisms (from benzene), almost insol boiling alcohol By passing hydrogen sulphide into its boiling ammoniacal alcoholic solution, nitro ψ cumidine sulphonic acid $\text{C}_6\text{Me}_3(\text{NO}_2)(\text{NH}_2)\text{SO}_3\text{H}$ [134.2.6.5] is formed (Mayer, *B* 19, 212, 20, 966)

NITRO ψ CUMENOL

$\text{C}_6\text{HMe}_3(\text{OH})(\text{NO}_2)$ [134.6.2] [48°] Obtained by evaporating an alcoholic solution of the nitrate to dryness, and distilling the residue with steam (Auwers, *B* 17, 2979, 18, 2658) Long reddish yellow crystals (from alcohol), insol hot water Reconverted into the nitrate by warming with dilute HNO_3

Nitrate $\text{C}_6\text{HMe}_3(\text{NO}_2)\text{ONO}$ [84°] Formed from ψ cumenol and cold fuming HNO_3 Trimetric tables or prisms, insol water, sl sol cold alcohol

Methyl ether $\text{C}_6\text{HMe}_3(\text{NO}_2)\text{OMe}$ [42°]

Nitro-cumenol $\text{C}_6\text{H}_3\text{Pr}(\text{NO}_2)(\text{OH})$ Oil, formed, together with an isomeride [86°], by nitrating $\text{C}_6\text{H}_3\text{Pr}(\text{OH})$ [12] (Filet, *G* 16, 120)

Di-nitro- ψ -cumenol

$\text{C}_6\text{Me}_3(\text{OH})(\text{NO}_2)_2$ [134.6.2.5] [112°] Formed by passing NH_3 into an alcoholic solution of the nitrate of nitro ψ cumenol [84°] Yellow crystals, insol water Forms a red solution in alkalis

NITRO CUMIDINE $\text{C}_6\text{H}_4\text{N}_2\text{O}_2$, *ee*

$\text{C}_6\text{H}_2(\text{C}_6\text{H}_4)(\text{NO}_2)(\text{NH}_2)$ [below 100°]. Formed

by reducing di nitro cumene with alcoholic ammonium sulphide (Cahours, *C R* 24, 557, 26, 315) Yellow scales Forms a crystalline benzoyl derivative — $\text{B}'\text{HCl aq}$ — $\text{B}'_2\text{H}_2\text{SO}_4\text{aq}$ needles

Nitro ψ cumidine

$\text{C}_6\text{HMe}_3(\text{NO}_2)(\text{NH}_2)$ [134.5.6] [47°] Formed from acetyl ψ cumidine by nitration and saponification (Edler, *B* 18, 629) Red needles (from dilute alcohol)

Acetyl derivative [194°] (E), [204°] (Auwers, *B* 18, 2661) Prisms (from alcohol)

Nitro- ψ -cumidine $\text{C}_6\text{HMe}_3(\text{NO}_2)(\text{NH}_2)$ [137°] Formed by treating tri nitro ψ -cumene with alcoholic ammonium sulphide (Fittig & Laubinger, *A* 151, 262) Yellow needles — $\text{B}'\text{HCl}$ — $\text{B}'_2\text{H}_2\text{SO}_4\text{aq}$

Nitro- ψ cumidine *Acetyl derivative* $\text{C}_6\text{HMe}_3(\text{NO}_2)\text{NHAc}$ [131°] Formed by nitration of acetyl ψ cumidine [112°] (Engel, *B* 18, 2231) Yellow needles

Di-nitro ψ cumidine $\text{C}_6\text{Me}_3(\text{NO}_2)_2(\text{NH}_2)$ [78°] Formed from acetyl ψ cumidine [112°] by nitration and saponification (Engel, *B* 18, 2232) Yellow needles

Acetyl derivative [204°] Needles

Di nitro ψ cumidine

$\text{C}_6\text{Me}_3(\text{NO}_2)_2(\text{NH}_2)$ [134.2.5.6] [183°] Obtained from acetyl ψ cumidine [164°] by nitration and saponification (Auwers, *B* 18, 2661) Orange needles (from alcohol)

Acetyl derivative [280°] Sl sol alcohol

NITRO ψ -CUMIDINE SULPHONIC ACID

$\text{C}_6\text{H}_4\text{N SO}_3$, *ee* $\text{C}_6\text{Me}_3(\text{NO}_2)(\text{NH}_2)(\text{SO}_3\text{H})$ [134.2.6.5] Formed by passing H_2S into a boiling solution of tri nitro ψ cumene in alcoholic NH_3 , and also by heating nitro ψ cumidine with ClSO_3H at 165° (Mayer, *B* 19, 2312, 20, 966) Colourless plates Melts, with decomposition at 240°–260° Forms an amorphous acetyl derivative $\text{C}_6\text{H}_4\text{AcN}_2\text{SO}_3$ [o 230°]

NITRO CUMINIC ACID $\text{C}_6\text{H}_4\text{NO}_2$, *ee* $\text{C}_6\text{H}_3\text{Pr}(\text{NO}_2)\text{CO}_2\text{H}$ [42.1] [99°] Formed by boiling nitro isopropyl cinnamic acid with CrO_3 in HOAc (Widman, *B* 19, 269) Tables or monoclinic prisms

Nitro-cuminic acid $\text{C}_6\text{H}_3\text{Pr}(\text{NO}_2)\text{CO}_2\text{H}$ [43.1] [159°] Obtained by nitration of cuminic acid (Gerhardt & Cahours, *A Ch* [3] 1, 73, 25, 36, Filet, *G* 11, 15, Alexejeff, *J R* 17, 112, *Bl* [3] 2, 727) Formed also by oxidation of its aldehyde (nitro cuminol) [54°] (Lippmann & Strecker, *B* 12, 77, Widman, *B* 15, 2547) and of nitro cumyl methyl ketone (Widman, *B* 21, 2232) Yellowish scales (from alcohol), turned red by sunlight, especially when dissolved in benzene (Alexejeff, *Bl* [2] 45, 178) — CaA' , — PbA' , — AgA'

Ethyl ether EtA' (290°) Oil

Nitrile $\text{C}_6\text{H}_3\text{Pr}(\text{NO}_2)\text{CN}$ [71°] Formed by nitrating cumonitrile (Czumpelik, *B* 2, 183)

Nitro ψ cuminic acid

$\text{C}_6\text{H}_3\text{Pr}(\text{NO}_2)\text{CO}_2\text{H}$ [43.1] [113°] Formed by oxidation of nitro ψ cumyl methyl ketone by KMnO_4 (Widman, *B* 21, 2231) Formed also by nitration of ψ -cuminic acid (Korner, *A* 216, 230) Colourless needles (from hot water), turned brown by light — BaA' , 4aq — SrA' , 5aq

Methyl ether MeA' [64°] Crystals (from alcohol) (Abenius, *J pr* [2] 40, 438).

Nitro-*n*-cuminic acid $C_9H_7Pr(NO_2)CO_2H$ [4 2 1] [157°] Formed by oxidation of nitro-propyl cinnamic acid (Widman, *B* 19, 276) Tables (from dilute alcohol), sl sol water

Di-nitro-cuminic acid $C_9H_5Pr(NO_2)_2CO_2H$ [221°] Formed by nitration of cuminic acid (Cahours, *A* 69, 243, Lippmann a Strecker, *B* 12, 78) Reddish crystals— BaA'_2 — CaA'_2 — AgA'_2 aq (Kraut, *C O* 1859, 85)

Ethyl ether EtA' [77 5°]

Amide $C_9H_5(NO_2)_2CONH_2$ Crystals

Di-nitro- ψ -cuminic acid $C_9Me_2(NO_2)_2CO_2H$ [1 8 4 2 5 6] [205°] *Di-nitro-durylic acid* Formed by nitrating ψ -cuminic acid (Gissmann, *A* 216, 207, Nef, *A* 237, 8) Prisms (from dilute alcohol)— CaA'_2 3aq— BaA'_2 3aq

NITRO CUMINIC ALDEHYDE $C_{10}H_{11}NO_3$ \pm $C_9H_7Pr(NO_2)CHO$ [4 2 1] *Nitro-cuminol* Formed by oxidising nitro isopropyl cinnamic acid with $KMnO_4$ (Einhorn a Hess, *B* 17, 2019) Oil, volatile with steam With acetone and $NaOH$ aq it produces di-isopropyl indigo

Nitro cuminic aldehyde $C_9H_7Pr(NO_2)CHO$ [4 3 1] [54°] Formed by nitration of cuminic aldehyde (Lippmann a Strecker, *B* 12, 76, Widman, *B* 15, 166) Trichino prisms Com bines with bisulphites

NITRO- ψ -CUMOQUINONE $C_9H_5NO_4$ \pm $C_9Me_2O_2(NO_2)$ [1 3 4 2 5 6] [113°] Formed by heating ψ -cumoquinone carboxylic acid with HNO_3 (S G 14) at 100° for half an hour (Nef, *C J* 53, 428, *A* 237, 17) Yellow plates, which may be sublimed Heated with alcoholic SO_2 in sealed tubes it yields $C_9Me_2(OH)(NO_2)$ [106°]

NITRO CUMYL ACRYLIC ACID ν **NITRO-PROPYL CINNAMIC ACID**

NITRO CUMYL METHYL KETONE $C_{11}H_{15}NO_3$ \pm [1 2 4] $C_9H_7Pr(NO_2)COCH_3$ *Nitro-aceto cumene* [49°] Formed by nitrating cumyl methyl ketone in the cold (Widman, *B* 21, 2227) Prisms, ν sol benzene, sl sol hgroun

Oxim $C_9H_7Pr(NO_2)C(OH)CH_3$ [117°]

Phenyl-hydrazide [138°]

Nitro-n-cumyl methyl ketone

[1 2 4] $C_9H_7Pr(NO_2)COCH_3$ Formed by nitrating *n*-cumyl methyl ketone (W) Oil

Oxim $C_9H_{10}(NO_2)C(OH)CH_3$ [86°]

Phenyl hydrazide [139°]

NITRO-*n*-CUMYL-PROPIONIC ACID

$C_9H_7Pr(NO_2)CH_2CH_2CO_2H$ [4 3 1] [99°] Formed by nitration (Widman, *B* 19, 2776) Crystals (from dilute $HOAc$)

NITRO-CYME NE $C_{10}H_{13}NO_2$ \pm $C_9H_7MePr(NO_2)$ [1 4 2] SG^{12} 1 085 Formed by nitrating cymene (Barlow, *A* 98, 245, Landolph, *B* 6, 987, Fittica, *A* 172, 314, Widman, *B* 19, 584, Söderbaum a Widman, *B* 21, 2126) Yellow oil Oxidised by $KMnO_4$ to nitro oxy-isopropyl benzoic acid and terephthalic acid

Nitro-isocymene $C_9H_7MePr(NO_2)$ [1 3 α] Formed from *m*-isocymene and fuming HNO_3 (Kelbe a Warth, *A* 221, 161) Oil, volatile with steam, but decomposed on distillation Yields nitro toluol acid [214°] on oxidation

Di-nitro cymene $C_9H_7MePr(NO_2)_2$ [54°] Formed by nitrating cymene (Kraut, *A* 92, 70) Got also from di-nitro amido cymene (Mazzara, *G* 19, 160) Iridescent tablets (from alcohol)

Di-nitro-cymene [78°] Formed from di-nitroso cymene [72°] and HNO_3 (S G 135)

(Kehrmann a Messinger, *B* 23, 3562) Crystals, ν sol alcohol

Di-nitro-cymene $C_{10}H_{13}(NO_2)_2$ SG^{12} 1 206 Formed by nitrating cymene from pyrochotis oil (Landolph) Oil, volatile with steam

Di-nitro cymene $C_{10}H_{13}(NO_2)_2$ [250°] Got from a coal tar cymene (Rommier, *Bl* [2] 19, 434)

Tri-nitro-cymene $C_9HMePr(NO_2)_3$ [119°] Formed by nitrating cymene (from camphor) (Fitting, *A* 145, 142) Thin plates

Tri-nitro isocymene $C_9HMePr(NO_2)_3$ [73°] Formed by nitration of *m*-isocymene (Kelbe, *A* 210, 54) Yellow leaflets, smelling like musk

NITRO CYME NE SULPHONIC ACID $C_9H_7MePr(NO_2)SO_3H$ [1 4 6 2] Formed from cymene by sulphonation and nitration (Errera, *G* 19, 533)— BaA'_2 aq— MgA'_2 5aq

Amide [139°] Scales

Nitro-cymene disulphonic acid $C_{10}H_{13}NS_2O_6$ \pm $C_9HMePr(NO_2)(SO_3H)_2$ Formed from nitro cymene and $ClSO_3H$ (Leone, *G* 11, 512) Not obtained pure— BaA' 3 $\frac{1}{2}$ aq— PbA' 4 $\frac{1}{2}$ aq needles

NITRO ISOCYIMIDINE $C_{10}H_{11}N_2O_3$ \pm $C_9H_7Me(C_2H_5)(NO_2)(NH_2)$ Formed by heating its phthalyl derivative with conc HCl aq at 180° (Kelbe a Warth, *A* 221, 176) Oil, volatile with steam

Benzoyl derivative [177°] Formed by nitrating benzoyl isocymidine (K a W) Needles (from alcohol)

Phthalyl derivative $C_{10}H_{13}(NO_2)N(C_2O_2C_6H_5)_2$ [167°] Formed by nitrating phthalyl isocymidine Needles

NITRODECOIC ACID $C_9H_5(NO_2)CO_2H$ A product of the action of boiling HNO_3 on the acids of cocoanut oil (Wirtz, *A* 104, 291)

NITRO DRACYLIC ACID is *p* **NITRO BENZOIC ACID**

NITRO-DULCITE ν **DULCITE**

NITRO-*c*-DURENE $C_{10}H_{13}NO_2$ \pm $C_9HMe_2(NO_2)$ [1 2 3 4 5] *Nitro prehnitene* [61°] (295° ν V) Formed by the action of HNO_3 on *c*-durene (Töhl, *B* 21, 905) Needles Yields on reduction *c*-duridine [70°]

Di-nitro *c*-durene $C_9Me_2(NO_2)_2$ [1 2 3 4 5 6] [178°] Formed from *c*-durene, HNO_3 , and H_2SO_4 in the cold (Jacobsen, *B* 19, 1214) and also from penta-methyl benzene and fuming HNO_3 (Gottschalk, *B* 20, 3287) Yellowish needles or prisms (from alcohol)

Di-nitro durene $C_9Me_2(NO_2)_2$ [1 2 4 5 3 6] [205°] Formed from durene and conc HNO_3 at 0° (Fitting a Jannasch, *Z* 1870, 162, Nef, *A* 237, 3, *C J* 53, 428) Colourless prisms, sl sol alcohol

Di-nitro isodurene $C_9Me_2(NO_2)_2$ [1 2 3 5 4 6] [156°] Prepared from isodurene, HNO_3 , and H_2SO_4 (Jacobsen, *B* 15, 1853) Prisms, sl sol cold alcohol

NITRO-DURENOL $C_9Me_2(NO_2)OH$ [180°] Formed by nitration of durenol with ordinary HNO_3 at 0° Yellow crystals ν e sol alcohol, nearly insol water Dissolves in alkalis with a dark-yellow colour (Jacobsen a Schnapauff, *B* 18, 2844)

NITRO-*c*-DURIDINE

$C_9Me_2(NO_2)(NH_2)$ [1 2 3 4 5 6] [131°] Formed by reducing di-nitro *c*-durene with alcoholic ammonium sulphide (Töhl, *B* 21, 904). Red

needles, sol alcohol Yields, on reduction, $C_6Me_3(NH_2)_2$ [140°]

NITRO-ERYTHRITE v ERYTHRITE TETRA-NITRATE

NITRO ETHANE $C_2H_5NO_2$, *ie* $CH_3CH_2NO_2$. Mol w 75 (114°) $\bar{S}G$ $\frac{1}{2}$ 10561, $\frac{25}{25}$ 10461 (Perkin, *C J* 55, 689) $\bar{M}M$ 2837 $\bar{S}V$ 803 (Schiff, Lossen, *A* 254, 73) $\bar{H}Fp$ 26,880 $\bar{H}Fv$ 25,140 (Thomsen, *Th*) Formed by adding EtI to cold silver nitrite and subsequently distilling from a water bath (*V Meyer*, *B* 5, 399, *A* 171, 1, 175, 88, Götting, *A* 243, 115, Kissel, *J R* 1882, 226) Formed also by distilling $KEtSO_3$ with $NaNO_2$, the yield being 6 p c of the theoretical (Lauterbach, *B* 11, 1225), and by the action of $AgNO_3$ on potassium chloro propionate (Kolotoff, *Bl* [2] 47, 169) Oil, with pleasant odour With alcoholic soda it gives an amorphous pp of C_2H_5ONa , a salt which is very soluble in water, forming a solution in which $HgCl_2$ ppts crystalline $C_2H_5(NO_2)HgCl$ The solution of sodium nitro ethane gives with $FeCl_3$ a blood red colour, with $CuSO_4$ a green solution, and with $AgNO_3$ a white pp rapidly turning black

Reactions —1 Iron and acetic acid reduce it to ethylamine —2 When mixed with potash and KNO_3 , and H_2SO_4 is slowly added, there is formed ethyl nitrolic acid $CH_3C(OH)NO_2$, [81°], the alkaline salts of which form deep red solutions (*V Meyer*, *B* 7, 425) —3 Fuming H_2SO_4 yields ethane s di sulphonic acid —4 $HClAq$ ($\bar{S}G$ 114) at 140° splits it up into hydroxylamine and $HOAc$ (*Meyer* & *Locher*, *A* 180, 163) —5 $NaOEt$ and EtI form only C_2H_5NO (168°) (*Götting*) $NaOMe$ and MeI form C_2H_5NO (c 155°) According to Socoloff (*J R* 20, 579) alcoholic soda forms C_2H_5NO (175°) and the presence of alkyl iodides does not affect the product —6 $ZnEt_2$, followed by water forms di ethyl hydroxylamine and other products (*Kissel*, *J R* 1887, 109) —7 Benzoyl chloride forms di benzoyl hydroxylamine and di acetyl hydroxyl amine (*Kissel*, *J R* 1882, 40)

Constitution —The constitution of nitro-ethane has been discussed by *Victor Meyer* (*B* 5, 404, 8, 30, *A* 244, 222), *Geuther* (*B* 7, 1620), *Alexejeff* (*Bl* [2] 46, 266), *Socoloff* (*Bl* [2] 47, 166), *Bevad* (*J R* 20, 125), and others

Di nitro methane $CH_2CH(NO_2)_2$ (186° cor) $\bar{S}G$ $\frac{25}{25}$ 13503 Formed by the action of KNO_2 and alcoholic potash on bromo nitro ethane (*Ter Meer*, *A* 181, 1) Formed also by the action of conc HNO_3 on di ethyl ketone and on methyl acetoacetic ether (*Chancel*, *Bl* [2] 31, 504, *C R* 96, 1466) Oil, with sweet taste Reduced by tin and $HClAq$ to hydroxylamine, NH_3 , and $HOAc$ Reduced by sodium amalgam to ethyl azaurolic acid — $CH_2CK(NO_2)_2$ yellow monoclinic crystals, m sol cold water, insol alcohol Explodes when struck Its aqueous solution gives a reddish-brown pp with $FeCl_3$, a pale blue pp with $CuSO_4$, and a light-brown pp with $HgCl_2$ — AgA lustrous yellow plates

Tri - nitro - ethane (?) $CH_3C(NO_2)_3$ [55°]. Formed from methyl-malonic acid and HNO_3 (*Franchimont*, *R T C* 5, 281) Crystals

Tetra-nitro-ethane (?) *Potassium derivative* $C_2K_4(NO_2)_6$ Formed from di-bromo-tetra-nitro-ethane, potash, and ammonium sulphide (*Vilhers*, *C R* 97, 258, 98, 431). Crystals,

which decrepitate below 100° and detonate at 200°, or even when treated with dilute acids

NITRO ETHENYL-TRI-AMIDO BENZENE $C_6H_3N_3O_3$, *ie*

[1 2 3 4] $C_6H_2(NO_2)_3(NH_2) < \begin{smallmatrix} NH \\ N \end{smallmatrix} > CCH_3$ [295°-300°] Formed by heating di acetyl di nitro *p*-phenylene diamine with alcoholic NH_3 at 150° (*Nietzki* & *Hagenbach*, *B* 20, 331, cf *Biedermann* & *Ledoux*, *B* 7, 1532) Red needles

Nitro - di - ethenyl - tetra - amido - benzene $C_6H_2O_2N_4$, *ie*

[5 1 2 3 4] $C_6H_2(NO_2)_4 < \begin{smallmatrix} NH \\ N \end{smallmatrix} > CMe_2$ [276°]

Formed by nitration of di ethenyl tetra amido-benzene (*Nietzki* & *Hagenbach*, *B* 20, 331) Orange red needles (containing aq) By reduction it is reconverted into di ethenyl tetra amido-benzene — $B''H_2Cl_2$, $\frac{1}{3}$ aq long golden yellow needles

DI NITRO-DI-ETHENYL-TETRA AMIDO-DITOLYL

$OMe < \begin{smallmatrix} NH \\ N \end{smallmatrix} > C_6HMe(NO_2)C_6HMe(NO_2) < \begin{smallmatrix} NH \\ N \end{smallmatrix} > OMe$ [1 3 4]

[242°] Formed from acetyl di nitro toluidine by reduction with ammonium sulphide, and treatment of the resulting hydrazo-compound with boiling dilute $HClAq$ (*Bankievitch*, *B* 21, 2407) Prisms, v e sol alcohol — $B''H_2Cl_2$ — $B'2HNO_3$ [214°] Yellow needles

NITRO ETHENYL-PHENYLENE DIAMINE

$C_6H_3N_2O_2$, *ie* [1 3 4] $C_6H_2(NO_2) < \begin{smallmatrix} NH \\ N \end{smallmatrix} > CMe$

[216°] Formed by heating nitro *p*-phenylene diamine with Ac_2O at 190°, cooling, and boiling with dilute H_2SO_4 (*Heim*, *B* 21, 2307) Yellowish-brown needles (from water), v sol hot alcohol

NITRO-ETHENYL-TOLYLENE-DIAMINE

$C_6H_2Me(NO_2) < \begin{smallmatrix} N \\ NH \end{smallmatrix} > CMe$ [1 3 4] [246°].

Formed from acetyl *p*-toluidine by nitration and reduction (*Bankievitch*, *B* 21, 2402) Needles Yields on reduction ethenyl-tetra amido toluene [100°] — $B''H_2Cl_2$ — $B'HNO_3$ [207°] Yellowish plates

NITRO ETHENYL-TOLYLENE-DIAMINE

[185°] (*L*), [202°] (*N*) Formed by nitrating ethenyl tolylene *o* diamine (*Ladenburg*, *B* 8, 677, *Niementowski*, *B* 19, 723) Needles

NITRO-ETHYL-ALCOHOL C_2H_5NO , *ie*

$CH_2(NO_2)CH_2OH$ $\bar{S}G$ $\frac{194}{194}$ 11691 Formed from glycol iodhydrin and $AgNO_3$ (*Demuth* & *V Meyer*, *B* 21, 3529, *A* 256, 29) Yellowish liquid, sol water, decomposed on distillation. Reacts with diazo salts yielding azo- dyes (e.g. $C_6H_5N_2CH(NO_2)CH_2OH$) Nitrous acid converts it into methyl nitrolic and glycollic acids — $CH_2(NO_2)CH_2ONa$ white granular powder

NITRO-ETHYL-AMIDO-BENZOIC ACID

$C_6H_3N_2O_4$, *ie* [1 3 5] $C_6H_2(NO_2)(NHEt)CO_2H$ [208°] Formed from nitro amido benzoic acid and $EtBr$ (*Rollwage*, *B* 10, 1704) Yellow needles (from water) — BaA , $\frac{1}{2}$ aq red needles

Nitro di-ethyl-m amido-benzoic acid

$C_6H_2(NO_2)(NEt_2)CO_2H$ Monoclinic crystals; $\alpha b c = 893 \ 1 \ 1095$ $\beta = 74^\circ 57'$ (*Heintze*, *J* 1885, 1454, cf. *Lehmann*, *Dessert*, Göttingen, 1884)

NITRO-ETHYL-AMIDO-PHENOL *Nitrosamine of the ethyl ether* $C_6H_3N_2O_4$, *ie*

$C_6H_5(NO_2)(OEt)NEt(NO)$ Formed from $C_6H_5(OEt)NHEt$ and nitrous acid (Förster, *B* 21, 364) Yellowish prisms Does not form salts

***o*-NITRO TETRA ETHYL-DI-*p*-AMIDO TRI-PHENYL-METHANE** $C_{24}H_{23}N_5O_2$ ϵ $C_6H_5(NO_2)CH(C_6H_5NEt)_2$ [110°] Formed by heating *o*-nitro benzene aldehyde with di ethyl-aniline and dehydrated oxalic acid (Fischer a Schmidt, *B* 17, 1898) Orange triclinic prisms. ***p*-Nitro-tetra ethyl di *p*-amido tri-phenyl-methane** [113°] Obtained from *p*-nitro benzene aldehyde and di ethyl aniline (Kaeswurm, *B* 19, 744) Thick needles or monoclinic plates

NITRO ETHYLAMINE C_2H_5NHNO *Ethyl-nitramine* [3°] Formed from ethylamine by treatment with $ClCO_2Me$ and decomposition of the resulting $C_2H_5NHCO_2Me$ by ammonia (Franchimont a Klobbie, *R T C* 7, 356)

***o*-NITRO ETHYL-ANILINE** $C_6H_4(NO_2)NEt$ ϵ $C_6H_4(NO_2)NHEt$ [12°] Formed by heating *o*-nitro phenol with alcoholic ethylamine for 12 hours at 175° Formed also by heating the ethylene ether of *o* nitro phenol with alcoholic ethylamine at 140° (Hempel, *J pr* [2] 39, 199, 41, 162) Red oil, sol acids, but reppd by water Yields on reduction *o* phenylene ethyl diamine (249°) Nitrous acid converts it, in ethereal solution, into di nitro ethyl aniline [114°]

Nitrosamine $C_6H_4(NO_2)NEt(NO)$ [30°] Formed from the hydrochloride of the base and $NaNO_2$ in aqueous solution Yellow needles (from dilute alcohol or HOAc)

***m*-Nitro-ethyl aniline** $C_6H_4(NO_2)NHEt$ [13°] [60°] Formed by heating *m* nitro aniline (16 g) with $EtBr$ (14 g) and aqueous $NaOH$ (6 g) Formed also by adding HNO_3 (41.5 g of SG 1.39) to a cooled solution of ethyl aniline (50 g) in H_2SO_4 (1,000 g) (Nolting a Stricker, *B* 19, 546) Reddish yellow needles, volatile with steam With diazotised *p* bromo aniline it yields $C_6H_4BrN_2NEtC_6H_4NO_2$ [136°] (Meldola a Streatfield, *C J* 55, 429)

Nitrosamine $C_6H_4(NO_2)NEt(NO)$ [47°] **Acetyl derivative** $C_6H_4(NO_2)NEtAc$ [89°]

***p*-Nitro ethyl-aniline** $C_6H_4(NO_2)NHEt$ [14°] [95°] Obtained by nitration of acetyl ethyl aniline dissolved in H_2SO_4 (5 pts), the product being saponified (Weller, *B* 16, 31, Nölting a Collin, *B* 17, 267) Formed also by heating *p* nitro aniline with $EtBr$ and alcoholic potash at 110° (Schweitzer, *B* 19, 142) Yellow prisms with violet reflex (from alcohol) Somewhat volatile with steam With diazotised *p*-bromo aniline it yields $C_6H_4BrN_2NEtC_6H_4NO_2$ [125°]

Nitrosamine $C_6H_4(NO_2)NEt(NO)$ [120°] Yellow needles (from alcohol) (Meldola a Streatfield, *C J* 49, 61)

Acetyl derivative $C_6H_4(NO_2)NEtAc$ [118°]

Benzoyl derivative $C_6H_4(NO_2)NEtBz$ [98°] Needles, v sl sol hot water (Meldola a Salmon, *C J* 53, 774)

***m*-Nitro-di-ethyl-aniline** $C_6H_4(NO_2)NEt_2$ [13°] (289°) Formed, together with a small quantity of the *p*-isomeric, by nitration of di-ethyl-aniline dissolved in H_2SO_4 (20 pts) (Groll, *B* 19, 199) Obtained also by heating *m*-nitro-aniline (20 g) with EtI (46 g) and $NaOH$ (12 g.)

in alcoholic solution for 8 hours at 100° (Nölting a Stricker, *B* 19, 550) Dark yellow oil

***p* Nitro di ethyl aniline** $C_6H_4(NO_2)NEt_2$ [14°] [78°] Formed by oxidation of nitroso di ethyl-aniline with $KMnO_4$ and H_2SO_4 , and also by the action of nitrous acid on di ethyl amido benzene-azo di ethyl aniline (Lippmann a Fleissner, *B* 16, 1422, Groll) Yellow monoclinic needles with blue reflex— $B'H_2PtCl_4$ thin prisms

Di nitro ethyl aniline

$C_6H_4(NO_2)_2NHEt$ [4 2 1] [114°] Formed from bromo di nitro benzene and alcoholic ethylamine (Van Romburgh, *R T C* 2, 104) Formed also by boiling C_6H_5NEtAc with dilute HNO_3 (SG 1.029) (Norton a Allen, *B* 18, 1997), and by the action of nitrous acid on an ethereal solution of *o* nitro ethyl aniline (Hempel, *J pr* [2] 39, 199, 41, 168) Yellow needles (from alcohol) Decomposed by boiling conc $KOHAq$ into ethyl amine and di nitro phenol

Di-nitro-di-ethyl-aniline $C_6H_4(NO_2)_2NEt_2$ [4 2 1] [80°] Prepared by nitrating di ethyl aniline, and also by treating bromo di nitro benzene with diethylamine (Van Romburgh, *R T C* 2, 35, 8, 251) Yellow needles Decomposed by boiling aqueous KOH into di ethylamine and di nitro phenol When gently oxidised by CrO_3 it yields di nitro aniline [175°]

Tri-nitro-ethyl-aniline $C_6H_3(NO_2)_3NHEt$ *Ethylpicramide* [84°] Formed from chloro-tri nitro benzene (picryl chloride) and NH_4Et in alcohol (Van Romburgh, *R T C* 2, 107) Crystals (from alcohol) which turn brown in air **Tri nitro-di-ethyl aniline** $C_6H_3(NO_2)_3NEt_2$ [164°] Prepared by adding a hot alcoholic solution of $NHEt_2$ to (1,2,4,6) chloro-tri nitro benzene Orange crystals (from benzene) Decomposed by potash into picric acid and di-ethylamine

Tetra-nitro-ethyl-aniline

$C_6H_3(NO_2)_4NEt(NO_2)$ *Nitramine of tri nitro-ethyl aniline* [96°] Obtained by the action of HNO_3 and H_2SO_4 on ethyl aniline and on di ethyl aniline (Van Romburgh, *R T C* 2, 31, 114) Yellow plates (from alcohol) Decomposed by 10 pc aqueous Na_2CO_3 into picric acid and ethylamine Reduced by tin and $HClAq$ to tri amido phenol

NITRO-ETHYL-ANTHRONE $C_{14}H_9NO_2$ ϵ

$C_6H_5 \begin{matrix} CO \\ \diagup \\ CET(NO) \end{matrix} C_6H_5$ [102°] Formed, as a by-product, in the preparation of ethyl anthracene hydride nitrite by the action of HNO_3 on ethyl anthracene hydride dissolved in $HOAc$ (Liebermann a Landshoff, *B* 14, 474)

***o*-NITRO-ETHYL BENZENE** $C_6H_4(NO_2)C_6H_5$ [228°] SG 25.1 126 Formed, together with the *p*-isomeric, by dissolving ethyl benzene in HNO_3 (Beilstein a Kuhlberg, *A* 156, 206, *Z* [2] 5, 524) Oil

***p*-Nitro-ethyl-benzene** $C_6H_4(NO_2)C_6H_5$ (246°) SG 25.1 124 Oil

Nitro di-ethyl benzene $C_6H_4Et_2(NO_2)$ (155° at 23 mm) Formed from di ethyl-benzene and fuming HNO_3 at 0° (Voswinkel, *B* 22, 316) Oil, boils with partial decomposition at 280°–285°

Di-nitro-tetra-ethyl-benzene $C_4Et_4(NO_2)_2$ [115°] Pale yellow prisms (Galle, *B* 16, 1745)

Tri-nitro-di-ethyl-benzene $C_6H_3(NO_2)_3Et_2$ [62°] Yellow prisms (Voswinkel, *B* 21, 2680).

o-NITRO-ETHYL-BENZENE SULPHONIC ACID $C_6H_4NSO_3$, $\pm C_6H_4(NO_2)EtSO_3H$ Formed by sulphonation (Beilstein a Kuhlberg, *A* 156, 207) — BaA'_2 *S* 54 at 17.5°

p-Nitro-ethyl-benzene sulphonic acid — BaA'_2 4aq *S* 261 at 17.5° Needles

NITRO-p-ETHYL-BENZOIC ACID

$C_6H_4Et(NO_2)CO_2H$ [156°] Formed from *p* ethyl benzoic acid and cold fuming HNO_3 (Aschenbrandt, *B* 12, 1304, *A* 216, 220) Needles (from water) — NaA'_2 2aq — CaA'_2 2aq — BaA'_2 4aq — BaA'_2 4aq leaflets, sl sol water

p-NITRO- α -ETHYL BENZOYL-ACETIC ETHER $C_6H_4(NO_2)COCH_2CO_2Et$ [40°] Formed from $C_6H_4(NO_2)COCH_2NaCO_2Et$ and EtI (Perkin a Bellenot, *C J* 49, 451) Plates

DI-NITRO-ETHYLENE-UREA

$CO \langle N(NO_2)CH_2 \rangle$ [210°] Obtained from ethylene urea and HNO_3 (Franchumont a Klobbe, *R T C* 7, 17) Prisms On boiling with water it loses CO_2 and forms ethylene di nitramine $C_2H_4(NHNO_2)_2$ [174°]

DI-NITRO-ETHYLIC ACID $C_6H_4N_2O_4$ *Ethyl-nitramine*? Formed from $ZnEt_2$ and NO Prepared by passing nitric oxide into a benzene solution of $ZnEt_2NaEt$, obtained by adding sodium (12.7 g) to cold zinc ethyl (100 g) The product is successively treated with ether, alcohol, and water, zinc is pptd by CO_2 , the filtrate evaporated, and the sodium salt extracted by alcohol (Frankland a Graham, *C J* 37, 570, cf Frankland, *C J* 9, 89, Zuckschwerdt, *B* 7, 291, *A* 174, 302) The free acid is unstable Its salts yield ethylamine on reduction by sodium amalgam Alcoholic potash forms ethylamine and nitric acid (Zorn, *B* 15, 1008) — $NaC_6H_4N_2O_4$ — CaA'_2 3aq — BaA'_2 — MgA'_2 — ZnA'_2 — ZnA'_2 4aq — CuA'_2 3aq flat dark blue needles (from alcohol) — AgA'_2 — AgA'_2AgNO_3

NITRO-o-ETHYL-PHENOL $C_6H_4Et(NO_2)OH$ (212°–215°) Formed in small quantity by the action of nitrous acid on $C_6H_4EtNH_2$ (Suida a Plohn, *Sitz W* [2] 81, 245) — BaA'_2 4aq orange plates

Di-nitro-o-ethyl-phenol $C_6H_4Et(NO_2)_2OH$ Formed from *o* ethyl phenol and cold HNO_3 (*S* a *P*) Heavy oil — BaA'_2 (at 100°) Yellow plates (from alcohol)

NITRO-p-ETHYL-ISOPROPYL-BENZENE $C_6H_4EtPrNO_2$ (265°) Obtained from [4.1] C_6H_4EtPr and HNO_3 (Von der Becke, *B* 23, 3194)

DI-NITRO-(β)-ETHYL-THIOPHENE $C_6H_4(C_2H_5)(NO_2)_2S$ Formed by nitration of (β) ethyl thiophene by passing air charged with its vapour into fuming HNO_3 (Bonz, *B* 18, 552) Crystalline solid With alcoholic KOH it yields a blue colouration, becoming red on longer exposure to the air, or by addition of more KOH

NITRO-o-ETHYL-TOLUENE

$C_6H_4MeEt(NO_2)$ Oil (Claus a Pieszcsek, *B* 19, 3087)

Di-nitro o-ethyl-toluene $C_6H_4MeEt(NO_2)_2$ Oil, not solid at 0°

Di-nitro-p-ethyl-toluene [52°] Obtained, with an oily isomeride, by nitrating *p* ethyl-toluene (Jannasch a Dieckmann, *B* 7, 1513)

Tri nitro-p ethyl-toluene $C_6H_4MeEt(NO_2)_3$ [92°] Obtained by nitration (Glinzer a Fittig, *A* 186, 303) Prisms (from alcohol)

Nitro-ethyl-p toluidine

$C_6H_4Me(NO_2)NH_2$ [4.3.1] [48°] Formed from ethyl *p* toluidine (1 pt), H_2SO_4 (20 pts), and HNO_3 (Nöling a Stricker, *B* 19, 549). Flat red prisms, v sol alcohol

Nitro-ethyl-p toluidine

$C_6H_4Me(NO_2)NH_2$ [4.2.1] [59°] Formed by heating nitro-*p* toluidine with EtI (Gattermann, *B* 18, 1483, Niementowski, *B* 20, 1883) Red crystals (from alcohol), v sol ether

Acetyl derivative (245°–250° at 150 mm)

Di-nitro-ethyl-o-toluidine *Nitramine* [1.3.5.6] $C_6H_4Me(NO_2)_2NH_2$ [72°] Formed, in small quantity, by the action of HNO_3 on di-ethyl *o* toluidine (Van Romburgh, *R T C* 3, 402) Yellow crystals (from alcohol)

Di nitro ethyl p toluidine

$C_6H_4Me(NO_2)_2NH_2$ [1.3.5.4] [126°] Formed by nitration of nitro ethyl *p* toluidine (Gattermann, *B* 18, 1485) Orange crystals

Nitrosamine $C_6H_4(NO_2)_2NH_2(NO)$ [78°]

Nitramine $C_6H_4Me(NO_2)_2NH_2(NO_2)$ [116°] (*R*, *G*), [106°] (*N* a *L*) Formed from di ethyl *p* toluidine and fuming HNO_3 (Van Romburgh, *R T C* 3, 408) Formed also from $C_6H_4Me(NH_2)Ac$ and dilute (10 p c) HNO_3 (Norton a Livermore, *B* 20, 2271) Converted by boiling $NaOH$ aq into di nitro *p* cresol [83°]

TRI-NITRO-ETHYL-o-XYLENE

$C_6Me_2Et(NO_2)_3$ [121°] Needles (from alcohol) (Fittig a Ernst, *A* 139, 193, Stahl, *B* 23, 992)

Tri-nitro-ethyl-m-xylene [127°] Formed from ethyl *m* xylene, HNO_3 , and H_2SO_4 (Stahl) White needles, m sol alcohol

Tri-nitro s ethyl m xylene [138°] Needles, v sl sol alcohol (Jacobsen, *B* 7, 1434)

Tri-nitro-ethyl-p xylene [129°] Prisms (from hot alcohol) (Jacobsen, *B* 19, 2516)

NITRO EUGENOL $C_{10}H_7NO_2$, \pm

$C_6H_4(C_2H_5)(NO_2)(OMe)(OH)$ [1.5.3.4] [44°] Formed by nitration of eugenol (Weselsky a Benedikt, *M* 3, 387) Trichmic crystals, sl sol water Volatile with steam

Acetyl derivative [61°] Tables

NITRO EUXANTHIC ACID v **EUXANTHIC ACID**

NITRO PSEUDO-FLAVENOL v FLAVENOL

NITRO-FLUORANTHENE v FLUORANTHENE

p NITRO-FLUORENE $C_{13}H_9NO_2$, \pm

$CH_2 \langle C_6H_4(NO_2) \rangle$ [151°] (*H*), [154°] (*S*) Formed from fluorene, $HOAc$, and HNO_3 (Hodgkinson, *C J Proc* 1, 37, Strasburger, *B* 17, 107) Prisms, v sl sol alcohol

Di nitro fluorene $CH_2 \langle C_6H_4(NO_2)_2 \rangle$ [201°]

Formed by nitrating fluorene (Fittig a Schmitz, *A* 193, 134) Needles (from $HOAc$)

DI NITRO FLUORESCÉIN $C_{20}H_9(NO_2)_2O_2$

Formed from fluorescein (1 pt), H_2SO_4 (20 pts), and HNO_3 (2 pts) at 0° (Baeyer, *A* 183, 1) Amorphous yellow powder

Di acetyl derivative Pale-yellow needles (from alcohol) On boiling for some minutes with dilute (15 p c) KOH it forms a blue solution

Tetra-nitro-fluorescein $C_{20}H_9(NO_2)_4O_2$

Formed from fluorescein (1 pt) and fuming HNO_3 (5 pts) Colourless crystals (from $HOAc$) Its alcoholic solution is yellowish red, and, on

adding an acid, becomes first reddish violet and then colourless

NITROFORM *v.* Tri-NITRO-METHANE

NITRO-FURFURYL-ETHYLENE

$C_4H_2O_2CH_2CH(NO_2)$ [184°] From furfuraldehyde and an alkaline solution of nitro ethane (P) Yellow prisms

Nitro-furfuryl-nitro-ethylene

$C_4H_2(NO_2)O_2CH_2CH(NO_2)$ [144°] Yellow felted needles Formed by nitration of furfuryl nitro ethylene It is oxidised by CrO_3 to nitro pyromucic acid

Dibromide [111°], yellow prisms (Priebs, B 18, 1862)

NITROGEN N (Azote) At w 14 01 Mol w 28 02 Boils at -194.4° (Olszewski, W 31, 58) According to Sarrau (*C R* 94, 639, 718, 845) the critical temperature of N is -128.8° , and the critical pressure is 42.1 atmos SG (gas) 97247 (air=1) SG (liquid) 885 (water=1) at b.p. (O, *l.c.*, cf Wroblewski, C R 102, 1011). Refraction-equivalent $\left(\frac{\mu-1}{d} \text{ At } w\right) = 4.1 \text{ to } 5.3$

(Gladstone, Pr 18, 49) Mean value of μ for white light = 1.0003019, dispersion power = 2086 (Croullebois, A Ch [4] 26, 236, v also Mascart, P 153, 149) MM N v c 114, Nⁱⁱⁱ c 611 (Perkin, C J 55, 736) TC (air=1) 98 (Nair, P 142, 123), 993 (Plank, Carl Rep 13, 164) HC [NⁱO] = -17,740, [NⁱO] = -21,575, [NⁱO] = -2,005, [NⁱOⁱAg] = -6,820, [NⁱOⁱAg] = -29,820 (Th 2, 198), [NⁱO] = -22,200, [NⁱO] = -1,200, [NⁱOⁱAg] = -8,400, [NⁱOⁱAg] = -28,600 (Berthelot, A Ch [5] 20, 255) Coefficient of compressibility 750-1,000 atmos 000407, 1000-1500 atmos 000265, 1500-2000 atmos 00017, 2000-2500 atmos 000123, 2500-3000 atmos 000091 (Amagat, C R 107, 522) Transpiration coefficient (O=1) 873 (Meyer a Springmuhl, P 148, 526), 885 (von Obermayer, W A B 73 [2nd part], 433) Friction coefficient at 0° = 000184 (M a S, *l.c.*), 0001659 (von O, *l.c.*) The spectrum of N varies much, there are two distinct spectra, known as the elementary line spectrum and the band-spectrum (for measurements of lines, v B A 1884 429, also Ames, P M [5] 30, 48)

Occurrence—In the atmosphere, forming c^{ths} by volume In the fluid-cavities of some specimens of rock crystals (Davy, T 1822 367) In the air-bladders of fishes, and in other cavities of the bodies of animals and vegetables In the gases from some fumaroles In certain wells (v L Smith, Am S [2] 12, 866) Probably in the sun (Young, Am S [3] 4, 856, Draper,

ibid [3] 14, 89) Compounds of N occur in very large quantities throughout the animal, vegetable, and mineral kingdom

In 1772 Rutherford (*De aere mephitico*, Edinburgh, 1772) showed that the expired breath of animals contained a gas which extinguished flame, but which was not carbonic acid, as it was not absorbed by potash A little later Lavoisier proved that this gas was present in air As this gas did not support animal life, Lavoisier called it *azote* (*à* and *wt*) Chaptal afterwards gave it the name *nitrogen*, because it was present in nitre

Formation—1 From air, by removing CO_2 by KOHAq, moisture and NH_3 by conc H_2SO_4 , and O by passing over red hot Cu (*v. Preparation*, No 1)—2 By passing air through a mixture of sawdust and Fe sulphide (obtained by saturating ppd Fe_2O_3 with H_2S), and then through alkaline pyrogallate solution, and finally through conc H_2SO_4 When the process is completed, passage of H_2S re forms Fe sulphide, which may be used again—3 By burning P in an inclosed quantity of air, over water, and allowing the P_2O_5 formed to dissolve in the water—4 By passing air through conc NH_4Aq , and then sending the mixture of air and NH_3 over Cu heated to redness, the CuO formed is reduced by the NH_3 (Lupton, C N 33, 90)—5 Berthelot (*Bl* [2] 13, 314) partly covers with NH_4Aq c 200 grams pure Cu turnings in a 10-14 litre flask, closes the flask by a cork carrying a safety funnel tube, and a delivery tube which is stopped by a caoutchouc cap, and shakes from time to time The O is thus completely removed from the air in the flask, the N may be obtained by pouring into the flask water previously freed from O by shaking with NH_4Aq and Cu, the gas should be passed through KOHAq, conc H_2SO_4 , and then through $CrCl_3Aq$ (B, *Bl* [3] 2, 643)—6 By shaking $FeO.H_2O$ or $MnO.H_2O$ with air, the hydroxides are obtained by adding NaOHAq to conc $FeSO_4Aq$ or $MnSO_4Aq$, and at once stopping the ingress of air—7 By placing pyrogallic acid in a flask, adding NaOHAq, corking, and shaking for some time (v Liebig, A 77, 107)—8 By passing over Pt black a mixture of 100 vols air (from which CO_2 has been removed) with 42 vols H (Dumoulin, *L'Institut*, 1851 11)—9 By passing Cl into rather dilute NH_4Aq , keeping the NH_3 always in large excess, $8NH_3 + 3Cl_2 = 6NH_4Cl + N_2$ (the experiment is dangerous, as NCl_3 may be formed and explode)—10 By warming conc NH_4NO_3Aq , or more easily conc KNO_3Aq mixed with 3 vols conc NH_4ClAq , whereby KCl and NH_4NO_3 are formed and the NH_4NO_3 is decomposed ($NH_4NO_3 = 2H_2O + N_2$, Cornwinder, A 72, 225) Addition of conc $K_2Cr_2O_7Aq$ oxidises N oxides (which are generally produced) to HNO_3 (*v. Preparation*, No 2) Loew (B 23, 3018) has found that a 4-5 p c solution of NH_4NO_3 is decomposed at the ordinary temperature by Pt black, with evolution of N—11 By heating in a retort an intimate mixture of equal parts dry NH_4Cl and $K_2Cr_2O_7$, and passing the gas through $FeSO_4Aq$ to absorb NO which is generally formed The chief change is represented approximately thus $2NH_4Cl + K_2Cr_2O_7 = 2KCl + 4H_2O + Cr_2O_3 + N_2$ —12 By heating powdered $(NH_4)_2Cr_2O_7$, which decomposes to Cr_2O_3 , H_2O , and N.—13. By

adding conc NH_4Cl aq to a strongly alkaline conc solution of NaBrO (prepared by adding Br to cold NaOH aq), N is evolved rapidly ($3\text{NaBrO} + 2\text{NH}_4\text{Cl} = 3\text{NaBr} + 3\text{H}_2\text{O} + 2\text{HCl} + \text{N}_2$). Solution of bleaching powder may be used, but there is danger of formation and explosion of NCl_3 . — 14 By heating a mixture of NH_4NO_3 and MnO_2 to c 200° (not over 215°) ($4\text{NH}_4\text{NO}_3 + \text{MnO}_2 = \text{Mn}(\text{NO}_3)_2 + 8\text{H}_2\text{O} + 3\text{N}_2$, Gatehouse, *B* 10, 1007) — 15 N is evolved in the reactions of several metals with HNO_3 , the gas evolved by the action of Zn on HNO_3 aq in presence of much NH_4NO_3 consists of c 90 p c N , with N_2O and NO (Acworth, *C J* 28, 839).

Preparation. — 1 A very slow stream of air is passed from a gasholder through U tubes containing slightly moistened KOH , to absorb CO_2 , then through U tubes containing CaCl_2 , to absorb H_2O , and then through a long hard glass tube, containing Cu turnings, or better Cu obtained by reducing CuO in H (Carius, *A* 94, 126), and heated to bright redness in a furnace, the gas which issues is allowed to bubble through a solution of CrCl_3 to remove any traces of O which may remain, and is then dried by passing through CaCl_2 in several U tubes, and then over P_2O_5 . Before the air stream is started, the tube containing the Cu should be heated and a stream of H passed through it, to remove traces of CuO (this is not necessary, of course, if the Cu has been prepared by reducing CuO by H), after cooling, one end of the tube should be sealed and the other connected with a Sprengel pump, and the Cu should be heated in a vacuum for some time. If this precaution is not taken, the N will contain H (von Jolly, *W* 6, 536). The solution of CrCl_3 is prepared before use by digesting CrCl_3 aq with scrap Zn and HCl aq until a clear blue liquid is obtained, which is poured into Na acetate solution, in an atmosphere of CO_2 , the red pp of chromium acetate is washed with H_2O containing CO_2 , and is then placed in a flask closed by a cork with entrance tube (to be attached to the N apparatus), exit tube, and a funnel through which HCl aq is dropped on to the acetate, which is thereby changed to CrCl_3 , the whole of the acetate is not dissolved, to avoid free HCl , the N apparatus is at once attached to the flask (O von der Pfordten, *A* 228, 112). — 2 Solid NH_4Cl is added to an almost saturated cold solution of NaNO_2 , when no more NH_4Cl dissolves the liquid is poured into a capacious flask, cold conc $\text{K}_2\text{Cr}_2\text{O}_7$ aq is added, about 1 pt $\text{K}_2\text{Cr}_2\text{O}_7$, for each 1 pt NaNO_2 used, and the mixture is gently warmed. The $\text{K}_2\text{Cr}_2\text{O}_7$ oxidises any oxides of N to HNO_3 (*v* Gibbs, *B* 10, 1387). It is advisable to pass the N through KOH aq to absorb any traces of Cl compounds coming from impurities in the salts used (Gibbs, *l.c.*) — 3 A solution of 1 pt $\text{K}_2\text{Cr}_2\text{O}_7$, 1 pt NH_4NO_3 , and 1 pt NaNO_2 in 3 pts water is warmed in a fair sized flask (Böttger, *Jahr des phys Vereins zu Frankfurt*, 1876-77 24).

Properties. — A tasteless, colourless, odourless gas, which does not burn, nor support combustion, nor form a pp with CaO aq. Liquid N is obtained by cooling the gas to -186° under a pressure of some hundred atmos., and then reducing pressure, not too suddenly, to not less than 50 atmos., the N does not remain liquid for more

than a few seconds. Liquid N is colourless, transparent, and shows a very sharp meniscus (Wroblewski & Olaszewski, *A Ch* [6] 1, 112). According to Cailletet (*A Ch* [5] 5, 132), N is liquefied, for a second or two, by subjecting the gas to 200 atmos pressure at 13° , and then suddenly reducing the pressure. It has not been solidified. N is slightly lighter than air, 1 litre at the sea level, lat 45° , weighs 1.2574614 grams (von Jolly, *W* 6, 536). N is very slightly sol water (for S v beginning of this art). Small quantities of N are absorbed by molten pig iron, cast iron, and steel (Parry, *Am Ch* 6, 107, Troost & Hautefeuille, *C R* 76, 482, 562, 80, 909, Ledebur, *C C* 1873 810). Wood charcoal also absorbs N , according to R A Smith, charcoal which has absorbed N and O , when exposed to the air for a time gives off O only (*Pr* 12, 424, cf Montmagon & de Laire, *Bl* [2] 11, 261). N is chemically inert, it combines slowly with O when electric sparks are sent through a mixture of the gases for some time, HNO_3 is formed when electrolytic gas ($\text{H}_2 + \text{O}$) is strongly compressed and then exploded in compressed air in presence of a little KOH aq, and also when C is burnt in a mixture of strongly compressed air and O (in presence of a little KOH aq) (Hempel, *B* 23, 1455). N and H combine under the influence of the electric discharge. At or towards white heat N combines with B , Cr , Mg , Si , and V , probably also with Al , Fe , and Zn . The compounds of N are extremely numerous and exhibit great differences of properties. N is related chemically to P , V , As , Nb , Sb , Bi , Er , Ta , and Br , these elements form Group VI. Most of the oxides of N are acidic, none is basic, NH_3 , however, is markedly basic and alkaline (*v* Nitrogen group of elements, p 571).

The influence exerted on the molecular volumes of N compounds by the N atoms has not yet been measured satisfactorily (for a synopsis of data *v* Kopp, *A* 250, 1). The molecular rotatory power of N compounds varies according as the N atom is in direct union with 3 or 5 other atoms, but the exact numerical value to be assigned to N^{III} and N^V has not yet been finally determined (*v* Perkin, *C J* 55, 680). Neither have final values been yet determined for the atomic refractions of N^{III} and N^V .

The atomic wt of N has been determined (1) by finding the ratio of Ag to AgNO_3 , the at wts of Ag and O being known (Marignac, *A* 59, 289, Stas, *Rech* 50, *Nouv R* 281), (2) by finding the ratio of NH_4Cl to Ag needed to ppt the Cl (*M, l.c.*, Stas, *Rech* 87, *Nouv R* 57).

Supposed allotropic form of nitrogen. — By passing a succession of powerful electric sparks through N at not more than 20 mm pressure, Thomson & Threlfall (*Pr* 40, 329) observed a diminution in the volume of the N , at 8 mm the diminution amounted to 8 to 10 p c of the original volume, after long warming to 100° the gas attained its original volume. T \& T supposed that an allotropic form of N is produced under these conditions. According to Johnson (*C J* 39, 130), when N , obtained from KNO_3 aq and NH_4Cl aq, is mixed with H , and the gases are passed over spongy Pt , NH_3 is formed, but NH_3 is not produced if the gases are passed through a hot tube before coming in contact with the spongy Pt . Johnson concluded that N can exist

in two forms one active and the other inactive, the latter being formed by the action of heat on the former (*v* also Johnson's pamphlet, *Elementary Nitrogen, and on the Synthesis of Ammonia* (Churchill, 1885))

Fixation of nitrogen by growing plants—Experiments conducted in recent years tend to show that certain plants, notably *Leguminosae*, are able to absorb N from the air and build up nitrogenous material therewith. The absorption of N seems to occur in nodules which grow on the roots of the plants. For an account of the more important experiments up to the early part of 1890 *v* Lawes & Gilbert, *Pr* 46, 85, abstract in *N* 42, 41 *v* also Atwater & Woods, *Am* 12, 526, also Schloesing & Laurent, *C R* 111, 750, abstracts in *C J* 60, 353

Reactions and Combinations—1 Combines with oxygen to form NO_2 when electric sparks are sent through the gases for some time. When air is strongly compressed and mixed with compressed O and some electrolytic gas ($\text{H}_2 + \text{O}$), an open tube containing KOHAq is placed in the vessel, and a spark is passed, a considerable quantity of KNO_3 is found in the KOHAq (Hempel, *B* 23, 1455). HNO_3 is also formed by exploding $\text{H}_2 + \text{O}$ in air at the ordinary pressure standing over Hg (Bunsen, *Gasom Methoden* [2nd ed.], 71). Nitrites, or HNO_2 , are formed in very small quantities in certain cases of combustion in air, *e g* when P, H, or ether is slowly burnt (Schönbein, *J pr* 84, 193, 86, 129, Berthelot, *A Ch* [5] 12, 440, *C R* 108, 543, Kolbe, *A* 119, 176, Zöller & Grete, *B* 10, 2145, Ilosva, *Bl* [3] 2, 734). It is doubtful whether the nitrites are produced by the oxidation of N or of NH_3 in the air, the experiments of L T Wright (*C J* 35, 42) tended to show that nitrites are not formed by burning H in air from which NH_3 has been carefully removed. According to Ilosva (*Bl* [3] 2, 734), nitrites are formed by passing air over Pt black heated to c 250°. Loew (*B* 23, 1443) showed that small quantities of nitrites are produced when pure Pt black is treated with pure NaOHAq in the air. Neither of these sets of experiments proves conclusively that the N, and not the NH_3 , of the air was the source of the N of the nitrites produced. Schönbein's statement that N combines with ozone has been disproved by Carius (*A* 174, 31).—2 N combines with hydrogen to form NH_3 , under the influence of the electric discharge (Chabrier, *C R* 75, 484, Donkin, *Pr* 21, 281, Morren, *C R* 48, 482, Perrot, *C R* 49, 204, *c* Johnson, *C J* 89, 130, and Wright, *C J* 39, 359). Ramsay & Young assert that a trace of NH_3 is formed when a mixture of moist N and H is passed through a red hot tube containing iron filings (*C J* 45, 93).—3 At a very high temperature N combines with boron, chromium, magnesium, and silicon, and probably also with aluminium, iron, and zinc, to form nitrides (*v* these elements).—4 N combines with carbon to form C_2N_2 , when induction-sparks are passed between C poles in an atmosphere of N (Morren, *C R* 48, 842). Cyanides are formed when a mixture of C with oxide of an alkali, or alkaline earth, metal is heated in N, Hempel (*B* 23, 8890) has shown that considerable quantities of cyanides are thus formed if the reaction occurs at pressures from 10 to 60 atmospheres.

Detection of nitre nitrogen, i.e. N in combination as nitrite or nitrate One part of N existing as a nitrite or nitrate in 20,000,000 parts of water suffices to give a violet-blue colour with a drop of diphenylamine sulphate in H_2SO_4 , followed by 2 cc conc H_2SO_4 , and stirring (*v* Warrington, *C J* 45, 644).

Nitrogen, acids of The compound N_2H_4 , known as *hydrazoic acid*, is described under *Nitrogen, hydrides of*, p 559, for the *Oxyacids of nitrogen v* p 587

Nitrogen, boride of, v BORON NITRIDE, vol 1, p 527

Nitrogen, bromide of ? NBr_2 . According to Millon (*A Ch* [2] 69, 75) the red, very explosive, oily, liquid formed by adding KBrAq to N chloride covered with a little water is a bromide of N

Nitrogen, chloride of NCl_3 . This compound is frightfully explosive. Experiments must be conducted with small quantities and with the greatest care. V Meyer (*B* 21, 26) describes a glass case in which experiments with NCl_3 may be conducted

Preparation—1 A stick of NH_4Cl is suspended in as conc HClO_4aq as can be obtained, an oily liquid slowly collects in a small leaden basin placed at the bottom of the vessel in which the reaction proceeds (*cf* Troost & Hautefeuille, *C R* 69, 152).—2 NH_4ClAq saturated at 35° is poured into a glass basin, and a glass cylinder, closed at one end by parchment, and partly filled with the same NH_4ClAq , is placed upright in the liquid in the basin, a Pt plate, forming the positive pole of a battery of at least 6 to 8 Grove or Bunsen cells, is immersed in the NH_4ClAq in the cylinder, and the negative pole—also a Pt plate—is placed obliquely under the parchment which closes the lower end of the cylinder. A very thin layer of turpentine is spread on the surface of the NH_4ClAq in the cylinder. When the current is sent through the liquid very small oily drops form at the positive pole and float to the surface, where they explode on coming into contact with the turpentine (Böttger & Kolbe, *A* 64, 236, Böttger, *J pr* 68, 374).—3 About 30 grams pure NH_4Cl are dissolved in hot water, the solution is filtered if necessary, diluted to 1½ litres, and placed in a perfectly clean leaden basin, a small leaden basin with a handle is placed in the centre of the larger basin, a fair-sized, very clean flask is filled with Cl, and this flask is immersed in the NH_4ClAq , so that the mouth of the flask covers the small leaden dish. The apparatus is placed out of direct sunlight, in a glass case with double walls, having an open door at one end (*v* V Meyer, *B* 21, 26). The Cl is slowly absorbed by the NH_4ClAq which rises in the jar, when about ½ of the Cl has disappeared, oily drops begin to be formed in the liquid, these drops increase in quantity and size, and at last sink into the small leaden dish. The leaden dish is very carefully removed, and its contents are poured into a small separating funnel made of very thin glass, the NH_4ClAq is removed by a pipette, the greatest care being taken that the liquid does not come into contact with any kind of organic matter, the oil in the funnel is repeatedly washed in the cold water till the washings are free from Cl, and a gentle stream of air is sent through the oil to remove

the last traces of Cl. The oil is now allowed to drop from the funnel into a very small glass vessel, where it is dried by contact with a little bit of dry CaCl_2 , the oil is then poured into a little weighed tube holding about 1 c.c., and closed by a loosely fitting stopper. The very greatest care is required in conducting these operations, especially the removal of the oil from the separating funnel, as the rubbing of the glass tap against the funnel is very apt to cause explosion, when a little of the oil has been dropped into the vessel in which it is to be dried, another clean glass dish must at once be placed beneath the funnel, as explosion would occur if a trace of the oil should drop on to the table (For more details *v* Gattermann, *B* 21, 751.) The oil thus obtained is a mixture of chlorinated ammonias $\text{NH}_{3-2}\text{Cl}_x$ (*G*, *l* c), the composition of portions of the oil varies. To prepare pure NCl_3 , after washing the oil in a separating funnel till free from Cl, and separating the water as completely as possible, Gattermann passes a fairly rapid stream of pure Cl over the oil, which is in the narrow part of the funnel, for about $\frac{1}{2}$ an hour, he then washes and dries the oil in the way described. The analysis was made by decomposing the oil by NH_4Aq , when N and HCl are formed (the HCl combining with excess of NH_3 to form NH_4Cl), and estimating Cl. The process is carried out by Gattermann (*l* c) by dropping the little weighing tube and the stopper (which is removed from the tube) into water in a flask, closed by a cork carrying a small dropping funnel and a tube passing downwards into a beaker of water, allowing about 20 c.c. conc. NH_4Aq to flow very slowly into the flask, when the decomposition is complete (about 4 hours are required) adding the water in the beaker to the contents of the flask, and boiling for a short time, adding HNO_3Aq and AgNO_3Aq , and weighing the AgCl formed.

Properties and Reactions.—A dark yellow oil, *S* *G* c 1 b (determined by finding that the oil very slowly sank in $\text{Fe}_2(\text{SO}_4)_3\text{Aq}$, *S* *G* 1 578, Porret, Wilson, a Kirk, *G* 47, 56). Explodes when exposed to direct sunlight or the light of burning Mg. Explodes at c. $90^\circ\text{--}95^\circ$ when heated in a perfectly clean tube (*v* *G*, *l* c), explodes on contact with wood, grease, oil, or almost any kind of organic matter. The explosion of NCl_3 is frightfully violent. The older observers said that explosions occurred under most curious and apparently contradictory conditions, *eg* contact with P, As, or Se caused explosion, but no explosion occurred by contact with C, S, gum, starch, or wax. Gattermann (*l* c) thinks that light was the cause of many of these explosions. The vapour of NCl_3 acts on the eyes and mucous membrane of the nostrils. NCl_3 is decomposed by conc. HClAq , giving NH_4Cl and Cl, NH_4Aq produces NH_4Cl and N, Hg forms HgCl_2 , and N, SO_3Aq produces NH_3 , H_2SO_4 , and HCl, $\text{As}_2\text{O}_3\text{Aq}$ and Se_2Aq also set free N.

The formation of NCl_3 from N and Cl would be accompanied by the disappearance of much heat. Deville a Hautefeuille give $[\text{N}, \text{Cl}] = -38,000$ (*C* *R* 69, 152, *cf* Oger, *A* *Ch* [5] 20, 5).

Nitrogen, chlorophosphide, *v* Nitrogen, phosphochloride of, p 570

Nitrogen, chlorosulphide of, *v* Nitrogen, sulphochloride of, p 571

Nitrogen, fluoride of Warren (*C* *N* 55, 289) says that a yellow oil, probably a fluoride of N, is obtained by electrolysis NH_4FAq , the oil explodes by contact with a gold wire.

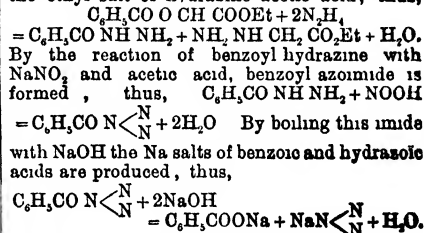

Nitrogen, hydrides of

Three compounds of N and H have been isolated, *viz* ammonia, NH_3 , hydrazine, N_2H_4 , and hydrazoic acid N_3H . Ammonia is described in vol 1 p 196, and hydrazine in vol 1 p 706. As hydrazoic acid has been isolated since the publication of vol 11 this compound is described here—

Hydrogen nitride (*B* 23, 3023) This acid was discovered by Carius in 1890 (*B* 23, 3023).

Formation.—Ethyl benzoylglycolate reacts with N_2H_4 to form benzoyl-hydrazine and the ethyl salt of hydrazine acetic acid, thus,

By adding dilute $\text{H}_2\text{SO}_4\text{Aq}$ and warming, hydrazoic acid gas is evolved.

Preparation.—Ethyl hippurate is dissolved in as small a quantity as possible of boiling alcohol, $\text{N}_2\text{H}_4\text{H}_2\text{O}$ is added in the ratio $\text{C}_6\text{H}_5\text{CO} \text{NH} \text{CH}_2 \text{COOEt} : \text{N}_2\text{H}_4\text{H}_2\text{O}$, hippuryl hydrazine, $\text{C}_6\text{H}_5\text{CO} \text{NH} \text{CH}_2 \text{CO} \text{NH} \text{NH}_2$, separates on cooling. The crystals are recrystallised from alcohol, and dissolved in much warm water, with addition of rather more than a molecular proportion of NaNO_2 , the solution is cooled to 0° , and mixed with excess of acetic acid, when lustrous tablets of a nitroso compound (probably $\text{C}_6\text{H}_5\text{CO} \text{NH} \text{CH}_2 \text{CO} \text{N} \text{N} \text{O}$) separate, the

crystals are collected by help of a filter pump, washed with cold water, and dissolved in very dilute NaOHAq . This solution is gently warmed for a short time on the water bath, and is then placed in a flask connected with a condenser and furnished with a dropping funnel. A flask containing AgNO_3Aq is used as a receiver, dilute $\text{H}_2\text{SO}_4\text{Aq}$ is allowed to drop very slowly into the boiling liquid in the flask, N_2H_4 distils over with steam, and, reacting with the AgNO_3 in the receiver, produces AgN_3 , the operation is continued so long as a pp is produced in the receiver. The AgN_3 is collected by the help of the pump, and well washed with cold water, it must not be heated above 60° , else there is danger of a severe explosion. The AgN_3 is decomposed by boiling with dilute HClAq , the dis-

tillate is fractionated, and the portion which distils over in the early stages is collected separately from the rest. In this way a solution of N_2H containing 27 p.c. N_2H is obtained. By repeatedly fractionating with great care, N_2HAq containing over 90 p.c. N_2H is obtained, and all water can be removed from this solution by fused $CaCl_2$ (Curtius a. Badenhause, *J pr* [2] 43, 207). The process of fractionation is often attended with explosions.

Properties and Reactions.—A 27 p.c. solution of N_2H is a thickish liquid, which sinks in water, it possesses an extremely offensive odour, with NH_3 it gives white clouds. Pure N_2H is a clear, colourless, very foully smelling, liquid. It boils at 87° . It is very explosive. When touched with a hot substance it explodes with violence, it also explodes when placed in a barometric vacuum. The solution of N_2H corrodes the skin and causes headache and giddiness. N_2HAq is a strong monobasic acid, it dissolves Fe, Zn, Cu, Al, and Mg with rapid evolution of H , it appears to dissolve slightly Au and Ag. With $AgNO_3$ and $HgNO_3$ white pps of AgN and HgN are obtained. The affinity of N_2HAq is a little greater than that of acetic acid. The salts of N_2H are also very explosive, with the exception of those of the alkali and alkaline earth metals.

The following salts are described by Curtius (*B* 23, 3032). $N(NH_2)_2$, $(N_2)_2Ba$, N_2Hg , N_2Ag , salts of Cu, Fe, and Na were also prepared.

In connexion with N_2H v. Mendelejeff, *B* 23, 3464.

Nitrogen, iodides of (Iodamines). Very explosive compounds containing N and I are obtained by rubbing I with conc. NH_3 or by pouring an alcoholic solution of I into NH_3 or alcoholic NH_3 , by pouring NH_3 into alcoholic I, by pouring a solution of I in *aqua regia* into NH_3 or NH_4Cl , by adding bleaching powder solution (neutralised by acetic acid) to NH_4I , by adding NH_3 to a mixed solution of HCl and HIO_3 , by the action of N chloride on $KIAq$, and by adding I and alcohol to 'white precipitate'. The products of these reactions are very dark-coloured powders, which explode, more or less readily and violently, by rubbing or striking. Analyses of these substances seemed to show that at least three different explosive compounds existed, viz. NH_2I , NH_2I , and $N_2H_2I_2$ ($=NH_2NI$). For details and analyses v. Serullas, *P* 17, 304, Millon, *A Ch* [2] 69, 78, Marchand, *J pr* 19, 1, Bineau, *A Ch* [8] 16, 71, Gladstone, *C J* 4, 84, 7, 61, Bunsen, *A* 84, 1, Stahlschmidt, *P* 119, 421, Champion a. Pellet, *Bl* [3] 24, 447, Mallet, *Am* 1, 4, Guyard, *A Ch* [6] 1, 358, Guthrie (*C J* [2] 1, 239), by adding I to conc. NH_4NO_3 or $(NH_4)_2CO_3$ containing KOH , obtained a brown black liquid, which, he said, had the composition NH_2I (*v post*).

Raschig (*A* 230, 212) has re-examined the various methods of preparing and analysing N iodides. According to B, three compounds exist, NI , NH_2I , and NH_2I , but only NI and NH_2I have been isolated by B.

Tri-iodamine NI_3 . NH_4Cl and I in the ratio NH_4Cl 61 (1.14 24) were dissolved in $KIAq$, and $NaOH$ was added in the ratio NH_4Cl 4NaOH, v.e. 2.99 parts NaOH for each part NH_4Cl used, the black pp which forms was collected immediately (with the help of a filter-pump) and

washed 6-8 times with cold water, as rapidly as possible, then dissolved in HCl and analysed. Raschig (*lc*) expresses the reaction thus, $NH_4Cl + 6IAq + 4NaOH$

$= NI_3 + NaCl + 3NaI + 4H_2O$. NI_3 is rapidly decomposed by water to NH_2I . Mallet (*Am* 1, 4) obtained NI_3 by triturating I with a large excess of the most conc. NH_3 , keeping temperature at or below 0° , pouring off the liquid and triturating with more NH_3 , repeating this several times, then agitating 2 or 3 times in a cooled flask with absolute alcohol, then with dry ether, and allowing the ether to evaporate. NI_3 is a heavy, nearly black, powder. According to Raschig (*lc*), the NI_3 prepared by the action of NH_3 on I is much more explosive than the iodide formed by the action of NH_4Cl and $NaOH$ on I. NI_3 dissolves in $KOCy$, forming IOy , KOH , and NH_3 (Millon, *A Ch* [2] 69, 78, Raschig, *A* 230, 212). $KSCy$ reacts similarly, producing IOy , HI , KOH , NH_3 , and H_2SO_4 (B, *lc*).

Di-iodamine NHI . Prepared similarly to NI_3 , using the materials in the ratio NH_4Cl 4I 8NaOH (Raschig, *lc*). Mallet (*Am* 1, 4) obtained this compound by triturating I with not very conc. NH_3 at the ordinary temperature, washing with water till NH_3 could not be detected in the washings, keeping under water for three days, washing with alcohol and ether, and allowing to dry. Gladstone obtained NHI by acting on an alcoholic solution of I with NH_3 (*C J* 4, 34, 7, 51), with H_2S it gave HI and NH_3 , with SO_4 the products were NH_3 , HI , and H_2SO_4 . Stahlschmidt obtained NHI by adding alcoholic NH_3 to an alcoholic solution of I (*P* 119, 421).

Mono-iodamine NH_2I . Raschig (*A* 230, 212) expected to obtain this compound by the reaction of NH_4Cl and $NaOH$ with I, using these materials in the ratio NH_4Cl 2I 2NaOH, but the pp was very quickly decomposed by water to NH_2NI . Millon (*A Ch* [2] 69, 78) gave the formula NH_2I to the iodide prepared by him, and Marchand (*J pr* 19, 1) confirmed this composition. Guyard (*A Ch* [6] 1, 358) describes a light-brown explosive compound, decomposed by light, exploding in contact with water, prepared by NH_3 reacting with I in an iodide solution, to this compound he gives the formula NH_2I , with an ammoniacal solution of a Cu salt it forms $Cu_2I_2 \cdot 2NH_3$.

Tri-iod diamine $N_2H_2I_2$ ($=NH_2NI_2$). Obtained by mixing cold nearly saturated alcoholic solution of I and NH_3 , decomposed by HCl giving NH_3 and IOI in the ratio $2NH_3$, 3IOI. This compound seems to have been obtained by Raschig (*A* 230, 212) by mixing NH_4Cl , I, and $NaOH$ in the ratio NH_4Cl 2I 2NaOH, and washing the pp with water.

OTHER COMPOUNDS OF NITROGEN, IODINE, AND HYDROGEN. (1) *Iodammonium iodide*, NH_4II , a mobile brownish red liquid, formed by adding finely powdered I to saturated NH_4NO_3 or $(NH_4)_2CO_3$ mixed with about $\frac{1}{2}$ of an equivalent of KOH (Guthrie, *C J* [2] 1, 239). Soluble alcohol, ether, $CHCl_3$, CS_2 , and $KIAq$, decomposes by heat, giving I and probably NH_2I , decomposes in the air to NH_3 and I, water forms NH_2I , HI , and NH_4I , which explodes producing N , I, and H_2O . According to Seamon (*C N* 44, 189), this compound is formed by act-

ing on dry I with dry NH_3 , and absorbing the excess of NH_3 by standing near H_2SO_4 . S describes the compound as a nearly black liquid, S G 2 46 at 15° , solidifying at -2° , decomposing slowly at 15° , quickly at 70°

(2) *Compounds of ammonia with iodine*— NH_3I , obtained by the action of NH_3 on I at 10° (Millon, *A Ch* [2] 69, 78), formed at 80° according to Raschig (*A* 241, 253) β $(\text{NH}_3)_2\text{I}$ formed at 20° (Bineau, *A Ch* [3] 15, 71, Raschig, *lc*) γ $(\text{NH}_3)_3\text{I}$, formed at 0° δ $(\text{NH}_3)_4\text{I}_2$ formed at -10° (R, *lc*) It is doubtful whether these bodies are true compounds or not

Nitrogen, oxides of N forms five oxides N_2O , NO , N_2O_3 , NO_2 , N_2O_5 N_2O_3 and N_2O_5 are the anhydrides of HNO_2 and HNO_3 , respectively, NO , reacts with water to produce both HNO and HNO_2 , NO is obtained by the decomposition of HNO_3Aq , but the acid has not been obtained from the oxide, NO is a neutral oxide Whether N_2O_3 exists in the gaseous state is not yet finally settled, the other oxides, with the exception of N_2O_5 , are gases under ordinary conditions NO_2 exhibits polymerism, at low temperature the molecular weight corresponds with the formula N_2O_4 , and at higher temperatures with the formula NO_2 Besides these five oxides, there is said to exist a pernitric oxide NO_3 , or N_3O_4

Nitrous oxide was discovered by Priestley in 1776, and carefully studied by Davy

Formation—1 By dissolving Zn in HNO_3Aq (S G 1 2 diluted with an equal vol of water)—2 By decomposition of NH_4OHAq by AgNO_3 , K_2CO_3 , &c. v HYDROXYLAMINE, *Reactions*, No 1 (vol u p 735)—3 By the gradual decomposition of $\text{H}_2\text{N}_2\text{O}_3\text{Aq}$ (v *Hyponitrous acid*, p 564)—4 By the action of SnCl_2 in HCl on HNO_3Aq or a nitrate—5 By passing NO through SO_2Aq or an acid sulphate—6 By the action of HNO_3Aq on Cu in presence of much Cu_2NO_3 , if NH_4NO_3 is present, much N_2O and N, with little NO , are produced (Acworth, *C J* 28, 828)

Preparation—1 Pure NH_4NO_3 is slowly heated in a retort to a temperature at which gas begins to be given off The gas flame is then lowered, and the decomposition allowed to proceed $\text{NH}_4\text{NO}_3=\text{N}_2\text{O}+2\text{H}_2\text{O}$ It is best to make the

VOL. III

NH_4NO_3 by neutralising pure dilute HNO_3Aq with pure NH_3Aq or $(\text{NH}_4)_2\text{CO}_3\text{Aq}$, evaporating till the B P gets to $c\ 120^\circ$ and a drop solidifies on a cold plate, allowing to cool, and breaking up into small pieces If the temperature rises above 250° , decomposition to N, O, and H_2O may occur with explosive violence, in the change $\text{NH}_4\text{NO}_3=\text{N}_2\text{O}+2\text{H}_2\text{O}$ c 31,100 cal are reproduced, whereas the change $\text{NH}_4\text{NO}_3=\text{N}_2+\text{O}+2\text{H}_2\text{O}$ is accompanied by the production of c 48,700 cal (*Th* 2, 205) To obviate explosions, Case neuve (*D P J* 257, 435) recommends to dry NH_4NO_3 carefully over a low flame, to bring the salt while warm into a retort or flask, to heat with a very small flame which is gradually increased till decomposition begins, and then to withdraw the flame The gas is collected over hot water, brine, or Hg If the gas is to be used as an anæsthetic, the greatest care should be taken that the NH_4NO_3 used is pure, and especially that it is quite free from NH_4Cl , else the N_2O may contain Cl, the gas should be passed through KOH Aq and FeSO_4Aq to absorb traces of Cl, NO , and $\text{NO}-2$ A mixture of 5 parts SnCl_2 , 10 parts HCl Aq S G 1 21, and 9 parts HNO_3Aq S G 1 38, is heated to boiling, when pure N_2O is evolved in a regular stream, any alteration in the proportions may cause explosions (Campari, *C C* 1888 1569)

Properties—A colourless gas, with a slightly sweetish smell and taste Supports combustion almost as well as O When breathed, N_2O produces insensibility, which lasts for a short time only It is often used as an anæsthetic in dental operations, for this purpose it is usually much compressed in iron bottles N_2O is decomposed by heat, the decomposition being complete at $c\ 900^\circ$ H and N_2O forms an explosive mixture, most inflammable gases burn in N_2O N_2O is liquefied at 0° by a pressure of c 30° atmos, the liquid occupies c $\frac{1}{30}$ of the volume of the gas (Faraday, *A* 56, 157) Liquid N_2O is colourless and very mobile, a drop burns when let fall on the skin, on evaporation much cold is produced, liquid N_2O boils in liquid CO_2 Metals dropped into liquid N_2O generally hiss as hot iron does in water Glowing C swims on the liquid and burns briskly Hg sinks and freezes, S, I, P do not react Water freezes when added to liquid N_2O , but so sudden an evolution of vapour occurs that an explosion generally takes place (Faraday, *A* 56, 157), nitric and sulphuric acids are frozen by liquid N_2O , alcohol, ether, and CS, mix, without freezing By evaporating liquid N_2O in an air stream, Wills (*C J* [2] 12, 21) obtained solid N_2O in some quantity, the solid is a snow like substance, more compact than solid CO, when slightly warmed it melts, at $c\ -99^\circ$, and then boils, at $c\ -92^\circ$

Reactions—1 Decomposed by heat to N and O, change is complete at $c\ 900^\circ$ (Langer a V Meyer, *Pyrochemische Untersuchungen* [Brunswick, 1885], 65, cf Berthelot, *C R* 77, 1448)—2 Decomposed to N and O, by electric sparks 3 Passed over red-hot iron, Fe_2O_3 , and N are formed—4 Potassium or sodium burns in N_2O setting free N—5 Mixed with hydrogen, or other combustible gas such as CO, PH_3 , H_2S , or a hydrocarbon, and brought to a flame, combustion ensues at the expense of the O of the N_2O (explosions occur with H)—6. *Easily burnt sub*

O O

stances, when inflamed and plunged into N_2O , burn almost as rapidly as in O, e.g. C, P, S, Na, &c.—7 Mixed with oxygen, and subjected to the electric discharge, NO_2 is formed.—8 A solution of N_2O in water is neutral to litmus, N_2O is, however, related to the acid $H_2N_2O_3$, as it is obtained by the decomposition of this acid in aqueous solution (*v. Hyponitrous acid*, p. 569). The hyponitrites may be regarded as compounds of the negative radicle N_2O with more positive oxides, e.g. Ag_2O , N_2O .

NO is liquefied at the following temperatures and pressures (Olszewski, *C R* 100, 940) —

Pressure in atmos	71.2	57.8	49.9	41
Temperature	-93.5°	-97.5°	-100.9°	-105°
Pressure in atmos	31.6	20	10.6	5.4
Temperature	-110.9°	-119°	-129°	-138°
Pressure	1 atmo	138 mm	18 mm	
Temperature	-153.6°	-167°	-176.5°	

The critical temp is c -93.5° according to Olszewski, but according to Cailliet (*C R* 85, 1016) NO is liquefied at -11° under a pressure of 104 atmos, but not at 8° even under 270 atmos pressure. NO solidifies at -167° (Olszewski, *l.c.*).

NO was discovered by Priestley and called by him *saltpetre gas*.

Formation—1 NO is probably formed in the first stages of those combustions in air whereby nitrites and nitrates are produced, e.g. in burning air with compressed O, in slowly burning P, ether, &c., in air (*v. Nitrogen, Reactions*, No 1, p. 558). NO is also probably formed when electric sparks are passed through a mixture of N and O.—2 By reducing HNO_3 Aq or HNO_2 Aq, e.g. by reaction with Cu, by passing in SO_2 , by electrolysis, &c. (*v. Nitric acid, Reactions*, Nos 3, 4, 5, p. 520).—3 By reacting on KNO_3 with $FeCl_3$ Aq and HCl Aq, or with $FeSO_4$ Aq and H_2SO_4 Aq.

Preparation—1 A quantity of HCl Aq is divided into 2 equal parts, one portion is converted into $FeCl_3$ Aq by dissolving iron wire in it until it is saturated, the two portions are then mixed and placed in a retort or flask, KNO_3 is added in quantity nearly equal to that of the Fe used, and the whole is warmed ($6FeCl_3$ Aq + $8HCl$ Aq + $2KNO_3$ = $6FeCl_2$ Aq + $2KCl$ Aq + $4H_2O$ + $2NO$). $FeSO_4$ Aq and H_2SO_4 Aq may be substituted for $FeCl_3$ Aq

and HCl Aq.—2 Cu cuttings are added to HNO_3 Aq, SG 1.2, in a flask arranged so that it can be surrounded by cold water when desired, action begins after a little and red fumes of NO_2 are evolved, when the gas in the flask is quite colourless it is collected over cold water, or if required dry it is passed over solid dry KOH and then through conc H_2SO_4 . About 130 c.c. acid are used for 15 grams Cu. The HNO_3 Aq used should not be more conc than SG 1.2, and temperature must be kept as low as possible, else N_2O and N_2O_3 may be formed. If the action proceeds for some time the gas contains considerable quantities of N_2O , as the reaction of Cu with much $Cu(NO_3)_2$ Aq in presence of HNO_3 produces this gas (Acworth, *C J* 28, 828). But with all precautions, NO prepared by this method is always liable to contain N_2O and N (*v. Acworth, l.c.*). Carus (*A* 94, 138) says NO can be obtained pure by passing the products of the reaction of Cu with HNO_3 Aq into $FeSO_4$ Aq, which absorbs NO but not N_2O or N, and then gently warming the solution thus obtained.—3 Kammerer (*B* 18, 3064) recommends to fill a Wolff's bottle with Cu turnings, add enough cold saturated $NaNO_2$ Aq to fill the bottle $\frac{1}{2}$, and then allow conc H_2SO_4 to drop in little by little.—4 Thiele (*A* 253, 246) prepares NO by adding conc $NaNO_2$ Aq (free from carbonate) to $FeCl_2$ or $FeSO_4$ in HCl Aq.—5 SO_2 is prepared by heating Cu with conc H_2SO_4 , and passed into slightly warmed HNO_3 Aq SG 1.15, the issuing gas is passed through wash bottles wherein excess of SO_2 is absorbed ($3SO_2 + 2HNO_3$ Aq + $2H_2O = 3H_2SO_4$ Aq + $2NO$).

Properties—A colourless gas, at great pressure and very low temperature, a colourless liquid, becomes solid at -167° . As NO combines with O immediately on coming into contact with air, it cannot be determined whether pure NO is or is not tasteless and odourless. Sl. sol water, v. sl. sol H_2SO_4 , less sol H_2SO_4 Aq. NO does not change the colour of litmus. Substances which produce much heat when burning, e.g. P and C, continue to burn in NO if plunged into the gas when burning vigorously, burning S or H, or a burning taper, ceases to burn in NO . A mixture of NO and H is not explosive. NO is reduced to N_2O by Zn, Fe, SO_2 , &c. At a very high temperature, c. 1700° , NO is decomposed to N and O.

The SG of NO has been determined from -100° to 1200° (*v. beginning of this article*), for this temperature interval the molecular formula is NO .

NO is a neutral oxide. In the compound $NOCl$, formed by the union of NO and Cl , NO acts as the more positive radicle, it also perhaps takes the part of the positive radicle in nitrosulphuric acid, which may be regarded as $SO_2.OH.ONO$.

Reactions—1 Decomposed into N and O by heat, but only at a very high temperature, c. 1700° , according to Langer and V Meyer (*Pyrochemische Untersuchungen*, 66).—2 *Electric sparks* produce N_2O (which then goes to N and O) and O (Berthelot, *Bl* [2] 26, 101).—3 Reduced to N_2O by many easily oxidised substances, e.g. moist zinc or iron filings (NH_3 also is produced), sulphur dioxide and water (reductions occurs even in presence of O if H_2SO_4 is

also present, *v* Lunge, *C J* 47, 465), hot copper, &c —4 Heated with potassium or sodium, K_2O or Na_2O , and N are formed —5 Passed over red hot carbon N and CO , are obtained —6 Mixed with hydrogen and inflamed, H_2O and N are formed, NH_3 is formed by passing a mixture of NO and H over spongy Pt (L Wright, *C J* 89, 357) —7 The copper-*unc* couple acting on NO in presence of water produces NH_3 (Gladstone a Tribe, *C J* 43, 341) —8 Stannous chloride, in presence of $HClAq$, produces NH_4OH , HCl , N, and $SnCl_4$, the action ceases at 100° (Divers a Haga, *C J* 47, 623) —9 When a flame is brought to a mixture of NO and carbon disulphide, CO_2 , SO_2 , and N are produced very rapidly, and with a brilliant white flash —10 In contact with water in the dark slowly produces HNO_3Aq , N, and a little N_2O (Cooke, *C N* 58, 115, *cf* Russell a Lapraik, *C J* 32, 37) —11 Contact with conc potash solution causes a slow formation of KNO_3Aq , N_2O , and N (Gay-Lussac, *Gm* 2, 378, Russell a Lapraik, *C J* 32, 35) —12 With alkaline solution of pyrogallol N_2O and N are formed (R a L, *l c*) —13 Reduced to NH_3 , with separation of I, by conc hydroiodic acid solution (Chapman, *C J* [2] 5, 166) —14 An alkaline solution of stannous hydroxide ($=K_2SnO_2$) produces $K_2N_2O_2$ and K_2SnO_3 (Divers a Haga, *C J* 47, 361) —15 Ferrous hydroxide, in presence of much conc $KOHAq$, reduces N_2O to NH_3 (D a H, *l c*) —16 Oxidised to HNO_3Aq by an alkaline solution of potassium permanganate, with separation of $MnO_2 \cdot xH_2O$ (Wanklyn a Cooper, *P M* [5] 6, 288) —17 Oxidised to NO , and N_2O , by nitric acid of SG >1.15 —18 With nitric acid in sulphuric acid, SO_2 , OH , ONO is produced —19 With oxygen and water NO is wholly oxidised to HNO_3Aq (Lunge, *C J* 47, 465) —20 With oxygen and conc sulphuric acid forms SO_3 , OH , ONO (L, *l c*)

Combinations —1 With oxygen to form NO_2 . According to Lunge (*C J* 47, 465), NO_2 is the chief or only product when excess of O is used, but with excess of NO both NO_2 and N_2O , are formed —2 With ferrous salts in solution, to form deep brown coloured liquids Gay (A Ch [6], 5, 145) finds that the quantity of NO absorbed is independent of the kind of ferrous salt used and of dilution It is proportional to the quantity of Fe in solution, and varies with temperature and pressure The relation between quantity of NO absorbed and pressure is a special one, it resembles that which holds good in the solution of NH_3 by water The solutions lose all NO *in vacuo*, or by passing a stream of H into them The quantity of NO absorbed at 8° and 760 mm nearly agrees with the formula $2NO \cdot 3FeSO_4$, between 8° and nearly 25° the formula $NO \cdot 2FeSO_4$, approximately expresses the quantity of NO absorbed, and at $c 25^\circ$ the NO agrees with that required by $NO \cdot 5FeSO_4$ NO is also absorbed by chromous, stannous, and mercurous salt solutions —3 With antimony chloride, to form $NO \cdot 2SbCl_5$, also with aluminum, bismuth, and ferric chloride (Beeson, *C R* 108, 1012) —4 NO combines with liquid N_2O , to form N_2O , (*q v*)

NITROGEN TRIOXIDE N_2O_3 . (Nitrous anhydride Nitrogen sesquioxide) Mol w 75.9 (*infra*)

Formation —1 By passing NO into liquid N_2O_4 at $c 20^\circ$, more or less pure liquid N_2O_3 is formed (Dulong, A Ch 2, 317, Péligot, A 39, 327, Ramsay, *C J* 57, 590) According to Hasenbach (*J pr* [2] 4, 1), N_2O_3 is produced by passing a mixture of NO and NO_2 through a hot tube, and then into a vessel surrounded by a freezing mixture Ramsay a Cundall (*C J* 47, 672) showed that no contraction occurs when NO_2 and NO are mixed at the ordinary temperature —2 By reacting on starch or As_2O_3 with HNO_3Aq SG 1.3 to 1.35 (Lunge, B 11, 1641, Stenhouse a Groves, *C J* 31, 545) —3 Fritzsche (*J pr* 22, 14) gently warmed red fuming HNO_3 , condensed the vapour, again very gently warmed this liquid, and passed the vapour into a strongly cooled receiver, to 92 parts of the liquid thus obtained (chiefly N_2O_3), he added 45 parts of cold water very slowly, the liquid being kept very cold Two layers of liquid were thus obtained, the under was very deep blue, and was regarded by Fritzsche as fairly pure N_2O_3 , the upper layer, which was grass green, was a solution of N_2O_3 and NO_2 in HNO_3Aq By placing both liquids in a retort kept at 0° , the lower layer boiled, and a pure indigo blue liquid condensed in the very strongly cooled receiver, this liquid consists chiefly of N_2O_3 , according to Fritzsche F (*l c*) obtained a deep blue liquid, containing, according to him, at least 93.4 p c N_2O_3 , by distilling a large quantity of nitric acid which had been used in a battery, condensing the distillate in a vessel surrounded by snow and $CaCl_2$, and redistilling several times at the lowest possible temperature —4 By the reaction of O on excess of NO, considerable quantities of N_2O_3 , are produced (Lunge, *C J* 47, 466) —5 By dropping water on to 'chamber crystals' (nitrosyl sulphate, $SO_3 \cdot OH \cdot ONO$) (Streiff, B 5, 285)

Preparation —Pure N_2O_3 , has not been obtained 1 The gas obtained by reacting on starch or powdered As_2O_3 with HNO_3Aq SG 1.35 is nearly pure N_2O_3 , according to Lunge (B 11, 1229, 1641), the starch is made into a paste with water, and the acid is added from a dropping funnel, the flask is gently warmed, and then plunged into cold water Stenhouse a Groves (*C J* 31, 545) also recommend HNO_3Aq SG, the reaction proceeds at 70° with production of nearly pure N_2O_3 —2 Pure NO is passed into cold liquid N_2O . The product is not pure N_2O_3 (Ramsay, *C J* 57, 591) But *v* Lunge, *Z anorg, Chem* 7, 209 [1894]

Properties —The liquid obtained by condensing the gaseous product of the reaction between As_2O_3 and HNO_3Aq , SG 1.3, at 70° , passing the vapour of this liquid over P_2O_5 , and condensing again, is deep blue, it does not solidify at -90° , it is miscible with liquid N_2O , O passed into liquid N_2O_3 , mixed with N_2O_3 , very slowly, if at all, combines with the N_2O_3 , liquid N_2O_3 appears to dissociate slightly to NO and N_2O , at -90° (Ramsay, *C J* 57, 597) Gaines (*C N* 48, 97) says that N_2O_3 liquefies at -14.4° According to Geuther, liquid N_2O_3 boils at 3.5° , and has the following SG 1.464 at -8° , 1.4555 at -4° , 1.451 at -1° , 1.449 at 0° , 1.4485 at 1° , 1.447 at 2° Birhausa

(*C R* 109, 68) says that N_2O_3 solidifies at -82° , Ramsay found the blue liquid to remain liquid at -90° (Birhauss's liquid probably contained N_2O_4 , as it was formed by the action of O on excess of NO_2 .)

Molecular weight of nitrogen trioxide—Ramsay determined the lowering of the freezing-point of N_2O_4 , after passing in NO and calculating the quantity of N_2O_3 produced by the increase in weight, his results, on the whole, are in favour of the formula N_2O_3 for the liquid compound. There has been much discussion as to the existence of this oxide in the state of gas. Some chemists deny the existence of a compound nN_2O_3 , and say that the reactions of this supposed compound are those of a mixture of NO and NO_2 (containing variable quantities of N_2O_4 according to the temperature). As NO rapidly combines with O, a mixture of NO and NO_2 would also surely combine with O, but Ramsay & Cundall have shown (*C J* 47, 187) that O acts very slowly on the blue liquid which, on the hypothesis of the non existence of N_2O_3 , is a mixture of NO and N_2O_4 , this result is confirmed by Ramsay's later observations (*C J* 57, 597), and also by observations made by Richardson (*C J* 51, 397). Lunge has shown (*D P J* 233, 63) that the gas from the blue liquid which has the empirical composition N_2O_3 is not wholly transformed into NO_2 even in presence of 10 times as much O as is required on the assumption that the gas in question is a mixture of NO and N_2O_4 . Moreover, Ramsay & Cundall (*C J* 47, 672) showed that although no change in appearance or volume occurs when NO_2 gas is mixed with NO, yet on lowering the temperature of the mixed gases, by $HClAq$ and ice, a dark blue liquid was formed (liquid NO_2 is colourless, and liquid N_2O_4 is yellow red). Again, Ramsay (*C J* 57, 597) found that the blue liquid does not freeze at -90° , but part of a mixture of NO and N_2O_4 would freeze at -10° , as this is about the freezing point of N_2O_4 . Some of the reactions of N_2O_3 with alkalis, H_2SO_4 , &c., are scarcely those of a mixture of two substances (*v. Reactions*, 1, 2, and 5). According to Gay Lussac (*G A* 58, 29) a mixture of excess of NO with O allowed to stand for a long time over $KOHAq$ forms KNO_2Aq , and the gases disappear in the ratio required to form N_2O_3 .

As regards the existence of N_2O_3 as a gas, Lunge's experiments show that the oxidation of the gas obtained by heating starch with HNO_3Aq S G 1 55 to NO_2 is not completed by a very large excess of O (*D P J* 233, 63, *B* 12, 357). Now, as Lunge has also shown (*C J* 47, 465), that NO_2 is the sole product, or almost the sole product, of the action of excess of O on NO, and therefore as soon as O is added to NO there must be present a mixture of NO, NO_2 , and O, it is difficult to escape the conclusion that the action of a large excess of O on a mixture of NO and NO_2 must result in the formation of much NO_2 , and that, therefore, the gas obtained by HNO_3Aq acting on starch, contains N_2O_3 , which is not oxidised by O to N_2O_4 . Ramsay & Cundall (*C J* 47, 672) found that no contraction occurred on mixing NO_2 with NO, if any N_2O_3 were formed contraction must have occurred. B & C prepared a blue liquid having the composition N_2O_3 (by action of HNO_3Aq on As_2O_3), and determined the

V D of the gas obtained by gently warming the liquid. The V D was 22 35 at 18.2° , V D corresponding to $N_2O_3 = 88$. If the gas was supposed to be a mixture of NO, NO_2 , and N_2O_3 (without any N_2O_4), there must have been present 17 63 p.c. N_2O_3 to raise the S G of $NO + NO_2$ to 22 35, hence the maximum percentage of N_2O_3 gas which could be present was 17 63, but as the gas certainly contained some N_2O_4 , the percentage of N_2O_3 gas must have been less than 17 63. R & C show that a mixture of NO, NO_2 , and N_2O_3 , having the same percentage of N and O as N_2O_3 , would have the V D 23 42 under the conditions of their experiment, assuming a formula given by Willard Gibbs to be correct, hence they conclude that the gas examined by them was more probably a mixture of NO, NO_2 , and N_2O_3 , than a mixture of these gases with N_2O_4 . R & C also draw attention to the remarkable result of Lunge's experiments, which he has himself stated, that the dissociation of N_2O_3 (supposing it to exist as a gas) is almost independent of temperature. According to Luck (*Fr* 8, 402) and Moser (*W* 2, 139), the absorption-spectrum of the gas supposed to be N_2O_3 is identical with that of NO_2 (containing N_2O_4). On the question of the existence or non existence of gaseous N_2O_3 , besides the memoirs referred to, *v. Lunge*, *B* 11, 1232, 1641, 12, 357, 15, 495, Witt, *B* 12, 2188, Geuther, *A* 245, 96.

Reactions—1 Dissolves in water at 0° , forming a blue liquid, on warming, NO is evolved and HNO_3Aq remains, if the solution is neutralised by alkali, a mixture of a nitrite (MNO_2) and nitrate (MNO_3) is obtained. According to Fremy (*C R* 79, 61) addition of a little water causes evolution of pure NO, and HNO_3 is formed, but addition of much cold water produces a fairly stable solution, which may be kept unchanged for some days, and which slowly evolves NO and N_2O_4 on warming. Addition of sand, powdered $CaSO_4$, or other indifferent substance, causes rapid decomposition to HNO_3Aq and NO. The solution is a strong reducer, cold SO_2Aq forms various nitro derivatives of S oxy acids, warm SO_2Aq forms NO, N, NH_3 , and H_2SO_4 (*F*, *1 c*, *cf. Reinsch*, *J pr* 28, 399).—2 Passed into *alkali solution*, nitrite and nitrate are formed (*cf. Nitrous acid and Nitrites*, p 567). Gay Lussac (*G A* 58, 29) says that KNO_2 is formed by allowing O, mixed with a large excess of NO, to stand over $KOHAq$, and that the gases disappear in the ratio required to form N_2O_3 .—3 Decomposes *urea* evolving N.—4 With *benzenoid primary amido compounds*, forms diazo-compounds (*q v. vol 1 p 397*). With *paraffinoid amido compounds*, the general result is to substitute OH for NH_2 , and evolve N.—5 With *conc sulphuric acid*, nitrosyl sulphate (SO_2OHONO) is formed. As NO_2 reacts with *conc* H_2SO_4 to form SO_2OHONO and HNO_3 , and as NO passed into H_2SO_4 containing NO_2 forms SO_2OHONO and H_2O , it is sometimes argued that the reaction of N_2O_3 with H_2SO_4 is easily explained by the view that regards N_2O_3 as a mixture of NO and NO_2 , if this view is held, then the two reactions

- (1) $2NO_2 + H_2SO_4 = SO_2OHONO + HNO_3$;
- (2) $HNO_3 + 2NO + 3H_2SO_4$

= SSO_2 , $\text{OH ONO} + 2\text{H}_2\text{O}$ must proceed simultaneously and at equal rates, and the supposed mixture must never contain more NO than is shown by the ratio NO NO_2 , otherwise some NO would pass on unabsorbed. According to Lunge (*lc*) (confirmed by Groves, *C S Proc* 1, 24), NO only slowly converts H_2SO_4 containing HNO_2 into SO_2 , OH ONO .

Combinations—According to Weber (*P* 118, 471) N_2O_5 combines with SnCl_4 and TiCl_4 , e.g. to form $\text{SnCl}_4\text{N}_2\text{O}_5$.

NITROGEN DIOXIDE NO_2 , and TETROXIDE N_2O_4 (Nitrogen peroxide Nitroso nitric anhydride) The mol w of the compound N_2O_4 varies with temperature, at low temperatures and small pressure (c -12° at 115 mm) the mol w is 91.86 = N_2O_4 , and at moderately high temperatures (c 150°) the mol w is 45.93 = NO_2 (*v infra*). N_2O_4 melts at -10° (Deville & Troost, *C R* 64, 257, Ramsay, *C J* 57, 590). Boils at 21.64° (760 mm, Thorpe, *C J* 87, 224) SG (liquid) $d_4^{20} = 1.4903$ (Thorpe, *lc*) V.D. at -12° and 115.4 mm = 42.54 (Natanson, *W* 27, 606), at 130° a 718 mm = 23.26 (Richardson, *C J* 51, 397), at 183° a 760 mm = 22.7 (Deville & Troost, *C R* 64, 237), at 27° a 16 to 35 mm = 23.1 (Troost, *C R* 86, 1395) SH (liquid) 46 (Ramsay, *C J* 57, 590), for SH at different temperatures *v* Berthelot & Ogier (*A Ch* [5] 30, 382). For heat of fusion *v* Ramsay (*lc*) H.F. $[\text{N}_2\text{O}_4] = -2.005$, $[\text{NO}_2] = 19.570$, $[\text{N}_2\text{O}_4\text{Aq}] = 5.750$ (*Th* 2, 199). For electrical resistance of liquid N_2O_4 *v* Boguski (*Z P C* 5, 69). For absorption-spectrum *v* Kundt (*P* 141, 157), Gernez (*C R* 74, 465), Luck (*Z* [2] 6, 237). For thermal expansion *v* Thorpe (*C J* 87, 224).

Molecular weights of nitrogen peroxide—The V.D. at low temperatures near the liquefying point corresponds with the formula N_2O_4 , and the same formula expresses the molecular composition at c 27° under a pressure of 16 to 35 mm, when heated to c 150° the V.D. shows that the molecular formula is NO_2 . Measurements of V.D. are given by Deville & Troost (*C R* 64, 257), Troost (*C R* 86, 1395), Playfair & Wanklyn (*C J* 15, 156), E & L Natanson (*W* 27, 606), Richardson (*C J* 51, 397). That the change in V.D. measures a process of dissociation from N_2O_4 to NO_2 has been shown by Natanson (*lc*), Naumann (*A Suppl* 6, 205, *B* 11, 2045), Salet (*C R* 67, 488). The amount of dissociation is increased by raising temperature or lowering pressure (*v* especially Natanson, *lc*). Ramsay determined the lowering of the freezing point of acetic acid by dissolving N peroxide in it (*C J* 53, 621), and also the lowering of f.p. of $\text{C}_2\text{H}_5\text{Cl}$ and CHCl_3 by the peroxide (*C J* 57, 590), both results tend to show that the mol w of the liquid compound is N_2O_4 .

Formation—1 By passing electric sparks through a mixture of O and N—2 By bringing NO into contact with excess of air or O—3 By heating $\text{Pb}(\text{NO}_3)_2$ —4 By the action of $\text{AgNO}_3 + \text{NO}_2\text{Cl}$ (Exner, *C C* 1872 278), but the existence of NO_2Cl is denied by Williams (*C J* 49, 226).—5 According to Hasenbach (*J pr* [2] 4, 1), by passing O into the liquid obtained by heating starch with HNO_3Aq and condensing, but the observations of Ramsay & Cundall (*C J* 47, 187) show that O very slowly, if at all, combines

with N_2O_4 —6 By the reaction between NOCl and KNO_3 (Girard & Pabst, *Bl* [2] 30, 351).

Preparation—1 A mixture of dry NO and about an equal volume of dry O is passed over dry KOH, and then into a vessel cooled to -20° , solid N_2O_4 is thus obtained (Péligot, *A* 9, 259, 39, 327, cf Dulong, *G A* 58, 53, a Lunge, *C J* 47, 465)—2 Dry powdered $\text{Pb}(\text{NO}_3)_2$ is heated in a tube of hard glass, and the gas is passed into a U tube cooled to c -8° , a stream of dry O is passed through the liquid in the U tube for some time (Péligot, *lc*, Thorpe, *C J* 87, 224)—3 By very gently heating As_2O_3 with HNO_3Aq SG 15 and a little conc H_2SO_4 , and passing O into the liquid thus obtained (cf Ramsay & Cundall, *C J* 47, 187, with Lunge, *B* 11, 1641)—4 By distilling fuming HNO_3 at a low temperature, and fractionating the distillate in a stream of dry O (Fritzsche, *J pr* 22, 21) Setliff (*C C* 1888 461) has determined the yields of NO_2 obtained by the various processes.

Properties—At temperatures below -10° a white, crystalline (? prismatic), deliquescent solid, between -10° and 21.6° a liquid, which is nearly colourless at -9° , yellow at 0° , and orange at 21° , at temperatures above 21.6° , a gas, the colour of which deepens from orange yellow to nearly black as temperature rises. At c 180° – 200° decomposition to NO + O begins and is complete at c 620° (Richardson, *C J* 51, 397, cf Reactions, No 1). The colourless liquid is N_2O_4 , as this dissociates into NO_2 , the colour becomes deeper and deeper red (*v* Salet, *C R* 67, 488, also *v supra*). The gaseous compound at ordinary temperatures is a mixture of NO_2 and N_2O_4 , this gas is reddish brown, has a pungent odour, is irrespirable, and stains the skin yellow. NO_2 dissolves in cold water, forming HNO_3Aq and HNO_2Aq , it is dissolved, apparently without change, by CHCl_3 , $\text{C}_2\text{H}_5\text{Cl}$, CS_2 (Friedburg, *C N* 47, 52), and $\text{C}_2\text{H}_5\text{NO}_2$. As solution of NO_2 in HNO_3 does not show the absorption-lines of gaseous and liquid N_2O_4 , it is probable that the solution in HNO_3 contains a compound or compounds of the two substances (Gernez, *C R* 74, 465). NO_2 probably combines with NO at low temperatures to form N_2O_3 (cf Combinations, No 1).

NO_2 is an acidic oxide, inasmuch as it reacts with H_2O to form HNO_3Aq and HNO_2Aq , because of this reaction it may be looked on as nitro-nitric anhydride, or perhaps better (as there is no nitroso nitric acid) as a mixed anhydride. There are no salts corresponding with NO_2 . Numerous nitro compounds are known, obtained by substituting the monovalent radicle NO_2 for H.

Reactions—1 Heat dissociates N_2O_4 to 2NO_2 (*v* beginning of this article). At c 180° a 755 mm decomposition to NO + O begins, at c 400° about 33 p.c. of the NO_2 is decomposed, at c 500° 60 p.c. is decomposed, and at c 620° the change is complete, on cooling, the NO + O recombine to form NO (Richardson, *C J* 51, 397)—2 Electric sparks are said to decompose NO_2 to N and O, according to Richardson (*C J* 51, 402) a very small quantity of a white solid is produced—3 NO_2 dissolves in water, added to a little ice-cold H_2O a green solution is obtained, which becomes blue on dilution, and then colour-

less, the solution gives the reactions of HNO_3 and HNO_2 . On warming NO_2Aq , or on adding NO_2 to hot water, NO is evolved and HNO_2Aq remains ($3\text{NO}_2 + \text{H}_2\text{O} + \text{Aq} = 2\text{HNO}_2\text{Aq} + \text{NO}$). The cold colourless solution of NO_2 in water may be raised to the boiling-point without a complete decomposition of the HNO_2Aq to HNO_3Aq and NO , addition of Pt wire or powdered glass, &c., causes decomposition of NO_2Aq with evolution of NO . NO_2Aq decomposes HIAq and iodides in solution with separation of I , it also deoxidises KMnO_4Aq —4 With aqueous solution of an alkali NO_2 produces a nitrite and a nitrate—5 Sulphuric acid in solution absorbs NO_2 , evolving NH_3 , and depositing S —6 NO_2 passed into conc sulphuric acid forms HNO_3 and nitrosyl sulphate (lead chamber crystals, SO_2OHONO) (*v* Lunge, *D P J* 233, 65)—7 NO_2 dissolves in very conc nitric acid, forming a yellow liquid, which is probably not merely a solution of NO_2 in HNO_3 , inasmuch as it does not show the absorption-lines of gaseous or liquid N_2O_4 , whereas a solution in CS_2 does show these lines (*v* Gernez, *C R* 74, 465)—8 NO_2 reacts with many carbon compounds replacing H by NO_2 , with alcoholic iodides it usually produces nitrates of the alcoholic radicle, e.g. $\text{C}_2\text{H}_5\text{I} + \text{N}_2\text{O}_4 = \text{C}_2\text{H}_5\text{NO}_2 + \text{NO} + \text{I}$ —9 With cold boron chloride, crystals BCl_2NOCl are formed (Geuther, *J pr* [2] 8, 854)—10 Carbon monoxide is said to be partly oxidised to CO_2 , while part of the CO combines with NO_2 —11 When NO_2 is mixed with hydrogen, and the mixed gases are passed over spongy Pt, H_2O and NH_3 are formed—12 Ordinary combustibles are extinguished in NO_2 , but strongly burning phosphorus and carbon continue to burn—13 Many metals decompose NO_2 , forming oxides and N , Fe , Cu , &c., at a red heat, K and Na at the ordinary temperature—14 Liquid N_2O_4 reacts with mercury to form HgNO_2 and NO without any nitrite, the equation $2\text{N}_2\text{O}_4 + 2\text{Hg} = 2\text{HgNO}_2 + 2\text{NO}$ is almost realised quantitatively (Divers a Shimidzu, *C J* 47, 630) With silver, liquid N_2O_4 forms AgNO_3 , copper probably forms $\text{Cu}_2(\text{NO}_3)_2$ (*D a S*, 1c)—15 Liquid N_2O_4 reacts with liquid sulphur dioxide to form $(\text{NO}_2)_2\text{S}_2\text{O}_4$ (De la Provostaye, *A Ch* [3] 73, 362)—16 With sulphuric anhydride, NO_2 gas forms $\text{NO}_2\cdot\text{S}_2\text{O}_4$, O NO_2 (Weber, *P* 123, 337)

Combinations—1 With nitric oxide, at low temperatures, to form a blue liquid which is chiefly N_2O_3 (Dulong, *A Ch* 2, 317, Peligot, *A* 39, 327, Ramsay, *C J* 57, 590, Richardson, *C J* 51, 397) Ramsay a Cundall (*C J* 47, 672) found that no contraction occurs when dry NO_2 and NO are mixed at the ordinary temperature. According to Hasenbach (*J pr* [2] 4, 1), N_2O_3 is formed by passing NO and NO_2 through a hot tube, and then into a well-cooled receiver—2 With chlorine, and bromine, to form NO_2Cl and NO_2Br , respectively (Gay-Lussac, *A Ch* [3] 23, 203, Landolt, *A* 116, 177, but denied by Williams, *C J* 49, 226)—3 With antimony chloride, to form $8\text{SbCl}_3\cdot\text{N}_2\text{O}_4$, obtained by heating in a sealed tube at 100° (Besson, *C R* 108, 1012)—4 NO_2 also combines with the chlorides of aluminium, antimony (SbCl_3), bismuth, and iron, the compounds are decomposed by water, and also by a gentle heat (*B*, 1c)—5 With phosphorus pentfluoride, to form crystals of $\text{NO}_2\cdot\text{PF}_5$, very

easily decomposed (Tassel, *C R* 110, 1264)—6 With magnesium hydrogen phosphate, to form $2\text{MgHPO}_4\cdot\text{NO}_2$ (Luck, *Fr* 1874 255)—7 With amylene (and some other hydrocarbons) to form $\text{C}_6\text{H}_{10}(\text{NO}_2)_2$

Constitution of N_2O_4 —From the reactions of liquid N_2O_4 with Hg and Ag , whereby HgNO_3 , or AgNO_3 , and NO are produced, Divers a Shimidzu conclude that N_2O_4 is best represented as NO NO_2 (*C J* 47, 630) This formula is in keeping with the reaction $\text{AgO NO} + \text{NO}_2\text{Cl} = \text{AgCl} + \text{NO ONO}_2$ (Exner, *C C* 1872, 273), this argument, however, assumes AgNO_2 to have the structure AgO NO (*v Nitrites*, p 567), it also assumes the existence of NO_2Cl The formation of nitrosyl sulphate by the reaction of N_2O_4 with H_2SO_4 is also in keeping with the formula NO NO_2 , $\text{NO NO}_2 + \text{H}_2\text{SO}_4 = \text{NO HSO}_4 + \text{HNO}_3$ Also, if nitrous acid is assumed to be HO NO , then the formation of this acid and HNO_2 by the reaction of N_2O_4 with water points to the formula NO ONO_2 ($\text{NO ONO}_2 + \text{H}_2\text{O} = \text{NO OH} + \text{HO NO}_2$) The formation of diazo benzene nitrate by the reaction of N_2O_4 with amido benzene is in keeping with the formula NO ONO_2 , thus $\text{C}_6\text{H}_5\text{NH}_2 + \text{NO ONO}_2 = \text{NO ON N C}_6\text{H}_5 + \text{H}_2\text{O}$ The formation of $\text{C}_6\text{H}_5\text{ONO}_2$ by the reaction of N_2O_4 with $\text{C}_6\text{H}_5\text{I}$ is best expressed by writing N_2O_4 as NO ONO_2 , ($\text{C}_6\text{H}_5\text{I} + \text{NO ONO}_2 = \text{C}_6\text{H}_5\text{ONO}_2 + \text{I} + \text{NO}$) The fact that $\text{C}_6\text{H}_{10}(\text{NO}_2)_2$, when reduced by Sn and HClAq yields NH_4Cl and not an NH_2 compound, induced V Meyer (*A* 171, 5) to assign to N_2O_4 the formula NO_2NO_2 and to write $\text{C}_6\text{H}_5(\text{NO}_2)_2$ as $\text{C}_6\text{H}_5(\text{ONO}_2)_2$, because had the C been in direct union with N , an NH_2 compound would have been formed on reduction N_2O_4 is dissociated by heat to 2NO_2 , this reaction seems to point to the constitution $\text{O}_2\text{N NO}_2$ or perhaps to $\text{NO O}_2\text{NO}$ Whichever formula is adopted, the reactions of N_2O_4 make it evident that some substances separate the group NO_2 , and others the group ONO , and that the way in which the molecule N_2O_4 splits up depends largely on the conditions of the reaction

NITROGEN PENTOXIDE N_2O_5 (*Nitric anhydride*) Mol w uncertain, as compound has not been gasified

Formation—1 By passing Cl over AgNO_3 ($2\text{AgNO}_3 + \text{Cl}_2 = 2\text{AgCl} + \text{N}_2\text{O}_5 + \text{O}$)—2 By dehydrating conc HNO_3 by P_2O_5 ($2\text{HNO}_3 + \text{P}_2\text{O}_5 = 2\text{HPO}_3 + \text{N}_2\text{O}_5$)—3 By the reaction of NO_2Cl on AgNO_3 at 60° – 70° ($\text{AgNO}_3 + \text{NO}_2\text{Cl} = \text{AgCl} + \text{N}_2\text{O}_5$, Odet a Vignon, *C R* 69, 1142, 70, 96, but the existence of NO_2Cl is very doubtful, *v* Williams, *C J* 49, 226)

Preparation—1 Perfectly dry AgNO_3 is placed in a dry U tube, which is connected by a glass tube, without corks or caoutchouc, with another dry U tube having a small reservoir at the bottom, the U tube containing AgNO_3 is immersed in a water bath, and the other U tube is surrounded by ice and salt, a very slow stream of dry CO_2 is passed through the apparatus, the AgNO_3 being kept at c 180° (to expel every trace of moisture), a very slow stream of dry Cl is then passed from a gasholder (the Cl being stored over conc H_2SO_4 and driven out by the inlet of H_2SO_4), the AgNO_3 being heated to 95° , and the temperature then lowered to 58° – 68° . After a time crystals of N_2O_5 appear

in the cooled U tube, while a little liquid (N_2O_4 or N_2O_5) collects in the small reservoir. Not more than 3 to 4 litres Cl should pass in 24 hours. To transfer the N_2O_4 to another vessel, the Cl is replaced by a current of dry CO_2 , the U tube is connected by a glass tube with the vessel, which is immersed in a freezing mixture, the U tube is removed from its freezing mixture, and the N_2O_4 is poured into the vessel (Deville, *A Ch* [3] 28, 241). — 2 Very conc HNO_3 is surrounded by ice and salt, rather more P_2O_5 than the wt of HNO_3 is added little by little, so that the temperature does not rise above 0° , the thick mass is brought into a wide retort and distilled at as low a temperature and as slowly as possible, the retort being cooled if the liquid froths, pure N_2O_4 condenses in the cooled receiver, but towards the end of the reaction liquid $2N_2O_5 \cdot H_2O$ is formed (Berthelot, *Bl* [2] 21, 53, a modification of the process given by Weber, *J pr* [2] 6, 342). About 80 grams N_2O_4 are obtained from 150 gr HNO_3 .

Properties and Reactions—Very lustrous, translucent, rhombic prisms, melts at 30° , with partial decomposition to N_2O_4 and O , and boils between 45° and 50° . N_2O_4 should be kept in stoppered bottles over H_2SO_4 . At $c 15^\circ$ the crystals become yellowish, but are colourless when kept in a freezing mixture (Weber, *lc*). $SG c 1.64$. $H F [N_2O_4] = -31,600$ (Berthelot, *A Ch* [5] 6, 145), $[N_2O_4, Aq] = 29,820$ (*Th* 2, 199), N_2O_4 decomposes slowly when kept, rapidly in sunlight, giving N_2O_4 and O (Berthelot, *Bl* [2] 21, 53). Burning P burns brightly in slightly warmed N_2O_4 , C burns in the vapour of N_2O_4 , but not in the solid or liquid compound, K burns brightly, but most of the metals are without action on N_2O_4 , with S there is formed $(NO)_2S_2O_8$ (Weber, *lc*). N_2O_4 reacts with water to form HNO_3 . With conc HNO_3 , it produces $H_2N_2O_{11}$ ($= 2N_2O_4 \cdot H_2O$, or $N_2O_4 \cdot 2HNO_3$), *v Dinitric acid*, under Nitric acid, p 520. The reactions of N_2O_4 point to the constitution $NO_2 \cdot O \cdot NO_2$.

PERNITRIC OXIDE NO_3 or N_2O_5 . According to Hautefeuille a Chappuis (*C R* 92, 80, 134, 94, 1111, 1306), a very unstable compound of this composition is obtained by the action of the silent electric discharge on a mixture of N and O at a low temperature. When a certain quantity is formed, the substance begins to decompose to NO_2 and O . Berthelot (*Bl* [2] 35, 227) says that the compound is obtained by the action of the induction discharge on a mixture of O and NO_2 . The compound is described as a liquid which does not solidify in a freezing mixture of ice and salt, and is extremely unstable, decomposing to NO_2 and O .

Nitrogen, oxyacids. The only oxyacids of N which have been isolated are nitric (HNO_3) and dinitric ($H_2N_2O_{11}$), nitrous acid (HNO_2) and hyponitrous acid ($H_2N_2O_4$) are known in aqueous solution. Nitric and dinitric acids are described under the heading Nitric acid (p 517). The present article contains descriptions of nitrous and hyponitrous acids and their salts.

Nitrous acid and Nitrites, HNO_2 and MNO_2 . Nitrites are usually, if not always, accompanied by nitrates in nature. Nitrites are present in the atmosphere, Warington (*C J* 39, 229) has shown that when distilled water is exposed to the air it soon gives the reactions of

nitrites. Small quantities of nitrites are present in many river and well waters (v Warington, *C J* 55, 537, Munro, *C J* 49, 632). The juices of many plants contain nitrites (Genadius, *Am Ch* 5, 7). Nitrites are sometimes, but not generally, found in saliva (Wurster, *B* 22, 1901). Nitrites are formed in the soil by oxidation of various nitrogenous compounds (v NITRIFICATION, p 521). $NaNO_2$ is formed by exposing Pt black to air and $NaOHAq$ (Loew, *B* 23, 1443). NH_4NO_2 is produced by passing O and air over Pt black at 180° – 300° (Ilosva, *Bl* [3] 2, 734). NH_4NO_2 is also produced by burning H in air (Struve, *J* 1870 199, 209, Schönbein, *J* 1862 94, Zöller a Grete, *B* 10, 2145), and also during the slow combustion in air of P or ether (Berthelot, *A Ch* [5] 12, 440, *C R* 108, 543, Kolbe, *A* 119, 176, Ilosva, *Bl* [8] 2, 734). It was formerly stated that NH_4NO_2 is formed by the direct union of N and H_2O (by evaporating H_2O in air), but this has been disproved (Carus, *A* 174, 31, Weith a Weber, *B* 7, 1745). Berthelot, however, asserts that NH_4NO_2 is produced by subjecting H_2O and pure N to the action of a very powerful induction coil (*Bl* [2] 27, 338). NH_4NO_2 is also formed by the oxidation of NH_3 by ozone (Carus, *lc*, Goppelsröder, *J pr* [2] 4, 139, 338). Fe nitrite is said to be formed by passing air over reduced Fe at 190° – 250° (Ilosva, *Bl* [3] 2, 734). Alkali nitrites are formed, along with nitrates, by the reaction of N_2O_4 on alkali solutions (v Nitrogen trioxide, *Reactions*, No 2, p 564). Nitrous acid, along with HNO_3 , is produced by the action of cold water on N_2O_5 (v Nitrogen trioxide, *Reactions*, No 1, p 564). Nitrites are also formed by the reduction of nitrates, *eg* by heating KNO_3 , O is evolved and KNO_2 remains, or by the action of amalgamated Zn on KNO_3 , Aq , KNO_2 , Aq is produced.

The normal nitrites have the composition MNO_2 and $M'(NO_2)_2$, several basic nitrites are known. Most of the normal nitrites are soluble in water and alcohol, $AgNO_2$ is one of the least soluble nitrites, from it most of the other nitrites may be obtained. Nitrites are decomposed by heat, evolving NO or NO_2 , and leaving metallic oxide or metal, solutions of nitrites are decomposed by boiling, generally with evolution of NO and formation of nitrates. Nitrites in solution are decomposed by dilute H_2SO_4 , giving HNO_2 , which soon decomposes to HNO , Aq and NO . Acidulated solutions of nitrites reduce $KMnO_4$, Aq , KCr_2O_7 , Aq , H_2SAq , &c., they ppt Au from $AuCl_3$, Aq , and Hg from mercurous solutions. These solutions decompose $KIAq$ with separation of I , and give a brown colour with $FeSO_4$, these reactions serve to distinguish nitrites from nitrates. (For details regarding the detection and estimation of nitrites, a manual of analysis must be consulted.) Nitrites may be regarded either as $MO \cdot NO$ or as MNO_2 , Divers (*C J* 47, 226) endeavours to show that the second view is preferable.

Nitrous acid HNO_2 . This acid is known only in aqueous solution, and it is doubtful whether HNO_2 , Aq has been obtained free from HNO_3 , Aq . Frey (*C R* 79, 61) says that a solution of N_2O_4 in a considerable quantity of cold water may be kept for some days without change, and that on boiling NO and N_2O_4 are

evolved. The solution very probably contains HNO_2 , but whether it is free from HNO_3 or not is undecided. This solution acts as a strong reducer. Thomson gives the thermal data $[\text{N}_2^0, \text{O}^0, \text{Aq}] = -6,820$, $[\text{H}_2\text{N}_2\text{O}^0, \text{Aq}] = 80,770$, $[\text{2NO}, \text{O}^0, \text{Aq}] = 86,880$, $[\text{H}_2\text{NO}, \text{O}^0, \text{Aq}] = 52,845$ (*Th* 2, 199).

Nitrites MNO_2 , and $\text{M}^{\text{IV}}(\text{NO}_2)_2$, also basic salts, $x\text{MO} \cdot y\text{N}_2\text{O}_5$, and $x\text{M}_2\text{O}_3 \cdot y\text{N}_2\text{O}_5$. The nitrites have been examined chiefly by Fischer (*P* 74, 116), Lenz (*P* 118, 282), Hampe (*A* 125, 295), Stromeyer (*A* 96, 230), Lang (*J* pr 86, 299).

Ammonium nitrite NH_4NO_2 . A crystalline mass, decomposed by heat to N and H_2O (*v* Nitrogen, Preparation, No 2, p 557). Obtained by decomposing NH_4ClAq by AgNO_3Aq . Berthelot (*Bl* [2] 21, 55) says this salt is formed, along with N, by the action of dry NH_3 on NO and O. It was formerly stated that NH_4NO_2 is produced by evaporating water in air free from NH_3 , but this was disproved by Carius (*A* 174, 81) and by Weith & Weber (*B* 7, 1745). According to Berthelot (*Bl* [2] 27, 238) NH_4NO_2 is produced by the action of a powerful induction-coil on a mixture of H_2O and pure N. NH_4NO_2 is also formed by oxidising NH_3Aq by ozone (Carius, *lc*, Goppebröder, *J* pr [2] 4, 139, 383), and also, along with ozone and H_2O_2 , by burning H in air (Struve, *J* 1870 199, 209, Zöllner & Grete, *B* 10, 2145).

Barium nitrite $\text{Ba}(\text{NO}_2)_2 \cdot \text{H}_2\text{O}$ (Fischer)

Cadmium nitrite $\text{Cd}(\text{NO}_2)_2 \cdot \text{H}_2\text{O}$ (Hampe, Lang).

Calcium nitrite $\text{Ca}(\text{NO}_2)_2 \cdot \text{H}_2\text{O}$ (Fischer, Hampe, Lang).

Cobalt nitrite. This salt is not known, but several double salts of $\text{Co}(\text{NO}_2)_2$ have been isolated.

Cobalt-potassium nitrite

$2\text{Co}(\text{NO}_2)_2 \cdot 6\text{KNO}_3 \cdot x\text{H}_2\text{O}$ (x varies from 0 to 1, 3, and 4). Prepared by mixing KNO_3Aq and $\text{Co}(\text{NO}_2)_2\text{Aq}$, or CoCl_2Aq , adding excess of acetic acid, washing the pp with K acetate solution, and then with 80 p c alcohol, and drying below 100° . A bright yellow powder, consisting of small 4 sided prisms, very slightly sol water, insol alcohol or ether. At 200° gives NO_2 , Co_2O_3 , and KNO_2 (Fischer, *P* 67, 245, Saint-Evre, *J* pr 54, 85, 58, 185, Braun, *Fr* 6, 42, 7, 313, Stromeyer, *A* 96, 220, Erdmann, *J* pr 97, 385, Sadtler, *Am S* [2] 49, 189). Various other Co-K nitrites are formed under different conditions of concentration and acidification (*v* especially Sadtler, *lc*). If Ca salts are present a triple nitrite of Co, Ca, and K is ppd (Erdmann, *lc*). A triple nitrite of Co, Pb, and K is described by Stromeyer (*lc*). Erdmann (*lc*) also describes a compound of $\text{Co}(\text{NO}_2)_2$, KNO_2 , and NH_4 .

Cobalt-cassium nitrite

$\text{Co}(\text{NO}_2)_2 \cdot 3\text{CsNO}_2 \cdot \text{H}_2\text{O}$ (Rosenblatt, *B* 19, 2531).

Cobalt-sodium nitrites

$2\text{Co}(\text{NO}_2)_2 \cdot 4\text{NaNO}_2 \cdot \text{H}_2\text{O}$ and $2\text{Co}(\text{NO}_2)_2 \cdot 6\text{NaNO}_2 \cdot \text{H}_2\text{O}$ (Sadtler, *lc*).

Copper nitrites, basic salts (Hampe, van der Meulen, *B* 12, 758).

Lead nitrites. These salts were examined by Prout, Chevreul (*G* 4, 176), and Berzelius (*G* 4, 194, 46, 166). Péligot (*A* 39, 838) revised and classified the work, Bromers (*A* 72, 88), von Lorenz (*W* 4, B [2nd part] 84

1133), and Meissner (*J Z* [2] 3, 26), more recently have examined these salts. The lead nitrites are all basic salts, many seem best looked on as compounds of basic nitrites with basic nitrates. They are obtained by digesting $\text{Pb}(\text{NO}_3)_2\text{Aq}$ with Pb, von Lorenz says that 14 different salts are thus obtained.

Magnesium nitrite $\text{Mg}(\text{NO}_2)_2 \cdot 3\text{H}_2\text{O}$ (Lang); $\text{Mg}(\text{NO}_2)_2 \cdot 2\text{H}_2\text{O}$ (Hampe).

Mercuric nitrite $\text{Hg}(\text{NO}_2)_2 \cdot 2\text{H}_2\text{O}$ (Lang).

Nickel nitrite $\text{Ni}(\text{NO}_2)_2$ (Lang). The double salts, $\text{Ni}(\text{NO}_2)_2 \cdot 4\text{KNO}_3$, $\text{Ni}(\text{NO}_2)_2 \cdot 2\text{KNO}_3 \cdot \text{Ba}(\text{NO}_3)_2$, $\text{Ni}(\text{NO}_2)_2 \cdot \text{Ca}(\text{NO}_3)_2 \cdot 2\text{KNO}_3$ have been isolated (Erdmann, *J* pr 97, 385).

Platino-nitrites *v* PLATINUM, vol 1v.

Potassium nitrite KNO_2 . Colourless, microscopic, prismatic crystals (according to Lang, *J* pr 86, 295, the crystals are $2\text{KNO}_2 \cdot \text{H}_2\text{O}$), very sol water, insol absolute alcohol. KNO_3Aq with H_2SO_4 evolves NO , and forms KNO_3Aq . KNO_2 is prepared by passing into cold KOHAq the gas obtained by heating starch with HNO_3Aq S G 135, evaporating till crystallisation begins, pouring off from the crystals of KNO_2 , adding dilute acetic acid and 2 vols alcohol, separating the lower layer which forms and evaporating it (Fischer). Stahlschmidt (*P* 128, 466) reduces KNO_3Aq by Zn in presence of NH_4Aq . Erdmann (*J* 1866 154) reduces KNO_3 by fusion with Fe, and crystallises from water.

Double salts of KNO with the nitrites Ba, Cd, Ca, Co, Cu, Pb, Mg, Hg, Ni, Pd, Ag, Sr, and Zn are described by Hampe, Lang, and Fischer.

Silver nitrite AgNO_2 . Obtained by adding AgNO_3Aq to the solution produced by passing into KOHAq the gas formed by heating starch with HNO_3Aq S G 135, after neutralising this solution by acetic acid. Small white crystals. Dissolves in 300 pts water at ordinary temperatures, easily in boiling water. The decomposition of AgNO_2 by heat has been examined by Divers & Shimidzu (*C J* 47, 630). Treated with H_2S , AgNO_2 yields Ag_2S , S, NO, NH_3 , and NH_4OH (Divers & Haga, *C J* 51, 48).

Sodium nitrite NaNO_2 . A crystalline salt, prepared similarly to KNO_2 . Liard (*Bl* [2] 27, 434) recommends to fuse NaNO_3 with an equivalent quantity of K_2SO_4 and to extract with alcohol.

Strontium nitrite $\text{Sr}(\text{NO}_2)_2$ (Hampe).

Zinc nitrite $\text{Zn}(\text{NO}_2)_2 \cdot 3\text{H}_2\text{O}$ (Lang, Hampe).

HYPONITROUS ACID and **HYPONITRITES**, $\text{H}_2\text{N}_2\text{O}_3\text{Aq}$ and $\text{M}_2\text{N}_2\text{O}_3$. Hyponitrites were first obtained by Divers in 1871, by reducing nitrates by Na-amalgam (*Pr* 19, 425). The salts were examined by Zorn (*B* 10, 1306, 11, 1630, 2217, 12, 1509, 15, 1007, 1258), van der Plaats (*B* 10, 1507), Menke, (*C J* 38, 401), Berthelot & Oger (*C R* 96, 80, 84). In 1884 Divers and Haga (*C J* 45, 78) showed that the silver salt is AgNO . The investigation has been continued by Divers and Haga (*C J* 47, 364, 55, 760), Dunstan and Dymond (*C J* 51, 646), and Berthelot and Maquenne (*C R* 108, 1286, 1303).

Zorn prepared ethyl hyponitrite and determined its molecular formula (from VD) to be $(\text{C}_2\text{H}_5)_2\text{N}_2\text{O}_3$, hence the formula for the salts is better written $\text{M}_2\text{N}_2\text{O}_3$ than MNO .

Hyponitrites are produced (1) by reducing

nitrate or nitrite in solution by Na amalgam (Divers), (2) by electrolyzing nitrite solution, using Hg as negative electrode (Zorn, Divers a Haga), (3) by the reaction of $\text{Fe}(\text{OH})_2$ on alkaline nitrite solution, or on NO in presence of alkali (Zorn, Dunstan a Dymond), (4) by decomposing oxysulphates [salts of $\text{NH}(\text{SO}_3\text{H})\text{OH}$] by alkali (Divers)

Silver hyponitrite $\text{Ag}_2\text{N}_2\text{O}_2$ (*Nitrosyl silver*)

Preparation—1 Na amalgam is added to KNO_3Aq in the ratio $\text{KNO}_3, 4\text{Na}$, the liquid being kept cold. When evolution of gas ceases the solution is neutralised by acetic acid, and AgNO_3 is added, the pp is washed in the dark with cold water, dissolved in cold dilute HNO_3Aq , and reprecipitated by $\text{Na}_2\text{CO}_3\text{Aq}$, the pp is thoroughly washed in the dark and dried *in vacuo* over H_2SO_4 (Divers, *Pr* 19, 425, D a Haga, *C J* 45, 78)—2 Zorn (*B* 12, 1509) reduces $\text{Ba}(\text{NO}_3)_2$ by Na amalgam, and pptd by AgNO_3Aq , the pp of $\text{Ag}_2\text{N}_2\text{O}_2$ thus obtained is pure. The $\text{Ba}(\text{NO}_3)_2$ is obtained by boiling $\text{Ba}(\text{NO}_3)_2\text{Aq}$ with Pb, prepared by ppg dilute Pb acetate solution by Zn, the boiling is continued till all the Pb is changed to PbO , the PbO in solution is removed by CO_2 , and the last traces by H_2S , the filtrate is evaporated to a thick oil, which cools to a mass of $\text{Ba}(\text{NO}_3)_2$, the salt is obtained pure by crystallising from 80 p.c. alcohol. For preparing large quantities of $\text{Ag}_2\text{N}_2\text{O}_2$, Zorn (*l.c.*) places the Na amalgam, in large pieces, in the middle bulb of a Kipp's apparatus, the $\text{Ba}(\text{NO}_3)_2\text{Aq}$ being in the lower bulb, and the upper half fills with distilled water. By regulating the stopcocks so that a slow stream of gas escapes, the reduction proceeds satisfactorily—3 Pure FeSO_4Aq is mixed with enough milk of lime to ppt the Fe as $\text{Fe}(\text{OH})_2$, NaNO_3Aq is added (1 part NaNO_3 to 10 parts FeSO_4), and the apparatus is kept cold. When the reaction is finished the solution is pptd by AgNO_3Aq (Zorn, *B* 15, 1258, cf Dunstan a Dymond, *C J* 51, 646)

Properties and Reactions— $\text{Ag}_2\text{N}_2\text{O}_2$ is a yellowish amorphous salt. By standing in NH_3Aq over H_2SO_4 , it is obtained in small crystals (Zorn). The salt is not hygroscopic, insoluble, may be kept in boiling water without decomposition, is decomposed at c. 100° , probably giving AgNO_3 , when quickly heated to c. 150° , $\text{Ag}_2\text{N}_2\text{O}_2$ explodes, evolving brown vapours. $\text{Ag}_2\text{N}_2\text{O}_2$ dissolves in HNO_3Aq and $\text{H}_2\text{SO}_4\text{Aq}$, it is pptd by NH_3Aq or $\text{Na}_2\text{CO}_3\text{Aq}$. Unacted on by CO_2 . Decomposed by NaOHAq at c. 70° . Decomposed by $\text{H}_2\text{PO}_4\text{Aq}$, H_2S , or boiling $\text{H}_2\text{C}_2\text{H}_3\text{O}_2\text{Aq}$, with production of $\text{H}_2\text{N}_2\text{O}_2\text{Aq}$. $\text{Ag}_2\text{N}_2\text{O}_2$ reacts with $\text{C}_2\text{H}_5\text{I}$ to form $(\text{C}_2\text{H}_5)_2\text{N}_2\text{O}_2$ (Zorn, *B* 11, 1630), the formula of which compound is molecular, as its V.D. has been determined.

Barium hyponitrite BaN_2O_4 is described by Zorn (*B* 15, 1007)

Calcium and Strontium hyponitrites

$\text{CaN}_2\text{O}_4 \cdot 4\text{H}_2\text{O}$ and $\text{SrN}_2\text{O}_4 \cdot 5\text{H}_2\text{O}$ are described by Maquenne (*C R* 108, 1808)

Hyponitrous acid $\text{H}_2\text{N}_2\text{O}_2\text{Aq}$ Known only in solution. Moist $\text{Ag}_2\text{N}_2\text{O}_2$ is suspended in water, such a quantity of dilute HClAq is added that a little $\text{Ag}_2\text{N}_2\text{O}_2$ remains unchanged, and the liquid is filtered from AgCl (van der Plaats, *B* 10, 1507). $\text{H}_2\text{N}_2\text{O}_2\text{Aq}$ is an acid liquid, fairly stable, may be boiled with HNO_3Aq or

$\text{H}_2\text{C}_2\text{H}_3\text{O}_2\text{Aq}$ without decomposition, reduces KMnO_4Aq , and separates I from KIAq . The solution slowly decomposes, and after a few weeks not a trace of $\text{H}_2\text{N}_2\text{O}_2$ remains. The liquid thus obtained is neutral, probably N_2O and H_2O are formed. It was proved by van der Plaats (*l.c.*) that conc. H_2SO_4 evolves N_2O from $\text{H}_2\text{N}_2\text{O}_2\text{Aq}$.

Constitution of hyponitrites—The compound $(\text{C}_2\text{H}_5)_2\text{N}_2\text{O}_2$ reacts not as an ethereal salt but as a diazo compound, with reducers it evolves N and forms $\text{C}_2\text{H}_5\text{OH}$, water produces $\text{C}_2\text{H}_5\text{OH}$, CH_3CHO , and N. The constitution of this compound is $\text{C}_2\text{H}_5\text{O} \cdot \text{N} \cdot \text{N} \cdot \text{O} \cdot \text{C}_2\text{H}_5$, and hence the constitution of the acid is probably $\text{HO} \cdot \text{N} \cdot \text{N} \cdot \text{OH}$ (Zorn, *B* 11, 1630). This formula is confirmed by the production of hyponitrites, along with sulphates, by the action of KOHAq on $\text{NH}(\text{SO}_3\text{K})\text{OH}$. This reaction shows that the O in hyponitrites is in direct union both with N and H (Divers a Haga, *C J* 55, 760)

Nitrogen, oxybromide of, NOBr (*Nitrosyl bromide*) Mol. w. not determined directly, probably = 109.72, from analogy with NOCl . A very dark brown liquid. Obtained by passing NO into Br at -7° to -15° (Landolt, *A* 116, 177), also by distilling nitrosyl sulphate (NOHSO_4) with KBr (Girard a Pabst, *Bl* [2] 30, 531). Landolt gives b.p. as -2° , Girard a Pabst as 19° . Easily decomposed to NO and Br by heat. With cold water forms HBrAq and HNO_3Aq , with KOHAq forms KBrAq and KNO_3Aq .

Nitryl tribromide Landolt (*A* 116, 117) supposed that a compound NOBr_3 is obtained (along with NOBr) by passing Br into well-cooled Br. That the amount of NO absorbed by Br, at c. 15° , is nearly independent of pressure, and corresponds approximately with the quantity required to form NOBr_3 , was shown by Pattison Muir (*C J* 28, 844). The experiments of Frohlich (*A* 224, 270), and of Roozeboom (*R T C* 4, 381) have shown that the so called nitryl tribromide is probably only a mixture of NOBr and Br.

Nitrogen, oxychlorides of The compound NOCl has been isolated, the existence of NO_2Cl is very doubtful, according to Hautefeuille a Ohappuis (*A Ch* [6] 2, 282), a compound $\text{N}_2\text{Cl}_2\text{O}_2$ is formed by passing N with O and Cl through an induction apparatus. The non existence of NOCl_2 , said by Gay Lussac to be produced by the reaction of conc. HClAq with HNO_3 (*A Ch* [3] 23, 203), has been proved by Tilden (*C J* 27, 639), and this has been confirmed by Goldschmidt (*A* 205, 372).

NITROSYL CHLORIDE NOCl (*Chloronitrous gas*) Mol. w. 65.34 V.D. 33 at c. 15° to 700° (Sudborough a Millar, *C J* 59, 78) S.G. at -18° 1.433, at -12° 1.4165 (Geuther, *A* 245, 97, Tilden, *C J* 27, 630). Boils at c. -8° (Tilden). An orange red gas, liquefied by passing through a U tube cooled by ice and salt, the liquid is reddish yellow. Dissociation into NO and Cl begins at c. 780° , at 985° about 42 p.c. is dissociated (S a M, *l.c.*) For absorption spectrum v. Magnanini (*Z P C* 4, 427). Formed by combination of NO with Cl (Gay-Lussac, *A Ch* [3] 23, 203), by the reaction of PCl_3 , PCl_5 , or AsCl_3 , with NO, or N_2O , and by the reaction of POCl_3 with KNO . (Naquet, *J* 1860 102), by passing

HCl into N_2O_4 at a low temperature by heating conc HClAq and HNO_3 , and by heating NO H SO₄ with NaCl

$NOCl$ is more readily prepared by warming HNO_3 Aq SG 1.42 with c 4 vols HClAq SG 1.16, passing the gases over $CaCl_2$ and then into conc H_2SO_4 until the acid is saturated, then adding perfectly dry NaCl, and heating gently (Tilden, *C J* 27, 630, cf Girard a Pabst, *Bl* [2] 80, 631)

$NOCl$ reacts with H_2O to form HClAq and HNO_3 Aq, with KOHAq it produces KClAq and KNO_3 Aq, Hg decomposes it, forming NO and $HgCl_2$, it dissolves Au and Pt more slowly (Tilden, *lc*) With conc H_2SO_4 , nitrosyl sulphate ($NOHSO_4$) is formed (Tilden) $NOCl$ reacts energetically with SO_2 to produce NO_2 , SO_2 , Cl (Weber, *P* 123, 333) Forms double compounds with many metallic chlorides, e.g. $AlCl_3$, $SbCl_3$ (v Sudborough, *C J* 59, 655)

NITRYL CHLORIDE NO_2Cl A compound with this composition was supposed to be formed by the reaction of $POCl_3$ with $AgNO_3$ or $Pb(NO_3)_2$, also by passing a very slow stream of Cl over $AgNO_3$ at c 95° (Odet a Vignon, *C R* 69, 1142, 70, 96), Hasenbach obtained a liquid which he took to be NO_2Cl by passing Cl and NO_2 through a hot tube and cooling the issuing gases (*J pr.* [2] 4, 1), Williamson (*Pr* 7, 16) poured SO_2 , OH Cl on to KNO_3 , and obtained a gas which formed HNO_3 Aq and HClAq with cold water, and was supposed by W to be NO_2Cl , Muller (*A* 122, 1) supposed that NO_2Cl was formed by the reaction of NO_2 with PCl_5 , and Schiff thought he had obtained the compound as a product of the reaction of HNO_3 with PCl_5 , Meissner (*J Z* 10, 27) failed to obtain any NO_2Cl by the processes used by Odet a Vignon, Schiff, Muller, and Williamson Geuther (*A* 245, 96) could not form NO_2Cl by the reaction of PCl_5 with HNO_3 , NO_2 , or a nitrate Williams (*C J* 49, 222) showed that NO_2Cl is not produced by the reaction (1) of $POCl_3$ with $Pb(NO_3)_2$, (2) of $POCl_3$ with HNO_3 , (3) of SO_2 , OH Cl with KNO_3 , (4) of SO_2 , Cl_2 with KNO_3 , he also established a very large probability in favour of the conclusion that the products of the reaction of NO_2 with Cl , at different temperatures, are $NOCl$, and N_2O , holding more or less Cl in solution

Nitrogen, phosphide of, v PHOSPHORUS NITRIDE

Nitrogen, phosphochloride of, $N_3P_2Cl_4$ (*Phosphorus chloronitride Nitrogen chlorophosphide Phosphorus nitrogen chloride*) Mol. w 847.13 V D 176.7 (Gladstone a Holmes, *C J* 17, 225, Wichelhaus, *B* 3, 163) SG 1.98 (G a H) Melts at c 110° (G a H), at 114° (W); boils at 240° (G a H), at 250° – 260° (W) Crystallises in trimetric forms, a b c = 4417.1 1.8165 (Groth, *B* 3, 166), c/a = 109.9. (G a H)

Formation—By heating PCl_5 with NH_4Cl , NH_3 , or NH_2HgCl

Preparation—1 PCl_5 is saturated with dry NH_3 , the product is distilled with water, and the crystals which form on the sides of the receiver are washed, dried, and recrystallised from hot ether (Wöhler a Liebig, *A* 11, 146)—2 A mixture of 1 pt. PCl_5 and 2 pts. NH_4Cl is heated in

a flask connected with a reversed condenser; the mass gets red, then brown, and the $N_3P_2Cl_4$ sublimes, the compound is dissolved out in ether and crystallised, or is blown over in steam (Gladstone, *C J* 3, 185, modified by Coultbridge, *C J* 53, 398) The yield is not more than 10 p c of the PCl_5 used—3 An intimate mixture of white pp (NH_2HgCl) and PCl_5 is gently heated in a flask, the product is treated with water, which dissolves out $HgCl_2$ and NH_4Cl , the residue is dried and the $N_3P_2Cl_4$ is dissolved out (from PCl_5 , N_2H_4) by ether (Gladstone a Holmes, *C J* 17, 225)

Properties—Hard, lustrous, trimetric, crystals, sol alcohol, ether, or $CHCl_3$, insoluble in water, but slowly decomposed (G a H, W) Gives off white fumes when heated in air, may be sublimed in H or H_2S Solution in alcohol slowly decomposes, also that in ether if a trace of water is present (even in absence of water, according to Wichelhaus) Is not acted on by I (G), nor by hot H_2SO_4 Aq, HClAq, or HNO_3 Aq (Wöhler a Liebig), decomposed by hot fuming HNO_3 (G)

Reactions—1 Water forms pyrophosphoric acid ($P_2N_2H_6O_8$) and HCl, according to G a H, but W says the products are many and complicated—2 Ammonia or potash decomposes $N_3P_2Cl_4$ in alcoholic solution, the reaction being similar to that of water (G a H)—3 Ammonia gas passed over melted $N_3P_2Cl_4$ forms phospham $nPN(NH_2)$, and HCl (Coultbridge, *C J* 53, 398)—4 Heated with *aniline*, $P_2N_2(NHCH_2)_4$ is formed (Hofmann, *B* 17, 1909, Coultbridge, *lc*), *ortho toluidine*, and *phenylhydrazine* produce similar reactions (G, *lc*)—5 Nascent hydrogen forms PH_3 (W, *lc*)—6 Heated with copper oxide, NO_2 and N are evolved—7 Passed over red hot iron, N is evolved and $FeCl_3$ and Fe phosphide remain (W a L)

Nitrogen, selenide of ($?NSe$) Espenschied (*A* 113, 101) passed NH_3 , diluted with H, over well cooled $SeCl_4$, shook the product with water, and washed the ppd mixture of Se and N selenide with CS_2 (to extract Se), he thus obtained an orange-yellow powder, which was extremely explosive and very dangerous to handle Analyses pointed to the formula NSe , but E supposed that the substance probably contained H besides N and Se For details of preparation and properties v Espenschied (*lc*)

Nitrogen, silicide of, v SILICON NITRIDE, in vol iv

Nitrogen, sulphide of, nNS Mol w unknown SG 2.1166 at 15° (Michaëlis, *Z* [2] 6, 460), 2.22 at 15° (Berthelot, *A Ch* [5] 27, 202) Sublimes at 135° , melts at 158° , and decomposes with slight explosions at 160° (M, *lc*, at 207° according to B, *lc*) Berthelot (*lc*) gives $[N,S] = -31,900$ N sulphide was prepared, but not pure, by Soubeiran (*A Ch* [2] 67, 71), Fordos and Gélis obtained it approximately pure (*A Ch* [3] 32, 385), it has been examined further by Michaëlis (*Z* [2] 6, 460), and Demarcay (*C R* 91, 854, 1066, 92, 726) N sulphide easily explodes when rubbed or struck with a hammer

Preparation—1 SO_2 or S_2Cl_2 is dissolved in 8–10 vols CS_2 , and dry NH_3 is passed in, the liquid darkens in colour, and a cochineal red pp is produced, which dissolves after a time and a

brown powder is *ppd.*, passage of NH_3 is continued until the brown *pp* dissolves, and the liquid becomes orange-yellow with a few nearly colourless flocks of NH_4Cl floating in it (addition of more NH_3 decomposes the *NS* in solution), the liquid is filtered and allowed to evaporate, when orange red *NS* separates, the *NS* is collected and washed with CS_2 , to remove traces of *S*. Omitting intermediate products, the reaction may be represented approximately as $8\text{NH}_3 + 3\text{SCl}_2 = 2\text{NS} + \text{S} + 6\text{NH}_4\text{Cl}$ (F & G) — 2 SOCl_2 is surrounded by cold water, and NH_3 is passed into it, after a time the cold water is removed, the solid mass is mixed by a glass rod, and NH_3 is passed over it as long as absorption continues, the nearly white mass thus obtained is treated with CS_2 , and the solution on evaporation deposits *NS*, the *insol* in CS_2 consists of NH_4Cl , $(\text{NH}_4)_2\text{SO}_4$, and polythionates of NH_4 (Michaelis).

Properties — Orange-red, rhombic (or ? triclinic) crystals, with a faint odour, which becomes more marked at $c\ 120^\circ$, the vapour rapidly attacks the mucous membrane of the nose and eyes, detonates at $c\ 160^\circ$, explodes violently when rubbed or struck by a hammer, adheres strongly to glass or paper when rubbed thereon, is electric *insol*, but slowly decomposed by water, slightly *sol* alcohol, ether, turpentine, CS_2 is the best solvent, this solution slowly decomposes.

Reactions — 1 *Water* slowly decomposes *NS*, forming NH_4Aq , $(\text{NH}_4)_2\text{S}_2\text{O}_8\text{Aq}$, and $(\text{NH}_4)_2\text{S}_2\text{O}_4\text{Aq}$ — 2 *Potash* forms NH_3 , $\text{K}_2\text{S}_2\text{O}_8\text{Aq}$, and $\text{K}_2\text{SO}_4\text{Aq}$ — 3 *Hydrogen chloride* produces NH_4Cl , chlorides of *S*, and probably a compound of *NS* with SCl_2 — 4 *Chlorine* reacts on *NS* in CHCl_3 with formation of a compound of *S* chloride and *NS*, Demarcay (C R 31, 854) gives the formula SNCl to the product, and says that addition of *NS* to this produces $(\text{SN})_2\text{Cl}$ — 5 A large excess of *sulphur chloride* reacting on *NS* in CHCl_3 produces a compound of *S*, *N*, and *Cl*, to which Demarcay (C R 91, 1066) assigns the formula $\text{S}_2\text{N}_2\text{Cl}$ — 6 *Nitric acid* forms $\text{S}_2\text{N}_2\text{NO}_3$, and *sulphuric acid* produces HCl and $\text{S}_2\text{N}_2\text{HSO}_4$ (D, l c, also C R 92, 726).

Combinations — With *sulphur dichloride* to form several compounds, especially 2NS SCl_2 , 4NS SCl_2 , and 6NS SCl_2 (Michaelis).

Nitrogen, sulphochloride of NS_2Cl ($=\text{N}_2\text{S}_2\text{SCL}_2$) According to Soubeiran (A Ch 87, 87, 101), this substance is formed by heating, in a sealed tube at 100° , the compound $2\text{NH}_4\text{SCl}_2$, which is obtained by passing a slow stream of NH_3 into SCl_2 . NS_2Cl is a citron-yellow solid, decomposed by heat to *N*, *S*, and S_2Cl_2 , decomposed by water to NH_4Cl and $\text{H}_2\text{S}_2\text{O}_8$. NS_2Cl is also said to be formed by passing CO_2 into a hot solution of *NS* in S_2Cl_2 (S., l c). M M P M

NITROGEN GROUP OF ELEMENTS *Nitrogen, phosphorus, vanadium, arsenic, molybdenum, antimony, didymium, erbium, tantalum, bismuth*. Of these ten elements, *N*, *As*, *Sb*, and *Bi* are found uncombined, the others occur only in combination. *N* is found in vast quantities in the air, compounds of *N* and also of *P* occur in large quantities in rocks and in animal and vegetable matter. Compounds of *As*, *Sb*, and *Bi* are widely distributed in minerals, but no very large quantities are found. Compounds of *V* are found widely spread about, but they occur only in comparatively small quantities. The compounds of *Nb*, *Di*, *Er*, and *Ta* have been found in but a few minerals, these four bodies are classed among the rare elements. *Sb* has been known as a metal from about the end of the fifteenth century, and *Bi* from the sixteenth century, *P* was prepared in 1669, *As* in 1694, and *N* in 1772, *V* was obtained by Roscoe in 1867, investigations on this element having been carried on from the beginning of this century, *Di* was isolated in 1842, *Nb* and *Ta* were obtained nearly pure in 1864, after a long series of investigations conducted by different chemists from 1801 onwards, researches on *Er* have been carried on since 1788 to the present day, but the element has not yet been isolated. Within recent years great doubt has been cast on the elementary character of *Di*, and although the investigation of *Er* is yet far from complete it is very probable that the substance known by this name is not a simple body. Of the names given to the ten elements, *As* is derived from the name by which the chief ore of this metal was known in ancient times, *N*, *P*, and *Di* express characteristic properties of the elements, *Er* is derived from the locality where the minerals were found from which the compounds of this element have been prepared, *V*, *Nb*, and *Ta* are taken from mythological personages, and the origins of the names *Bi* and *Sb* are not known with certainty.

N is obtained from air by removing the *O* by hot *Cu*, or other deoxidiser, *P* is prepared by heating *Ca* phosphate with SiO_2 to combine with the *Ca*, and *C* to remove the *O*, *As*, *Sb*, and *Bi* are prepared by removing *O* from the oxides by *C*, *V* and *Nb* by reducing the chlorides at a high temperature by *H*, and *Di* by reducing the chloride by *Na* or *K*, to obtain *Ta*, the compound Na_2TaF_6 is reduced by *Na*, *Er* has not yet been isolated. *N* is a gas at ordinary temperatures, but has been liquefied at a very low temperature under great pressure, *P* is a soft solid with a low melting point and not high *S G*, the other elements are hard, lustrous, and metal like, none has a very high *S G*, *Ta* = 11 (?) is the heaviest, and all melt at or below a full red heat (*M P* of *V*, *Nb*, and *Ta*, not determined, *Er* not isolated). The following table presents some of the chief properties of the ten elements —

	NITROGEN	VANADIUM	NIOBIUM	DIDYMIUM	TANTALUM
Atomic weights	14.01	51.2	94	144	182
One or more compound of each element, except <i>Di</i> , has been gasified, specific heat of <i>Di</i> only has been determined directly. Mol. w of $\text{N}=\text{At. w} \times 2$; mol. w of none of the others known.

<i>Atomic weight</i>	15.8	91	134	221	166(?)
<i>Spec grav (approx)</i>					
<i>Occurrence and preparation</i>	In large quantity in air. Many compounds, especially nitrates and NH_3 compounds, are widely distributed in large quantities. Prepared by removing O from air.	Vanadates of Pb, Ca, Bi, &c occur as comparatively rare minerals. Small quantities of V compounds are very widely distributed. Prepared by long continued heating VCl_2 in H.	Niobates occur in a few rare minerals. Prepared by repeatedly heating NbCl_5 in H.	Silicate of D ₁ is found in several rare minerals. Prepared by heating D_1Cl_5 with K, or by electrolyzing molten D_1Cl_5 .	Tantalates occur with niobates in a few rare minerals. Prepared by heating K_2TaF_7 with K, or Na_2TaF_6 with Na.
<i>Physical properties</i>	Colourless, tasteless, odourless gas, liquefied at very low temp and great pressure, liquid boils at -195°	Grey, lustrous crystalline powder	Steel grey, lustrous solid	White solid, with slightly yellow tinge, hard, ductile	Grey, lustrous, solid, not obtained free from impurities
<i>Chemical properties</i>	Combines slowly with O under influence of electric discharge, also to a small extent with H. At high temp combines with B, Cr, Mg, Si, and V, and perhaps also with Al, Fe, and Zn. Compounds exhibit most diverse chem properties, oxides are generally acidic, one hydride is strongly alkaline, another is acidic. Never replaces H of acids to form salts. Forms the oxychloride NOCl . An allotropic form perhaps exists, proof is not satisfactory. Atom is trivalent in NH_3 .	Burns in air to V_2O_5 , then to V_2O_3 , and finally to V_2O_4 . Burns in Cl to VCl_5 . Combines with N to form VN. Dissolved by conc H_2SO_4 and HNO_3 , forms vanadates with molten alkalis. Some oxides are basic, e.g. V_2O_3 , others are basic and acidic, e.g. V_2O_5 , which forms salts with acids and also with alkalis. Reacts both as a metal and a non-metal. Forms oxychlorides VOCl_2 , VOCl_3 , and VOCl_4 . Does not form a hydride. Atom is tetravalent in VCl_4 , perhaps trivalent in VOCl_2 .	Burns in air to Nb_2O_5 . Combines with Cl to NbCl_5 . Sol in conc H_2SO_4 , not in HNO_3 or HClAq . Nb_2O_5 forms niobates with basic oxides, also dissolves in H_2SO_4 , but no definite salts isolated. No hydride known with certainty, but there are indications of existence of hydride. Forms a nitride. Oxychloride is NbOCl_2 . Compounds formed by replacing H of acids by Nb not yet isolated, but probably exist NbF_5 and NbOF_3 form many double salts. Atom pentavalent in NbCl_5 .	Burns in air to D_1O_5 , D_2O_5 exists and acts as a peroxide. D_1O_5 is basic, easily soluble in dilute acids. Decomposes cold water slowly, and hot water rapidly. D ₁ is almost certainly a mixture or compound of two or more elements. D_1OCl is isolated. No hydride. No compounds gasified.	Burns in air to Ta_2O_5 . Combines with Cl to form TaCl_5 . Ta_2O_5 forms tantalates with alkalis, seems to have no basic properties. Sol only in HFAq , and H_2SO_4 + HFAq . Forms a nitride. No hydride known. No oxychlorides isolated. Atom pentavalent in TaCl_5 .

<i>Spec grav</i>					
<i>Occurrence and preparation</i>	Many phosphates occur in large quantities and widely distributed in rocks and waters, also in bones and plants. Compounds of P with C, N, and O, are found in nerve and brain matter. Prepared by heating $\text{Ca}_3(\text{PO}_4)_2$ with SiO_2 and C.	Is found native in small quantities, compounds with S and other elements are widely distributed, but are not found in very large quantities. Prepared by reducing As_2O_3 by C.	Sb found native in small quantity, Sb_2S_3 occurs in comparatively small quantities, fairly widely distributed, other compounds also occurs sparingly. Prepared by reducing Sb_2O_3 by C.	As silicate in a few rare minerals. Er has not yet been isolated.	Bi found native, chief compounds are Bi_2S_3 and Bi_2O_3 , not found in any large quantities, but fairly widely distributed. Prepared by reducing Bi_2O_3 by C.
<i>Physical properties</i>	Soft, wax like, crystalline solid, also a red amorphous solid. Non conductor of electricity.	Grey, hard, brittle, crystalline, solid, also as a black amorphous powder. Fair conductor of electricity.	White, lustrous, brittle, very crystalline, solid. Fair conductor of electricity.	Not isolated.	White, with slightly reddish tinge, brittle, crystalline, not good conductor of electricity.
<i>Chemical properties</i>	Burns in air to P_2O_3 and P_2O_5 . Combines directly with Cl, Br, and I, to form PX_3 and PX_5 . Oxidised by HNO_3 to H_3PO_4 . Oxides are anhydrides, several oxy-acids known. Does not form salts by replacing H of acids. Hydride PH_3 resembles NH_3 , but is less alkaline. Exists in two allotropic forms. Atom trivalent and pentavalent in gaseous molecules.	Burns in air to As_2O_3 , As_2O_5 , also known. Combines directly with Cl, Br, and I, to form AsX_3 . Oxidised by HNO_3 to H_3AsO_4 . Oxides are acidic, and As_2O_3 is also feebly basic. Does not form salts by replacing H of acids. Hydride AsH_3 is scarcely if at all alkaline. Exists in two allotropic forms. Atom trivalent in gaseous molecules.	Burns in air to Sb_2O_3 , Sb_2O_5 , also known. Combines directly with Cl, Br, and I, to form SbX_3 and SbX_5 . Oxidised by HNO_3 to Sb_2O_3 and $\text{Sb}_2\text{O}_5 \cdot x\text{H}_2\text{O}$. Oxides are acidic and basic. Forms a few salts by replacing H of acids. Decomposes steam, evolving H. Hydride SbH_3 is not alkaline. Atom trivalent in gaseous molecules.	Reactions of Er not known, as the metal has not yet been isolated. Very probably Er is a mixture or compound of two or more elements. Er_2O_3 is basic, no acidic oxide known. No hydride known. No compound yet gasified.	Burns in air to form Bi_2O_3 , Bi_2O_5 , also known. Combines directly with Cl, Br, and I, to form BiX_3 . Oxidised by HNO_3 to Bi_3NO_5 . Oxides are basic, Bi_2O_3 acts as a basic peroxide with perhaps very feeble acidic properties. Many salts formed by replacing H of acids by Bi. Decomposes steam, evolving H. No hydride isolated. Atom trivalent in gaseous molecules.

General formulae and characters of chief compounds MH_3 , $M = N, P, As, Sb, Bi, M_2O_3$, $M =$ any element of the group except Nb and Ta M_2O_5 , $M = N, P, V, Nb, Sb, Ta, Bi, M_2O_3$, $M =$ any of the elements except Er M_2S_3 , $M = P, V, As, Sb, Bi, Bi, M_2S_3$, $M = P, V, As, Sb$, some other sulphides known, *e.g.* NS, VS, TaS_3 , no sulphide of Nb or Er isolated MCl_3 , $M =$ any of the elements except Er and Ta MCl_3 , $M = P, Nb, Sb, Ta$, some other haloid compounds exist, *e.g.* P_2I_4, VCl_4 , no haloid compounds of Er isolated with certainty HMO, H_2MO, H_3MO, H_4MO , most of these acids except for $M = N, P, V, As, Sb$, acids containing Nb and Ta also known, no acids of Di, Er , or Bi isolated M_2SO_3 , &c, $M = Di, Er, Bi, VO(SO_3), (VO_2)_2(SO_3)_2$, &c $As_2O_3, Sb_2O_3, Sb_2O_5, As_2O_5$, &c

The *hydrides* NH_3, PH_3, AsH_3 , and SbH_3 show a gradation of properties, from the strongly alkaline NH_3 to the neutral AsH_3 and SbH_3 , NH_3 combines readily with acids, PH_3 only with such strong acids as HI or HCl , AsH_3 and SbH_3 do not combine with acids AsH_3 and SbH_3 are easily decomposed by heat, while NH_3 and PH_3 are stable in this respect The hydrides are all oxidised by mixing with O and heating, NH_3 being the most difficult to change in this way A hydride of Nb (? NbH) probably exists N forms also the hydrides N_2H and N_2H_4 , the former is a fairly strong acid, the latter is basic Besides PH_3 , two hydrides of P, *viz.* P_2H_2 and P_2H_4 , exist

Regarded broadly, the *oxides* may be divided into three classes (1) *acidic oxides*, those of N and P, (2) *basic*, those of Di, Er , and Bi , (3) *acidic and basic*, those of V, As, and Sb—acidic and ?basic, oxides of Nb and Ta The distinctly acidic oxides of N are N_2O, NO_2 , and N_2O_5 , with water N_2O forms HNO_2Aq , and N_2O_5 forms HNO_3Aq , but NO_2 produces both HNO_2 and HNO_3 , N_2O may be called the anhydride of $H_2N_2O_5Aq$, inasmuch as it is formed by heating $H_2N_2O_5Aq$, but the acid has not been obtained from N_2O NO can hardly be classed as acidic or basic, there are compounds in which NO may be regarded as playing the part of the more positive radicle, *e.g.* $NOCl$ and $NOHSO_4$, and there are others in which NO seems to form the negative radicle, *e.g.* $(NO)_2H_2$, and perhaps $NOOH, P_2O_5$, and P_2O_5 react with water to form H_2PO_4Aq and H_3PO_4Aq respectively, P_2O_5 forms both of these acids The oxides M_2O_3 , where $M = Di, Er$, or Bi , react with acids to form salts M_2X ($X = SO_3, 2NO_2$, &c), Bi_2O_3 forms salts Bi_2X and evolves O_2 , this oxide probably forms bismuthates— Bi_2O_3, xM_2O —when fused with large excess of alkalis, but these bismuthates cannot be isolated V_2O_5 probably forms salts with acids, the compound $V_2O_5(SO_3)_2, H_2O$ has been isolated V_2O_5 with strong acids forms salts xV_2O_5, yA ($A =$ acidic oxide, SO_3 , &c), and with alkalis it produces salts of the type xV_2O_5, yM_2O, V_2O_5 reacts with alkalis to produce vanadates xV_2O_5, yM_2O , it also combines with several anhydrides to form salts xV_2O_5, yA ($A =$ acidic oxide, P_2O_5, SO_3 , &c), the acids HVO_3 and $H_2V_2O_7$ have been isolated As_2O_3 does not form an acid with water, but with $KOHAq$ it produces $KAsO_3, As_2O_3$ with water

forms H_2AsO_4, As_2O_3 combines with a few anhydrides of strong acids to form such compounds as xAs_2O_3, ySO_3 Neither Sb_2O_3 nor Sb_2O_5 forms an acid with water, a few unstable salts Sb_2O_3, M_2O have been isolated, three weakly acidic hydrides of Sb_2O_3 are known, from each of which salts are derived With acidic oxides Sb_2O_3 combines to form xSb_2O_3, yA ($A =$ acidic oxide, SO_3 , &c), some of these compounds are fairly well-defined salts, *e.g.* $Sb_2O_3, 3SO_3$ The oxides Nb_2O_5 and Ta_2O_5 form salts when fused with alkalis, xM_2O, yM_2O , these oxides dissolve in some strong acids, probably with formation of salts, although none has yet been isolated

The *oxyacids* of the nitrogen elements are numerous, oxyacids of all except Di, Er , and Bi are known The table on p 575 presents the composition of the most marked of the acids, and the relations between them, their corresponding oxides, and their salts, the symbol Aq added to the formula of an acid means that that acid is known only in aqueous solution, M here stands for a monovalent metal, $RO =$ basic oxide generally, including M_2O, MO, M_2O_3

The acids of N and P possess the characteristics of acids much more fully than any of the other oxyacids of the N elements $HNO_2, HNO_3, HPO_3, H_3PO_4, H_2P_2O_7, H_4P_2O_7, H_4AsO_4$, these acids are produced by the reaction of their corresponding oxides with water—the other acids of the N elements are not obtained directly from their oxides, although in many cases the oxides are formed by heating the acids HNO_2Aq is a very strong acid, about equal to $HClAq$, putting the strength or affinity of HNO_2Aq as 100, that of H_3PO_4Aq is approximately about 6, and that of H_2AsO_4Aq about 4 One can scarcely give the name *acid* to the hydrated oxides of Nb and Ta, and it is very doubtful whether $Sb_2O_3, 3H_2O$ ($= H_2SbO_3$) can be called an acid It should be remembered that the oxides of Nb and Ta have not been very fully examined

The chief *haloid compounds* of the nitrogen elements are MX_3 and MX_5 , no haloid compound of Er has been isolated with certainty, TaX_5 is not known, and pentahaloid compounds of N, V, As, Di, and Bi have not yet been prepared V forms VCl_4 , which has been gasified unchanged Most of the haloid compounds are formed by the direct union of their elements, they are decomposed by water, forming $HXAq$, and oxyacids or hydrated oxides in the cases of N, P, V, As, Nb, and Ta, and oxyhaloid compounds in the cases of Di (? Er) and $Bi, SbCl_5$ gives $SbOCl$ if little water is used, but Sb_2O_3Aq if much warm water is employed

The *sulphides*, M_2S_3 , of P, V, As, and Sb react with alkali sulphides to form alkali thio-salts, Di_2S_3 and Bi_2S_3 show no acidic properties, Er and Nb sulphides have not been isolated, and the sulphides of Ta have been studied but slightly, NS is an explosive compound, which forms NH_3 salts of thionic acids when treated with water or potash

The nitrogen elements form Group V of the elements in the classification based on the periodic law This group is composed as follows —

Even series	N = 14	V = 51	Nb = 94	Di = 144	Ta = 182
Odd series	P = 81	As = 75	Sb = 120	Er = 166	Bi = 208

Acid	Salts	Corresponding oxide	Remarks
<i>Nitrogen</i>			
$\text{H}_2\text{N}_2\text{O}_2\text{Aq}$	$\text{M}_2\text{N}_2\text{O}_2$	N_2O	Acid not formed from N_2O , but N_2O obtained by heating $\text{H}_2\text{N}_2\text{O}_2\text{Aq}$, and by action of H_2SO_4 on $\text{M}_2\text{N}_2\text{O}_2\text{Aq}$
HNO_2Aq	MNO_2	N_2O_3	Acid obtained by dissolving N_2O_3 in fair quantity of cold water, solution slowly decomposes to HNO_2Aq and NO . Doubtful whether HNO_2Aq has been obtained quite free from HNO_3 .
HNO_3	MNO_3 , also M_2NO_4 , and many basic nitrates $x\text{N}_2\text{O}_5, y\text{RO}$, also probably a few acid salts $\text{M}'\text{NO}_3, x\text{N}_2\text{O}_5$	N_2O_5	N_2O_5 reacts with water to form HNO_3Aq , N_2O_5 obtained by removing H_2O from HNO_3 by P_2O_5 .
$\text{H}_2\text{N}_2\text{O}_{11}$	None	N_2O_5	Acid formed by adding very conc HNO_3 to melted N_2O_5 , and cooling
<i>Phosphorus</i>			
$\text{H}_2\text{H}_2\text{PO}_3$	$\text{M H}_2\text{PO}_3$	None	Acid obtained by action of equivalent quantity of $\text{H}_2\text{SO}_4\text{Aq}$ on $\text{Ba}(\text{H}_2\text{PO}_3)_2$, which is produced by P reacting with BaO Aq . H_2PO_3 decomposes by heat to H_3PO_3 and PH_3 .
H_3PO_3	M HPO_3 and M_2PO_3	None	H_3PO_3 obtained by H_2S on PbPO_3 in water and evaporation <i>in vacuo</i> . $\text{H}_2\text{PO}_3\text{Aq}$ fairly stable, boiled with $\text{H}_2\text{SO}_4\text{Aq}$ forms $\text{H}_2\text{PO}_4\text{Aq}$ and $\text{H}_3\text{PO}_4\text{Aq}$.
$[\text{H}_2\text{H}_2\text{P}_2\text{O}_5]$	$\text{M}_2\text{H}_2\text{P}_2\text{O}_5$	$\text{P}_2\text{O}_4(?)$	Acid unknown. Na salt got by heating $\text{NaH}_2\text{P}_2\text{O}_5, 5\text{H}_2\text{O}$ to 160° . Pb salt got by heating $\text{PbH}_2(\text{HPO}_3)_2$ to 140° <i>in vacuo</i> .
H_4HPO_3	M HPO_3 and $\text{M H}_2\text{PO}_3$	P_2O_5	Acid obtained by slow action of cold water on P_2O_5 , decomposed by heat to H_3PO_3 and PH_3 .
$\text{HPO}_3, \text{H}_2\text{PO}_4, \text{H}_3\text{P}_2\text{O}_7$	$\text{M PO}_3, \text{M}_2\text{PO}_4, \text{M HPO}_3, \text{M H}_2\text{PO}_4, \text{M}_2\text{P}_2\text{O}_7, \text{M}_2\text{H}_2\text{P}_2\text{O}_7$	P_2O_5	Acids obtained by action of water on P_2O_5 . A little cold water gives HPO_3 , cold water and P_2O_5 in ratio $\text{P}_2\text{O}_5, 2\text{H}_2\text{O}$ give H_2PO_4 , much water gives $\text{H}_3\text{P}_2\text{O}_7$, H_3PO_4 heated gives $\text{H}_2\text{P}_2\text{O}_7$, and this at higher temperature gives HPO_3 . P_2O_5 is not obtained by heating the acids.
<i>Vanadium</i>			
$\text{HVO}_3, \text{H}_4\text{V}_2\text{O}_7$	$\text{MVO}_3, \text{M}_2\text{V}_2\text{O}_7$, also salts of types $\text{M}_2\text{VO}_4, \text{M}_2\text{V}_2\text{O}_7, \text{M}_2\text{V}_2\text{O}_{11}$, &c	V_2O_5	Acids not obtained directly from the oxide, but V_2O_5 obtained by heating the acids.
<i>Arsenic</i>			
—	$\text{MAsO}_2, \text{M}_2\text{AsO}_4$	As_2O_3	As_2O_3 in water does not form an acid, but reacts with alkalis &c to form salts.
$\text{HAsO}_3, \text{H}_2\text{AsO}_4, \text{H}_4\text{As}_2\text{O}_7$	$\text{MAsO}_3, \text{M}_2\text{HAsO}_4, \text{M}_2\text{AsO}_4, \text{M}_2\text{As}_2\text{O}_7$	As_2O_5	H_2AsO_3 obtained by action of H_2O on As_2O_5 , H_2AsO_4 gives $\text{H}_4\text{As}_2\text{O}_7$, and at higher temperature HAsO_3 is formed; on heating $\text{HAsO}_3, \text{As}_2\text{O}_5$, and H_2O are produced.

Acid	Salts	Corresponding oxide	Remarks
Niobium $x\text{Nb}_2\text{O}_5, y\text{H}_2\text{O}$ (? acids)	$x\text{Nb}_2\text{O}_5, y\text{RO}$, some be long to types MnNbO_5 and $\text{M}_2\text{Nb}_2\text{O}_7$, others are more complex	Nb_2O_5	Hydrates of Nb_2O_5 are known, but salts are not obtained by reaction of these with alkalis, but by fusing Nb_2O_5 with alkalis and alkaline carbonates
Antimony H_3SbO_4 (? acid)	MSbO_3	Sb_2O_3	H_3SbO_4 is not obtained directly from Sb_2O_3 , but Sb_2O_3 is formed by heating H_3SbO_4 . H_3SbO_4 scarcely exhibits acidic properties. MSbO_3 are few, produced by dissolving Sb_2O_3 in alkalis
—	$\text{M}_2\text{Sb}_2\text{O}_7$ (? $\text{MSbO}_3, \text{MSbO}_3$)	? Sb_2O_4	Said to be formed by fusing Sb_2O_3 with alkalis and alkaline carbonates
$\text{HSbO}_3, \text{H}_3\text{SbO}_4, \text{H}_4\text{Sb}_2\text{O}_7$	$\text{MSbO}_3, \text{M}_2\text{H}_2\text{Sb}_2\text{O}_7, \text{M}_4\text{Sb}_2\text{O}_7$	Sb_2O_5	Acids are not obtained directly from Sb_2O_5 , but oxides are formed by heating the acids. H_3SbO_4 gives HSbO_3 at 175° . $\text{H}_4\text{Sb}_2\text{O}_7$ is obtained from its salts, it is easily decomposed to HSbO_3 . HSbO_3 dissolves in KOH aq, but does not form salts thus. MSbO_3 obtained by fusing Sb_2O_3 or HSbO_3 with alkalis or alkaline carbonates. $\text{M}_2\text{Sb}_2\text{O}_7$ are formed by action of RO on MSbO_3 .
Tantalum $\text{Ta}_2\text{O}_5, 2\text{H}_2\text{O}$ (? acid)	MTaO_3 , also complex salts of general form $x\text{Ta}_2\text{O}_5, y\text{RO}$	Ta_2O_5	Acid not formed directly from oxide, but oxide obtained by heating the acid. Salts formed by fusing Ta_2O_5 or $\text{H}_2\text{Ta}_2\text{O}_7$ with basic oxides

The division into two families is not marked, the properties of the members of the group vary gradually from N, which is a typical non metal, to Bi, which is distinctly metallic. The properties of these elements and their compounds show that on the whole V, Nb, and Ta form a family, As, Sb, and Bi another family, and N and P a third family. Di and Er have not been much examined, and it is very probable that neither is an elementary substance. For detailed descriptions of the elements and their chief compounds, v. NITROGEN, PHOSPHORUS, &c

M P M M

NITROGLYCERIN v GLYCERIN

NITRO-HARMALINE v HARMALINE

NITRO-HEMIPIC ACID v HEMIPIC ACID

NITRO-HEPTANE (?) $\text{C}_7\text{H}_{15}\text{NO}_2$ (193°–197°) S G 12 937 Occurs among the products of the action of HNO_3 (S G 1 38) on light petroleum oils (95°–100°) (Beilstein a Kurbatoff, B 18, 2029) Oil, sol warm KOH aq

NITRO-HEPTYL-BENZENE $\text{C}_7\text{H}_{15}, \text{C}_7\text{H}_9\text{NO}_2$ (178° at 10 mm) Formed by nitration (Auger, Bk [2] 47, 50) Heavy straw-coloured oil

DI-NITRO-HEPTYLENE $\text{C}_7\text{H}_9(\text{NO}_2)_2$ [182°] From heptene and HNO_3 (S G 1 3) (Morris, C. J. 41, 176). Tables (from alcohol) Sol alcohol, ether, and benzene, volatile with steam

NITRO HEXADECYL-BENZENE

$\text{C}_{16}\text{H}_{33}(\text{C}_{16}\text{H}_{33})\text{NO}_2$ Nitro cetyl benzene [c 36°] Formed by nitration of cetyl benzene (Krafft, B 19, 2984)

NITRO-p-HEXADECYL TOLUENE

$\text{C}_6\text{H}_4(\text{NO}_2)\text{Me C}_{16}\text{H}_{33}$ [40°] Obtained by nitration of hexadecyl toluene (Krafft a Götting, B 21, 3182)

DI NITRO HEXANE $\text{C}_6\text{H}_{14}, \text{CH}(\text{NO}_2)_2$ Obtained from hexyl methyl ketone and HNO_3 (Chancel, C R 94, 399) Heavy oil Yields π hexoic acid on reduction $-\text{KC}_6\text{H}_{11}\text{N}_2\text{O}_4$ yellow plates (from hot water) $-\text{AgA}'$

Tetra nitro hexane $\text{C}_6\text{H}_6(\text{NO}_2)_4$ Crystals, obtained by passing NO_2 into an ethereal solution of diallyl at 0° (Henry, B 2, 279)

NITRO-HEXOIC ACID $\text{C}_6\text{H}_9\text{NO}_4$ [112°] Formed by reducing di nitro hexoic acid in alcoholic solution by sodium amalgam (Kullhem, A 167, 45, Kachler, A 191, 159) Four sided prisms, v sol water and alcohol With tin and HCl aq it yields methyl isopropyl ketone, hydroxylamine, and CO_2 On adding H_2SO_4 to a solution of the K salt mixed with KNO_3 , there is produced a blue colour, which can be taken up by ether $-\text{NaA}'$ 8aq $-\text{BaA}'$, 3aq $-\text{BaC}_6\text{H}_9\text{NO}_4$, $-\text{AgA}'$

Di-nitro-hexoic acid $\text{C}_6\text{H}_{10}\text{N}_2\text{O}_6$ [215°] Formed by boiling camphor with HNO_3 (Kull-

hem, *A* 163, 231, Kachler, *A* 191, 144) Plates (from water) — $\text{NH}_4\text{A}'$ — $\text{NaA}'4\text{aq}$ — CaA' , 3aq slender needles — BaA' , 5aq — BaA' , 3aq — AgA' Formerly supposed to be $\text{C}_6\text{H}_4\text{N}_2\text{O}_6$, v *Di nitro heptonic acid*, under CAMPHOR, vol 1 p 672

NITROHEXYLENE $\text{C}_6\text{H}_4\text{N}_2$ (?) (210°–215°) A product of the action of HNO_3 (S G 134) on the fraction 95°–100° of the petroleum of Baku (Belstein a Kurbatoff, *B* 13, 1920)

m **NITRO HIPPURIC ACID** $\text{C}_8\text{H}_6\text{N}_2\text{O}_5$, 16 $\text{C}_6\text{H}_4(\text{NO}_2)\text{CO NH CH}_2\text{CO}_2\text{H}$ [162°] S 36 at 23° Formed by the action of HNO_3 and H_2SO_4 on hippuric acid, and occurs in dogs' urine after administration of *m* nitro benzoic acid (Berta gmini, *A* 78, 100, Schwanert, *A* 112, 69, Conrad, *J pr* [2] 15, 254) Needles Split up by HClAq into glycoicoll and *m* nitro benzoic acid CaA' , 3aq — BaA' , 2 — CuA' , 5aq — ZnA' , 6aq — PbA' , 5aq — AgA'

p Nitro hippuric acid $\text{C}_8\text{H}_6\text{N}_2\text{O}_5$ [129°] Occurs in urine after a dose of *p* nitro toluene (Jaffé, *B* 7, 1673) Orange prisms (from alcohol) — BaA' , 4aq — AgA' long needles — Urea salt $\text{HA}'\text{CON}_2\text{H}$, [180°] Occurs in dogs' urine after a dose of *p* nitro benzoic aldehyde (Sieber a Smirnoff, *M* 8, 90) Pearly plates

NITROHYDANTOIN $\text{C}_8\text{H}_7\text{N}_3\text{O}_4$, 16 $\text{NH} \begin{array}{c} \text{CO NH} \\ \text{CO CH(NO)} \end{array}$ [170°] Formed from hydantoin and HNO_3 (Franchumont a Klobbie, *R T C* 7, 12)

DI *p* NITRO HYDROBENZOIN

Acetyl derivative

$\text{C}_6\text{H}_4(\text{NO})\text{CH}(\text{OAc})\text{CH}(\text{OAc})\text{C}_6\text{H}_4\text{NO}$, [340°] From the dibromide of di *p* nitro di phenyl ethylene and alcoholic KOAc (Elbs a Bauer, *J pr* [2] 34, 346) Small yellow crystals, m sol alcohol, ether, and glacial HOAc

NITROHYDROCHLORIC ACID v CHLORHYDRIC ACID, *Reactions*, No 17, vol 11 p 3

NITRO-HYDROCINNAMIC ACID v NITRO β PHENYL PROPIONIC ACID

DI NITRO-HYDRO-*p*-COUMARIC ACID v DI NITRO *p* OXY β PHENYL PROPIONIC ACID

NITRO HYDRO ψ -CUMOQUINONE $\text{C}_6\text{H}_4\text{NO}$, 16 $\text{C}_6\text{Me}_3(\text{NO})(\text{OH})_2$ [106°] Formed from nitro ψ cumoquinone and SO_2 (Nef, *A* 237, 18) Yellow needles (from ether)

NITRO-HYDRO-(β)-NAPHTHOQUINONE

$\text{C}_{10}\text{H}_6\text{N}_2\text{O}_2$, 16 $\text{C}_{10}\text{H}_6(\text{NO})(\text{OH})_2$ [159.5°] Formed from nitro (β) naphthoquinone and SO_2 (Ziertling, *B* 23, 177, v Groves, *C J* 45, 299) Red needles, sol boiling water

NITRO HYDROQUINONE *Mono methyl ether* $\text{C}_6\text{H}_4(\text{NO}_2)(\text{OMe})(\text{OH})$ [83°] Formed from HNO_3 and $\text{C}_6\text{H}_4(\text{OMe})(\text{OH})$ in ether (Weselsky a Benedikt, *M* 2, 369) Orange needles

Di methyl ether $\text{C}_6\text{H}_4(\text{NO}_2)(\text{OMe})_2$ [71°] Formed from $\text{C}_6\text{H}_4(\text{OMe})_2$ and cold dilute (1 10) HNO_3 (Habermann, *B* 11, 1034, Muhlhauser, *A* 207, 253) Felted needles

Mono-ethyl ether $\text{C}_6\text{H}_4(\text{NO}_2)(\text{OEt})(\text{OH})$ [83°] Yellow needles (W a B)

Di-ethyl ether $\text{C}_6\text{H}_4(\text{NO}_2)(\text{OEt})_2$ [49°] Formed by nitration (Nietzki, *A* 215, 148)

Mono-benzyl derivative

$\text{C}_6\text{H}_4(\text{NO}_2)(\text{OC}_6\text{H}_5)(\text{OH})$ [158°] Formed by boiling the benzyl derivative of nitro arbutin with dilute H_2SO_4 (Schiiff a Pellizzari, *A* 221, 871, G 14, 501) Yellow needles (from water).

Vor. III

Di-benzyl derivative

$\text{C}_6\text{H}_4(\text{NO}_2)(\text{OC}_6\text{H}_5)_2$ [83°] Obtained by nitration of $\text{C}_6\text{H}_4(\text{OC}_6\text{H}_5)_2$ Yellow needles (from alcohol)

Di propionyl derivative

$\text{C}_6\text{H}_4(\text{NO}_2)(\text{O COEt})_2$ [86°] Obtained by nitration (Hesse, *A* 200, 247)

Di nitro hydroquinone $\text{C}_6\text{H}_4\text{N}_2\text{O}_6$, 16

$\text{C}_6\text{H}_4(\text{NO}_2)_2(\text{OH})$ [5 2 4 1] [136°] Obtained by saponification of its di acetyl derivative (Nietzki, *B* 11, 469, *A* 215, 145) and also by boiling di-nitro arbutin with dilute H_2SO_4 (Streeker, *A* 118, 293) Flat golden needles (from water) Its alkaline solutions are violet — BaA' violet black needles with bronze lustre

Di acetyl derivative [96°] Obtained by nitrating the di acetyl derivative of hydroquinone Yellow needles

Mono methyl ether [102°] Needles

Di methyl ether The two crystalline isomerides $\text{C}_6\text{H}_4(\text{NO}_2)_2(\text{OMe})_2$ [3 2 1 4] [177°] and $\text{C}_6\text{H}_4(\text{NO}_2)_2(\text{OMe})_2$ [5 2 1 4] [202°] are formed by nitrating $\text{C}_6\text{H}_4(\text{OMe})_2$ (Nietzki a Reehberg, *B* 23, 1216)

Mono ethyl ether [71°] Yellow needles

Di ethyl ether The two crystalline isomerides $\text{C}_6\text{H}_4(\text{NO}_2)_2(\text{OEt})_2$ [3 2 1 4] [130°] and $\text{C}_6\text{H}_4(\text{NO}_2)_2(\text{OEt})_2$ [5 2 1 4] [176°] are formed by nitration of the di ethyl derivative of hydroquinone (Nietzki, *A* 215, 150, N a R)

Methylethyl ether

$\text{C}_6\text{H}_4(\text{NO}_2)_2(\text{OMe})(\text{OEt})$ [144°] Formed from $\text{C}_6\text{H}_4(\text{NO}_2)_2(\text{OMe})(\text{OEt})$ (Fiala, *M* 6, 914)

Benzyl ether $\text{C}_6\text{H}_4(\text{NO}_2)(\text{OC}_6\text{H}_5)(\text{OH})$

[137°] Formed by nitration (S a P) Golden needles — KA' aq explosive scarlet needles — $\text{C}_6\text{H}_4\text{N}_2\text{O}_6 \cdot 2\text{NH}_3$ Loses NH_3 in air, forming $\text{NH}_4\text{A}'$, which is stable

Tri nitro hydroquinone *Di methyl ether* $\text{C}_6\text{H}_4(\text{NO}_2)_3(\text{OMe})$ [101°] Formed by adding a solution of $\text{C}_6\text{H}_4(\text{OMe})_2$ in HOAc to a cold mixture of H_2SO_4 and fuming HNO_3 (H) Yellow needles (from alcohol)

Di ethyl ether $\text{C}_6\text{H}_4(\text{NO}_2)_3(\text{OEt})_2$ [130°] Formed from either $\text{C}_6\text{H}_4(\text{NO}_2)_2(\text{OEt})_2$ by further nitration (Nietzki) Yellow needles Aniline forms red crystals of $\text{C}_6\text{H}_4(\text{NO}_2)_3(\text{NHPh})(\text{OEt})_2$ [133°] whence alcoholic potash yields yellow crystals of $\text{C}_6\text{H}_4(\text{NO}_2)_3(\text{OH})(\text{OEt})_2$ [152°]

Tetra nitro hydroquinone *Di isobutyl ether* $\text{C}_6(\text{NO}_2)_4(\text{OC}_4\text{H}_9)_2$ Formed by nitrating $\text{C}_6\text{H}_4(\text{OC}_4\text{H}_9)_2$ (Schubert, *M* 3, 686) Needles (from alcohol), v sol hot HOAc

DI-NITRO HYDROTOLUQUINONE

$\text{C}_6\text{HMe}(\text{NO}_2)_2(\text{OH})_2$ [149°–153°] Obtained by saponifying its mono acetyl derivative, which is got by nitrating the di acetyl derivative of hydro toluquinone (Kehrmann a Brasch, *J pr* [2] 39, 377) Yellowish red crystals (containing aq)

Acetyl derivative

$\text{C}_6\text{HMe}(\text{NO}_2)_2(\text{OAc})(\text{OH})$ [146°] Yellow crystals

Di acetyl derivative

$\text{C}_6\text{HMe}(\text{NO}_2)_2(\text{OAc})_2$ [154°–157°] Colourless silky needles

NITRO-DI IMIDO-HYDROQUINONE

$\text{C}_6\text{H}(\text{NO})_2(\text{NH})_2(\text{OH})_2$ [3 5 2 4 1] Formed from di amido hydroquinone sulphate, HOAc, and HNO_3 (S G 14) (Nietzki a Schmidt, *B* 22, 1658) Needles or prisms. Reduced by SnCl_2 to tri amido hydroquinone

NITRO IMIDO-DI PHENYL-SULPHOXIDE

$\text{NH} \begin{smallmatrix} \text{C}_6\text{H}_5 \\ \text{C}_6\text{H}_4(\text{NO}_2) \end{smallmatrix} \text{SO}$ Formed by nitration of imido di phenyl sulphoxide (Bernthsen, *B* 17, 2858)

(a)-Di nitro imido-di phenyl sulphoxide

$\text{NH} \begin{smallmatrix} \text{C}_6\text{H}_5 \\ \text{C}_6\text{H}_3(\text{NO}_2)_2 \end{smallmatrix} \text{SO}$ Formed, together with the (β)-isomeride by nitration of imido di phenyl sulphide (Bernthsen, *A* 230, 115) Orange needles Reduced by SnCl_2 and HCl to (α) di-amido imido di phenyl sulphide

Acetyl derivative $\text{C}_{12}\text{H}_9\text{Ac}_2\text{N}_2\text{SO}_2$

(β) Di nitro imido-di phenyl sulphoxide

Lemon yellow powder Reduced by SnCl_2 and HCl to (β) di amido imido di phenyl sulphide

NITRO-DI IMIDO-RESORCIN

$\text{C}_6\text{H}(\text{NH})_2(\text{NO}_2)(\text{OH})_2$ [6 4 2 3 1] Formed from di amido resorcin sulphate, HOAc , and HNO_3 (Nietzki & Schmidt, *B* 22, 1659) Needles — $\text{K}_2\text{A}''$ orange needles

NITRO-INDAZINE $\text{C}_8\text{H}_5(\text{NO}_2)_2\text{N}_2$ [181°]

Formed, together with nitro cresol, by heating diazotised (4, 1, 2) nitro *o* toluidine sulphate with water (Witt, Nollung, & Grandmougin, *B* 23, 3636) Needles Yields a methyl derivative $\text{C}_8\text{H}_5\text{Me}(\text{NO}_2)_2\text{N}_2$ [159°], an acetyl derivative [140°], and a bromo derivative $\text{C}_8\text{H}_4\text{Br}(\text{NO}_2)_2\text{N}_2$ [229°]

DI NITRO-INDIN *v* INDINDI NITRO-INDIGO *v* INDIGONITRO INOSITE *v* INOSITENITRO-IODO- compounds *v* IODO-NITRO-compoundsNITRO-ISATIN *v* ISATINNITRO-ISATOIC ACID *v* ISATOIC ACIDNITRO-LACTIC ACID *v* NITRO OXY PROPIONIC

ACID

TRI-NITRO-LAURENE $\text{C}_{11}\text{H}_5(\text{NO}_2)_3$ (?) [84°] From laurene, HNO_3 , and H_2SO_4 (Fittig, *A* 145, 150)

NITROLIC ACIDS Compounds of the form $\text{RCH}(\text{NO})(\text{NO}_2)$ or $\text{RC}(\text{NO}_2)\text{NOH}$ They are formed by the action of nitrous acid (*ie* KNO_2 and H_2SO_4) on the sodium derivatives of primary nitro paraffins, and by the action of hydroxyl amine on the compounds $\text{RC}(\text{NO}_2)\text{Br}$. Their alkaline solutions are red (V Meyer, *B* 7, 1510, cf vol 1 p 101) The compounds of the form $\text{RR}'\text{C}(\text{NO})(\text{NO}_2)$ formed by the action of nitrous acid on secondary nitro paraffins are called pseudonitrols The pseudonitrols are also formed by the action of NO_2 upon ketones, thus acetone yields $(\text{CH}_3)_2\text{C}(\text{NO})(\text{NO}_2)$ (Scholl, *B* 21, 506) The pseudonitrols may perhaps be formulated $\text{RR}'\text{C}(\text{N}=\text{O})\text{NO}_2$ (V Meyer, *B* 21, 1291) The pseudonitrols do not form salts, their solutions are blue

NITRO-MALONIC ETHER $\text{CH}(\text{NO}_2)(\text{CO}_2\text{Et})_2$ Formed from malonic ether (1 pt) and HNO_3 (5 pts of *SG* 15), the product being extracted with ether (Franchimont & Klobbie, *R T C* 8, 283) Heavy oil, decomposing carbonates and forming a white crystalline compound with NH_3 , decomposing at 150°

Methyl nitro-malonnate forms the analogous $\text{CH}(\text{NO}_2)(\text{CO}_2\text{Me})_2\text{NH}_3$ [c 166°]

NITRO-MANDELIC ACID $\text{C}_8\text{H}_7\text{NO}_4$ *ie* $\text{C}_6\text{H}_5(\text{NO}_2)\text{CH}(\text{OH})\text{CO}_2\text{H}$ [140°] Formed from di *o*-bromo-*o*-nitro acetophenone and very dilute KOH (Engler & Wöhrl, *B* 20, 2201) Formed

also from *o* nitro benzoic aldehyde, KC_6H_5 , MeOH , and HCl (Engler & Ziehl, *B* 22, 207) Small crystals, *v* sol water

Methyl ether MeA' [74.5°] Sol alcohol

m Nitro mandelic acid [120°] Formed from *m* nitro *o* amido phenyl acetic acid and HNO_3 (Plochl & Loe, *B* 18, 1181) and also from di *o* bromo *m* nitro acetophenone and dilute KOH (E & W) Yellowish rhombohedra with bitter taste — $\text{NH}_4\text{A}'$ — AgA'

Ethyl ether EtA' [63°].

m Nitro mandelic imido ether

$\text{C}_8\text{H}_7(\text{NO}_2)\text{CH}(\text{OH})\text{C}(\text{NH})\text{OEt}$ [84°] Formed from *m* nitro-benzoic aldehyde, KC_6H_5 , alcohol, and HCl (Beyer, *J pr* [2] 31, 393) Dendritic needles (from ligron) — BHCl [129°] Needles Cold dilute HClAq converts it quickly into *m* nitro mandelic ether [68°]

p Nitro mandelic acid [126°] Formed in like manner (E & Z) Yields *p* oxy phenyl glyoxylic acid on boiling with aqueous Na_2CO_3

Methyl ether MeA' [87°] Prisms

Ethyl ether EtA' [76°] Needles.

NITRO-MESIDINE *v* NITRO AMIDO MESITYLENE

NITRO-MESITOL $\text{C}_6\text{HMe}_3(\text{NO}_2)(\text{OH})$ [64°] From nitro amido mesitylene and HNO_3 (Knecht, *B* 15, 1376, *A* 215, 98) Yellow plates (from water), volatile with steam

NITRO-MESITYLENE $\text{C}_6\text{HMe}_3(\text{NO}_2)$ [42°] (255°) Formed, together with much di-nitro mesitylene, from mesitylene and HNO_3 (*SG* 1 38) (Fittig, *A* 141, 132, 147, 2) Formed also from nitro amido mesitylene and HNO_3 (Ladenburg, *A* 179, 170, Klobbie, *R T C* 6, 31) Triclinic prisms (from alcohol) CrO_3 in HOAc oxidises it to $\text{C}_6\text{HMe}_3(\text{NO}_2)_2\text{CO}_2\text{H}$ [6 2 1 4] [200°-225°] (Emerson, *Am* 8, 268)

Di-nitro mesitylene $\text{C}_6\text{HMe}_3(\text{NO}_2)_2$ [86°] Obtained by dropping mesitylene into cooled fuming HNO_3 . Trimetric prisms, *m* sol hot alcohol

Tri-nitro-mesitylene $\text{C}_6\text{Me}_3(\text{NO}_2)_3$ [232°] Formed from mesitylene, HNO_3 , and H_2SO_4 . Colourless needles (from hot alcohol) or triclinic prisms (from acetone) Yields NH_3 , and di amido mesitylene on reduction by tin and HClAq

NITRO MESITYLENE SULPHONIC ACID $\text{C}_6\text{H}_3\text{NSO}_3$ *ie* $\text{C}_6\text{HMe}_3(\text{NO}_2)(\text{SO}_3\text{H})$ [131°] *S* 100 in the cold Formed from mesitylene sulphonic acid and HNO_3 (Roze, *Z* [2] 6, 74, *A* 164, 65) Prisms (containing $1\frac{1}{2}$ aq) — $\text{KA}'\text{aq}$ — BaA'_2 , 4aq — CaA'_2 , 3aq — PbA'_2 , aq

(a) **NITRO-MESITYLENIC ACID** $\text{C}_6\text{H}_3\text{NO}_4$ *ie* $\text{C}_6\text{H}_2\text{Me}_2(\text{NO}_2)(\text{CO}_2\text{H})$ [5 3 2 1] [212°]

Formed by nitrating mesitylene acid (Schmitz, *A* 193, 162) Colourless crystals (from alcohol) — BaA'_2 , 4aq needles, *v* *e* sol water

Ethyl ether EtA' [64°] Tables

(β) Nitro-mesitylenic acid

$\text{C}_6\text{H}_2\text{Me}_2(\text{NO}_2)(\text{CO}_2\text{H})$ [5 3 4 1] [223°] Found, in small quantity, in preparing the preceding acid (Fittig, *A* 141, 149, 147, 48, Schmitz) Formed also by oxidising nitro mesitylene (*q v*) monoclinic crystals (from alcohol) Melts at 179° when crystallised from water — BaA'_2 , 4aq — BaA'_2 , 2aq — BaA'_2 , 6aq — CaA'_2 , 6aq — MgA'_2 , 11aq — AgA'

Ethyl ether EtA' [72°]. Needles.

NITRO-MESITYL-PHTHALIMIDE

$C_6H_5 \cdot \langle \begin{smallmatrix} CO \\ CO \end{smallmatrix} \rangle N C_6H_4Me_3(NO_2)$ [210°] Formed by nitration of mesityl phthalimide (Eisenberg, *B* 15, 1018) Prisms, sol alcohol

Di-nitro-mesityl-phthalimide

$C_6H_5 \cdot \langle \begin{smallmatrix} CO \\ CO \end{smallmatrix} \rangle N C_6H_3Me_3(NO_2)_2$ [242°] Formed from mesityl phthalimide, HNO_3 , and $H_2SO_4(E)$ Needles, sol alcohol

NITRO METHANE CH_3NO_2 Mol w 61 (101°) *S* G $\frac{15}{15}$ 1.1441, $\frac{25}{25}$ 1.1330 *M* M 1858 (Perkin, *C* J 55, 687) *S* V 59 5 (Schniff, Lossen, *A* 254, 73) *H* F p 18,600 *H* F v 17,440 (Thomson, *Th*) Formed, unaccompanied by methyl nitrite, from MeI and $AgNO_3$ (V Meyer, *A* 171, 32) Formed also by heating potassium chloroacetate with potassium nitrite (Kolbe, *J pr* [2] 5, 427, Preibisch, *J pr* [2] 7, 480, 8, 316) Heavy oil With alcoholic potash it gives a pp of $CH_3KNO_3(EtOH)$, the aqueous solution of which is ppd by $HgCl_2$, the pp being explosive Iron and acetic acid reduce it to methylamine Fuming H_2SO_4 forms hydroxylamine and CO $HClAq$ (*S* G 1 14) at 150° forms formic acid and hydroxylamine Benzoic aldehyde yields $C_6H_5 \cdot CH \cdot CH \cdot NO_2$ (characteristic) (Priebs, *A* 225, 319) Nitro methane converts dichlorhydrin $CH_2Cl \cdot CH(OH) \cdot CH_2Cl$ into di-chloroformin $CH_2Cl \cdot CH(CHO) \cdot CH_2Cl$ (Pfungst, *J pr* [2] 32, 237) $ZnEt_2$, followed by water, yields methyl-diethyl hydroxylamine (Bevad, *J R* 20, 125)

Di nitro-methane Potassium salt $CHK(NO_2)_2$ Formed by passing H_2S into a solution of $GBrK(NO_3)_2$ mixed with ammonia (Vilhers, *Bl* [2] 41, 282) Yellow explosive crystals

Tri nitro methane $CH(NO_2)_3$ Nitroform [15°] Formed by boiling with water tri nitro acetonitrile, a product of the action of HNO_3 and H_2SO_4 on fulminuric acid (Schischkoff, *A* 103, 364) White crystals, m sol water Explodes when quickly heated Reduced by tin and HCl to hydroxylamine, NH_3 , and H_2C (V Meyer & Locher, *A* 180, 172)

Tetra nitro-methane $C(NO_2)_4$ Mol w 196 [13°] (126°) Formed from tri nitro methane, conc H_2SO_4 , and fuming HNO_3 (Schischkoff, *A* 119, 248) White crystals, which will not burn

NITRO METHANE TRICARBOXYLIC

ETHER $C(NO_2)(CO_2Et)_2$ Formed from $CH(CO_2Et)_2$ and HNO_3 (*S* G 1 52) (Franchumont & Klobbie, *R T C* 9, 220) Oil

NITRO-METHANE DISULPHONIC ACID $CH(NO_2)(SO_3H)_2$ The salt K_2A' , formed by the action of conc H_2SO_4 on chloropierin crystallises in minute plates, v sl sol cold water (Rathke, *A* 161, 153, 167, 220)

NITRO METHOXY- compounds v Methyl derivatives of Nitro oxy compounds

NITRO-DI-METHYL-AMIDO-BENZENE SULPHONIC ACID $C_6H_4(NO_2)_2SO_3H$ Formed together with $C_6H_4(NO_2)_2NMe_2$ from $C_6H_4(NO_2)_2SO_3H$ and aqueous $NaNO_2$ (Michler & Walder, *B* 14, 2176) Yellow crystals (from water) — BaA' , — CaA' .

NITRO-TETRA-METHYL-DI-AMIDO-BENZOPHENONE $C_6H_4(NO_2)_4$ $NMe_2 \cdot C_6H_4(NO_2)_2CO \cdot C_6H_4(NO_2)_2NMe_2$ [144°] Formed from $CO(C_6H_4NMe_2)_2$ by nitration (Nathansohn

& Muller, *B* 22, 1883) Needles (from warm alcohol), sl sol ether

Di-nitro di-methyl-amido-benzophenone $C_6H_4(NO_2)_2NMe_2 \cdot CO$ [142°] Obtained from $C_6H_4NO_2 \cdot CO \cdot C_6H_4NMe_2$ and fuming HNO_3 (Fischer *A* 206, 88) Nodules (from dilute $HOAc$)

Tetra-nitro di-methyl-di-amido-benzophenone $CO(C_6H_4(NO_2)_2NMe_2)_2$ [225°] Formed by boiling its di nitro-derivative with phenol (Van Romburgh, *R T C* 6, 252, 365) Plates, v sl sol alcohol

Di nitro-derivative

$CO(C_6H_4(NO_2)_2NMe_2)_2$ Formed by the action of conc HNO_3 on $CO(C_6H_4NMe_2)_2$ or $CS(C_6H_4NMe_2)_2$ (*R*, Baither, *B* 20, 3296) Yellow crystals, decomposing at about 210°

NITRO-DI-METHYL-AMIDO-PHENOL Anhydride of the methylo-hydroxide

$C_6H_4N_2O_2 \cdot C_6H_4(NO_2)_2 \cdot \langle NMe_2 \rangle$ Formed from nitro amido phenol, MeI and KOH (Griess, *B* 13, 647) Yellow crystals — $B'HClAq$ — $B'HI$ 2aq — $B'H_2PtCl_6$ 6aq yellow crystals

Di-nitro-di-methyl-amido phenol $C_6H_3N_2O_2 \cdot C_6H_4(NO_2)_2NMe_2(OH)$ [195°] Formed from KCy and alcoholic $C_6H_4(NO_2)_2NMe_2$ at 50° (Lippmann & Fleissner, *M* 6, 808) Triclinic yellow crystals Converted by boiling $KOHAq$ into dimethylamine and di nitro resorcin [145°] — NH_4A' [195°] — KA' — BaA' , 1 1/2 aq — AgA' red crystalline pp

Tri nitro methyl amido phenol Nitro-derivative $C_6H(NO_2)_3(OH)NMe_2(NO_2)$ [188°] Formed by boiling $C_6H(NO_2)_2NMe_2(NO_2)$ with water (Van Romburgh, *R T C* 8, 275) Yellow crystals (from water) Its methyl ether $C_6H(NO_2)_3(OMe)NMe_2(NO_2)$ [99°] is formed by dissolving $C_6H(NO_2)_2NMe_2(NO_2)$ in $MeOH$ The ethyl ether $C_6H(NO_2)_3(OEt)NMe_2(NO_2)$ [98°] is formed in like manner

DI NITRO TETRA METHYL DI p AMIDO DIPHENYL $C_6H_4(NO_2)_2(NMe_2) \cdot C_6H_4(NO_2)_2(NMe_2)$ [188°] Obtained by nitration (Michler, *B* 14, 2164, 17, 118) Red needles

DI NITRO-DI-METHYL-p-AMIDO-DI-PHENYLAMINE [4 2 1]

$C_6H_4(NO_2)_2 \cdot NH \cdot C_6H_4NMe_2$ [168°] Formed from $C_6H_4Cl(NO_2)_2$ and $C_6H_4(NH_2)(NMe_2)$ (Leilmann & Mack, *B* 23, 2739) — Orange plates

p NITRO DI METHYL AMIDO DI PHENYL CARBINOL $C_6H_4(NO_2) \cdot CH(OH) \cdot C_6H_4NMe_2$ [96°] Formed by boiling p-nitro benzoic aldehyde with di methyl aniline and $HClAq$ (Albrecht, *B* 21, 3294) Thin yellow needles

Reactions — 1 Dimethylaniline and $ZnCl_2$ yield $C_6H_4(NO_2) \cdot CH(C_6H_4NMe_2)_2$ [177°] — 2 Boiling alcoholic potash and zinc-dust form an azo compound [199°] — 3 Zinc-dust and HCl reduce it to di methyl-di amido di phenyl carbinol [165°] and di methyl di amido di-phenyl-methane [93°]

Methylo iodide $B'MeI$ [c 175°]

o-Nitro tetra-methyl-di-p-amido tri-phenyl carbinol $C_6H_4(NO_2)_2 \cdot C_6H_4(NO_2)_2 \cdot C_6H_4(NO_2)_2 \cdot CO(OH)(C_6H_4NMe_2)_2$ *o-Nitro malachite green* [163°] Formed by heating di-methyl aniline (3 1/2 pts) with o-nitro-benzoic aldehyde (1 pt) and $ZnCl_2$ (1 pt) on the water bath, and oxidising the resulting leuco base with PbO_2 and dilute H_2SO_4 (O Fischer & Schmidt, *B*, 17, 1890) Small yellow crystals, sol alcohol

***m*-Nitro-tetra-methyl-di-*p* amido-tri-phenyl-carbinol** [31] $C_6H_4(NO_2)C(OH)(C_6H_5NMe_2)_3$ Formed by oxidation of *m* nitro tetra methyl di amido tri phenyl methane (E & O Fischer, *B* 12, 802) — *Picrate* small green needles

***p*-Nitro - tetra - methyl - di - amido - tri - phenyl - carbinol** Formed like the two preceding isomerides, and also by heating dimethylaniline with $BzCl$ and $ZnCl$ (E & O Fischer, *B* 12, 800, 14, 2528) Small golden prisms Dyes a splendid green — *Picrate* minute needles

NITRO - DI - METHYL - AMIDO - PHENYL

HEXYL KETONE $C_6H_4(NO_2)C(=O)C_6H_5$ [65°] Obtained by nitrating $C_6H_4(NMe_2)C(=O)C_6H_5$ (Auger, *Bl* [2] 47, 42) Yellow needles (from alcohol)

o-NITRO - TETRA - METHYL - DI - *p* - AMIDO - TRI-PHENYL-METHANE

$C_6H_4(NO_2)CH(C_6H_5NMe_2)_2$ *o Nitro leuco mala chite green* [160°] Prepared by heating *o* nitro benzoic aldehyde with dimethylaniline and $ZnCl$. (Fischer, *B* 15, 682, 17, 1889) Yellow monoclinic prisms, sl sol alcohol

***m*-Nitro - tetra - methyl - di - amido - tri - phenyl - methane** $C_6H_4(NO_2)CH(C_6H_5NMe_2)_2$ [152°] Obtained in the same way from *m* nitro benzoic aldehyde (E & O Fischer, *B* 12, 802) Yellow crystals, sl sol alcohol

***p* Nitro - tetra - methyl di amido tri phenyl methane** [177°] Obtained from *p* nitro benzoic aldehyde, dimethylaniline, and $ZnCl_2$ at 100° (Fischer, *B* 14, 2526) Golden plates *Methylo-vodide* $B'Me_2I_2$ aq [220°]

Tetra nitro - di - methyl di amido di phenyl methane $CH_2(C_6H_4(NO_2)_2NMeH)_2$ [250°] Formed by boiling its di nitro derivative with phenol (Van Romburgh, *R T C* 7, 233) Orange crystals, sl sol hot alcohol

Di nitro derivative

$CH_2(C_6H_4(NO_2)_2NMeNO_2)_2$ Formed from $CH_2(C_6H_4NMe_2)_2$, acetic acid, and HNO_3 Yellow crystalline substance, decomposing at 217°-220°

Hexa - nitro tetra methyl di amido tri - phenyl methane [200°] Formed by nitrating $CH_2(C_6H_4NMe_2)_2$ (Fischer, *A* 206, 122) Golden needles, sl sol alcohol

NITRO - DI - METHYL - *p* AMIDO-PHENYL

OXAMIC ETHER $C_{12}H_8N_2O_3$ *ie* [134] $C_6H_4(NMe_2)(NO_2)NHCOCO_2Et$ [152°] Formed from di methyl-amido phenyl oxamic ether and nitrous acid (Wurster & Sendtner, *B* 12, 1804) Red needles Gives $C_6H_4(NMe_2)(NH_2)_2$ on reduction by tin and $HClAq$

NITRO - TETRA - METHYL - DI - AMIDO - PHENYL-DI-TOLYL-METHANE

$C_6H_4(NO_2)CH(C_6H_4MeNMe_2)_2$ [224°] Formed from di methyl *m* toluidine and *p* nitro benzoic aldehyde (Kook, *B* 20, 1562) Yields a picrate [199°]

NITRO METHYL-AMINE *v* METHYL NITRO AMINE, *p* 279

Nitro-di-methyl-amine *v*. Di methyl nitro-amine, *p* 280

***o*-NITRO-METHYL-ANILINE** $C_6H_4N_2O_2$ *ie* [12] $C_6H_4(NO_2)NMe_2$ [28°] Formed by heating *o* nitro phenol with alcoholic methylamine at 180° (Hempel, *J pr* [2] 41, 164)

Nitrosamine $C_6H_4(NO_2)N(NO)Me$ [36°]

Nitro-methyl-aniline

[13] $C_6H_4(NO_2)NMe_2$ [66°]. Formed by methyl-

ation of *m* nitro aniline (Nöbling & Stricker, *B* 19, 548) Reddish yellow needles, sol Pot Aq

Acetyl derivative $C_6H_4(NO_2)NAcMe$ [95°] Needles, sol water (Meldola, *C J* 53, 777).

Benzoyl derivative $C_6H_4BzN_2O_2$ [105°]

Nitrosamine $C_6H_4(NO_2)N(NO)Me$ [70°]

p Nitro methyl aniline

[14] $C_6H_4(NO_2)NMe_2$ [152°] Formed by heating [14] $C_6H_4(NO_2)N_2NMeC_6H_4(NO_2)$ [41] with $HClAq$ (Meldola & Salmon, *C J* 53, 774) Short thick yellowish brown prisms or tablets (from alcohol), sl sol hot water, v sol alcohol

Acetyl derivative $C_6H_4(NO_2)NAcMe$ [153°]

Benzoyl derivative [112°] Prisms

Nitrosamine $C_6H_4(NO_2)N(NO)Me$ [100°]

m Nitro di methyl-aniline

$C_6H_4(NO_2)NMe_2$ [13] [61°] (280°-285°)

Large red prisms Obtained by heating *m* nitro aniline hydrobromide (1 mol) with $MeOH$ (2 mols) at 100° (S & B) Prepared by nitration of dimethylaniline in presence of a large excess of H_2SO_4 , *p* nitro dimethylaniline being formed in smaller quantity A mixture of 193 g of HNO_3 (S G 1.35) and 600 g of ordinary H_2SO_4 is allowed to slowly drop into a solution of 200 g of dimethylaniline in 4,000 g of ordinary H_2SO_4 , keeping the mixture cooled below 5° After standing for 4 or 5 hours it is poured into about 10 litres of iced water and filtered from the ppd *p* nitro derivative, more of which separates on partial neutralisation with Na_2CO_3 (50 or 60 g on the whole) The filtrate neutralised with Na_2CO_3 deposits the *m* nitro di methyl aniline, the yield is 160 to 170 g (Groll, *B* 19, 198)

Methylo bromide $C_6H_4(NO_2)NMe_2Br$ Crystalline (Stadel & Bauer, *B* 19, 1941) Yields crystalline $B'MeCl$, $B'MePtCl_6$, and unstable $B'MeOH$ which is converted by *m* nitro phenol into $C_6H_4(NO_2)NMe_2$ $O C_6H_4(NO_2)$ [62°]

***p* Nitro di methyl aniline** $C_6H_4(NO_2)NMe_2$ [163°] Formed by adding HNO_3 to a solution of dimethylaniline in $HOAc$ (Webster, *B* 10, 760) Formed also by oxidising *p* nitroso di methyl-aniline with $KMnO_4$ (Wurster, *B* 12, 528, cf Schraube, *B* 8, 616), by heating *p* chloro nitro benzene with NMe_2 at 180° (Leymann, *B* 15, 1234), and by the action of nitrous acid on $C_6H_4(NMe_2)SO_3H$ (Michler & Walder, *B* 14, 2176), on $C_6H_4(NMe_2)N_2C_6H_4NMe_2$ (Lippmann & Fleissner, *B* 16, 1421), and on the base $C_6H_4(NO_2)(NH_2)NMe_2$ (Hewitt, *B* 21, 2309) Yellow needles Does not form salts

Di nitro-methyl aniline $C_6H_4N_2O_4$ *ie* $C_6H_4(NO_2)_2NMe_2$ [177°]

Formation — 1 From chloro di nitro benzene and methylamine (Leymann, *B* 15, 1234) — 2 By heating $C_6H_4(NO_2)_2NMe_2$ (78°) in $HOAc$ with bromine (L), or CrO_3 (Van Romburgh, *R T C* 8, 250) — 3 By nitrating the formyl, acetyl, or oxalyl derivative of methyl aniline (Norton & Allen, *B* 18, 1995, Norton & Livermore, *B* 20, 2273)

Properties — Yellow crystals, v sol alcohol, sl sol hot water

Di nitro di-methyl-aniline

$C_6H_4(NO_2)_2NMe_2$ [421] [87°] Formed from $C_6H_4Cl(NO_2)_2$ and NMe_2 (Leymann, *B* 15, 1283) Prepared by slowly adding 500 g of dimethyl aniline to a mixture of 6 litres of ordinary conc.

HNO₃ and 6 litres of water, cooled to 0°, the yield being 116° (Mertens, *B* 19, 2123, cf Weber, *B* 10, 763). Large yellow pointed crystals or prisms. V sol alcohol, chloroform, benzene, acetic acid, and HClAq. Heated with 10 p.c. KOH aq it readily decomposes into di nitro phenol [114°] and dimethylamine. Boiled with fuming HNO₃ it is converted into tri nitro phenyl methyl nitramide C₆H₃(NO₂)₃NMe(NO₂). Salts — B'HCl unstable — B'₂H₂Cl PtCl₄, granular pp., or large brownish red pyramids.

Di nitro di methyl aniline

C₆H₄(NO)₂NMe [5317]. Formed by nitration of dimethylaniline with dilute HNO₃ (equal vols of HNO₃ (S G 1.4) and water) without cooling, the yield being 15 p.c. (Mertens, *B* 19, 2125). Golden brown plates. Decomposes at 250°–272°. Soluble in phenol. It is attacked only by very strong KOH. Boiled with fuming HNO₃ it is converted into di nitro phenyl methyl nitramine C₆H₄(NO)₂NMe(NO₂), a crystalline body which explodes above 220°.

Tri-nitro methyl-aniline

C₆H₃N₃O₆ 2e C₆H(NO₂)₃NHMe [111°]. Formed from C₆H₅Cl(NO₂)₃ (picryl chloride) and methylamine in hot alcoholic solution (Van Romburgh, *R T C* 2, 31, 105, 305). Yellow needles (from alcohol). Gives off NMeH₂ when heated with KOH aq.

Nitro derivative C₆H(NO₂)₃NMe(NO₂) [127°]. Obtained from dimethylaniline (10 pts), H₂SO₄ (100 pts), and HNO₃ (200 pts of S G 1.48). Obtained also from methyl aniline and HNO₃ (Romburgh), and by nitration of di methyl amido phenyl naphthyl sulphone (Michler a Schacht, *B* 12, 1790). Pale yellow crystals (from alcohol). Yields picric acid on boiling with aqueous Na₂CO₃. Reduced by tin and HClAq to tri amido phenol.

Tri nitro-di-methyl aniline C₆H(NO₂)₃NMe₂ [138°]. Formed from picryl chloride and alcoholic dimethylamine (Van Romburgh, *R T C* 2, 105, 8, 250). Yellow crystals (from benzene). Forms with picric acid the crystalline compound C₆H₂N₃O₆C₆H(NO₂)₃OH [114°].

Tetra-nitro-methyl-aniline Nitro derivative C₆H(NO₂)₄NMe(NO) [146°]. Formed from the preceding tri nitro di methyl aniline and HNO₃ (S G 1.5) (Van Romburgh, *R T C* 8, 274). Yellowish white needles. On dissolving in MeOH it yields C₆H(NO₂)₃(OMe)NMe(NO₂) [99°], alcohol forms C₆H(NO₂)₃(OH)NMe(NO₂) [98°] in like manner. Aqueous methylamine produces C₆H(NO₂)₃(NMeH)NMe(NO₂) [192°] and C₆H(NO₂)₃(NMeH)₂ [235°]. If a few drops of aniline be poured upon the nitro derivative it catches fire.

NITRO-METHYL-ANTHRAQUINONE

C₁₀H₆O₂(CH₃)₂(NO₂) [270°]. Prepared by nitration of methyl anthraquinone by adding KNO₃ to its solution in H₂SO₄ (Romer a Lunk, *B* 16, 696). Sublimes in small white needles. Sol alcohol and ether, v sol nitrobenzene.

TRI-NITRO-TRI-METHYL-BENZENE

C₆Me₃(NO₂)₃ [128456] [209°]. Got by nitration (Jacobsen, *B* 19, 2517).

NITRO-METHYL-BENZOIC ACID v Nitro TOLUIC ACID

Nitro di-methyl benzoic acid C₆H₂NO₂ 2e C₆H₂Me₂(NO₂)CO₂H [195°]. Formed by ox-

dising nitro ψ cumene (Schaper, *Z* 1867, 13). Slender needles — CaA', 6aq — BaA', 9aq — EtA' p-NITRO-METHYL COUMARILIC ACID

C₆H₂(NO₂)₂ < $\begin{smallmatrix} \diagup \\ \diagdown \end{smallmatrix}$ [178°] Obtained by

saponification of its ethyl ether, which is formed by heating dry p-nitro phenol sodium with chloroacetoacetic ether and dissolving the product (probably p nitro phenoxy acetic ether) in conc H₂SO₄ (Nuth, *B* 20, 1332). Short yellow needles. M sol hot water, alcohol, and ether, nearly insol cold water. Most of the salts are sparingly soluble — AgA' 3aq small needles.

Ethyl ether EtA' [74°] White needles

NITRO-METHYL ETHYL-BENZENE v

NITRO ETHYL TOLUENE

NITRO (B 2 Py 2) DIMETHYL (Py 3)

ETHYL QUINOLINE C₁₀H₇N(NO₂) [109°]

Formed by nitration of di methyl ethyl quinoline (Harz, *B* 18, 3391). Triclinic crystals. Easily soluble in chloroform, m sol ether.

Salts — B'HCl 2e easily soluble yellow crystals — B'₂H₂ PtCl₄ 2aq short thick orange crystals, sol hot water.

Nitro (B 2, 4, Py 2) tri methyl-(Py 3) ethyl quinoline C₁₀H₇(NO₂)₃N [90°]. Formed by nitration of the base (cf p 326). Needles (from alcohol). It is accompanied by the di-nitro derivative C₁₀H₇(NO₂)₂N [1525°] Waldbott, *B* 23, 2272).

DI NITRO METHYLIC ACID (so called)

CH₂N₂O₂ 2e CH₂NHNO₂? By passing NO into ZnMe there is formed CH₃(ZnMe)N₂O₂, which is decomposed by water yielding CH₃(ZnOH)N₂O₂, whence CO₂ yields crystalline (CH₃N₂O₂)₂Znaq, which is converted, by adding Na₂CO₃ to its aqueous solution, into very soluble CH₃NaN₂O₂ aq (Frankland, *C J* 11, 88).

DI NITRO METHYL MESIDINE Nitramine

C₆Me₂(NO₂)₂NMe(NO₂) [138°]. Formed from C₆Me₂H₂NMe, H₂SO₄, and HNO₃ (Klobbie, *R T C* 6, 31). Crystals, sl sol ether.

NITRO METHYL NAPHTHALENE

C₁₀H₇NO₂ [81°]. Formed, together with the di nitro derivative [206°], by nitration of (β) methyl naphthalene (Schulze, *B* 17, 844). Thin yellowish needles.

DI NITRO (Py 3) METHYL-(β) NAPHTHO

QUINOLINE C₁₀H₇(NO₂)₂N. Four bodies of this constitution, melting at 227°, 230°, 205°–212°, and 250°, may be obtained, as well as a tetra nitro derivative [277°], by nitrating the (Py 3) methyl (β) naphthoquinoline which is formed by condensation of (β) naphthylamine with paraldehyde (Seitz, *B* 22, 256).

NITRO DI METHYL PHENYL ACETIC

ACID [3521] C₆H₂(CH₃)₂(NO₂)CH₂CO₂H **Nitro mesitylic acetic acid** [139°]. Formed by heating (531) di methyl phenyl acetic acid with dilute nitric acid (Wisepek, *B* 16, 1679). Long fine needles. Sol alcohol, ether, and hot water, insol cold water. On reduction it gives carbo mesyl (C₆H₂(CH₃)₂< $\begin{smallmatrix} \text{CH} \\ \text{NH} \end{smallmatrix}$ >CO).

Salts — A'₂Ca 4aq thick needles — A'₂Ba 4aq fine needles — A'Ag

Di-nitro-methyl phenyl acetic acid v Di-NITRO TOLYL ACETIC ACID,

(B 4) **NITRO-(Py 3) METHYL QUINOLINE**
 $C_9H_8N_2O_2$, $\begin{smallmatrix} CH\ CH\ CH \\ CH\ CNO_2\ C\ N\ CMe \end{smallmatrix}$ *o*-Nitro
quinaldine [187°] Formed, together with the
 isomeride [82°] by nitration of (Py 3) methyl
 quinoline (Doebner & Miller, *B* 17, 1699, Ger-
 deissen, *B* 22, 245) Formed also by the action
 of aldehyde on *m* nitro aniline Long needles,
 sl sol cold water—B'HCl prisms—B₂H₂PtCl₆,
 small needles

(B 1 or 3) Nitro (Py 3)-methyl-quinoline
 $C_9H_8Me(NO_2)N$ *m* Nitro *quinaldine* Formed
 as above, and also by the action of aldehyde on
m nitro aniline (D & M) Slender needles,
 volatile with steam—B'HCl prisms—
 B₂H₂PtCl₆ needles

(B 1 or 3) Nitro-(B 2) methyl-quinoline
 [117°] Formed by nitrating (B 2) methyl
 quinoline (Noelting & Trautmann, *B* 23, 3655)
 Formed also from (2, 1, 4) nitro toluidine, gly-
 cerin, picric acid, and H₂SO₄ Needles Yields
 a methylo iodide [190°]

(B 4) Nitro-(B 2) methyl-quinoline
 $CMe\ CH—C\ CH\ CH$
 $CH\ C(NO_2)\ CN\ CH$ [122°] Formed from
 nitro *p* toluidine (N & T) Yellow needles

(B 1) Nitro-(B 4) methyl-quinoline
 $CH\ C(NO_2)\ C\ CH\ CH$
 $CH\ CMe\ CN\ CH$ [93°] Formed from
 (4, 2, 1)-nitro-*o* toluidine and also by nitrating
 (B 4) methyl quinoline

Nitro-methyl-quinoline [127°] Got by
 nitrating lepidine (Busch & Königs, *B* 23, 2687)

Nitro-(Py 3) methyl quinoline tetrahydride
Nitroso derivative $C_{10}H_{11}(NO_2)N\ NO$ [152°]
 A product of the action of nitrous acid on (Py 3)
 methyl quinoline tetrahydride (Möller, *A* 242,
 814) Golden plates (from alcohol benzene)

Nitro (Py 4) methyl-quinoline tetrahydride
 $C_9H_8(NO_2) \begin{smallmatrix} CH_2\ CH_2 \\ NMe\ CH_2 \end{smallmatrix}$ *Nitro karoiline* [94°]

Formed by careful nitration of karoiline (Feer &
 Königs, *B* 18, 2390) Long red needles

(B 1) Nitro (B 2, 4) di methyl quinoline
 $CMe\ C(NO_2)\ C\ CH\ CH$
 $CH\ CMe\ CN\ CH$ [108°] Formed by
 nitrating di methyl quinoline, and also from
 nitro *m*-xyldine [125°], glycerin, H₂SO₄, and
 picric acid (N & T) Yellow needles

Nitro-(B 2, 4, Py 3)-tri methyl quinoline
 $CMe\ CH\ C\ CH\ CH$
 $CH\ CMe\ CN\ CMe$ [92°] Formed by nita-
 ting tri methyl quinoline (Panajotoff, *B* 20, 35)
 Needles—B₂H₂PtCl₆, jag crystalline

Di-nitro-(Py 4)-methyl-quinoline tetra-
 hydride $C_9H_8(NO_2)_2 \begin{smallmatrix} CH_2\ CH_2 \\ NMe\ CH_2 \end{smallmatrix}$ *Di nitro*
karoiline [148°] Formed from karoiline, HOAc,
 and HNO₃ (Feer & Königs, *B* 18, 2390) Golden
 yellow plates, sol alcohol

DI-NITRO-DI-METHYL-SULPHAMIDE
 $C_9H_8N_2SO_2$, $\begin{smallmatrix} SO_2\ (NMe\ NO_2)_2 \end{smallmatrix}$ [90°] Formed
 from di methyl sulphamide and HNO₃ (Franchi
 mont, *R T C* 8, 419) Crystals (from benzene)

NITRO-METHYL-THIENYL METHYL
KETONE $C_9H_8NSO_2$, $\begin{smallmatrix} C_6Me_4H\ CO\ CH_3 \end{smallmatrix}$
 [121°] Obtained by nitrating $C_6Me_4H\ S\ CO\ CH_3$
 (Demuth, *B* 19, 1861) Needles (from ether)

NITRO DI-METHYL-THIOPHENE
 $C_9H_8NSO_2$, $\begin{smallmatrix} SC_6Me_4H\ (NO_2)_2 \end{smallmatrix}$ *Nitro thioxene*

Oil, formed from di methyl thiophene vapour,
 HOAc, and HNO₃ (Messinger, *B* 18, 1638)

NITRO METHYL-*o*-TOLUIDINE $C_8H_8N_2O_2$,
 $\begin{smallmatrix} CH_3\ Me\ (NO_2)\ NHMe \end{smallmatrix}$ [2 4 1] [134°] Obtained
 by oxidation from nitroso methyl *o* toluidine
 $C_8H_8Me(NO)\ NHMe$ (Kock, *A* 243, 309) Green
 ish yellow needles, sol benzene

Nitro-methyl *p* toluidine
 $C_8H_8Me(NO_2)\ NHMe$ [4 2 1] [85°] Formed from
 nitro-*p* toluidine and MeI (Gattermann, *B* 18,
 1487, Niementowski, *B* 20, 1874) Red needles
 (from alcohol) or tables (from benzene)

Acetyl derivative [64°] (250-255° at
 270 mm) Plates—B'C₆H₄(NO₂)₂OH [212°]

Di-nitro-methyl-*o*-toluidine *Nitro deriva-*
tive [2 4 6 1] $C_8H_8Me(NO_2)_2\ NMe\ NO$, [120°]
 Formed from di methyl *o* toluidine and HNO₃
 (Van Romburgh, *R T C* 3, 395) Pale yellow
 crystals Potash converts it into methylamine
 and di nitro *o* cresol

Di-nitro-methyl-*p* toluidine
 $C_8H_8Me(NO_2)_2\ NHMe$ [4 6 2 1] [129°] Obtained
 from $C_8H_8Me(NaCMe)$ and HNO₃ (A L Thomsen,
B 10, 1582, Gattermann, *B* 18, 1487) Red
 needles (from dilute alcohol)

Nitrosamine $C_8H_8Me(NO_2)_2\ NMe\ NO$
 [125°] Yellow needles

Nitro derivative $C_8H_8Me(NO_2)_2\ NMe\ NO$,
 [139°] Formed from di methyl-*p* toluidine (1 pt),
 H₂SO₄ (2 pts), and HNO₃ (10 pts) (Van Rom-
 burgh, *R T C* 3, 404) The same compound
 [130°] appears to be formed by the action of
 dilute HNO₃ on [1 4] $C_8H_8Me\ NaCMe$ (Norton &
 Livermore, *B* 20, 2268) Nearly colourless
 crystals (from boiling alcohol) Yields di nitro
p cresol on boiling with potash

Tri nitro-methyl *m* toluidine *Nitro-de-*
rivative [3 6 4 2 1] $C_8H_8Me(NO_2)_3\ NMe\ NO$
 [102°] Formed from di methyl *m* toluidine and
 HNO₃ (S G 1.5) (Van Romburgh, *R T C* 3,
 413) Pale yellow crystals

Tri nitro methyl *p* toluidine
 $C_8H_8Me(NO_2)_3\ NHMe$ [4 6 3 2 1] [138°] Formed
 by further nitration of nitro methyl *p* toluidine
 (G) Yellowish crystals

Nitro di-methyl *m* toluidine
 $C_8H_8Me(NO_2)_2\ NMe_2$ [84°] Obtained by ox-
 idising nitroso di methyl *m* toluidine with KMnO₄
 (Wurster & Riedel, *B* 12, 1800) Yellow needles

Di nitro di-methyl-*m* toluidine
 $C_8H_8Me(NO_2)_2\ NMe_2$ [107°] Prepared by nita-
 ration of di methyl *m* toluidine dissolved in
 HOAc (W & R) Yellow needles

Di nitro di-methyl *m* toluidine
 $C_8H_8Me(NO_2)_2\ NMe_2$ [168°] Formed from di
 methyl-*m* toluidine, HNO₃, and H₂SO₄ (W & R)
 Less sol alcohol than the isomeride [107°]

(a) **NITRO NAPHTHALENE** $C_{10}H_8NO_2$ Mol
 w 173 [56°] (Mills, *P M* [5] 14, 27), [61°]
 (D'Aguiar, *B* 5, 370, Schiff) (304°) (De Coninck,
B 5, 12) S V S 141 (Schiff, *A* 223, 265)
 S G 1 1331 (Schröder, *B* 12, 1613) S (88 p c
 alcohol) 28 Formed by nitration of naph-
 thalene (Laurent, *A Ch* [2] 59, 378, Beilstein
 & Kuhlberg, *A* 169, 88, Guareschi, *B* 10, 294)
 Formed also by elimination of NH₃ from (a) nitro
 (a)-naphthylamine (Liebermann, *A* 183, 235)

Preparation—By shaking naphthalene with
 nitric acid in the cold, and recrystallising from
 alcohol or ligroin (B & K, cf Piria, *A* 78, 32)
 Prepared also by stirring naphthalene (250 pts.)

with a mixture of HNO_3 (200 pts) and H_2SO_4 (800 pts) at $40^\circ\text{--}50^\circ$ (Witt, *Chem Ind* 10, 215).

Properties—Pale yellow prisms. A few milligrammes projected into a red hot test tube containing nitrogen detonates slightly with a white flame, a larger quantity gives a red flame, with a still larger quantity no flame is seen (Berthelot, *A Ch* [6] 16, 24).

Reactions—1 Readily reduced to (a) naphthylamine. Zinc dust and HClAq yields chlorinated naphthylamines—2 PCl_5 forms (a) chloro naphthalene—3 *Chlorine* yields mono-, di, tri-, and tetra chloro naphthalenes (Atterberg, *B* 9, 316, 926)—4 *Bromine* forms bromo nitro naphthalene [122 5°], di bromo-nitro naphthalene [98°], and two tetrabromides—5 HBrAq at 195° yields $\text{C}_{10}\text{H}_7\text{Br}$ and $\text{C}_{10}\text{H}_6\text{Br}_2$ (Baumhauer, *B* 4, 926)—6 CrO_3 in HOAc forms *c*-nitro phthalic acid (Beilstein a Kurbatoff, *C* 1881, 359)—7 Distillation over *vacuo* distill produces ($\alpha\beta$) naphthazine (G Schultz, *B* 17, 478).

Tetrabromide $\text{C}_{10}\text{H}_6(\text{NO}_2)\text{Br}_4$ [181°] *S* (93.5 p.c. alcohol) 26 at 15.2° . Formed from nitro naphthalene and bromine (Guareschi, *A* 222, 286). White needles. When kept at 137° in a current of air for some time it changes to an isomeride [145°] and $\text{C}_{10}\text{H}_6\text{Br}(\text{NO}_2)$ [122 5°]. When boiled with alcohol for a long time it changes to a second isomeride [173°], *S* (93.5 p.c. alcohol) 13 at 15.2° .

(β) Nitro naphthalene $\text{C}_{10}\text{H}_7\text{NO}_2$ [79°] Formed by eliminating NH_3 from (2, 1) nitro (a) naphthylamine (Lellmann, *B* 19, 236, 20, 891). Formed also by the action of precipitated Cu_2O (2 mols) upon a solution of (β) diazo naphthalene nitrite (1 mol) obtained by adding a solution of 12 g NaNO_2 in 40 g water to a mixture of 7 g of (β) naphthylamine, 15 g HNO_3 , and 250 cc of water. The yield is small (Sandmeyer, *B* 20, 1496). Yellow needles, *v* sol alcohol. Volatile with steam. Reduced by zinc and HOAc to (β) naphthylamine.

' α ' Di-nitro-naphthalene $\text{C}_{10}\text{H}_6(\text{NO}_2)_2$ [1 4°] Mol w 218 [212°] Formed, together with the (1,1') isomeride, by boiling naphthalene with fuming HNO_3 or by heating it with HNO_3 and H_2SO_4 at 100° (Darmstadter a Wichelhaus, *B* 5, 253, D'Aguiar, *B* 5, 370, Beilstein a Kurbatoff, *A* 202, 219). Formed also by heating nitro (a) naphthoic acid [239°] with HNO_3 (*S* G 13) (Ekstrand, *B* 18, 2881).

Properties—Six sided needles (from HOAc), *v* sol HOAc . A few milligrammes thrown into a red hot tube full of nitrogen detonate with reddish white flame (Berthelot, *A Ch* [6] 16, 25).

Reactions—1 *Oxidised* by HNO_3 (*S* G 115) at 150° to *c* nitrophthalic, *s* di nitro benzoic, and picric acids (Beilstein a Kurbatoff, *Bl* [2] 34, 327)—2 PCl_5 yields (γ)-di-chloro naphthalene [107°].

' β ' Di-nitro-naphthalene $\text{C}_{10}\text{H}_6(\text{NO}_2)_2$ [1 1°] [172°] *S* (88 p.c. alcohol) 187 at 19° *S* (benzene) 72 at 19° *S* (chloroform) 11 at 19° . Formed, at the same time as the preceding, by nitrating naphthalene (Darmstadter a Wichelhaus, *A* 152, 301, Beilstein a Kuhlberg, *A* 169, 86). Formed also by heating nitro (a) naphthoic acid [216°] with HNO_3 (*S* G 13) (Ekstrand, *B* 18, 2881), and by eliminating NH_3 from di-nitro (β)-naphthylamine (Gaess, *J. pr*

[2] 43, 37). Tables, more soluble in HOAc , chloroform, benzene, and acetone than the (1,4')-isomeride.

Reactions—1 Dilute HNO_3 at 150° yields di nitro phthalic acid [226°], *s* di nitro benzoic acid, and picric acid—2 PCl_5 forms (γ) di-chloro-naphthalene and (δ) tri-chloro naphthalene.

(γ) Di-nitro-naphthalene $\text{C}_{10}\text{H}_6(\text{NO}_2)_2$ [1 3°] [144°] Obtained from di nitro (a)-naphthylamine [235°] by elimination of NH_3 (Liebermann a Hammerschlag, *A* 183, 272). Yellow needles.

(δ) Di-nitro-naphthalene $\text{C}_{10}\text{H}_6(\text{NO}_2)_2$ [1 3°] [162°] Formed by eliminating NH_3 from di-nitro-(β) naphthylamine [238°] (Graebe a Drews, *B* 17, 1172). Yellow needles, *v* sol alcohol.

' α '-Tri-nitro-naphthalene $\text{C}_{10}\text{H}_5(\text{NO}_2)_3$ Mol w 263 [122°] Formed by further nitration of ' α '-di nitro naphthalene (D'Aguiar, *B* 5, 372, 897). Monoclinic crystals, *v* sol HOAc .

' β '-Tri-nitro-naphthalene $\text{C}_{10}\text{H}_5(\text{NO}_2)_3$ [213°] *S* (88 p.c. alcohol) 06 at 23° . Obtained by further nitration of ' β ' di nitro naphthalene (Laurent, *A* 41, 98, D'Aguiar, Beilstein a Kuhlberg, *A* 169, 96). Formed also by eliminating NH_3 from tri nitro (a) or (β)-naphthylamine (Staedel, *B* 14, 901, *A* 217, 174), and by the action of fuming HNO_3 and conc H_2SO_4 on nitro (a) naphthoic acid (Ekstrand, *B* 19 1181). Prisms (from HOAc), *v* sol HOAc and ether.

(γ) Tri-nitro-naphthalene $\text{C}_{10}\text{H}_5(\text{NO}_2)_3$ [147°] (*B* a *K*), [154°] (*A*). *S* (90 p.c. alcohol) 11 at 18.5° *S* (ether) 38 *S* (benzene) 105 at 18.5° . Obtained by boiling ' α ' di nitro naphthalene for a few minutes with H_2SO_4 and fuming HNO_3 (Beilstein a Kuhlberg, *B* 6, 647). Yellow plates.

' α '-Tetra-nitro-naphthalene $\text{C}_{10}\text{H}_4(\text{NO}_2)_4$ [259°] Formed by boiling ' α ' di nitro naphthalene with HNO_3 and H_2SO_4 for some hours (*A*, *B* a *K*). Crystals (from chloroform), almost insol alcohol.

' β ' Tetra-nitro-naphthalene $\text{C}_{10}\text{H}_4(\text{NO}_2)_4$ [200°] Formed by heating ' β ' di nitro naphthalene with fuming HNO_3 for 4 days at 100° (Lautemann a D'Aguiar, *Bl* 3, 261). Asbestos-like needles (from alcohol). Explodes when heated.

References—Bromo-, Chloro-, and Iodo-

NITRO NAPHTHALENE

NITRO-NAPHTHALENE DICARBOXYLIC ACID $\text{C}_{10}\text{H}_6(\text{NO}_2)(\text{CO}_2\text{H})_2$. Nitro naphthoic acid. Got by oxidising nitro acenaphthene (Quincke, *B* 21, 1454). Yellow needles. On heating it yields an anhydride [220°]— CaA ' aq— $(\text{NH}_4)_2\text{A}$ ' aq.

' α '-NITRO-NAPHTHALENE SULPHONIC ACID $\text{C}_{10}\text{H}_5(\text{NO}_2)(\text{SO}_3\text{H})$ [1 4°] Formed from (a) nitro naphthalene and fuming H_2SO_4 or ClSO_3H (Laurent, *C* 81, 537, Armstrong a. Williamson, *C J Proc* 2, 233, Erdmann, *A* 247, 311). Formed also by nitrating naphthalene (a)-sulphonic acid (Cleve, *Bl* [2] 24, 506). Straw yellow prisms (containing 4 aq), *v* sol. water, sl sol dilute H_2SO_4 . Tastes bitter. Its *K* salt distilled with $\text{K}_2\text{Cr}_2\text{O}_7$ and HCl gives chloro nitro-naphthalene [111°] and di-chloro-nitro naphthalene [85°]. Sodium amalgam reduces it to (a) naphthylamine and H_2SO_4 (Claus a Graeff, *B* 10, 1308).

Amide [225°] Long needles

(θ) Nitro-naphthalene sulphonic acid

$\text{C}_{10}\text{H}_6(\text{NO}_2)(\text{SO}_3\text{H})$ [1 2'] The Ba salt is the most soluble of the Ba salts of the acids obtained by nitration of naphthalene (θ) sulphonic acid (Cleve, *Bl* [2] 29, 415, *B* 21, 3264) Occurs also among the products of sulphonation of (α) nitro naphthalene (Palmaer) Its chloride, heated with PCl_5 , yields $\text{C}_{10}\text{H}_6\text{Cl}_2$ [62°] — $\text{KA}'_2, 3\text{aq}$ — $\text{NaA}'_2, 3\text{aq}$ — $\text{NH}_4\text{A}'$ — $\text{BaA}'_2, 3\text{aq}$ S (of BaA'_2) 11 at 100°, 2 at 17° — $\text{CaA}'_2, 2\text{aq}$ — $\text{MgA}'_2, 9\text{aq}$ — $\text{PbA}'_2, 3\text{aq}$ — $\text{MnA}'_2, 10\text{aq}$ — $\text{CuA}'_2, 8\text{aq}$ — $\text{ZnA}'_2, 10\text{aq}$ — AgA'

Ethyl ether EtA' [107°] Needles

Chloride [167°] Yellow needles

Amide [223°] Needles

Nitro naphthalene sulphonic acid

$\text{C}_{10}\text{H}_6(\text{NO}_2)(\text{SO}_3\text{H})$ [1 4'] Formed, together with the (1'') and (1'') isomerides by nitration of naphthalene (α) sulphonic acid, the acids being separated by crystallisation of their chlorides from benzene (Cleve, *B* 23, 958) Yellowish crystalline mass — KA' — $\text{NaA}'_2, 3\text{aq}$ — $\text{CaA}'_2, 2\text{aq}$ S 27 at 17°, 7 at 100° — $\text{BaA}'_2, 3\text{aq}$ S 15 in the cold, 3 at 100° — $\text{PbA}'_2, 6\text{aq}$ — AgA' needles

Methyl ether MeA' [117°]

Ethyl ether EtA' [93°]

Chloride $\text{C}_{10}\text{H}_6(\text{NO}_2)(\text{SO}_2\text{Cl})$ [99°]

Amide [188°] Octahedra

Nitro naphthalene sulphonic acid

$\text{C}_{10}\text{H}_6(\text{NO}_2)(\text{SO}_3\text{H})$ [1 1'] A product of the nitration of naphthalene (α) sulphonic acid (Cleve, *B* 28, 962)

Chloride [101°]

' α ' Nitro naphthalene disulphonic acid

$\text{C}_{10}\text{H}_4(\text{NO}_2)_2(\text{SO}_3\text{H})_2$ [4 2 2'] Obtained from its chloride, which is formed by nitrating naphthalene ' α ' disulphonic chloride $\text{C}_{10}\text{H}_4(\text{NO}_2)_2(\text{SO}_2\text{Cl})_2$ (Alén, *Bl* [2] 89, 63, *Bn* 2, 156) Needles, v e. sol water — $\text{Na}_2\text{A}'_2, 6\text{aq}$ — $\text{K}_2\text{A}'_2, 3\text{aq}$ — $\text{CaA}'_2, 5\text{aq}$ — $\text{BaA}'_2, 5\text{aq}$ — $\text{PbA}'_2, 4\text{aq}$ — $\text{Ag}_2\text{A}'_2, 3\text{aq}$

Chloride $\text{C}_{10}\text{H}_4(\text{NO}_2)_2(\text{SO}_2\text{Cl})_2$ [141°] With PCl_5 it yields θ -tri chloro naphthalene

Amide [287°]

' β ' Nitro naphthalene disulphonic acid

$\text{C}_{10}\text{H}_4(\text{NO}_2)_2(\text{SO}_3\text{H})_2$ [1 3 2'] Formed by nitrating naphthalene ' β ' disulphonic acid (Alén) Scales — $\text{Na}_2\text{A}'_2, 2\text{aq}$ — $\text{K}_2\text{A}'_2, 2\text{aq}$ — $\text{CaA}'_2, 2\text{aq}$ — $\text{BaA}'_2, 2\text{aq}$ — $\text{PbA}'_2, 2\text{aq}$ — $\text{Ag}_2\text{A}'_2, 2\text{aq}$

Chloride $\text{C}_{10}\text{H}_4(\text{NO}_2)_2(\text{SO}_2\text{Cl})_2$ [186°]

With PCl_5 it gives (γ) tri chloro naphthalene

Amide [above 300°] Needles

Di nitro naphthalene ' α '-disulphonic acid

$\text{C}_{10}\text{H}_4(\text{NO}_2)_2(\text{SO}_3\text{H})_2$ Obtained from its chloride which is formed by nitrating naphthalene ' α ' disulphonic acid (Alén) — $\text{K}_2\text{A}'_2, 4\text{aq}$ — $\text{BaA}'_2, 6\text{aq}$ — $\text{Ag}_2\text{A}'_2, 4\text{aq}$

Chloride [219°] Needles (from benzene)

Amide $\text{C}_{10}\text{H}_4(\text{NO}_2)_2(\text{SO}_2\text{NH}_2)_2$ [c 306°]

Peri NITRO (α) NAPHTHOIC ACID

$\text{C}_{10}\text{H}_6(\text{NO}_2)(\text{CO}_2\text{H})$ [1 1'] [215°] S 04 in the cold S (alcohol) 5 Formed, together with the (1,4')-isomeride by nitrating (α) naphthoic acid (Kuchenmeister, *B* 3, 739, Ekstrand, *B* 12, 1393, 18, 73, 2881, 19, 1138, *J pr* [2] 38, 156, 276) Prisms, v sol alcohol Yields on nitration di nitro naphthalene [170°]

Salts — NaA' — $\text{CaA}'_2, 3\text{aq}$ S 2 at 15° —

$\text{BaA}'_2, 6\text{aq}$ — $\text{PbA}'_2, 4\text{aq}$ yellow prisms

Ethyl ether EtA' [69°] Octahedra

Amide $\text{C}_{10}\text{H}_6(\text{NO}_2)(\text{CONH}_2)$ [280°] Needles, converted by conc HClAq at 170 into

$\text{C}_{10}\text{H}_6\text{Cl}_2 < \begin{smallmatrix} \text{NH} \\ \text{CO} \end{smallmatrix} >$ [261°]

Nitro (α) naphthoic acid

$\text{C}_{10}\text{H}_6(\text{NO}_2)(\text{CO}_2\text{H})$ [1 4'] [239°] S 02 at 15° S (alcohol) 5 at 15° Formed as above, and also by saponifying its nitrile which is obtained by nitrating the nitrile of (α) naphthoic acid (Graeff, *B* 14, 1063, 16, 2250, Ekstrand, *J pr* [2] 38, 241) Needles HNO_3 (S G 1.3) converts it into di nitro naphthalene [212°] — $\text{NaA}'_2, 5\text{aq}$ — $\text{CaA}'_2, 2\text{aq}$ S 63 at 15° — $\text{BaA}'_2, 3\text{aq}$ yellow needles — $\text{PbA}'_2, 5\text{aq}$

Methyl ether MeA' [110°]

Ethyl ether EtA' [93°]

Isopropyl ether PrA' [101°]

Nitrile $\text{C}_{10}\text{H}_5(\text{NO}_2)\text{CN}$ [205°]

(γ) Nitro (α -naphthoic acid [255°] Formed by heating its nitrile with HClAq at 160° (Graeff, *B* 16, 2252) Needles (by illumination)

Nitrile [153°] Formed, together with the isomeride [205°] by nitrating (α) naphthonitrile

' α '-Nitro (β) naphthoic acid [220°] Formed, as well as the four following acids, by nitration of (β) naphthoic acid (Ekstrand, *B* 12, 1325) Needles — CaA'_2 S 26 at 15°

Ethyl ether EtA' [82°] Needles

' β ' Nitro (β) naphthoic acid

$\text{C}_{10}\text{H}_6(\text{NO}_2)(\text{CO}_2\text{H})$ [1 or 4 2] [293°] Formed as above (Ekstrand, *B* 18, 1207, *J pr* [2] 42, 375) Obtained also by saponifying its nitrile (Graeff, *B* 16, 2252) Needles, m sol hot alc hol — $\text{KA}'_2, 3\text{aq}$ — $\text{NaA}'_2, 2\text{aq}$ — $\text{CaA}'_2, 3\text{aq}$ S 12 at 15° — $\text{BaA}'_2, 4\text{aq}$

Methyl ether MeA' [112°] Needles

Ethyl ether EtA' [109°] Needles

Isopropyl ether PrA' [76°] Needles

Nitrile $\text{C}_{10}\text{H}_5(\text{NO}_2)\text{CN}$ [173°] Formed by nitration of (β) naphthoic nitrile Needles
 (γ) Nitro- (β) naphthoic acid [269°] Formed as above Needles, v sol alcohol

Ethyl ether EtA' [93°]**(β) Nitro-(β)-naphthoic acid**

$C_{10}H_7(NO_2)(CO_2H)$ [4' or 1' 2] [288°] S (alcohol) 25 in the cold. Formed as above (Ekstrand, *J pr* [2] 42, 292). Needles. Yields di-nitro naphthoic acid [226°] with fuming HNO_3 , $-NH_4A'$ — NaA' 2aq — BaA' , 8aq — CaA' , 4½aq S 15 in the cold.

Ethyl ether EtA' [121°] Plates

(ε)-Nitro (β) naphthoic acid [285°] One of the products of the action of HNO_3 (SG 1 42) on (β) naphthoic acid (Ekstrand, *J pr* [2] 42, 304). Stellate needles (from alcohol).

Ethyl ether EtA' [75°] Needles**Di-nitro-(α) naphthoic acid**

$C_{10}H_6(NO_2)_2CO_2H$ [4' 1' 1] [265°] Obtained by nitration of (α) naphthoic acid and of (1,4')-nitro naphthoic acid (Ekstrand, *B* 17, 1600, 19, 1984, 20, 219, 1353, *J pr* [2], 38, 259). Prisms or needles (from alcohol). Reduced by tin and $HClAq$ to naphthylene diamine [65°] H S in alkaline solution forms $C_{10}H_7N_2CO_2H$ (?), a bluish violet pp — NaA' 6aq — BaA' , 2½aq — CaA' , 3aq needles S 7 in the cold.

Ethyl ether EtA' [143°] Needles**Di-nitro (α) naphthoic acid**

$C_{10}H_6(NO_2)_2CO_2H$ [215°] Formed, together with the preceding acid, by nitrating (α) naphthoic acid (Ekstrand, *B* 19, 1984, *J pr* [2] 38, 270). Needles or plates (from alcohol). Yields nitro amido naphthoic acid [c 110°] on reduction by H S and NH_3 — CaA' .

Ethyl ether EtA' [137°] Needles**Di-nitro-(α)-naphthoic acid**

$C_{10}H_6(NO_2)_2CO_2H$ [4' 1' 1] [218°] Formed by nitrating nitro (α) naphthoic acid [239°], and occurs among the products of the action of fuming HNO_3 on (α) naphthoic acid (Ekstrand, *B* 20, 220, *J pr* [2] 38, 267). Trimetric crystals (from alcohol), *abc* — 973 1 1 442. Yields a lactam of di amido naphthoic acid on reduction — CaA' , 7aq yellow needles, v e sol water.

Ethyl ether EtA' [129°] Needles**Di nitro-(β) naphthoic acid**

$C_{10}H_6(NO_2)_2CO_2H$ [226°] S (alcohol) 17 in the cold. Formed, together with the isomeride [148°] by dissolving (β) naphthoic acid in fuming HNO_3 . Formed also, in like manner, from nitro (β) naphthoic acid [288°] (Ekstrand, *B* 17, 1602, *J pr* [2] 42, 300). Needles (from alcohol). Yields by reduction nitro amido naphthoic acid [235°] and di amido naphthoic acid [c 230°] — NH_4A' aq S 35 in the cold — BaA' , 6aq — CaA' , 4aq S 06 in the cold.

Ethyl ether EtA' [141°] Needles**Di-nitro-(β)-naphthoic acid**

$C_{10}H_6(NO_2)_2CO_2H$ [1' 1' 2] or [4' 4' 2] [248°] S (alcohol) 16 in the cold. Formed as above, and also by nitrating nitro (β) naphthoic acid [293°] (Ekstrand, *B* 17, 1602, *J pr* [2] 42, 286). Rectangular prisms. Reduced by $FeSO_4$ and NH_3 to di amido naphthoic acid [202°] — NH_4A' aq — NaA' 4aq — BaA' , 8aq — CaA' , 5aq

Ethyl ether EtA' [165°]**Tri nitro-(α) naphthoic acid**

$C_{10}H_4(NO_2)_3CO_2H$ [288°] Formed in small quantity by the action of H_2SO_4 and HNO_3 on nitro (α) naphthoic acid [215°] (Ekstrand, *B* 19, 1181, *J pr* [2] 38, 372). Wedge shaped needles (from alcohol). Tastes very bitter — CaA' , 5aq

Ethyl ether EtA' [131°]. Prisms.**Tri nitro (α) naphthoic acid**

$C_{10}H_4(NO_2)_3CO_2H$ [236°] Formed from di nitro (α) naphthoic acid [265°], H_2SO_4 , and fuming HNO_3 (Ekstrand, *B* 19, 1987). Needles

Ethyl ether EtA' [191°] Needles**Tri-nitro (α) naphthoic acid**

$C_{10}H_4(NO_2)_3CO_2H$ [293°] A product of nitration of di nitro (α) naphthoic acid [265°] (E) Cubes, sl sol alcohol.

Ethyl ether EtA' [150°] Needles**NITRO (α) NAPHTHOL**

$C_{10}H_7(NO_2)(OH)$ [2 1] [128°] Formed, together with the isomeride [164°], from acetyl- or benzoyl naphthylamine by nitrating and boiling the product with $NaOHAq$ (Andreoni a Biedermann, *B* 6, 342, Liebermann a Dittler, *A* 183, 245, Worms, *B* 15, 1815, Lellmann, *B* 19, 802). Obtained also by oxidising (β) naphthoquinone (β) oxim (Fuchs, *B* 8, 629), and by the action of nitrous acid on (α) naphthylamine at 100° (Deninger, *J pr* [2] 40, 300). Yellow needles, sl sol water, m sol alcohol, volatile with steam — KA' aq — BaA' , 3aq red needles.

Nitro-(α) naphthol $C_{10}H_7(NO_2)(OH)$ [4 1]

[164°] Formed as above, and also by the action of (nascent) nitrous acid on (α) naphthylamine in the cold (Deninger, *J pr* [2] 40, 300). Golden needles (from water), not volatile with steam, v e sol alcohol. Yields di nitro naphthol [138°] on nitration. By successive reduction and oxidation it may be converted into (α) naphthoquinone — KA' — NaA' , 2aq crimson needles, bluish red when anhydrous — BaA' , aq — BaA' , 3aq (Hubner, *A* 208, 325) — CaA' , 3aq — PbA' , scarlet powder — AgA' .

Nitro-(β) naphthol **Ethyl ether**

$C_{10}H_7(NO_2)(OEt)$ [1 2] [73°] Formed, together with the ethyl ethers of the two following isomerides, by nitrating $C_{10}H_7(OEt)$ dissolved in $HOAc$ (Gaess, *J pr* [2] 43, 25). Needles.

Nitro-(β) naphthol **Ethyl ether**

$C_{10}H_7(NO_2)(OEt)$ [2 2] [114°] Needles. Yields on oxidation nitrophthalic acid [114°].

Nitro-(β)-naphthol $C_{10}H_7(NO_2)(OH)$ [1 2]

[103°] Formed by oxidising the (α) oxim of (β) naphthoquinone (Stenhouse a Groves, *C* 32, 51), or by boiling the acetyl derivative of nitro (β) naphthylamine with $NaOHAq$ (Liebermann a Jacobson, *A* 211, 46). Formed also by the action of (nascent) nitrous acid on (β) naphthylamine (D). Needles. By reduction followed by oxidation it may be converted into (β) naphthoquinone.

Acetyl derivative $C_{10}H_6(NO_2)(OAc)$ [61°]

Yields $C_{10}H_6(NHAc)(OH)$ on reduction by zinc dust and $HOAc$ (Botcher, *B* 16, 1933).

Benzoyl derivative $C_{10}H_6(NO_2)(OBz)$

[142°] Yields $C_{10}H_6(NHBz)(OH)$ on reduction.

Ethyl ether EtA' [104°] Yellow needles

(Witkamp, *B* 17, 393, Gaess, *J pr* [2] 43, 22).

Di nitro (α) naphthol

$C_{10}H_5(NO_2)_2(OH)$ [4 2 1] **Martiusyellow** [138°]

Formed by the action of HNO_3 on (α) naphthol, (α) naphthol sulphonic acid, and (2,1)- or (4,1)-nitro naphthol (Martius, *Z* [2] 4, 80, Darmstadter a Wichelhaus, *A* 152, 299, Liebermann, *A* 183, 249). Formed also by boiling diazonaphthalene chloride or sulphamate with dilute nitric acid (Martius, Neville a Winther, *C* 37, 632). Sulphur yellow crystals, nearly insol boiling water, sl sol alcohol. Not volatile with steam.

Yields phthalic acid on oxidation Its salts dye wool yellow Poisonous 4 g killed a dog (Weyl, *B* 21, 2191) $\text{—NH}_4\text{A}^+ \text{aq} \text{—Na}_2\text{A}^{2-} \text{aq} \text{—CaA}^+ 6\text{aq} \text{—SrA}^+ 3\text{aq} \text{—BaA}^+ 3\text{aq} \text{—AgA}^+$

Ethyl ether EtA' [88°] Needles

Di nitro-(\beta)-naphthol

$\text{C}_{10}\text{H}_7(\text{NO}_2)_2(\text{OH})$ [1' 2'] [194°] Formed by heating (\beta) naphthol with alcohol and HNO_3 (Wallach a Wichelhaus, *B* 3, 846) Prepared by boiling a solution of (\beta) diazonaphthalene chloride with HNO_3 (Graebe a Drews, *B* 17, 1170) Yellow needles Dyes deep yellow On oxidation it yields nitro phthalic acid [160°] $\text{—KA}^+ 2\text{aq}$ yellow needles $\text{—Ba}^+ \text{A}_2\text{aq}$ (Löwe, *B* 23, 2542) —AgA^+ scarlet pp

Ethyl ether EtA' [138°] (Graebe), [144°] (Gaess) Formed by nitrating the compounds $\text{C}_{10}\text{H}_7(\text{NO}_2)(\text{OEt})$ [114°] and [104°] Yellow needles Converted by NH_3 into di nitro naphthylamine [238°]

Di nitro-(\beta)-naphthol

$\text{C}_{10}\text{H}_7(\text{NO}_2)_2(\text{OH})$ [1' 2'] [198°] Formed from its ether by saponifying with alcoholic potash (Gaess) Plates Yields nitrophthalic acid [212° or 218°] on oxidation

Ethyl ether EtA' [215°] Obtained by nitrating $\text{C}_{10}\text{H}_7(\text{NO}_2)(\text{OEt})$ [1 2] (Gaess), and also from the [1 2'] isomeride Needles Possibly identical with the following isomeride

Di nitro-(\beta)-naphthol

$\text{C}_{10}\text{H}_7(\text{NO}_2)_2(\text{OH})$ [4' 1 2']

Ethyl ether EtA' [215°] Formed by nitrating $\text{C}_{10}\text{H}_7(\text{OEt})_2$ (Onufrovitch, *B* 23, 3356) Orange needles Yields (6, 3, 2, 1) di nitro phthalic acid on oxidation

Tri nitro-(\alpha)-naphthol $\text{C}_{10}\text{H}_5(\text{NO}_2)_3(\text{OH})$

[176°] S 28 at 15° Formed from di nitro (\alpha) naphthol, H_2SO_4 , and HNO_3 (Ekstrand, *B* 11, 161, Diehl a Merz, *B* 11, 1662) Small crystals Yields di nitro phthalic acid [213°] on oxidation $\text{—KA}^+ \text{aq}$ S 25 in the cold $\text{—NaA}^+ \text{aq}$ S 3 in the cold $\text{—NH}_4\text{A}^+$ S 15 in the cold $\text{—BaA}^+ 2\frac{1}{2}\text{aq}$ S 09 $\text{—CaA}^+ 3\frac{1}{2}\text{aq}$ S 4 —AgA^+

Methyl ether MeA' [128°] Got by nitrating $\text{C}_{10}\text{H}_7\text{OMe}$ (Staedel, *B* 14, 899, *A* 217, 172) Yellow plates

Ethyl ether EtA' [148°]

Tri nitro-(\beta)-naphthol $\text{C}_{10}\text{H}_5(\text{NO}_2)_3\text{OH}$

Methyl ether MeA' [213°] Got by nitrating $\text{C}_{10}\text{H}_7\text{OMe}$ (Staedel)

Ethyl ether EtA' [186°]

Tetra-nitro-(\alpha)-naphthol $\text{C}_{10}\text{H}_3(\text{NO}_2)_4\text{OH}$

[180°] S (benzene) 45 at 18° Formed by boiling $\text{C}_{10}\text{H}_7\text{Br}(\text{NO}_2)$, [170 5°] with $\text{Na}_2\text{CO}_3\text{Aq}$ (Merz a Werth, *B* 15, 2714) Yields di nitro phthalic acid [227°] on oxidation $\text{—NaA}^+ 2\text{aq}$ S 1 at 19° $\text{—CaA}^+ 2\text{aq}$ $\text{—BaA}^+ 3\text{aq}$ $\text{—AgA}^+ 3\text{aq}$ red needles

DI-NITRO-(\alpha)-NAPHTHOL SULPHONIC ACID $\text{C}_{10}\text{H}_5\text{N}_2\text{SO}_5$

$\text{C}_{10}\text{H}_4(\text{SO}_3\text{H})\text{C}(\text{OH})(\text{NO}_2)\text{C}(\text{NO}_2)\text{OH}$ *Naphthol yellow*

S Formed by warming (\alpha)-naphthol trisulphonic acid with dilute nitric acid at 50° (Lauterbach, *B* 14, 2028) Obtained also from mono- or di sulphonic acids of (\alpha)-naphthol in which one SO_3H is in a different ring to the hydroxyl. Long yellow needles. Very powerful dye, producing a very fast greenish-yellow shade—

KA^+ v sl sol cold water Not poisonous (Weyl, *B* 21, 2191)

Di nitro-(\alpha)-naphthol sulphonic acid

$\text{C}_{10}\text{H}_4(\text{NO}_2)_2(\text{OH})(\text{SO}_3\text{H})$ [4' x 2 4] *Crocein yellow* Formed by warming (\beta) naphthol (\alpha) sulphonic acid with dilute HNO_3 (Nietzki a Zübelen, *B* 22, 454) —KA^+ golden scales

NITRO-(\beta)-NAPHTHOQUINONE

$\text{C}_{10}\text{H}_6(\text{NO}_2)_2\text{O}$ [158°] Formed by nitrating (\beta) naphthoquinone (Stenhouse a Groves, *A* 194, 203, *C J* 33, 416, 45, 299) Crimson plates (from HOAc), sl sol ether and water With alcoholic aniline it forms the compound

$\text{C}_{10}\text{H}_6(\text{NO}_2)(\text{OH})\text{C}_6\text{H}_5\text{N}$ [253°] (Korn, *B* 17, 908)

p Bromo aniline forms the corresponding body

$\text{C}_{10}\text{H}_6(\text{NO}_2)(\text{OH})\text{C}_6\text{H}_4\text{Br}$ [245°] (Brauns, *B*

17, 1133) The corresponding *o* toluidine melts at 240°, the *p* toluidine at 241° Excess of aniline in benzene forms yellow needles of $\text{C}_{10}\text{H}_6\text{N}_2\text{O}$, [186°] Hydroxylamine hydrochloride in presence of HOAc forms a salt $\text{C}_{10}\text{H}_6\text{NO}_2(\text{NH}_2\text{OH})$ [141°], which on boiling with HOAc yields nitro hydro-(\beta) naphthoquinone (Zaerthling, *B* 23, 179)

Nitro-(\gamma)-naphthoquinone [208°] Formed by oxidising nitro acenaphthene (Quincke, *B* 21, 1460) Yellowish red needles yielding with aniline $\text{C}_{10}\text{H}_6\text{O}_2(\text{NO}_2)(\text{NHPH})$ [128°], and, with diphenylamine, $\text{C}_{10}\text{H}_6\text{O}_2(\text{NO}_2)(\text{NPh}_2)$

NITRO-(\alpha\alpha)-DINAPHTHYL $\text{C}_{12}\text{H}_8\text{C}_2\text{H}_4\text{NO}_2$

[188°] Formed from dinaphthyl, HNO_3 , and HOAc (Julius, *B* 19, 2549) Orange plates

Di-nitro-dinaphthyl $\text{C}_{10}\text{H}_6(\text{NO}_2)_2\text{C}_{10}\text{H}_6(\text{NO}_2)_2$

[280°] Formed by nitrating dinaphthyl (J) Yellow needles, insol alcohol, v sl sol C_6H_6

Tetra-nitro-dinaphthyl $\text{C}_{20}\text{H}_{10}(\text{NO}_2)_4$ Formed from dinaphthyl and fuming HNO_3 (Lossen, *A* 144, 77) Amorphous orange powder

Tetra-nitro-(\beta\beta)-dinaphthyl [150°] Formed from isodinaphthyl and HNO_3 (Staub a Watson

Smith, *C J* 47, 104) Amorphous yellow powder

NITRO-(\alpha)-NAPHTHYL-AMIDO-BENZOIC ACID $\text{C}_{10}\text{H}_7\text{NH C}_6\text{H}_4(\text{NO}_2)\text{CO}_2\text{H}$ [1 3 1] Formed by heating (\alpha) naphthylamine with bromo nitro benzoic acid (Heidenleben, *B* 23, 3158) Yields on reduction the amido-acid [90°] —NaA reddish brown powder

Ethyl ether EtA' [109°]

Nitro-(\beta)-naphthyl-amido-benzoic acid Formed in like manner from (\beta) naphthylamine (H) Brick-red crystals, insol water $\text{—NaA}'$

Ethyl ether EtA' [127 5°]

NITRO-(\alpha) NAPHTHYLAMINE

$\text{C}_{10}\text{H}_6(\text{NO}_2)(\text{NH}_2)$ [2 1] [144°] Formed by saponifying its acetyl derivative, which is produced, together with that of the (4, 1) isomeride [190°], by nitrating the acetyl derivative of (\alpha)-naphthylamine (Lellmann a Remy, *B* 17, 109, 19, 236, 796) Red monoclinic prisms (from alcohol) Converted by boiling alcoholic potash into nitro-naphthol [128°]

Acetyl derivative $\text{C}_{10}\text{H}_6(\text{NO}_2)(\text{NHAc})$ [199°] With 1 mol of the (4, 1)-isomeride it forms a compound [170°]

Di-acetyl derivative $\text{C}_{10}\text{H}_6(\text{NO}_2)(\text{NAc}_2)$ [115°] Got by using Ac_2O at 140°

Benzooyl derivative $\text{C}_{10}\text{H}_6(\text{NO}_2)(\text{NHBz})$ [175°] (Worms, *B* 15, 1814) Yields benzenyl-

naphthylamine [210°] on reduction with tin and HCl (Hubner, *A* 208, 324)

Nitro (α)-naphthylamine

$C_{10}H_7(NO_2)(NH_2)[4\ 1]$ [190°] Formed as above (Liebermann, *A* 183, 232, *L* & *R*) Orange needles (from alcohol) Yields naphthylene-diamine [186°] on reduction

Acetyl derivative [190°]

Di acetyl derivative [144°]

Benzoyl derivative [224°] Yields nitro-naphthol [164°] on boiling with potash

Nitro (α) naphthylamine

$C_{10}H_7(NO_2)(NH_2)[4\ 1]$ [119°] Formed by reduction of 'α' di nitro naphthalene with alcoholic NH_3 and H_2S (Beilstein & Kuhlberg, *A* 169, 81) Small red needles (from water) On elimination of NH_3 it yields (α) nitro naphthalene - $B_2H_5SO_4$ 2aq needles, sl sol cold water

Sulphonic acid

$C_{10}H_7(NO_2)(NH_2)(SO_3H)[4\ 1\ 4]$ Formed from (1, 4) naphthylamine sulphonic acid by acetylation, nitration, and subsequent saponification (Nietzki & Zubelen, *B* 22, 451) Colourless needles Potash yields nitro naphthylamine

Nitro (β) naphthylamine

$C_{10}H_7(NO_2)(NH_2)[1\ 2]$ [127°] (*L* & *J*), [124°] (Meldola, *C* *J* 47, 520) Formed by saponifying its acetyl derivative, which is obtained by nitrating the acetyl derivative of (β) naphthylamine (Liebermann & Jacobson, *B* 14, 806, 1792, *A* 211, 42) Orange needles, sol hot water

Acetyl derivative $C_{10}H_7(NO_2)(NHAc)$ [124°] Reduced by tin and $HOAc$ to ethenyl (αβ) naphthylene diamine (Fischer & Hepp, *B* 20, 2473)

Di nitro (α)-naphthylamine $C_{10}H_6(NO_2)_2(NH_2)[4\ 2\ 1]$ [239°] (Witt, *B* 19, 2032) Obtained from its acetyl derivative, which is formed by nitrating $C_{10}H_7NHAc$ The saponification is effected by alcoholic NH_3 or by H_2SO_4 (Liebermann, *A* 183, 274, Meldola, *B* 19, 2683) Formed also by heating di nitro (α) naphthol with alcoholic NH_3 (Witt) Lemon yellow needles Readily converted by potash into di nitro α naphthol On elimination of NH_3 , it yields di nitro naphthalene [144°]

Acetyl derivative [250.5°] (Ebell, *A* 208, 330), [247°] (*L*) Needles

Benzoyl derivative [252°] Needles

Di nitro-(β) naphthylamine

$C_{10}H_6(NO_2)_2(NH_2)[242°]$ Formed by heating $C_{10}H_7(NO_2)(OEt)$ [144°] with aqueous NH_3 at 140° (Graebe & Drews, *B* 17, 1172, Gaess, *J* *pr* [2] 43, 31) On elimination of NH_3 it yields di nitro naphthalene [161.5°] or [167°] Two isomeric compounds $C_{10}H_6(NO_2)_2NHAc$ [185°] and [235°] are got by nitrating acetyl (β) naphthylamine (Maschke, *C* *C* 1886, 824)

Di-nitro (β) naphthylamine

$C_{10}H_6(NO_2)_2(NH_2)[1\ 1\ 2]$ [223°] Formed from $C_{10}H_7(NO_2)(OEt)$ [215°] (Gaess) Yields di nitro naphthalene [172°]

Di-nitro-naphthylamine obtained from the $C_{10}H_7(NO_2)_2(OEt)$ [215°] of Onufrovitch (*B* 23, 3362) carbonises at 235°-250°

Tri-nitro-(α)-naphthylamine

$C_{10}H_5(NO_2)_3(NH_2)[c\ 264°]$ Formed from $C_{10}H_7(NO_2)_2OEt$ and alcoholic NH_3 at 50° (Staedel, *B* 14, 901, *A* 217, 173) Yellow prisms (from toluene) On elimination of NH_3 it yields tri nitro naphthalene [181°]

Tri-nitro (β) naphthylamine. Formed from $C_{10}H_7(NO_2)_2OEt$ and NH_3 (*S*) Yellow needles Yields tri nitro-naphthalene [181°] on elimination of NH_3

Tetra nitro-(α)-naphthylamine

$C_{10}H_4(NO_2)_4NH_2$ [194°] Formed from $C_{10}H_7Br(NO_2)_3$ and NH_3 (Merz & Weith, *B* 15, 2718) Yellow needles, sl sol alcohol

Tetra-nitro-(β) naphthylamine [202°]

Formed from (β) bromo tetra nitro naphthalene and NH_3 (*M* & *W*) Yellow needles

Nitro-di-(β)-naphthylamine **Benzoyl derivative** $C_{10}H_5NBzC_{10}H_6NO_2$ [168°] Got by nitrating $(C_{10}H_7)_2NBz$ (Ris, *B* 20, 2625) Nodules (from alcohol) or prisms (containing C_6H_5) [95°] (from benzene) Yields, on reduction, benzenyl naphthylene naphthyl-diamine [163°]

Di nitro di (β)-naphthyl-amine

$C_{20}H_{12}(NO_2)_2NH$ [225°] Formed from di (β) naphthylamine, $HOAc$, and HNO_3 (Ris & Weber, *B* 17, 197)

Tetra nitro-di-(β)-naphthyl amine

$C_{20}H_{10}(NO_2)_4NH$ [286°] Formed by mixing di (β) naphthylamine, $HOAc$, and HNO_3 without cooling (*R* & *W*) Granules On further nitration it yields hexa-nitro di naphthyl amine

NITRO NAPHTHYLENE DIAMINE **Di-**

acetyl derivative $C_{10}H_7(NO_2)(NHAc)$ [244°] [*c* 295°] Formed by nitrating $C_{10}H_7(NHAc)$ (Kleemann, *B* 19, 335) Yellow needles, yielding phthalic acid on oxidation

DINITRO-(α) DINAPHTHYLENE-OXIDE

$C_{20}H_{10}(NO_2)_2O$ [270°] Prepared by nitration of (α) dinaphthylene oxide (Knecht & Unzeitig, *B* 13, 1725) Yellow needles

Dinitro (β) dinaphthylene-oxide

$C_{20}H_{10}(NO_2)_2O$ [221°] Prepared by nitration of (β) dinaphthylene oxide (*K* & *U*) Orange-red needles

TETRA NITRO DI NAPHTHYL METHANE

$CH_2(C_{10}H_7(NO_2)_2)_2$ Formed from di (α) naphthyl methane and HNO_3 (Grabowski, *B* 7, 1605) Colourless crystals, decomposing at 260°-270°

NITRO-(α) NAPHTHYL PIPERIDINE

$C_{10}H_5(NO_2)NC_5H_{10}$ [77°] Formed by heating (1, 4) bromo nitro naphthalene with piperidine (Lellmann & Buttner, *B* 23, 1387) Yellow needles Weak base

DI NITRO DI-(α) NAPHTHYL DISULPHIDE

$S(C_{10}H_6NO_2)_2$ [186°] Formed from nitro naphthalene sulphonic chloride and HI (Cleve, *B* 23, 960) Greenish yellow scales

NITRO-NITROSO-ANTHRONE $C_{14}H_9NO_3$

[263°] Formed by boiling hydroanthracene nitrite (vol 1 p 277) with alkalis (Liebermann & Landshoff, *B* 14, 470) Yellow needles, yielding anthraquinone on oxidation

NITRO-OCTANE $C_8H_{17}NO_2$ (205°-212°)

Formed by distilling octyl iodide with $AgNO_3$ (Eichler, *B* 12, 1883)

NITRO-OCTOIC ACID $C_8H_{15}(NO_2)_2O_2$ *S* *G*

A 1093 Formed by boiling the non volatile acids of cocoa nut oil for a long time with HNO_3 (Wirz, *A* 104, 289) Oil - AgA' - EtA' *S* *G* *A* 1031 Oil

NITRO-OCTYL-BENZENE $C_8H_7(NO_2)C_6H_5$

The three isomerides may be got by nitrating octyl benzene (Ahrens, *B* 19, 2721) *o* Nitro octyl benzene carbonises at 130°, the *m* isomeride melts at 124°, the *p*-variety melts at

204° They yield the corresponding nitro benzene acids on oxidation by KMnO_4 .

Di-nitro-octyl-benzene $\text{C}_8\text{H}_7(\text{NO}_2)_2\text{C}_8\text{H}_{17}$, [226°] Formed by nitration of octyl benzene

NITRO-OPICIANIC ACID ν **OPICIANIC ACID**

NITRO OREIN $\text{C}_8\text{H}_7\text{NO}_2$, ν

$\text{C}_8\text{H}_7\text{Me}(\text{NO}_2)(\text{OH})_2$ Two nitro oreins [120°] and [115°] are formed, together with an azo compound, by the action of a cold mixture of nitrous and nitric acids on an ethereal solution of orein (Weselsky, *B* 7, 439) They may be separated by steam distillation, the compound melting at 120° being volatile The nitro orein [120°] forms $\text{Ba}(\text{HA}'')_2$, the isomeride [115°] yields $\text{Ba}(\text{HA}'')_2 \cdot 8\text{aq}$ and $\text{BaA}'' \cdot 3\text{aq}$ By the action of HNO_3 and HNO_2 on the ethyl derivative of orein there are formed two compounds $\text{C}_8\text{H}_7\text{Me}(\text{NO}_2)(\text{OH})(\text{OEt})$, melting at 64° and 103° respectively (Weselsky a Benedikt, *M* 2, 871)

Di-nitro-orein $\text{C}_8\text{H}_7\text{Me}(\text{NO}_2)_2(\text{OH})_2$, [164 5°] *S* (alcohol) 5.5 at 15° Formed from di nitroso-orein and cold dilute HNO_3 (*S* G 1 3) (Stenhouse a Groves, *A* 188, 358) Yellow plates, m sol boiling water May be sublimed — $\text{Ba}(\text{HA}'')_2 \cdot \text{aq}$

Di-nitro-orein [110°] Obtained by saturating toluene with NO_2 (Leeds, *A C J* 2, 416, *B* 14, 483) Golden needles (from alcohol) Dyes silk yellow

Tri-nitro-orein $\text{C}_8\text{H}_7\text{Me}(\text{NO}_2)_3(\text{OH})_2$, [163°] Formed from orein, H_2SO_4 , and HNO_3 (Stenhouse, *Pr* 19, 410, Merz a Zetter, *B* 12, 681) Yellow needles, v sol hot water Explodes above 163° Dyes the skin yellow — $\text{K}_2\text{A}''$ orange needles — $\text{BaA}'' \cdot 3\text{aq}$ — PhA'' — $\text{Ag}_2\text{A}''$ amorphous orange red pp

Methyl ether MeA'' , [69 5°].

Ethyl ether EtA'' , [61 5°]

NITRO-OXINDOL $\text{C}_8\text{H}_7\text{ON}(\text{NO}_2)$ Prepared by adding powdered KNO_3 to a solution of oxindol in H_2SO_4 (Baeyer, *B* 12, 1313) Yellow needles, sol alcohol Begins to decompose at 175°

p NITRO-o-XY-ACETOPHENONE

$\text{C}_8\text{H}_7(\text{NO}_2)\text{COCH}_2\text{OH}$, [121°] Formed by boiling bromo nitro acetophenone with NaOAc and HOAc , diluting with water, and boiling again (Engler a Zulke, *B* 22, 204) Sol hot alkalis

Nitro-di-oxy-acetophenone

$\text{C}_8\text{H}_7(\text{NO}_2)(\text{OH})_2\text{COCH}_3$, [142°] Formed by nitration (Nencki a Sieber, *J pr* [2] 23, 537)

TETRA NITRO OXY AMIDO ANTHRAQUINONE $\text{C}_{14}\text{H}_7\text{N}_4\text{O}_{11}$, ν $\text{C}_{14}\text{H}_7(\text{NO}_2)_4(\text{NH}_2)(\text{OH})_2$

Chrysammidic acid Formed by boiling chrysammic acid $\text{C}_{14}\text{H}_7(\text{NO}_2)_4(\text{OH})_2$, with ammonia (Schunck, *A* 65, 236, Graebe a Liebermann, *A Suppl* 7, 310) Olive green needles, forming a dark purple aqueous solution Its salts explode when heated

NITRO OXY AMIDO BENZOIC ACID

$\text{C}_8\text{H}_7\text{N}_2\text{O}_5$, ν $\text{C}_8\text{H}_7(\text{NO}_2)(\text{OH})(\text{NH}_2)\text{CO}_2\text{H}$ [5 2 3 1] [220°] Got by reducing di nitro o oxy benzoic acid (Hubner a Babcock, *B* 12, 1345) Crystals

NITRO-OXY-AMIDO DIPHENYL *Acetyl*

derivative $\text{C}_8\text{H}_7(\text{NHAc})\text{C}_6\text{H}_5(\text{NO}_2)(\text{OH})$ [264°] (Schmidt a Schultz, *A* 207, 347) Yellow needles

NITRO-DI-OXY-DI AMIDO TRI PHENYL

METHANE *Di methyl-ether*

$\text{C}_8\text{H}_7(\text{NO}_2)(\text{OH})(\text{C}_6\text{H}_5(\text{OMe})\text{NH}_2)_2$, [108°] Formed by heating *p* nitro benzoic aldehyde with anis-

idine sulphate and H_2SO_4 (Fischer, *B* 15, 680) Golden needles (containing C_6H_5) *n* Anisidine yields an isomeric body [189°] (Kock, *B* 20, 1562)

NITRO DI OXY AMIDO QUINONE $\text{C}_{12}\text{H}_7\text{N}_2\text{O}_5$, ν $\text{C}_6(\text{NO}_2)(\text{OH})_2(\text{NH}_2)_2\text{O}_2$ The salt $\text{C}_6\text{H}_7\text{K}_2\text{N}_2\text{O}_5$ is precipitated on exposing a solution of $\text{C}_6(\text{NO}_2)(\text{NH}_2)(\text{OH})$, in aqueous K_2CO_3 to the air (Nietzki a Benckiser, *B* 18, 499) It forms coppery needles

NITRO OXY ANTHRAQUINONE *Ethyl*

ether $\text{C}_6\text{H}_4\text{<CO>C}_6\text{H}_4(\text{NO}_2)(\text{OEt})$ [1 2 3]

[243°] Formed by oxidation of the nitroso anthrone of the ethyl ether of nitro anthrol (Liebermann a Hagen, *B* 15, 1795) Colourless needles, sl sol alcohol

Nitro-di-oxy-anthraquinone $\text{C}_{14}\text{H}_7(\text{NO}_2)_2\text{O}_4$

(a) **Nitro alizarin** [196°] Prepared by nitration of the di acetyl derivative of alizarin (Schunck a Romer, *B* 12, 687) Less soluble in alcohol and HOAc than the (β) isomeride Oxidised by HNO_3 to phthalic acid Yields purpurin on warming with H_2SO_4

Nitro-di-oxy-anthraquinone (β) **Nitro alizarin** *Alizarin orange* [244°] Formed by nitration of alizarin dissolved in HOAc (*S* a *R*, Rosenstiel, *Bl* [2] 26, 63) Formed also by boiling di nitro oxy anthraquinone with dilute (20 p c) NaOH (Simon, *B* 15, 692) Orange needles (from benzene), sl sol KOH aq Dyes alumina mordants red and iron mordants reddish-violet

Di-acetyl derivative [218°] Needles

Nitro-tri-oxy-anthraquinone $\text{C}_{14}\text{H}_7(\text{NO}_2)_3\text{O}_4$ Formed from alizarin and fuming HNO_3 (Strecker, *Z* 1868, 264) Red crystalline powder — $\text{K}_2\text{A}''$

Di-nitro-oxy-anthraquinone

$\text{C}_6\text{H}_4\text{C}_6\text{O}_2\text{C}_6\text{H}_4(\text{NO}_2)_2(\text{OH})$ [1 3 2] [270°] Formed from oxy anthraquinone and fuming HNO_3 (Simon, *B* 14, 464, 15, 694) Yellow needles Dyes wool and silk orange — KA' — $\text{CuA}'_2 \cdot 2\text{aq}$ — $\text{MgA}'_2 \cdot 5\text{aq}$ — AgA'

Ethyl ether EtA' , [158°]

Di nitro di oxy anthraquinone

$\text{C}_{14}\text{H}_7(\text{NO}_2)_2\text{O}_4$ *Di nitro-purpuroxanthin* [250°] Formed from purpuroxanthin and cold HNO_3 (*S* G 1 48) (Plath, *B* 9, 1205) Red needles (from HOAc) — $\text{NH}_4\text{HA}''$ — BaA'' red needles

Tetra-nitro di oxy anthraquinone

$\text{C}_{14}\text{H}_7(\text{NO}_2)_4\text{O}_4$ *Tetra nitro anthraflavic acid* *Tetra nitro anthraflavone* Formed by boiling anthraflavic acid with HNO_3 (*S* G 1 4) (Schardinger, *B* 8, 1487) Yellow needles, melting with explosion at 307 6° cor — Salts — $(\text{NH}_4)_2\text{A}''$ — $(\text{NH}_4)_2\text{A}''\text{NH}_3$ — $(\text{NH}_4)_2\text{A}''\text{NH}_3$ — $\text{Ag}_2\text{A}''$ brownish needles

Tetra-nitro-di-oxy-anthraquinone

$\text{C}_{14}\text{H}_7(\text{NO}_2)_4\text{O}_4$ *Tetra-nitro isanthraflavic acid* Formed by nitrating isanthraflavic acid (Roemer a Schwarzer, *B* 15, 1045) Yellow plates (from dilute HNO_3) Its alkaline solution is red Dyes wool and silk orange yellow, but does not combine with mordants — $\text{KA}'' \cdot 2\text{aq}$ silky red needles

Tetra nitro-di-oxy-anthraquinone

$\text{C}_{14}\text{H}_7(\text{NO}_2)_4\text{O}_4$ *Tetra nitro anthrarufin* Formed by nitration of anthrarufin (Liebermann, *B* 12, 188) Small yellow plates (from fuming HNO_3) — $\text{Na}_2\text{A}'' \cdot 4\text{aq}$ — $\text{K}_2\text{A}'' \cdot \text{aq}$; bronze coloured prisms. $\text{MgA}'' \cdot 6\text{aq}$

Tetra-nitro di-oxy-anthraquinone

$C_{14}H_4(NO_2)_4O_4$ *Chrysammic acid* Formed by heating aloes with HNO_3 (S G 137) (Schunck, *A* 39, 1, 65, 235, Stenhouse & Muller, *C J* 19, 319, Tilden, *Ph* [3] 2, 845) Formed also by nitration of chrysazin (di oxy anthraquinone) (Liebemann & Giesel, *B* 8, 1643, 9, 329, *A* 183, 193) Golden plates or monoclinic prisms Explodes when quickly heated Aqueous potassium cyanide at 60° forms chrysocyanmic acid $C_{14}H_4N_2O_{12}$ 6aq, which forms the dark red salts $(NH_4)'A'$ 3aq, K_2A'' 3aq, and CaA'' 3aq

Salts — NaA'' 3aq (Mulder, *A* 68, 339, 72, 285) — K_2A'' 3 S 08 in the cold Flat rhomboidal plates, polarises light, the two rays being differently coloured (Brewster, *P* 69, 552, Hirschwald, *A* 183, 198) — BaA'' 2aq — BaA'' 4aq — MgA'' 5aq — PbA'' 5aq — $PbA''(OH)_2$ — PbA'' 4aq — MnA'' 5aq — CuA'' 4aq

Ethyl ether EtA'' Pale red needles or yellow prisms (Stenhouse)

Benzoyl derivative $C_{14}H_4BzN_4O_{12}$ Yellow, almost insoluble, prisms

NITRO-OXY-BENZENE NITRO PHENOL

Nitro tri oxy benzene Tri methyl derivative $C_6H_3(NO_2)_3(OMe)_3$ [x 123] [100°] Formed from $C_6H_3(OMe)_3$ and conc HNO_3 (Will, *B* 21, 612) Thick prisms with HNO_3 it yields $C_6H_3(NO_2)_3(OMe)_3$ [126°], sl sol alcohol

Di-nitro tetra-oxy-benzene Methylene di nitro apone

$C_6(NO_2)_2(OMe)_2 \begin{smallmatrix} O \\ \diagup \quad \diagdown \end{smallmatrix} CH$ [118°] Formed from apionic acid (4 g), $HOAc$ (50 cc), and HNO_3 (100 cc of SG 14) (Ciamician & Silber, *B* 22, 2489, 23, 2290) Yellow needles, insol water Yields on reduction $C_6H_5O_2(NH)_2$ [119°] With diacetyl it condenses to $C_6H_4N_2O_4$ [176°], and with benzil to $C_6H_5O \begin{smallmatrix} N \\ \diagup \quad \diagdown \end{smallmatrix} \begin{smallmatrix} Ph \\ CPh \end{smallmatrix}$ [222°], both crystallising in needles

NITRO-OXY-BENZOIC ACID

$C_6H_5(NO_2)(OH)(CO_2H)$ [5 21] *Nitro salicylic acid Amiotu acid* [228°] Mol w 183 S 176 at 22° (Hubner), 07 at 155° (Schiff) Formed, together with the isomeride [144°], by the action of nitric acid on salicylic acid and on indigo (Chevreul, *A Ch* [1] 72, 131, Buff, *A Ch* [2] 37, 160, Dumas, *A Ch* [2] 63, 205, [3] 2, 227, Gerhardt, *A Ch* [3] 7, 325, Marchand, *J pr* 26, 385, Piria, *A* 56, 35, Stenhouse, *A* 70, 253, Schiff, *A* 154, 14, Schiff & Masimo, *G* 9, 318, *A* 198, 258, Hubner, *A* 195, 6) Formed also by the action of aqueous $NaNO_2$ and H_2SO_4 on salicylic acid at 50° (Deninger, *J pr* [2] 42, 550), by boiling (e) nitro amido benzoic acid [263°] with potash (Griess, *B* 11, 1730), and by heating *p* nitro phenol with COI and alcoholic potash at 100° (Hasse, *B* 10, 2188) White needles, v sol alcohol Its aqueous solution is coloured red by $FeCl_3$ Distillation with CaO yields *p* nitro phenol [114°]

Salts — KA' — NH_4A' — BaA' 6aq — $BaO_2C_6H_4NO_2$ 2aq — CaA' 6aq — SrA' 5½aq — MgA' 4aq — ZnA' 5aq — AgA'

Methyl ether MeA' [88°] Formed from methyl salicylate and nitrous acid (Deninger, *J pr* [2] 40, 302)

Ethyl ether EtA' [94°] Needles.

Methyl derivative $C_6H_4(NO_2)(OMe)(CO_2H)$ [149°] Formed from

$C_6H_4(OMe)(CO_2H)$ and HNO_3 (Kraut, *A* 150, 6, Salkowski, *A* 173, 41) Needles Gives no colour with $FeCl_3$

Ethyl derivative $C_6H_4(NO_2)(OEt)CO_2H$ [163°] (P), [161°] (K) Formed from ethoxy benzoic aldehyde $C_6H_4(OEt)CHO$ and conc HNO_3 (Perkin, *A* 145, 311) Formed also from $C_6H_4(NO_2)(OH)CO_2Me$, EtI , and KOH , the resulting $C_6H_4(NO_2)(OEt)CO_2Me$ being saponified (Kraut) Plates (from boiling water) — BaA' 2aq — EtA' [98°] (Hubner)

Amide $C_6H_4(NO_2)(OH)CONH_2$ [225°] Needles Behaves as an acid, decomposing carbonates, and forming the salts $C_6H_4KN_2O_4$ aq — CaA' 4aq — BaA' 4aq — PbA' 4aq

Amide $C_6H_4(NO_2)(OH)CONHPh$ [224°] Formed by nitrating $C_6H_4(OH)CONHPh$ (Mensching, *A* 210, 343) Needles

Nitro-oxy-benzoic acid

$C_6H_4(NO_2)(OH)CO_2H$ [3 21] [144°] S 13 at 155° (Schiff) Formed as above, and also by adding H_2SO_4 to a solution of salicylic acid and $NaNO_2$ at 100° (Deninger, *J pr* [2] 42, 551), and by the action of nitrous acid on oil of wintergreen (Smith & Knapp, *Am* 8, 100) Obtained also by heating *o* nitro phenol with CCl_4 and alcoholic potash at 100° (Hasse) Needles (containing aq) Melts at 125° when hydrated, 144° when anhydrous $FeCl_3$ colours its solution red Yields *o* nitro phenol on heating with dilute H_2SO_4 at 150°

Salts — NaA' — KA' — BaA' Needles — $BaC_6H_4NO_2$ 1½aq — MgA' 2aq — $PbC_6H_4NO_2$ — AgA'

Ethyl ether EtA' [118°]

Amide $C_6H_4(NO_2)(OH)CONH_2$ [146°] Needles Yields the salts $Ca(C_6H_4NO_2)_2$ 4aq — BaA' 2aq — $Pb(OH)A'$ 2aq

Nitro-oxy benzoic acid $C_6H_4NO_2$ 12

$C_6H_3(NO_2)(OH)(CO_2H)$ [6 21] *Amide of the methyl derivative* $C_6H_3(NO_2)(OMe)CONH_2$ [195°] Formed by boiling its nitrile with baryta water (Lobry de Bruyn, *R T C* 2, 217) Yellowish needles, m sol acetone

Nitrile of the methyl derivative $C_6H_3(NO_2)(OMe)CN$ [171°] Formed by boiling *m* di nitro benzene with KCy and $MeOH$ (Lobry de Bruyn, *R T C* 2, 212) Needles (from alcohol) Boiling alcoholic potash converts it into $C_6H_4(OH)_2CO_2H$

Amide of the ethyl derivative $C_6H_4(NO_2)(OEt)CONH_2$ [197°] Needles

Nitrile of the ethyl derivative $C_6H_4(NO_2)(OEt)CN$ [137°] Formed from *m* di-nitro benzene and alcoholic KCy Tables

***a* Nitro-m oxy benzoic acid**

$C_6H_4(NO_2)(OH)CO_2H$ [6 31] [169°] Formed by boiling (a) nitro amido benzoic acid with potash (Griess, *B* 11, 1733) Light yellow crystals containing aq, v sol water — $BaC_6H_4NO_2$ 6aq orange prisms

Methyl derivative

$C_6H_4(NO_2)(OMe)(CO_2H)$ [188°] Formed by oxidising $C_6H_4(NO_2)(OMe)CHO$ with $KMnO_4$ (Rieche, *B* 22, 2354)

***β* Nitro-m oxy benzoic acid**

$C_6H_4(NO_2)(OH)CO_2H$ [4 31] [230°] Formed by boiling the corresponding nitro amido-benzoic acid with KOH aq and, together with the (2,3,1) and (5,3,1) isomerides, by nitration of a boiling aqueous solution of *m* oxy-benzoic acid by HNO_3

(Griess, *B* 5, 856, 20, 403). Yellow plates (from hot water) — $\text{BaC}_2\text{H}_3\text{NO}_3$, aq

Nitrile $\text{C}_6\text{H}_3(\text{NO}_2)(\text{OH})\text{CN}$ [183°] From *m* oxy benzoic nitrile and HNO_3 (Smith, *J pr* [2] 16, 227) Coloured dark red by aqueous FeCl_3 . Belongs perhaps to one of the isomeric nitro-*m*-oxy-benzoic acids

(*γ*)-Nitro-*m*-oxy-benzoic acid
 $\text{C}_6\text{H}_3(\text{NO}_2)(\text{OH})\text{CO}_2\text{H}$ [2 3 1] [178°] Formed by boiling (2,3,1)-nitro amido benzoic acid with potash, and also by nitrating *m* oxy benzoic acid (Griess, *B* 11, 1734, 20, 403) Yellow plates or prisms (containing aq) Tastes sweet — BaA'_2 , 13aq

Methyl derivative $\text{C}_6\text{H}_3(\text{NO}_2)(\text{OMe})\text{CO}_2\text{H}$ [251°] Formed from its aldehyde and Ag_2O (Rieche, *B* 22, 2352) White plates — AgA'

(*δ*)-Nitro-*m*-oxy-benzoic acid
 $\text{C}_6\text{H}_3(\text{NO}_2)(\text{OH})\text{CO}_2\text{H}$ [5 3 1] [167°] Formed by nitrating *m*-oxy benzoic acid (*o supra*) Crystals (containing aq) — BaA'_2 , 6aq prisms

Methyl derivative $\text{C}_6\text{H}_3(\text{NO}_2)(\text{OMe})\text{CO}_2\text{H}$ [233°] Long white needles (Rieche, *B* 22, 2356)

δ-Nitro-*p*-oxy-benzoic acid
 $\text{C}_6\text{H}_3(\text{NO}_2)(\text{OH})\text{CO}_2\text{H}$ [3 4 1] [185°]

Formation — 1 By dissolving *p* oxy-benzoic acid in dilute nitric acid (Barth, *Z* 1866, 647, Griess, *B* 20, 408) — 2 By boiling (3,4,1)-nitro-amido benzoic acid with potash (Griess, *B* 5, 856) — 3 By the action of aqueous NaNO_2 and H_2SO_4 on *p*-oxy benzoic acid at 40° (Deninger, *J pr* [2] 42, 552) — 4 In small quantity in the action of CCl_4 and alcoholic potash on *o* nitro phenol (H)

Properties — Needles, sl sol hot water Gives no colour with FeCl_3

Salt — $\text{BaC}_2\text{H}_3\text{NO}_3$, aq red nodules

Methyl derivative $\text{C}_6\text{H}_3(\text{NO}_2)(\text{OMe})\text{CO}_2\text{H}$
Nitransic acid [187°] Formed by boiling anisic acid or oil of anise with nitric acid (Laurer, *B* 23, 416, Cahours, *A Ch* 41, 71, Engelhardt, *A* 108, 243, Salkowski, *A* 163, 6, *B* 10, 1254) Also from $\text{C}_6\text{H}_3(\text{NO}_2)(\text{OMe})\text{CH}_2\text{NHAc}$ by oxidation with $\text{K}_2\text{Cr}_2\text{O}_7$ (Goldschmidt a Polonowska, *B* 20, 2410) Small needles (from water) Yields *o*-nitro phenol on heating with water at 220° — NaA'_2 aq — KA'_2 aq — CaA'_2 , 4aq — SrA'_2 , 4aq — BaA'_2 , flocculent pp — PbA'_2 — AgA'

Methyl ether of the methyl derivative
 $\text{C}_6\text{H}_3(\text{NO}_2)(\text{OMe})\text{CO}_2\text{Me}$ [108°] Plates

Ethyl ether of the methyl derivative
 $\text{C}_6\text{H}_3(\text{NO}_2)(\text{OMe})\text{CO}_2\text{Et}$ [100°] Tables

Nitrile of the methyl derivative
 $\text{C}_6\text{H}_3(\text{NO}_2)(\text{OMe})\text{CN}$ [150°] Formed from $\text{C}_6\text{H}_3(\text{OMe})\text{CN}$ and HNO_3 (Henry, *B* 2, 668) Small needles (from alcohol)

Nitro di-oxy-benzoic acid Di methyl derivative $\text{C}_6\text{H}_2(\text{NO}_2)(\text{OMe})_2\text{CO}_2\text{H}$ [4 5 3 1] [225°] Formed from $\text{C}_6\text{H}_2(\text{OMe})_2\text{CO}_2\text{H}$ and dilute HNO_3 (H Meyer, *M* 8, 431) Needles (from water) Yields on reduction, $\text{C}_6\text{H}_2(\text{NH}_2)(\text{OMe})_2\text{CO}_2\text{H}$ [182°] — NaA'_2 , 23aq — PbA'_2 — AgA' needles

Nitro-di-oxy-benzoic acid Methyl derivative $\text{C}_6\text{H}_2(\text{NO}_2)(\text{OH})(\text{OMe})\text{CO}_2\text{H}$ [x 4 3 1]
Nitro-xanthic acid White needles (Matsumoto, *B* 11, 122)

Acetyl derivative
 $\text{C}_6\text{H}_2(\text{NO}_2)(\text{OAc})(\text{OMe})\text{CO}_2\text{H}$ [182°] Needles

Di-methyl derivative
 $\text{C}_6\text{H}_2(\text{NO}_2)(\text{OMe})_2\text{CO}_2\text{H}$ *Nitro veratric acid*.

Yellow needles (containing 3aq) Its methyl ether melts at 144° and its ethyl ether at 100°

Di-nitro-oxy-benzoic acid

$\text{C}_6\text{H}_2(\text{NO}_2)_2(\text{OH})\text{CO}_2\text{H}$ [5 3 2 1] *Di nitro-salicylic acid* [173°] Formed by nitration of salicylic acid (Cahours, *A Ch* [8] 25, 11, Stenhouse, *A* 78, 1, Hübner, *A* 195, 45) Tables or needles (containing aq) After fusion it melts at 158° FeCl_3 colours its solution red — $\text{NH}_4\text{A}'$ — KA' sl sol water — $\text{K}_2\text{C}_2\text{H}_3\text{N}_2\text{O}$, aq m sol water — NaA' — BaA'_2 — $\text{BaC}_2\text{H}_3\text{N}_2\text{O}$, 3aq needles — CaA'_2 , 2aq — $\text{PbC}_2\text{H}_3\text{N}_2\text{O}$, 3aq — AgA' sparingly soluble granules

Methyl ether MeA' [127°] Yellowish scales Yields $\text{NH}_4\text{C}_2\text{H}_3\text{N}_2\text{O}$, and $\text{AgC}_2\text{H}_3\text{N}_2\text{O}$,

Ethyl ether EtA' [99°] Yields the salts $\text{NH}_4\text{C}_2\text{H}_3\text{N}_2\text{O}$, and $\text{AgC}_2\text{H}_3\text{N}_2\text{O}$,

Methyl derivative of the methyl ether $\text{C}_6\text{H}_2(\text{NO}_2)_2(\text{OMe})\text{CO}_2\text{Me}$ [69°] Prisms (Salkowski, *A* 173, 43)

Methyl derivative of the ethyl ether $\text{C}_6\text{H}_2(\text{NO}_2)_2(\text{OMe})\text{CO}_2\text{Et}$ [47°] Tables

Ethyl derivative of the methyl ether $\text{C}_6\text{H}_2(\text{NO}_2)_2(\text{OEt})\text{CO}_2\text{Me}$ [80°] Prisms

Ethyl derivative of the ethyl ether $\text{C}_6\text{H}_2(\text{NO}_2)_2(\text{OEt})\text{CO}_2\text{Et}$ [49°] Prisms

Di nitro p oxy benzoic acid

$\text{C}_6\text{H}_2(\text{NO}_2)_2(\text{OH})\text{CO}_2\text{H}$ [5 3 4 1] [237°] Formed by boiling di nitro-*p*-amido benzoic acid with potash (Salkowski, *A* 173, 36) Thin tables — KA' S 7 at 16 5° — $\text{K}_2\text{C}_2\text{H}_3\text{N}_2\text{O}$, 2aq S 32 at 16 5° — $\text{BaC}_2\text{H}_3\text{N}_2\text{O}$, 5aq — $\text{BaC}_2\text{H}_3\text{N}_2\text{O}$, 33aq — AgA' — $\text{AgC}_2\text{H}_3\text{N}_2\text{O}$,

Ethyl ether EtA' [87°] Yields $\text{KC}_2\text{H}_3\text{N}_2\text{O}$, S 9, and $\text{AgC}_2\text{H}_3\text{N}_2\text{O}$,

Methyl derivative $\text{C}_6\text{H}_2(\text{NO}_2)_2(\text{OMe})\text{CO}_2\text{H}$
Dinitransic acid [182°] Formed by nitration of nitro anisic acid (Salkowski a Rudolph, *B* 10, 1254, Stöhr, *A* 225, 86) — KA' aq — AgA'

Ethyl ether EtA' [79°]

Ethyl derivative of the ethyl ether $\text{C}_6\text{H}_2(\text{NO}_2)_2(\text{OEt})\text{CO}_2\text{Et}$ [59°] Needles

Tri nitro m oxy benzoic acid

$\text{C}_6\text{H}(\text{NO}_2)_3(\text{OH})\text{CO}_2\text{H}$ Formed by warming *m* diazoamide benzoic acid with HNO_3 (Griess, *A* 117, 28), and by the action of fuming HNO_3 on *m* amido benzoic acid (Beilstein a Geitner, *A* 139, 11) Large crystals (from conc HNO_3) Explodes when heated ($\text{NH}_4\text{C}_2\text{H}_3\text{N}_2\text{O}$, 2aq — $\text{BaC}_2\text{H}_3\text{N}_2\text{O}$, 3aq — $\text{AgC}_2\text{H}_3\text{N}_2\text{O}$,

Tri-nitro oxy benzoic acid [105°] Formed from *m*-oxybenzoic acid by successive treatment with dilute H_2SO_4 and HNO_3 (Schardinger, *B* 8, 1490) Tables and prisms (containing aq) — $\text{BaC}_2\text{H}_3\text{N}_2\text{O}$, 2aq — $\text{CaC}_2\text{H}_3\text{N}_2\text{O}$, 5aq green needles, exploding at 237°

NITRO-OXY BENZOIC ALDEHYDE

$\text{C}_6\text{H}_3(\text{NO}_2)(\text{OH})\text{CHO}$ [3 2 1] [109°] Formed together with the (5,2,1) isomeride, by nitrating salicylic aldehyde (Mazzara, *B* 6, 460, Von Miller, *B* 20, 1927, 22, 1709, Taegge, *B* 20, 2109) Its compound with NaHSO_3 does not crystallise Sodium amalgam forms brown amorphous $\{\text{C}_6\text{H}_3(\text{OH})(\text{CHO})\}_n\text{N}_2\text{H}_4$ (Briegleb, *A* 135, 169) — $\text{NaC}_2\text{H}_3\text{NO}$ — $\text{BaC}_2\text{H}_3\text{NO}$, 2aq orange crystals

Acetyl derivative [110°]

Phenyl-hydraside [165°]

Methyl derivative $\text{C}_6\text{H}_3\text{NO}_4$ [102°]

Nitro-oxy-benzoic aldehyde

$\text{C}_6\text{H}_3(\text{NO}_2)(\text{OH})\text{CHO}$ [5.2.1] [125°] Formed as

above Fo ms a solid compound with NaHSO_4 — NaA' 2aq needles — BaA' 6aq — BaA' 8aq

Acetyl derivative [119°]

Phenyl-hydrazide [186°]

Methyl derivative $\text{C}_6\text{H}_5(\text{NO}_2)(\text{OMe})\text{CHO}$ [90°] Formed by nitrating $\text{C}_6\text{H}_5(\text{OMe})\text{CHO}$ (Schnell, *B* 17, 1382, cf Voswinkel, *B* 15, 2027) Needles (from water)

Nitro-m-oxy-benzoic aldehyde

$\text{C}_6\text{H}_5(\text{NO}_2)(\text{OH})(\text{CHO})$ [2 3 1] [128°] Formed, together with the isomeride [166°], by nitration of *m*-oxy benzoic aldehyde (Tiemann & Ludwig, *B* 15, 2052, 3052) Yellow plates, sol benzene

Methyl derivative

$\text{C}_6\text{H}_5(\text{NO}_2)(\text{OMe})\text{CHO}$ [107°] (T & L), [102°] (R) Formed from the aldehyde, KOH, and MeI (T & L) Formed also, together with the (6, 3, 1) and (5, 3, 1) isomerides from $\text{C}_6\text{H}_5(\text{OMe})\text{CHO}$ and HNO_3 at 0° (Rieche, *B* 22, 2350) Forms a very soluble compound with NaHSO_4 With acetone and NaOH it condenses to di methoxy indigo $\text{C}_6\text{H}_5(\text{NO}_2)(\text{OMe})\text{CH NOH}$, its oxim, melts at 170°, and its phenyl hydrazide $\text{C}_6\text{H}_5(\text{NO}_2)(\text{OMe})\text{CH N}_2\text{HPH}$ at 134°

Nitro-m-oxy-benzoic aldehyde

$\text{C}_6\text{H}_5(\text{NO})_2(\text{OH})\text{CHO}$ [6 3 1] [166°] Formed by nitrating *m*-oxy benzoic aldehyde (T & L) Needles, v sl sol benzene

Methyl derivative [83°] Plates, vola-

tile with steam Its compound with NaHSO_4 is m sol water With acetone and KOH it yields a substance resembling indigo Its oxim $\text{C}_6\text{H}_5(\text{NO}_2)(\text{OH})\text{CH NOH}$ melts at 152°, and the corresponding phenyl hydrazide at 154°

Nitro-m-oxy-benzoic aldehyde *Methyl*

derivative $\text{C}_6\text{H}_5(\text{NO}_2)(\text{OMe})(\text{CHO})$ [5 3 1] [97°] (U), [104°] (R) A product of the nitration of [3 1] $\text{C}_6\text{H}_5(\text{OMe})\text{CHO}$ (Ulrich, *B* 18, 2572, Rieche, *B* 22, 2354) Does not give the indigo reaction Forms an oxim [148°], and a phenyl hydrazide [126°]

Nitro p oxy benzoic aldehyde

$\text{C}_6\text{H}_5(\text{NO})_2(\text{OH})\text{CHO}$ [3 4 1] [140°] Formed by nitrating *p*-oxy benzoic aldehyde (Mazzara, *G* 7, 285, Herzfeld, *B* 10, 1269) Needles, slightly volatile with steam — $\text{C}_6\text{H}_5(\text{NO}_2)(\text{OK})\text{CHO}$ aq — AgA' canary yellow pp

Methyl derivative *Nitro anisic alde-*

hyde [84°] Formed from anisic aldehyde, HNO_3 , and H_2SO_4 (Einhorn & Grabfield, *A* 243, 370) Yellow needles Forms a phenyl hydrazide [131°]

Di nitro m-oxy benzoic aldehyde *Methyl*

derivative $\text{C}_6\text{H}_5(\text{NO}_2)_2(\text{OMe})\text{CHO}$ [110°] Formed, together with an isomeride [155°], by treating [3 1] $\text{C}_6\text{H}_5(\text{OMe})\text{CHO}$ with H_2SO_4 and KNO_3 (Tiemann & Ludwig, *B* 15, 2055)

Nitro-di oxy benzoic aldehyde *Ethyl*

derivative $\text{C}_6\text{H}_5(\text{NO}_2)(\text{OEt})(\text{OH})\text{CHO}$ [5 2 1] [180°] Formed from $\text{C}_6\text{H}_5(\text{OEt})(\text{OH})\text{CHO}$ and dilute HNO_3 (Hantzsch, *J pr* [2] 22, 472) Scarcely volatile with steam

TETRA-NITRO o-OXY BENZYL ANILINE

$\text{C}_{10}\text{H}_5(\text{OH})(\text{NO}_2)_4\text{N}$ [86°] Formed from *o*-oxybenzyl aniline, HNO_3 , and H_2SO_4 (Emmerich, *A* 241, 345) Yellow needles (from benzene)

DI-NITRO-DI-OXY DI BENZYL UREA

Di-ethyl derivative $\text{CO}(\text{NH CH}(\text{OEt})\text{C}_6\text{H}_5(\text{NO}_2))_2$ [170°] Formed from urea, nitro-benzoic aldehyde, alcohol, and H_2SO_4 (Lüdy, *M* 10, 305).

NITRO-OXY-CINNAMIC ACID *o*. **NITRO-COUMARIC ACID**

NITRO-OXY-CUMINIC ACID *Methyl*

derivative $\text{C}_6\text{H}_3(\text{C}_6\text{H}_5)(\text{NO}_2)(\text{OMe})\text{CO}_2\text{H}$ [146°] Formed from the methyl derivative of cymophenol and dilute HNO_3 (Paterno & Canzoneri, *G* 10, 233) Yellowish crystals — BaA' 2½aq

Isomeride *v* **NITRO OXY ISOPROPYL BENZOIC ACID**

NITRO DI OXY ETHYL PYRIMIDINE

$\text{CO} \begin{smallmatrix} \text{Net CH} \\ \text{NH CO} \end{smallmatrix} \text{C}(\text{NO}_2)_2$ aq *Nitro-ethyl uracil* [194 5°] Formed from potassium nitro uracil and EtBr at 150° (Lehmann, *A* 253, 84) White needles — KA' — AgA' needles, v sl sol cold aq

DI NITRO OXY-ETHYL QUINOLINE

TETRAHYDRIDE *Ethyl derivative*

$\text{C}_{10}\text{H}_7\text{N}_2\text{O}_2$ *vs* $\text{C}_6\text{H}_5\text{Et}(\text{OEt})(\text{NO}_2)_2\text{N}$ [77°] Formed by nitrating $\text{C}_6\text{H}_5\text{Et}(\text{OEt})\text{N}$ (Kohn, *C J* 49, 509, *B* 19, 1048) Yellow prisms (from alcohol), with basic properties

NITRO OXY MALEIC IMIDE $\text{C}_6\text{H}_5\text{N}_2\text{O}_2$

The salt $\text{NH} \begin{smallmatrix} \text{CO CNO} \\ \text{CO COK} \end{smallmatrix}$ separates as light-yellow crystals when a solution of di chloro maleic imide is warmed with KNO_3 (Ciamician & Silber, *Rend Accad Linc* [4] 4, 447, *B* 22, 33, 2490). It is almost insol water

TETRA NITRO-DI-OXY METHYL-ANTHRAQUINONE $\text{C}_{14}\text{H}_2\text{Me}(\text{OH})_2(\text{NO}_2)_4\text{O}_2$ *Tetra nitro chrysophanic acid*

Formed by heating chrysophanic acid with fuming HNO_3 (Liebermann & Giesel, *A* 183, 175) Yellow plates or needles

NITRO-DI OXY METHYL-ETHYL-PYRIMIDINE

$\text{CO} \begin{smallmatrix} \text{NMe CH} \\ \text{Net CO} \end{smallmatrix} \text{C}(\text{NO}_2)_2$ [73°] *Nitro-methyl ethyl uracil* Formed from silver nitro-ethyl uracil and MeI at 130° (Lehmann, *A* 253, 86) Pearly rhombohedra (containing aq)

Nitro-di oxy methyl ethyl pyrimidine

$\text{CO} \begin{smallmatrix} \text{Net CH} \\ \text{NMe CO} \end{smallmatrix} \text{C}(\text{NO}_2)_2$ [109°] Formed from silver nitro methyl uracil and EtBr at 150° (L) Needles (containing aq)

NITRO-OXY-TRI METHYL-PYRIDINE

$\text{C}_6\text{H}_5(\text{NO}_2)\text{NO}$ *Nitro methyl ψ lutidostyryl* [161°] Formed by nitrating oxy tri methyl-pyridine (Hantzsch, *B* 17, 1032) Yellow needles or prisms, sol hot alcohol

NITRO-DI OXY METHYL PYRIMIDINE

$\text{C}_6\text{H}_5\text{N}_2\text{O}_2$ *vs* $\text{CO} \begin{smallmatrix} \text{NH CH} \\ \text{NMe CO} \end{smallmatrix} \text{CNO}_2$ *Nitro-methyl-uracil* [255°] S 714 at 20° Formed from potassium nitro-uracil and MeI at 140° (Hoffmann, *A* 253, 77) Needles (containing aq), v sol hot water Baryta water at 160° liberates methylamine and NH_3 — KA' needles — BaA' — AgA' minute white needles (from hot water)

Nitro-di-oxy-di-methyl pyrimidine

$\text{CO} \begin{smallmatrix} \text{NMe CH} \\ \text{NMe CO} \end{smallmatrix} \text{C}(\text{NO}_2)_2$ [154 5°] From the silver salt of nitro di oxy methyl pyrimidine and MeI at 120° (Lehmann, *A* 253, 82) Needles (containing aq) Yields NMeH , when heated with baryta at 180°

NITRO-OXY METHYL-QUINAZOLINE

$\text{C}_6\text{H}_5(\text{NO}_2) \begin{smallmatrix} \text{C(OH) N} \\ \text{N} \text{---} \text{CMe} \end{smallmatrix}$ Formed from oxy-methyl-quinazoline [288°] and conc. HNO_3 (De

hoff, *J pr* [2] 42, 348) Yellow crystalline powder, sol alcohol Does not melt below 280°

Methyl derivative [165°] Needles

(Py 2) **NITRO (Py 1) OXY (Py 3)-METHYL-QUINOLINE** $C_8H_7 \begin{smallmatrix} \diagup C(OH)C(NO_2) \\ \diagdown N=CMe \end{smallmatrix}$ Formed by nitrating oxy (Py 3) methyl quinoline (Conrad a Lumpach, B 20, 950) Needles, v sl sol boiling alcohol Does not melt at 270°

(B 3) Nitro (B 4) oxy (B 1) methyl quinoline $\begin{smallmatrix} CHCMe \\ C(NO_2)C(OH)CNOH \end{smallmatrix}$ [206°] This body

is formed by oxidising the corresponding nitroso oxy-methyl quinoline with alkaline K_2FeC_4 (Noelting a Trautmann, B 23, 3667) In the same way may be formed (B 4) nitro (B 1) oxy- (B 2)-methyl quinoline, (B 1) nitro (B 4) oxy- (B 3) methyl quinoline [193°], and (B 2) nitro- (B 1) oxy- (B 4) methyl quinoline [182°]

NITRO-OXY-TRI-METHYL QUINOLINE CARBOXYLIC ACID $C_8H_7N_3O_6$ Formed by warming (Py 1) oxy (B 1, 2, 4, Py 3) tetra methyl-quinoline with HNO_3 (S G 14) (Conrad a Lumpach, B 21, 529) White insoluble powder —NaA' aq yellowish needles

NITRO-DI OXY-NAPHTHALENE v NITRO-HYDRONAPHTHOQUINONE

Di-nitro di-oxy-naphthalene *Di ethyl-derivative* $C_{10}H_6(NO_2)_2(OEt)_2$ [229°] Formed from (e)-di chloro di nitro naphthalene and alcoholic potash (Alén, B [2] 36, 435) Yellow needles

NITRO-OXY-NAPHTHOIC ACID $C_{10}H_5(NO_2)(OH)CO_2H$ [242°] Formed by dissolving its anhydride in alkalis (Ekstrand, *J pr* [2] 38, 282) Plates — $CaC_2H_5NO_5$ aq yellowish-red needles

Anhydride $C_{10}H_5(NO_2) \begin{smallmatrix} O \\ \diagdown CO \end{smallmatrix}$ [242°]

Formed by nitrating *peroxy* oxy naphthoic acid Yellow needles (from HOAc)

Nitro-oxy-naphthoic acid [202°] (Schmidt a Burkard, B 20, 2700) Yields (β)-nitro (α) naphthol on distillation with lime

NITRO-OXY-(α)-NAPHTHOQUINONE

$C_{10}H_6NO_4$ is $C_6H_5 \begin{smallmatrix} COCNO_2 \\ COCOH \end{smallmatrix}$ *Nitronaphthalic acid* [157°] Formed from oxy (α)-naphthoquinone, H_2SO_4 , and HNO_3 , the yield being 85 p c of the theoretical (Diehl a Merz, B 11, 1317) Formed also from di chloro (α)-naphthoquinone and alcoholic $NaNO_2$ at 100° (Kehrmann, B 21, 1780, *J pr* [2] 40, 180) Yellow leaflets or tables — NH_4A' — NaA' aq — $KA'A'$ — BaA'_2 — PbA'_2 aq — PbA'_2 — AgA'_2

Sulphonic acid

$C_{10}H_6(SO_3H)(NO_2)(OH)O_2$ [2 3 2 4 1] Formed from di chloro (α) naphthoquinone sulphonic acid [229°] and $NaNO_2$ (K) — $K_2C_8H_5N_2SO_6$ (dried at 100°) slender yellow needles

DI-NITRO-DI OXY (ββ) DINAPHTHYL DISULFONIC ACID $C_{20}H_{12}(NO_2)_2(OH)_2(SO_3H)_2$ Got by nitrating $C_{20}H_{12}(OH)_2(SO_3)_2Ba$ (Julius, *Chem Ind* 10, 97) Yellow needles (containing 3aq)

o NITRO-p OXY-DIPHENYL

[4 1] $C_6H_4(OH)C_6H_5$ [1 2] [138°] Formed by the action of nitrous acid on the corresponding nitro amido diphenyl (Schultz a Strasser, B 14, 614, A 207, 351) Yellow needles

p Nitro p oxy-diphenyl

[4 1] $C_6H_4(OH)C_6H_4NO_2$ [1 4] [170°] Formed from p nitro p amido diphenyl (S a 3)

Nitro oxy-diphenyl $C_{12}H_9(NO_2)(OH)$ [67°] Formed by nitration of oxydiphenyl (Latschhoff, *J R* 5, 52) Lemon yellow prisms (from ether)

Di-nitro-oxy-diphenyl $C_{12}H_7(NO_2)_2(OH)$ [154°] Formed at the same time as the preceding (L) Golden plates (from alcohol) — KA' , 2aq sparingly soluble plates

Di nitro di-oxy-diphenyl

[3 4 1] $C_6H_4(NO_2)(OH)C_6H_4(NO_2)(OH)$ [1 3 4] [272°] (K), [280°] (S) Formed from *pp* di-oxy diphenyl and HNO_3 (S G 1 45) (Kunze, B 21, 3331, Schutz, B 21, 3531) Yellow needles, insol alcohol

Di-acetyl derivative [215°] Needles

Di-benzoyl derivative [206°] Plates

Ethyl ether [193°] Formed by nitrating the ethyl ether of di oxy diphenyl (Husch, B 22, 336)

Di-nitro-di-oxy-diphenyl $C_{12}H_7N_2O_6$ [184°]

Formed by oxidising o nitro phenol with aqueous $KMnO_4$ (Goldstein, *J R* 6, 193, 10, 318) Yel low needles (from benzene)

Di-benzoyl derivative [191°] Needles

Tetra-nitro-di-oxy-diphenyl

[4 3 5 1] $C_6H_4(OH)(NO_2)C_6H_4(NO_2)(OH)$ [1 3 5 4] [220°] (K), [225°] (S) From di-oxy diphenyl, HOAc, and HNO_3 (Kunze, B 21, 3333, Schutz, B 21, 3532) Yellow needles — NaA'' — $NaHA''$ brownish red needles

Di-acetyl derivative [236°] Needles

Hexa-nitro tetra-oxy-diphenyl $C_6H_4N_6O_{10}$ *Hexa nitro duresorein* Formed by warming tetra acetyl duresorein with fuming HNO_3 (Bene dikt a Julius, M 5, 178) Yellow crystals, exploding at 230°, v e sol water

m NITRO α OXY PHENYL ACETIC ACID v NITRO MANDELIC ACID

NITRO OXY PHENYL AMIDO BENZOIC ACID $C_8H_5(OH)NH C_6H_4(NO_2)CO H$ [4 3 1] [261°] Formed from bromo nitro benzoic acid, alcohol, and amido phenol at 120° (Schopff, B 22, 3248) Small needles, m sol water

DI NITRO α OXY DIPHENYLAMINE

[2 1] $C_6H_4(OH)NH C_6H_4(NO_2)$ [1 2 4] [199°] Got from $C_6H_5Br(NO_2)_2$ and o amido phenol (Schopff, B 22, 900) Orange crystals (from alcohol)

Acetyl derivative [150°] Needles

Ethyl derivative [164°] Red needles.

Methyl derivative [161°] Needles

Di-nitro p oxy-diphenylamine *Di benzoyl derivative* $C_{12}H_7(NO_2)_2(OBz)NBz$ [195°] Got by nitrating $C_{12}H_7(OBz)NBz$ (Philip a Calm, B 17, 2437) Small crystals, sl sol alcohol

Di-nitro-di-oxy-diphenylamine *Diethyl derivative* $C_{12}H_9NHC_6H_4(NO_2)_2(OEt)_2$ [133°]

Formed by heating aniline with the diethyl derivative of di nitro hydroquinone (Dietzki, A. 215, 157) Red needles (from alcohol)

NITRO-OXY-PHENYL-ANGELIC-(β) LACTONE

[4 1] $C_6H_4(NO_2)CHCH \begin{smallmatrix} CH_2 \\ O \end{smallmatrix} CO$ [111°] Formed by adding soda to a cold solution of $C_6H_4(NO_2)C_6H_4BrCH \begin{smallmatrix} CH_2 \\ O \end{smallmatrix} CO$ (Einhorn a Gehrenbeck, B 22, 47, A 253, 870)

o-NITRO-β-OXY PHENYL BUTYLENE DI-CARBOXYLIC ACID

[1 2] $C_6H_4(NO_2)CHCHCH(OH)CH(CO_2H)_2$

[269°] Formed by heating malonic acid (10 g) with *o*-nitro cinnamic aldehyde (15 g) at 125° (Einhorn) *A* 253, 375) Stellate needles

NITRO-OXY-PHENYL-CARBAMIC ETHER

Ethyl derivative $C_6H_4(NO_2)(OEt)NHCO_2Et$ [71°] Formed, as well as two di-nitro-derivatives [141°] and [121°] and a tri-nitro derivative [212°] by the action of nitric acid on [4 1] $C_6H_4(OEt)NHCO_2Et$ (Köhler, *J pr* [2] 29, 261) All four compounds crystallise from alcohol in needles

NITRO DI OXY PHENYL CROTONIC ACID

Anhydride $C_6H(NO)(OH)<\overset{CMe}{O}-CO$ Nitro (8) methyl umbelliferone Formed, as well as the di-nitro derivative [220°] by nitration of (8) methyl umbelliferone dissolved in HOAc (Fechmann & Cohen, *B* 17, 2136) Both compounds crystallise in yellow needles, sol alcohol

NITRO-OXY-PHENYL-ETHYLENE

NITRO- α -STYRENE

o-NITRO- β -OXY-PHENYL ETHYL METHYL KETONE

$C_{10}H_{11}NO_3$ *ie* $C_6H_4(NO_2)CH(OH)CH_2COCH_3$ [69°] Formed from *o*-nitro benzoic aldehyde, acetone, and dilute aqueous NaOH (Baeyer & Drewsen, *B* 15, 2857) Prisms

p-Nitro- β -oxy-phenyl-ethyl methyl ketone [58°] Formed in like manner from *p*-nitro benzoic aldehyde (Baeyer & Becker, *B* 16, 1969) Crystals Yields nitro styryl methyl ketone on boiling with AcO Boiling potash forms a compound ($C_{10}H_9NO_3$)_n [254°]

p-NITRO- β -OXY-PHENYL (Py 3) ETHYL-QUINOLINE $C_6H_4(NO_2)CH(OH)CH_2(CNCH_2)_3$ [160°] Formed by heating (Py 3) methyl quinoline with *p*-nitro benzoic aldehyde at 120° (Bulach, *B* 20 2016) Silky needles (from alcohol) —B' H_2PtCl_6 —B' HNO_3 white needles

DI-NITRO DI OXY DI PHENYL-HYDRAZINE

Di-ethyl derivative $\{C_6H_4(NO_2)(OEt)\}_2N_2H_2$ [202°] Formed by reduction of the corresponding azo compound [285°] by alcoholic ammonium sulphide (Andree, *J pr* [2] 21, 325) Yellow prisms, insol cold alcohol Hot HClAq converts it into nitro amido phenol and $\{C_6H_4(NO)(OEt)\}_2N_2$

NITRO OXY-PHENYL-METHYL PYRAZOLE

$C_{10}H_9N_3O_2$ *ie* $C_6H_4N<\overset{COCH(NO_2)}{N}CMe$ [127°-130°] Formed by the action of nitrous acid on oxy phenyl methyl pyrazole, and of nitric acid on the oxim thereof (Knorr, *A* 238, 187) Prisms (from alcohol), insol acids

NITRO-OXY-PHENYL-PROPIOLIC ACID

Methyl derivative $C_6H_4(NO_2)(OMe)CCO_2H$ [135°] Formed from $C_6H_4(NO_2)(OMe)CHBrCHBrCO_2H$ and alcoholic potash (Einhorn & Grabheld, *A* 243, 377) White needles, sol water

NITRO-OXY-PHENYL-PROPIONIC ACID

[8 4 1] $C_6H_4(NO_2)(OH)CH_2CH_2CO_2H$ Nitro-hydro-*p*-coumaric acid [91°] Formed by nitrating *p*-oxy phenyl propionic acid (Stöhr, *A* 225, 57) Orange needles (from water)

Methyl ether MeA' [64°] Needles

Ethyl ether EtA' [38°] Needles

Nitro- α -oxy-phenyl-propionic acid

$C_6H_4(NO_2)CH_2CH(OH)CO_2H$ A mixture of the *o*- and *p*- isomerides is formed by the action of fuming HNO_3 at —5° on α -oxy phenyl pro-

piotic acid (Erlenmeyer & Lupp, *A* 219, 228) The nitrate $C_6H_4(NO_2)CH_2CH(ONO_2)CO_2H$ of the *p* isomeride crystallises from hot water in needles, leaving that of the *o* compound in solution

o-Nitro- β -oxy-phenyl-propionic acid $C_6H_4NO_3$ *ie* [2 1] $C_6H_4(NO_2)CH(OH)CH_2CO_2H$ [126°] Formed by oxidation of the product of condensation of *o*-nitro benzoic aldehyde with acetic aldehyde (Baeyer & Drewsen, *B* 16, 2206) Formed also from β bromo *o*-nitro phenyl propionic acid and hot Na_2CO_3 Aq (Einhorn, *B* 16, 2214, 17, 1660, 2013) Monoclinic prisms (from water) Dilute H_2SO_4 at 190° converts it into *o*-nitro cinnamic acid — BaA_2 2aq needles

Methyl ether MeA' [51°]

β Lactone $C_6H_4(NO_2)CH<\overset{CH_2}{O}>CO$

[124°] Formed from $C_6H_4(NO_2)CHBrCH_2CO_2H$ and cold aqueous Na_2CO_3 Yellow monoclinic crystals (from chloroform) Split up by boiling with water into *o*-nitro styrene and CO_2 Boiling HOAc yields indigo

Amide $C_6H_4NO_3N_2O$ [197°] Formed from β bromo *o*-nitro phenyl propionic acid and ammonia Formed also from the lactone and NH_3 (Einhorn, *B* 16, 2646, Basler, *B* 17, 1494) Needles, v sol water Yields with AcO an acetyl derivative $C_6H_4AcN_2O$ [142°], a compound $C_6H_4N_2O_3$ [c 80°], and the acetyl derivative thereof $C_6H_4AcN_2O_3$ [172°]

m-Nitro- β -oxy-phenyl propionic acid

[3 1] $C_6H_4(NO)CH(OH)CH_2CO_2H$ [105°] Formed by boiling β bromo *m*-nitro phenyl propionic acid with water (Prausnitz, *B* 17, 596, 1660) Plates (from water)

Ethyl ether EtA' [56°] Crystals

Lactone $C_6H_4NO_3$ [98°] Deposited from a cold solution of the sodium salt Yields *m*-nitro styrene on boiling with water

p-Nitro- β -oxy phenyl-propionic acid

$C_6H_4NO_3$ [132°] Formed by the action of alkalis on β bromo *p*-nitro phenyl propionic acid, its lactone being the intermediate product (Basler, *B* 16, 3004, 17, 1494) Needles, m sol cold Aq

Methyl ether MeA' [74°] Prisms

Ethyl ether EtA' [46°] Crystalline

Lactone $C_6H_4NO_3$ [92°] Yields *p*-nitro styrene when boiled with HOAc

Amide $C_6H_4NO_3N_2O$ [166°] Prisms (from alcohol) Forms with Ac_2O an acetyl derivative [146°-150°]

Anilide $C_6H_4N_2O$ [176°] Plates

p-Nitro- α -di-oxy-phenyl-propionic acid

$C_6H_4NO_3$ *ie* $C_6H_4(NO_2)CH(OH)CH(OH)CO_2H$ [168°] Formed from *p*-nitro phenyl glycidic acid and diluted H_2SO_4 (Lupp, *B* 19, 2645) Plates, sl sol cold water

o-Nitro- m -di-oxy phenyl propionic acid

Methyl derivative

[2 5 1] $C_6H_4(NO_2)(OMe)CH(OH)CH_2CO_2H$ [106°] Got from $C_6H_4Cl(NO)CH(OH)CH_2CO_2H$ and NaOMe (Eichengrün & Einhorn, *B* 23, 1491) Colourless plates (from water)

ap-Di-nitro- β -oxy-phenyl-propionic acid.

Methyl derivative

$C_6H_4(NO_2)CH(OMe)CH(ONO_2)CO_2H$ Methyl ether MeA' [118°] Formed from methyl *ap*-di-nitro cinnamate by boiling with MeOH (Friedlander & Mahly, *B* 16, 851, *A* 229, 210).

Q Q

Ethyl ether EtA' [77°]. Formed in like manner, using EtOH

Ethyl derivative

$C_6H_4(NO_2)CH(OEt)CH(NO_2)CO_2H$ Methyl ether MeA' [110°] Formed by boiling *o*-nitro-cinnamic ether with alcohol Monoclinic prisms $a b c = 849 \text{ 1 517}$, $\beta = 87^\circ 25'$ Sol potash Yields the salts $Ba(C_{12}H_{11}N_2O_7)_2$ and $AgC_{12}H_{11}N_2O_7$. Ethyl ether EtA' [52°]. Monoclinic crystals

Di-nitro-oxy-phenyl-propionic acid $C_6H_4N_2O_7$, te [5 3 4 1] $C_6H_4(NO_2)_2(OH)CH_2CH_2CO_2H$ Di-nitro hydro *p*-coumaric acid [138°] Formed by nitrating oxy phenyl propionic acid (Stöhr, A 225, 68) Trimetric prisms (from HOAc) — NH_4A' [230°] — $(NH_4)_2A'$ — $AgHA'$ — AgA' dark red needles

Methyl ether MeA' [87°] Needles Yields $AgMeA'$ on adding Ag_2CO_3 to its ethereal solution

Ethyl ether EtA' [175°] Yields red needles of $AgEtA'$

Methyl derivative

$C_6H_4(NO_2)_2(OMe)CH_2CH_2CO_2H$ [124°] Got by saponifying its methyl ether with H_2SO_4 and HOAc Needles or plates (from dilute alcohol) Methyl ether $C_6H_4(NO_2)_2(OMe)C_6H_4CO_2Me$ [53°] From the basic silver salt and MeI Ethyl ether EtA' [71°] Needles, v sl sol Aq

Ethyl derivative

$C_6H_4(NO_2)_2(OEt)CH_2CH_2CO_2H$ [126°] Needles Methyl ether MeA' [36°] Ethyl ether EtA' [50°] Needles or plates

Di-nitro oxy-phenyl-propionic acid $C_6H_4N_2O_7$, *Dinitromeliotic acid* [155°] Formed by nitrating meliotic acid (Zwenger, A Suppl 5, 118) Prisms (from alcohol) — BaA' aq — Ag_2A'

Two isomeric acids are obtained by nitration of phloretic acid (Hlasiwetz, A 102, 155) Both form yellow crystals

o-NITRO- β -OXY-PHENYL PROPIONIC ALDEHYDE $C_6H_4NO_3$, te

[1 2] $C_6H_4(NO_2)CH(OH)CH_2CHO$ Formed from *o*-nitro benzoic aldehyde, acetic aldehyde, and 2 p c aqueous NaOH (Baeyer & Drewsen, B 16, 2205) Crystalline Forms a compound with aldehyde $C_6H_4NO_3(C_2H_5O)$ [125°], which yields indigo on treatment with alkalis Similar compounds of the formula $C_6H_4NO_3(C_2H_5O)$ are formed by the action of *m*- and *p*-nitro benzoic aldehydes on aldehyde and NaOH aq The *m* compound gives off aldehyde at 100°, the *p* compound melts at about 115° (Göhring, B 18, 372, 720)

m-NITRO- β -OXY-PHENYL-PYROTARTARIC ACID Lactone $C_{11}H_7NO_7$, te

$C_6H_4(NO_2)CH \begin{smallmatrix} O \\ \diagup \diagdown \\ CO \\ \diagdown \diagup \end{smallmatrix} CH_2$ Nitro-phenyl-paraconic acid [171°] Formed by heating *m*-nitro benzoic aldehyde with sodium succinate and Ac_2O at 125° (Salomonson, R T C 6, 1) Crystalline Boiling with NH_4Aq and $BaCl_2$ ppts $C_{11}H_7BaNO_7$ Phenylhydrazine at 130° forms $C_{11}H_7NO_7(N_2HPh)$ [132°] — $Cu(C_{11}H_7NO_7)_2$ — PbA'_2 needles (from hot water)

Methyl ether $MeC_{11}H_7NO_7$ Oil

p-Nitro- β -oxy-phenyl-pyrotartaric acid. Lactones [163°] (S), [155°] (Erdmann, B 18, 2742) Formed in like manner from *p*-nitro-benzoic aldehyde. Boiling with NH_4Aq and $BaCl_2$ ppts. $BaC_{11}H_7NO_7$ — CuA'_2 — AgA'_2

NITRO-*p*-OXY-PHENYL-QUINOLINE

$C_{13}H_9N_2O_2$ [151°] Formed in small quantities when *p*-amido (Py 8) phenyl-quinoline is heated with KNO_3 (Weidel, M 8, 138) Yellow plates, m sol alcohol

m Nitro-(B 2) oxy (Py 1) phenyl-quinoline

Methyl derivative $MeO \begin{smallmatrix} C \\ \diagup \diagdown \\ CH \\ \diagdown \diagup \end{smallmatrix} CHC \begin{smallmatrix} C \\ \diagup \diagdown \\ CH \\ \diagdown \diagup \end{smallmatrix} (C_6H_4NO_2) \begin{smallmatrix} CH \\ \diagup \diagdown \\ CH \\ \diagdown \diagup \end{smallmatrix} [130°]$ Formed

by heating *m* nitro cinnamic aldehyde with *p* anisidine and $HClAq$ (Miller & Kinkeln, B 20, 1919) Needles (from benzene), sl sol alcohol. (Py 1,4,2)-Nitro oxy phenyl isouquinoline

$C_{13}H_{11}N_2O_2$, te $C_6H_4 \begin{smallmatrix} C(NO_2) \\ \diagup \diagdown \\ C(OH) \end{smallmatrix} CPh$ [c 245°].

Formed by passing nitrous acid gas through a solution of oxy phenyl isouquinoline in HOAc (Gabriel, B 19, 831) Small yellow crystals

Methyl derivative $C_{13}H_{11}MeN_2O_2$ [169°]

DI NITRO DI OXY-DI-PHENYL SULPHONE

$C_{12}H_8N_2SO_4$, te $SO_2 \{C_6H_4(NO_2)(OH)\}_2$ Formed by nitrating di oxy di phenyl sulphone (Glutz, A 147, 59) Scales, insol water, sol alkalis Yields $C_6H_4Na_2N_2SO_4$ and $C_6H_4Ag_2N_2SO_4$, a dimethyl derivative $C_6H_4Me_2N_2SO_4$ [215°], a diethyl derivative [192°], and a diisomethyl derivative [151°] With aniline it forms the compound $C_{12}H_8(NHPh)(NO_2)_2SO_4$ crystallising from aniline in red prisms

Tetra nitro di-oxy-di phenyl sulphone

$SO_2 \{C_6H_4(NO_2)_2(OH)\}_2$ [253°] Formed by further nitration of the preceding body (Annahme, B 11, 1668) Long yellow needles — K_2A' — NaA' octahedra

TETRA NITRO DI OXY DIPHENYL DISULPHONIC ACID $C_{12}H_8(NO_2)_4(OH)_2SO_4H_2$ Formed by nitration (Limpriht, A 261, 336) — NaA' aq K_2A' yellow crystals

m NITRO *p* OXY-DI-PHENYL THIO-UREA

[3 1] $C_6H_4(NO_2)NHCSNH C_6H_4(OH)$ [1 4] [152°] Formed from *m* nitro phenyl-thiocarbamide and *p* amido phenol (Staudemann, B 16, 2335) Needles, sl sol ether

DI NITRO OXY PHENYL UREA $C_6H_4N_2O_3$, te

$C_6H_4(NO_2)_2(OH)NHCO NH_2$ Uranidic di-nitro phenol Formed by heating urea with di nitro amido phenol (picramic acid) (Griess, J pr [2] 5, 1) Plates (from water) — AgA' pp

NITRO DI-OXY-PHTHALIC ACID Methyl derivative $CH(OMe)(OH)(NO_2)(CO_2H)_2$ [4 3 6 2 1] Normethylnitrohemipic acid [220°] Formed by boiling its imide with KOH (Elbel, B 19, 2310) White needles, v sol water

Imide $C_6H(OMe)(OH)(NO_2) \begin{smallmatrix} C(NH) \\ \diagup \diagdown \\ CO \end{smallmatrix} O$

[252°] Formed by boiling the oxim $C_6H(OMe)(OH)(NO_2)(CO_2H)CHNOH$ with HOAc Yellow needles, sol hot water and alkalis

Dimethyl derivative v Nitro HEMIPIC ACID

Di-nitro oxy phthalic acid

$C_6H(NO_2)_2(OH)(CO_2H)_2$ Juglonic acid Formed by oxidation of juglone or its acetyl derivative by boiling with HNO_3

Salts — $A'(NH_4)_2$ reddish yellow tables or thin needles, v sol water — $A'HK$ — $A'Ba'$ yellow tables (Berntsen & Semper, B 18, 210)

NITRO-OXY-ISOPROPYL-BENZOIC ACID

$CM_2(OH)C_6H_4(NO_2)CO_2H$ [4 8 1]. [191°] Formed by oxidising nitro-cuminic acid or nitro-cuminol with $KMnO_4$ (Widman, B 15, 2549; 16,

2567, 2., 2292) Long needles (from water) — $\text{NH}_4\text{A}'2\text{aq} - \text{CaA}' - \text{BaA}', 6\text{aq} - \text{PbA}', 5\text{aq} - \text{CuA}', 1\frac{1}{2}\text{aq} - \text{AgA}'\frac{1}{2}\text{aq}$ crystals, m sol hot Aq

Acetyl derivative [138°]

Ethylether EtA' [96°]

Nitro oxy isopropyl benzoic acid

$\text{CMe}_2(\text{OH})\text{C}_6\text{H}_4(\text{NO}_2)\text{CO}_2\text{H}$ [4 2 1] [168°]

Formed by oxidising nitro cymene or the acid $\text{C}_6\text{H}_4\text{Pr}(\text{NO}_2)\text{C}_6\text{H}_4\text{CO}_2\text{H}$ with alkaline KMnO_4 (Widman, *B* 19, 270, Söderbaum, *B* 21, 2128) Tables (from ether), m sol hot water

Isomeride *v* Nitro oxy-cuminic acid

Di nitro-oxy propyl benzoic acid *Lactone*

$\text{C}_6\text{H}_4\langle\frac{\text{C}(\text{NO}_2)(\text{CHMeNO}_2)}{\text{CO}}\rangle$. [90°] Formed

from ethylidene phthalide and NO_2 (Gabriel, *B* 19, 838) Colourless needles (from alcohol)

NITRO- β -OXY-*p*-ISOPROPYL-PHENYL-PROPIONIC ACID

[4 2 1] $\text{C}_6\text{H}_4\text{Pr}(\text{NO}_2)\text{CH}(\text{OH})\text{CH}_2\text{CO}_2\text{H}$ [120°] Formed by boiling $\text{C}_6\text{H}_4\text{Pr}(\text{NO}_2)\text{CHBrCH}_2\text{CO}_2\text{H}$ with aqueous Na_2CO_3 (Einhorn & Hess, *B* 17, 2024) Silvery plates

Amide $\text{C}_{11}\text{H}_{14}\text{N}_2\text{O}_4$ [150°]

Anhydride $\text{C}_6\text{H}_4\text{Pr}(\text{NO}_2)\text{CH}\langle\frac{\text{CH}_2}{\text{O}}\rangle\text{CO}$

[73°] Formed by the action of cold aqueous Na_2CO_3 on bromo nitro cumyl propionic acid Crystals, v sol alcohol

NITRO DI OXY PYRIMIDINE $\text{C}_4\text{H}_2\text{N}_4\text{O}_4$ *tc*

$\text{CO}\langle\frac{\text{NH CH}}{\text{NH CO}}\rangle\text{CNO}_2$. Nitro uracil Formed

by heating the K salt of its carboxylic acid at 130° (Behrend, *A* 229, 85, 240, 8) Yellow needles, which explode on heating Yields isobarbituric acid on reduction Urea forms crystalline $\text{C}_4\text{H}_2\text{N}_4\text{O}_3$ Guanidine gives a similar salt $\text{C}_4\text{H}_2\text{N}_4\text{O}_3\text{aq} - \text{KA}'\text{aq}$ prisms, sl sol water — $\text{CaA}', 6\text{aq} - \text{BaA}', 5\text{aq} - \text{ZnA}', 3\frac{1}{2}\text{aq} - \text{CuA}', 7\text{CuO}$

Nitro-di oxy pyrimidine carboxylic acid

$\text{C}_4\text{H}_2\text{N}_4\text{O}_4\text{tc}$ $\text{CO}\langle\frac{\text{NH C}(\text{CO}_2\text{H})}{\text{NH CO}}\rangle\text{CNO}_2$. Formed

by warming di oxy methyl pyrimidine (methyl uracil) with H_2SO_4 and HNO_3 at 80° (Behrend, *A* 229, 32, 240, 4, Köhler, *A* 236, 32) Yellow crystals (containing 2aq) — $\text{KHA}'\text{aq}$ plates, sl sol water — $\text{BaA}'\frac{1}{2}\text{aq} - \text{AgA}'\text{aq} - \text{PbA}'\frac{1}{2}\text{aq}$

Ethyl ether EtHA' [250°] Prisms

(a) **NITRO (Py 3)-OXY-QUINOLINE**

$\text{C}_8\text{H}_5\text{N}_3\text{O}_4$, *a'*-Nitro-carbostyryl Formed by heating *a'*-nitro *o* amido cinnamic acid with HClAq at 150° (Friedländer & Lazarus, *A* 229, 243) Needles (from alcohol) Does not melt below 220°

(β) Nitro (Py 3)-oxy quinoline [260°]

Formed in like manner from β' nitro amido-cinnamic acid (F & L) Needles (from HOAc)

(γ) Nitro-(Py 3) oxy quinoline [280°]

Formed by nitrating carbostyryl (F. & L) Needles (from HOAc)

Methyl derivative [181°]. From the silver salt and MeI (Feer & Königs, *E* 18, 2398)

(B 4)-Nitro-(Py 3)-oxy quinoline

$\text{CH CH} - \text{C OH CH}$ [168°]. Formed from

$\text{CH C}(\text{NO}_2)\text{O} - \text{N COH}$ Formed from di-methyl *o*-nitro-coumarinate and alcoholic NH_3 , the resulting (8, 2, 1)-nitro amido-cinnamic amide being heated with HClAq at 140° (Miller

& Kinkelin, *B* 22, 1711) Prisms, v sol hot water

(B 4, 2) Nitro-oxy quinoline

$\text{C}(\text{OH})\text{CH}\langle\frac{\text{C OH CH}}{\text{C}(\text{NO}_2)\text{O N CH}}\rangle$ [186°] Formed by nitra

ting (B 2) oxy-quinoline (Skraup, *M* 3, 551) and by the action of nitric acid on (B 2)-oxy-quinoline carboxylic acid (Schmidt & Altschul, *B* 20, 2697, 21, 2255) and on nitroso oxy-quinoline (Mathéus, *B* 21, 1642, 1886) Yellow needles — $\text{B'HNO}_3\text{aq}$ orange prisms, v sol hot alcohol

Nitro-(B 4) oxy-quinoline [173°] Formed

by heating its carboxylic acid with glycerin at 200° (Schmitt & Engelmann, *B* 20, 2693) and by the action of HNO_3 (S G 1 38) on nitroso-(B 4)-oxy-quinoline (Von Kostanecki, *B* 24, 154) Needles, sl sol alcohol

Nitro-(B 2) oxy quinoline [255°] Formed

by nitrating *m* oxy-quinoline (Skraup, *M* 3, 564) Yellow plates, decomposed by fusion

Nitro-oxy quinoline Formed by the action

of HNO_3 on a syrupy acid obtained by oxidation of cinchonine (Weidel & Hazura, *M* 3, 773) Crystalline powder, melting far above 300° — $\text{B'H}_2\text{PtCl}_6$ monoclinic prisms

(B 1, 3) Di nitro (B 4) oxy-quinoline

$\text{CH C}(\text{NO}_2) - \text{C CH CH}$ [276°] Formed by the action of HNO_3 on *o* oxy quinoline carb oxylc acid, and on *ana* nitroso *o* oxy quinoline (Schmitt & Engelmann, *B* 20, 2692, Kostanecki, *B* 24, 155, cf Bedall & Fischer, *B* 14, 1368) Plates

NITRO-(B 4) OXY-QUINOLINE CARBOXYLIC ACID $\text{C}_8\text{H}_5(\text{NO}_2)\text{N}(\text{OH})(\text{CO}_2\text{H})$ Formed

by boiling the nitrate of *o* oxy quinoline carb oxylc acid with HOAc (Schmitt & Engelmann, *B* 20, 2693) Needles, sl sol HOAc

NITRO-OXY-QUINONE *Carbonyl deri-*

ivative $\text{C}_8\text{H}_4\text{O}_2(\text{NO}_2)_2\text{CO}$ [260°] Formed by oxidation of nitro amido phenyl carbonate by chromic acid mixture (Lowenberg, *C* C 1886, 390) Pale brown needles

Nitro-di-oxy quinone

$\text{CO}\langle\frac{\text{CH C}(\text{OH})}{\text{C}(\text{OH})\text{C}(\text{NO}_2)}\rangle\text{CO}$ Formed by warming nitro di imido resorcin with dilute (10 p c) NaOHAq (Nietzki & Schmidt, *B* 22, 1659) Golden needles, m sol water — KA' orange needles

Di nitro di-oxy quinone

$\text{CO}\langle\frac{\text{C}(\text{NO}_2)\text{C}(\text{OH})}{\text{C}(\text{OH})\text{C}(\text{NO}_2)}\rangle\text{CO}$ *Nitrilic acid*.

Formation — 1 By the action of nitrous acid

on hydroquinone (Nietzki, *B* 10, 2147) — 2 By the action of a mixture of fuming HNO_3 and conc H_2SO_4 on di acetyl hydroquinone below — 5°, the yield in this case being 65 p c (Nietzki, *B* 16, 2092, 18, 499) — 3 By adding dimethoxyhydroquinone to a cooled mixture of HNO_3 (3 pts) and HOAc (6 pts) (Nietzki, *A* 215, 142) — 4 By boiling di-nitro-di-amido-quinone with dilute potash (Nietzki, *B* 20, 2116) — 5 By the action of fuming HNO_3 on $\text{CO}_2\text{H C}\langle\frac{\text{CO C}(\text{OH})}{\text{C}(\text{OH})\text{CO}}\rangle\text{CO}_2\text{H}$ (Hantzsch, *B* 19, 2398, cf Loewy, *B* 19, 2385)

Preparation — By slowly adding a hot saturated alcoholic solution of chloranil (4 pts) to a concentrated aqueous solution of sodium nitrate (10 pts), heated to 80°–90°, a yellow crystalline

pp of the sodium nitranilate soon separates, and a small quantity which remains in solution is precipitated by NaOH, the whole is recrystallised from hot water (Nef, *B* 20, 2027)

Properties—Golden tables, v sol water and alcohol, insol ether. When anhydrous it explodes at 170° without previous fusion. FeCl₃ gives a green crystalline pp. Chlorine forms oxalic acid and chloropierin (Levy, *A* 249, 66). On reduction it yields tetra oxy di amido benzene which gives p phenylene diamine on distillation with zinc-dust (Nietzki, *B* 19, 2727). Hydroxylamine hydrochloride forms an explosive salt C₆O₄(NO₂)₂(NH₂O)₂ (Nef, *Am* 11, 17).

Salts—Na₂A'' dichroic monoclinic crystals, *a b c* = 946.1 985, β = 87° 51'—K₂A'' yellow needles (from hot water)—(NH₄)₂A''—BaA'' plates, insol water.

Di-nitro-di-oxy-quinone A product of the action of nitrous acid on protocatechuic acid dissolved in ether (Gruber, *B* 12, 519). Greenish-yellow needles, v sol water—Na₂A'' 2aq explodes when heated.

NITRO-OXY STYRENE *Methyl derivative* [1 2 4] C₆H₃(OMe)(NO₂)CH CH₃ [89°] Formed, together with the di nitro derivative C₆H₃(OMe)(NO₂)₂C₆H₅ [163°], by the action of conc HNO₃ on [4 1] C₆H₄(OMe)CH CH CO₂H (Einhorn a Grabfeld, *A* 243, 366). Crystals, volatile with steam. Yields a dibromide [79°]. Forms, on oxidation, nitranisic acid [187°].

NITRO-OXY-STYRYL METHYL KETONE *Methyl derivative* C₆H₃NO₂ [4 3 1] C₆H₃(OMe)(NO₂)CH CH CO CH₃ [159°] Formed by nitration of the ketone, and also by condensation of C₆H₃(OMe)(NO₂)CHO with acetone (Einhorn a Grabfeld, *A* 243, 364). Yellow needles (from water), sol ether.

NITRO-OXY SULPHO BENZOIC ACID C₆H₃NSO₃ *ie* C₆H₃(NO₂)₂(OH)(SO₃H)(CO₂H) Formed from nitro-o oxy benzoic acid and fuming H₂SO₄ (Mandt, *B* 10, 1701)—Ba₂A'' 12aq hair-like needles.

NITRO OXY TOLUENE *v* Nitro Cresol

Nitro-di oxy-toluene *v* Nitro-ORCIN

Nitro-tetra oxy toluene C₆Me(NO₂)(OH)₄ [157°] Formed by the action of HCl and SnCl₄ on nitro-di oxy-toluquinone (Kehrmanna Brasch, *J pr* [2] 89, 382). Black needles, forming a violet powder. Its solution forms HCl, oxalic acid, and other products on boiling.

Di nitro di-oxy-toluene

C₆HMe(NO₂)₂(OH)₂ [1 3 5 2 4] *Di-nitro cres orcin* [90°] Formed from cresorcin and HNO₃ (Von Kostanecki, *B* 20, 3136). Needles, m sol cold water.

NITRO-OXY-*o* TOLUIC ACID C₆H₃NO₂ *ie* C₆H₂Me(OH)(NO₂)CO₂H [1 4 x 2] [172°] Formed by nitration of oxy *o* toluic acid (Kostanecki a Niemientowski, *B* 18, 254). Needles, sol hot Aq.

Nitro oxy-*m*-toluic acid

C₆H₂Me(OH)(NO₂)CO₂H [3 4 5 1]? [87°] Formed by heating (4,8,1)-oxy toluic acid with conc HNO₃ (Mahon, *Am* 4, 186). Yellow needles, sl sol water. Its salts explode when heated—CaA', 4aq—BaA', 4aq orange needles; crimson when anhydrous.

Nitro-oxy-*p*-toluic acid

C₆H₂Me(OH)(NO₂)CO₂H [4 3 x 1] [188°] Formed by the action of nitrous acid on (3,4,1) amido-

toluic acid (Ahrens, *Z* 1869, 105). Golden needles—BaA', 2aq scarlet, sl sol alcohol.

Nitro-oxy toluic acid *Methyl derivative* C₆H₂Me(OMe)(NO₂)CO₂H [175°] Formed from the methyl ether of thymol and dilute HNO₃ (Paterno a Canzoneri, *G* 9, 445). Slender needles, v sol alcohol—BaA', 2aq straw coloured crystals.

Ethyl derivative [162°] Formed, in like manner, from the ethyl ether of thymol. Long slender needles.

Nitro *o* oxy *o* toluic acid

C₆H₃(NO₂)(CH₂OH)CO₂H [4 2 1] [129°] Formed by dissolving nitro phthalide in aqueous KOH (Hoernig, *B* 18, 3451). Minute needles—AgA'.

Tri nitro oxy *m*-toluic acid

C₆HMe(OH)(NO₂)₃CO₂H [1 3 2 4 6 5] *Nitrococcic acid* [170°-180°] Formed by the action of boiling nitric acid (S G 1 37) on cochineal (De la Rue, *A* 64, 23, Liebermann a Dorp, *A* 163, 100) and on (5,3,1) oxy toluic acid (Kostanecki a Niemientowski, *B* 18, 250). Colourless plates (containing aq). On boiling with moist Ag₂O it yields silver tri nitro cresol and CO₂—(NH₄)₂A' 1/2 aq—BaA', aq—AgA' needles.

NITRO OXY *m* TOLUIC ALDEHYDE

C₆H₃NO₂ *ie* C₆H₂Me(NO₂)(OH)CHO [5 3 2 1] [141°] Formed by warming oxy toluic aldehyde with HNO₃ (Schotten, *B* 11, 788). Yellow needles, sl sol hot water.

Nitro oxy *m* toluic aldehyde

C₆H₂Me(NO₂)(OH)CHO [5 3 4 1] [152°] Formed by nitrating (4,3,1) oxy toluic aldehyde (S) Needles, sl sol hot water.

NITRO DI OXY TOLUQUINONE

C₆Me(NO₂)(OH)₂O₂ [2 5 3 6 4 1] *Tolunitranilic acid* [180°] Formed by the action of a dilute alcoholic solution of KNO₃ on tri chloro tolu quinone (Kehrmann, *B* 21 1779, *J pr* [2] 39, 377). Golden needles (containing 2aq). Its aqueous solution decomposes on boiling forming HCl, oxalic acid, and CO₂—K₂A' 3aq yellowish red prisms.

DI NITRO DI OXY DITOLYL C₁₁H₇N₂O₄

[273°] (G), [270°] (D). Formed by boiling tetrato ditolyl sulphate with HNO₃ (Gerber, *B* 21, 750), by the action of nascent nitrous acid on di amido ditolyl (the yield being quantitative), and by heating di oxy ditolyl di carboxylic acid with HNO₃ (Deninger, *J pr* [2] 40, 300, *B* 21, 1639). Yellow needles (from toluene or pyridine).

NITRO - OXY - TOLYLENE ETHERYL

AMIDINE C₆H₃N₂O₄ [256°] Formed by the action of alcoholic ammonium sulphide on the acetyl derivative of di nitro *p* toluindine (Bankievitch, *B* 21, 2404). Lustrous green needles, not affected by HClAq at 200°.

NITRO-PENTANE C₅H₇NO₂ *ie*

Pr CH₂CH₂NO₂ (150°-160°) Formed from isoamyl iodide and AgNO₃ (V Meyer, *B* 5, 203, *A* 171, 43, 175, 135).

Di nitro pentane C₅H₃CH(NO₂)₂ Formed from di amyl ketone and HNO₃ (Chancel, *C R* 94, 399). Heavy oil. Forms *n*-valeric acid on reduction—KC₆H₇N₂O₄—AgA'.

***o* NITRO-PHENOL** C₆H₃NO₂ *ie*

C₆H₂(NO₂)OH [1 2] Mol w 189 [45°] (214°) S V S 107 64 (Schiff).

Formation—1 Together with the *p* isomeride by nitration of phenol (Hofmann, *A* 103, 847; Fritzsche, *A* 110, 150, *J pr* 78, 293, Gold

stein, *B* 11, 1943)—2 By heating *o*-bromonitro benzene [38°] or *o*-chloronitro benzene with aqueous potash in sealed tubes (Zincke & Walker, *B* 5, 117, Engelhardt & Latschinoff, *B* 3, 423)—3 By boiling *o*-di-nitrobenzene with NaOH aq (Laubenheimer, *B* 9, 1828)—4 Together with *p*-nitro phenol by boiling diazobenzene sulphate with nitric acid (Nörling & Wild, *B* 18, 1338)—5 Together with *p*-nitro phenol by adding liquid N_2O to cooled CS_2 containing C_6H_5ONa in suspension (Schall, *B* 16, 1901)—6 By heating diazobenzene nitrate with dry toluene, nitrogen being given off (Remsen & Orndorff, *Am* 9, 390)—7 By the action of $NaNO_2$ and H_2SO_4 on aniline (Deminger, *J pr* [2] 40, 298)

Preparation—Phenol (1 pt) is slowly added to a mixture of HNO_3 (1 pt of SG 1.38) and water (6 pts), cooled to 0°, the product is neutralised with Na_2CO_3 and distilled with water (Neumann, *B* 18, 3320)

Properties—Light yellow prisms or needles, v sol alcohol and ether, sl sol cold water

Reactions—1 Reduced by tin and HCl to *o*-amido phenol—2 Aqueous NH_3 (35 p.c.) at 160°–200° yields *o*-nitro aniline (Merz & Ris, *B* 19, 1749)—3 Phenyl hydrazine dissolved in xylene at 100° produces *o*-amido phenol, benzene, NH_3 , and nitrogen (Barr, *B* 20, 1497)

Salts—The colour of the salts has been examined by Carnelley & Alexander (*C J Proc* 4, 64)— NH_4A' scarlet plates— KA' aq orange red crystals (F)— KA' aq (Post, *B* 8, 1552) S 16 at 6°, 21 at 15°— NaA' scarlet plates, v e sol water— BaA' , S 9 at 6°— SrA' , 3 aq— CaA' , 4 aq plates— CaA' , aq orange needles— AgA' orange red pp S 14 at 15°

Acetyl derivative $C_6H_4(NO_2)OAc$ [41°] (253°) Long colourless needles or prisms, v sol alcohol (Butcher, *B* 16, 1933)

Benzoyl derivative $C_6H_4(NO_2)(OBz)$ [59°] Formed from *o*-nitro phenol and $BzCl$ (Hübner, *A* 210, 386, Schiaparelli, *G* 11, 73, Neumann, *B* 18, 3320, 19, 2018) Prisms or needles Yields on nitration the compound $C_6H_4(NO_2)OCO_2C_6H_4(NO_2)$ [13] [126°], crystallising in needles

Methyl ether $C_6H_4(NO_2)(OMe)$ *o*-Nitro anisole [9°] (277°) at 735 mm Formed, together with the *p* isomeride, by nitration of anisole Formed also by methylation of *o*-nitro phenol (Brunck, *Z* 1867, 204, Mühlhauser, *A* 207, 237) and by boiling *o*-chloronitro benzene with $NaOMe$ in $HOme$ (De Bruyn, *R T C* 9, 200) Oil Converted into *o*-nitro aniline by heating with ammonia (Salkowski, *A* 174, 278)

Ethyl ether $C_6H_4(NO_2)(OEt)$ *o*-Nitrophenetol (267°) Formed by ethylation of *o*-nitro phenol (Groll, *J pr* [2] 12, 207, Seidel, *J pr* [2] 42, 448) and by heating $C_6H_4Cl(NO_2)$ with $NaOEt$ (De Bruyn) Oil When distilled with alcoholic potash it yields $C_6H_4(NH_2)(OEt)$ and no azo compound, but when reduced in alcoholic solution by sodium-amalgam it forms $N_2(C_6H_4OEt)_2$ and $N_2O(C_6H_4OEt)_2$ (Schmitt & Möhlau, *J pr* [2] 18, 200)

Bromo-ethyl ether $C_6H_4(NO_2)OC_2H_4Br$ [44°] Formed from $C_6H_4(NO_2)(ONa)$ and ethylene bromide (Weddige, *J pr* [2] 24, 246). Yellow prisms (from alcohol)

Reactions—1. With an alcoholic solution of

NH_3 it yields $C_6H_4(NO_2)OC_2H_4NH_2$ [78°] and $NH(C_6H_4OC_2H_4NO_2)_2$ [192°]—2 Heated with potassium salicylic ether $C_6H_4(OK)CO_2Et$ in alcoholic solution it yields two products: (a) an ether $C_6H_4(NO_2)OC_2H_4OC_2H_4CO_2Et$ [c 100°] saponified by HCl yielding the corresponding acid [145°], which may be reduced to an amido acid [110°] whose hydrochloride melts at 177°, and (b) a compound of the formula $C_6H_4(NO_2)OC_2H_4OCO_2C_6H_4OH$ [106°] which gives an acetyl derivative [80°] (Wagner, *J pr* [2] 27, 212)—3 Heated with [41] $C_6H_4(OK)CO_2Et$ in alcoholic solution it forms *o*-nitro phenoxy ethyl *p*-oxy benzoic ether [103°] which is saponified by HCl at 140°, forming an acid $C_6H_4(NO_2)OC_2H_4OC_6H_4CO_2H$ [c 206°] The corresponding amido acid melts at 185° (Wagner)—4 Potassium benzoate at 140° yields $C_6H_4(NO_2)OC_2H_4OBz$ [77°]

Amido ethyl ether
 $C_6H_4(NO_2)OC_2H_4NH_2$ [73°] Formed as above Small plates (from water) Yields a benzoyl derivative [95°] and a dibenzoyl derivative $C_6H_4(NO_2)OC_2H_4NBz_2$ [122°] The benzoyl derivative reduced by tin and hydrochloric acid yields $C_6H_4<NH CPh>N$ [151°] (Weddige, *J pr* [2] 24, 250)

Ethylene ether $C_6H_4(OC_2H_4NO_2)_2$ [163°] Formed from $C_6H_4(NO)ONa$ and C_2H_5Br

Isobutyl ether (275°–280°) SG 22 1.136 (Riess, *B* 3, 780)

Benzyl ether $C_6H_4CH_2OC_6H_4(NO_2)$ [29°] From the K salt and CH_2Cl (Kumpf, *A* 224, 121)

***p*-Nitro benzyl ether**
 $C_6H_4(NO_2)CH_2OC_6H_4NO_2$ [129°] Needles (K)

Phenacetyl ether
 $C_6H_4(NO_2)OCOCH_3$ [118°] (194°) Formed from the K salt and ω -bromo acetophenone (Lellmann & Donner, *B* 23, 172) Needles, m sol alcohol $ZnCl_2$ and HCl at 100° convert it into $C_6H_4<OCH N CPh>$ [103°] crystallising in needles, and forming the salts $B'H.PtCl_4$ and $B'HuCl_4$

***m*-Nitro phenol** $C_6H_4(NO)OH$ [13] [96°] (194° at 70 mm) Obtained from *m*-nitroaniline by the diazo reaction (Fittig & Bantlin, *B* 7, 179, 11, 2099, Henriques, *A* 215, 323, Wagner, *J pr* [2] 32, 70) Yellow crystals, sol. hot water, not volatile with steam— KA' 2 aq: orange needles S 12 at 6° (Posta Mehrrens, *B* 8, 1552)— BaA' 2 aq S 17 at 6°— PbA' (OH) S 013 at 15°— AgA' brownish red pp

Benzoyl derivative $C_6H_4(NO_2)OBz$ [95°] Pale yellow crystals (Neumann, *B* 19, 2979) Nitric acid (SG 1.48) converts it into the crystalline *m*-nitro benzoyl derivative $C_6H_4(NO_2)OCO_2C_6H_4(NO_2)$ [129°]

Methyl ether MeA' [38°] (254°). Needles, volatile with steam (Bantlin)

Ethyl ether EtA' [34°] (264°) (Bantlin, Wagner, *J pr* [2] 32, 71)

Bromo-ethyl ether C_6H_4BrA' [39°]. Formed, with the following, from the K salt and ethylene bromide (Weddige, *J pr* [2] 24, 255)

Ethylene ether C_6H_4A' [139°]

***p*-Nitro-phenol** $C_6H_4(NO_2)OH$ [114°]. S.V.S 108.28 (Schiff)

Formation—1 Together with the *o* isomer-

ide, by the nitration of phenol, especially at low temperatures (Fritzsche, *J pr* 75, 257, Goldstein, *J R*, 10, 353)—2 By heating *p* chloro-nitro-benzene [85°] or bromo nitro-benzene [125°] with aqueous potash at 130° (Engelhardt & Latschnoff, *B* 3, 423, Richter, *B* 4, 460)—3 From acetanilide by nitrating, and heating the [4] $\text{C}_6\text{H}_4(\text{NO}_2)(\text{NHAc})$ with conc NaOH aq (Wagner, *B* 7, 76)—4 From *p*-nitro-aniline by the diazo-reaction (Fittig, *B* 7, 280)—5 By dry distillation of nitro *o* oxy-benzoic acid (Schmidt & Cook, *K* 3, 41)—6 By oxidation of nitroso phenol (Bayer, *B* 7, 965)—7 Together with the *o* isomeride, by adding liquid N_2O , to cooled CS_2 containing $\text{C}_6\text{H}_5\text{ONa}$ in suspension (Schall, *B* 16, 1901)—8 By the action of NaNO_2 (in excess) and H_2SO_4 on aniline, *o* nitro phenol being also formed (Deming, *J pr* [2] 40, 298)

Preparation—The mixture of *o*- and *p* nitro-phenols is distilled with steam. The residue is dissolved in hot water and mixed with excess of Na_2CO_3 when $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{ONa}$ crystallises out on cooling (Salkowski, *A* 174, 280)

Properties—Slender colourless needles (from water Dimorphous (Lehmann, *Z K* 1, 45) V sol alcohol Not volatile with steam Sol hot HCl aq (Kollrepp, *A* 234, 1)

Reactions—1 Distillation with PCl_5 yields *p* chloro-nitro benzene [85°]—2 Aqueous ammonia at 160° to 200° forms *p* nitro aniline (Merz & Ris, *B* 19, 1749)—3 Phenyl hydrazine at 100° produces *p*-amido phenol, benzene, NH_3 , and nitrogen (Barr, *B* 20, 1499)

Salts—The colour of the salts has been examined by Carnelley (*G J Proc* 4, 64)— NaA' aq yellow tables— NaA' 2aq Heat of neutralisation 12,840 (Alexejeff & Werner, *Bi* [3] 2, 718)— NaHA' 2aq orange red prisms (from water)— KA' 2aq S 4.5 at 6° (Post & Mehrrens, *B* 8, 1552)— KHA' 2aq— BAa' 8aq monochlonic prisms S 1 at 6°, 13 at 15°— BaHA' 4aq— SrA' 7aq yellow needles— CaA' 4aq— CaHA' 8aq— MgA' 8aq— $\text{PbO}_2\text{A}'$ — $\text{Pb}_2\text{HA}'$ — AgA' aq scarlet pp, changing to orange prisms— AgA' 2aq S 3 at 15°— AgHA' aq yellowish green laminae— $\text{Ag}_2\text{HA}'$ purple needles

Benzoyl derivative $\text{C}_6\text{H}_4(\text{NO}_2)\text{OBz}$ [142.5°] Colourless efflorescent needles (from alcohol) (Schiaparelli, *G* 11, 73, Neumann, *B* 19, 2020) On treatment with HNO_3 (S G 148) it forms [4] $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{OCO C}_6\text{H}_4\text{NO}_2$ [13] [185.5°]

Methyl ether MeA' . [51°] (259°) Formed by methylation of *p* nitro phenol (Brunck, *Z* [2] 3, 202, Willgerodt & Ferko, *J pr* [2] 83, 152, Skraup, *M* 6, 761) Formed also by heating *p* chloro nitro benzene with KOH dissolved in MeOH (Willgerodt, *B* 14, 2632, 15, 1004) Prisms

Ethyl ether EtA' [58°] (283°) (Andreas, *J pr* [2] 21, 831) Formed from the Ag salt and EtH (Fritzsche) and also from $\text{C}_2\text{H}_5\text{OEt}$ and fuming HNO_3 (Hallock, *Am* 1, 271) Obtained also by boiling *p*-chloro-nitro benzene with KOH and dilute (60 *p c*) alcohol (Willgerodt, *B* 15, 1002) Prepared by heating $\text{C}_6\text{H}_4(\text{NO}_2)(\text{OK})$ with KEtSO_4 in alcoholic solution for 8 hours (Willgerodt & Ferko, *J pr* [2] 83, 158). Prisms Sodium amalgam rapidly re-

duces it, in alcoholic solution, to $\text{N}_2(\text{C}_6\text{H}_4\text{OEt})$. (Schmitt & Möhlau, *J pr* [2] 18, 199)

Ethylene ether $\text{C}_2\text{H}_4\text{A}'$. [143°] Formed, at the same time as the bromo ethyl ether, by heating the Na compound with ethylene bromide at 140° (Weddige, *J pr* [2] 21, 127, 24, 254)

Bromo-ethyl-ether $\text{CH}_3\text{Br C}_6\text{H}_4\text{A}'$ [63°] Yellowish plates, insol water, v sol alcohol

Reactions—1 Heated with potassium *p* oxy benzoic ether [4] $\text{C}_6\text{H}_4(\text{OK})\text{CO}_2\text{Et}$ it forms $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{OCO C}_6\text{H}_4\text{CO}_2\text{Et}$ [181°], which when saponified by HCl aq at 130° yields the corresponding acid [218°] (Wagner, *J pr* [2] 27, 224)—2 Alcoholic [2] $\text{C}_6\text{H}_4(\text{OK})\text{CO}_2\text{Et}$ forms $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{OCO C}_6\text{H}_4\text{OH}$ [181°] and the ether $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{OCO C}_6\text{H}_4\text{CO}_2\text{Et}$ [c 81°] whence HCl liberates the acid [132°]

Amido ethyl ether $\text{C}_6\text{H}_4(\text{NH}_2)\text{A}'$ [103°] Formed by heating the bromo ethyl ether with alcoholic ammonia Yellow scales (from water)

Isobutyl ether (285°–290°) S G 20 1105

Benzylether $\text{C}_6\text{H}_5\text{CH}_2\text{A}'$ [106°] Prisms. Yields on nitration a compound melting at 163° (Kumpf, *A* 224, 123)

***p* Nitro-benzyl ether** [183°] Needles Fourth and fifth nitro-phenols have been described by Fittica (*J pr* [2] 24, 5, *B* 13, 711) but their existence has not been confirmed by other chemists (Natanson, *B* 13, 415)

(a)-**Di nitro-phenol** $\text{C}_6\text{H}_3(\text{NO}_2)_2(\text{OH})$ [4 2 1] [114°] S 4.8 at 100°, 5 at 18°, 0.14 at 0° (Gruner, *J pr* 102, 222)

Formation—1 By nitration of phenol, *o* nitro phenol, and *p* nitro phenol (Laurent, *A Ch* [3] 3, 212, Körner, *Z* [2] 2, 662, 731)—2 From anisole by nitration and saponification (Cahours, *A Ch* [3] 25, 22)—3 From di nitro amido phenol (picramic acid) by elimination of NH_2 (Griess, *A* 113, 210)—4 From chloro di-nitro benzene [50°] and bromo di nitro benzene [72°] by heating with potash (Clemm, *J pr* [2] 1, 145, Engelhardt & Latschnoff, *B* 3, 97)—5 By boiling *i tri* nitro benzene with aqueous Na_2CO_3 or by heating it with water at 160° (De Bruyn, *R T C* 9, 191)—6 By boiling *i di* nitro aniline with KOH aq for a long time (Willgerodt, *B* 9, 979)—7 From di nitro di ethyl aniline and dilute potash (Van Romburgh, *R T C* 2, 35)

Properties—Yellowish rectangular plates (from water), v sol cold alcohol

Reactions—1 Yields only picric acid on further nitration (Hübner & Schneider)—2 Aqueous KCy at 70° forms potassium meta purpurate $\text{C}_6\text{H}_3\text{KN}_3\text{O}_6$ which separates as brownish red crystals with green lustre (Pfaunder & Oppenheim, *Z* 1866, 470, Sommaruga, *A* 157, 335)

Salts— KA' aq S 1.4 at 6° (Post & Mehrrens, *B* 8, 1554), 1.6 at 7° (Hübner & Schneider, *A* 167, 92)— KA' aq (Romburgh)— NaA' aq— BAa' 7aq golden needles— BaA' 6aq yellow needles— BAa' 5aq orange prisms S 3 at 7°— BaA' 4aq monochlonic crystals (*P a M*)— MgA' 8aq— MgA' 12aq— $\text{Pb}(\text{OH})\text{A}'$ 2aq S .09 at 15°— MnA' 5aq— NiA' 8aq— AgA' aq. S 4 at 15°

Benzoyl derivative $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{OBz}$. Plates (from alcohol) (Laurent & Gerhardt, *A* 75, 77).

m-Nitro-benzoyl derivative [161°] Formed by nitration of $2[1]C_6H_4(NO_2)OBz$ or of the *o*-isomeride (Neumann, *B* 18, 3322, 19, 2021) Needles

*Methyl ether MeA' [88°] Formed by boiling anisole or anisic acid with fuming HNO_3 (Cahours, *A* 69, 236) or by heating (4, 2, 1)-chloro di nitro benzene or 1 tri nitro benzene with KOH dissolved in MeOH (Willgerodt, *B* 12, 762, De Bruyn, *R T C* 9, 190) Needles

Ethyl ether EtA' [86°] Formed by the action of HNO_3 on C_6H_5OEt (Cahours, *A* 74, 315) and on $N_2(C_6H_4OEt)[14]$, (Andrem, *J pr* [2] 21, 335), and also in the same way as the methyl ether (W) Needles

Allyl ether C_6H_5A' [47°]

Di-oxy propyl ether $C_6H_4(OH)_2A'$ [o 83°] Formed from $[124]C_6H_4Cl(NO_2)_2$, glycerin, and KOH (W)

Phenyl ether C_6H_5A' [71°] (W)

Benzyl ether $C_6H_5CH_2A'$ [149°]

p-Nitro benzyl ether [201°] (Kumpf)

(*g*) Di nitro phenol $C_6H_3(NO_2)_2(OH)$ [431] [64°] Formed, together with the (*a*) isomeride, by nitrating *o*-nitro phenol (Hubner & Schneider, *A* 167, 89, Salkowski, *A* 174, 270, Körner, *G* 4, 325) Pale yellow needles (from water), sl sol water, v e sol hot alcohol. Somewhat volatile with steam—NaA' 3aq red needles—KA' S 13 at 6°—BaA', aq golden needles S 18 at 7°—MgA', 6aq—Pb₂OA', S 037 at 15°—AgA' S 3 at 6° (Post & Mehrrens, *B* 8, 1552)—AgA' aq red needles

m-Nitro benzoyl derivative [149°] Got from $[31]C_6H_4(NO_2)OBz$ and HNO_3 (Neumann, *B* 19, 2930) Yellow needles, sl sol ether

Methyl ether MeA' [117°] Converted by NH_4Aq at 130° into di nitro aniline [138°]

Ethyl ether EtA' [58°] Needles

Benzyl ether PhCH₂A' [76°] Prisms

Yields $[41]C_6H_4(NO_2)_2CH_2OC_6H_4(NO_2)_2$ [136] [137°] on nitration (Kumpf, *A* 224, 130)

(*γ*) Di nitro phenol $C_6H_3(NO_2)_2(OH)$ [531] [104°] (B), [122°] (De B) Formed, together with the (*g*) and (*e*) isomerides, by nitration of *m*-nitro phenol (Bantlin, *B* 11, 2103, *A* 215, 324) Obtained also by heating its methyl ether with conc HClAq at 180° (De Bruyn, *R T C* 9, 208) Needles, volatile with steam—KA' 2aq—BaA', 3aq—BaA', 2aq red feathery crystals

Methyl ether MeA' [96°] (B), [105°] (De B) (above 360°) Formed by heating *s*-trinitro benzene with NaOMe in HOMe for 24 hours (De Bruyn) Needles

(*g*) Di-nitro phenol $C_6H_3(NO_2)_2(OH)$ [431] [134°] Prepared, together with the (*e*)- and (*γ*)-isomerides, by nitration of *m*-nitro phenol (Bantlin, *B* 11, 2104) Colourless needles, not volatile with steam—BaA', 3aq brown prisms

Methyl ether MeA' [70°] Needles

(*e*) Di-nitro-phenol $C_6H_3N_2O_5$ s.e.

$C_6H_3(NO_2)_2(OH)$ [821] [144°] Prepared, together with the (*γ*) and (*g*) isomerides, by nitration of *m*-nitro phenol (Bantlin, *B* 11, 2104) Yellow needles (from water)—KA' 2aq yellow needles—BaA', brown needles

Methyl ether MeA' [118°] Tables

Tri-nitro-phenol $C_6H_2(NO_2)_3OH$ [6421]

Picric acid Mol. w 229 [122°] S 626 at 5°; 1225 at 20°; 389 at 77° (Marchand, *J*

pr 64, 91) R_∞ 7862 in a 174 p.c. benzene solution (Kanonnikoff, *J pr* [2] 31, 348)

Formation—1 By the action of hot nitric acid on phenol, tri-bromo phenol, *o* and *p*-nitro-phenols, (*α*)- and (*β*)-di nitro phenols, saligenin, salicylic aldehyde, salicin, salicylic acid, phlorizin, indigo, coumarin, aloes, gum benzoïn, balsam of Peru, and from the resin of *Xanthorrhoea hastilis* (Hausmann, *Journ de Phys et de Chimie*, 1788, Welter, *A Ch* 29, 301, Liebig, *P* 13, 191, 14, 466, *A* 9, 80, 39, 350, Dumas, *A Ch* [2] 53, 178, [3] 2, 228, Laurent, *A Ch* [3] 3, 221, *A* 43, 219, Perra, *D P J* 165, 386, Piria, *A* 56, 63, Stenhouse, *A* 57, 88, 66, 243, Carey Lea, *Am S* [2] 26, 279, E Kopp, *A Ch* [3] 13, 233, Delalande, *A* 45, 337, Marchand, *A* 48, 336, 52, 345, Schunck, *A* 39, 6, 65, 234)—2 By boiling (1,2,4,6)-chloro-tri nitro-benzene (picryl chloride) with aqueous Na₂CO₃ (Engelhardt & Latschmoff, *B* 3, 98, Clemm, *J pr* [2] 1, 145)—3 By oxidation of *s*-tri nitro benzene with K₂FeCy₄ in slightly alkaline solution (Hepp, *B* 13, 2346)—4 By heating iodo benzene with silver nitrite at 150° (Geuther, *A* 245, 100)

Preparation—Phenol (1 mol) is dissolved in conc H₂SO₄ and the resulting phenol sulphonic acid treated with HNO₃ (4½ mols of SG 135) (Schmitt & Glutz, *B* 2, 52)

Properties—Light yellow laminae (from water) or trimetric prisms (from ether) May be sublimed if slowly heated, but if a few milligrammes be dropped into a red hot tube violent detonation occurs, with a larger quantity a less violent decomposition occurs (Berthelot, *A Ch* [6] 16, 21) Sl sol water, a 01 p.c. solution being distinctly yellow V sol alcohol and ether Tastes bitter Dyes silk and wool yellow It is poisonous Forms crystalline compounds with aromatic hydrocarbons (Fritzsche, *J pr* 73, 212, *A* 109, 247)

Reactions—1 Bleaching powder yields, on boiling, chloropiericn KCl₂NO₂ and tetra chloro quinone A mixture of KClO₃ and HCl acts in like manner—2 Distillation with aqueous NaOBr forms bromopiericn (Stenhouse, *P M* [4] 8, 363) 3 Ferrous sulphate and lime reduce it to di nitro amido phenol (picramic acid) (Girard, *C R* 36, 421)—4 Tin and HClAq reduce it to tri amido phenol (picramine) (Roussin, *Bl* 1861, 60, Beilstein, *A* 130, 244) Iodide of phosphorus acts in like manner on its aqueous solution (Lautemann, *A* 125, 1)—5 Hot conc KCyAq forms a blood red solution of potassium isopurpurate which crystallises in brownish-red scales with green luster having either the formula $KC_6H_3N_3O_5$ (Hlasiwetz, *A* 110, 289) or $KC_6H_3N_3O_5$ (Baeyer, *J* 1859 458) Ammonium chloride converts this salt into an ammonium salt $NH_4C_6H_3N_3O_5$, greatly resembling murexide—6 PCl₅ yields $C_6H_3Cl(NO)_3$ (Pisani, *C R* 39, 852)

Salts—Explodes when struck or when strongly heated—NH₄A' trimetric prisms (Laurent, *Rev Scient* 9, 26)—LiA' SG 12 1716 slender yellow prisms (Beamer & Clarke, *Am* 1, 153)—NaA' S about 8 at 15° S (alcohol) 125 in the cold (Hager, *Pharm Centr* 22, 225)—KA' Trimetric prisms, *a b c* = 1270 188 (Laurent, *Rev Scient* 10, 26) S 4 at 15°, 7 at 100° S (alcohol) 04 (Hager) Explodes when struck, giving off CO₂, CO, and

nitrogen, with smaller quantities of hydrogen and CH_4 , and leaving a residue of K_2CO_3 , carbon, and K_2CO_3 (Sartana a Vieille, *C R* 93, 61) — BaA'_2 , 5aq monoclinic crystals — BaA'_2 , 6aq S (of BaA'_2) 12 at 17° (Tscheltzoff, *A Ch* [6] 8, 233) — BaA'_2 , 4aq S 6 at 6° (Post a Mehrtens) — CaA'_2 , 5aq S (of CaA'_2) 50 at 20° — SrA'_2 , 5aq yellow crystals (Marchand) S (of CaA'_2) 14 at 20° — MgA'_2 , 8aq S (of MgA'_2) 10 at 22° — MgA'_2 , 3 NaA'_2 , 9aq (Muller, *Z* 1865, 189) — CdA'_2 , 7aq — CdA'_2 , 3 NH_3 (Carey Lea, *Am S* [2] 81, 78) — CdA'_2 , 6 NaA'_2 , 12aq — CuA'_2 , 5aq green needles — CuA'_2 , 8aq — CuA'_2 , 10aq — CuA'_2 , 4 NH_3 — CoA'_2 , 5aq brown needles — CoA'_2 , 4 NH_3 — CoA'_2 , 6 NaA'_2 , 12aq — NiA'_2 , 8aq — NiA'_2 , 6 NaA'_2 , 12aq — FeA'_2 , 5aq yellow crystals — FeA'_2 , 6 NaA'_2 , 12aq — FeA'_2 , (OH) 8aq — MnA'_2 , 5aq (Muller) — MnA'_2 , 8aq (Marchand) — PbA'_2 , 9aq (E. Kopp, *A Ch* [3] 13, 233) S 9 at 15° — PbA'_2 , 2aq — PbA'_2 , (OH) — PbA'_2 , A_2O , 3aq — PbA'_2 , A_2O — $\text{Pb}(\text{OAc})\text{A}'_2$, 4aq — HgA'_2 , A_2O — AlA'_2 , (OH) 8aq — ZnA'_2 , 8aq S (of ZnA'_2) 125 in the cold — ZnA'_2 , 3 NH_3 — ZnA'_2 , 6 NaA'_2 , 12aq — AgA'_2 , aq S 9 at 15° — AgA'_2 , 2 NH_3 . Compounds of picric acid with organic bases and with aromatic hydrocarbons, are described under those bases and hydrocarbons.

Acetyl derivative $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{OAc}$ [76°] Yellow crystals (Tommasi a David, *C R* 77, 207)

Benzoyl derivative $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{OBz}$

Methyl ether MeA' *Trinitroanisole* [60°] (O), [64°] (Post a Mehrtens, *B* 8, 1552) Formed by nitrating PhOMe (Cahours, *A* 69, 238) and by methylation of picric acid. Monoclinic tables (Friedlander, *J* 1879, 514)

Ethyl ether EtA' [78°] Long needles (Stenhouse a Muller, *A* 141, 80, Willgerodt, *B* 12, 1277)

Iodoethyl ether $\text{C}_2\text{H}_5\text{IA}'$ [70°] From the Ag salt and $\text{C}_2\text{H}_5\text{I}$ (Andrews, *B* 13, 244)

Phenyl ether PhA' Formed from KOPh and $\text{C}_6\text{H}_5\text{Cl}(\text{NO}_2)_2$. Needles (W)

***o* Nitro phenyl ether** $\text{C}_6\text{H}_4(\text{NO}_2)\text{A}'$ [173°]

***p*-Nitro-phenyl ether** $\text{C}_6\text{H}_4(\text{NO}_2)\text{A}'$ [153°] Plates (from alcohol) (Willgerodt, *B* 17, 1766)

Benzyl ether $\text{C}_6\text{H}_5\text{CH}_2\text{A}'$ [147°] Yellow prisms (Kumpf, *A* 224, 131)

***p*-Nitro-benzyl ether** $\text{C}_6\text{H}_4(\text{NO}_2)\text{CH}_2\text{A}'$ [108°] Formed from silver picrate and *p* nitro-benzyl iodide (K)

(β)-**Tri-nitro-phenol** $\text{C}_6\text{H}_2(\text{NO}_2)_3\text{OH}$ [6431] [96°] Formed, together with the (γ) isomeride and tri nitro resorcin (styphnic acid) by the action of conc HNO_3 on (γ) di nitro phenol (Henriques, *A* 215, 325, cf Bantlin, *B* 8, 21) Needles, v e sol alcohol and ether, m sol hot water. Forms with naphthalene a compound [72°] — KA' violet needles, insol alcohol — BaA'_2 , 4aq red prisms

(γ)-**Tri-nitro-phenol** $\text{C}_6\text{H}_2(\text{NO}_2)_3\text{OH}$ [6321] [118°] Formed by nitrating (ϵ) dinitrophenol, and also, together with the (δ) isomeride, by nitrating (γ - or (δ) dinitrophenol (Henriques) White needles. Readily converted into styphnic acid by boiling with fuming HNO_3 . Forms with naphthalene a compound crystallising in yellow needles [100°] — KHA' red needles, insol alcohol — BaA'_2 , golden yellow scales.

References — **Chloro**, **Bromo**, and **Iodo-nitro-phenol**

***o* Nitro-phenol sulphonic acid**

$\text{C}_6\text{H}_3(\text{OH})(\text{NO}_2)(\text{SO}_3\text{H})$ [124] [122°] Formed by sulphonating *o* nitro phenol (Kekulé, *Z* 1867, 641, Armstrong, *Z* 1871, 321, Armstrong a Brown, *B* 7, 923) Formed also by nitration of phenol *p* sulphonic acid (Schmitt a Glutz, *B* 2, 51, Körner, *G* 2, 444, Kolbe a Gauhe, *A* 147, 71) and by boiling (1, 2, 4) bromo nitro benzene sulphonic acid (Goslich, *A* 180, 105) Needles (containing 8aq) Melts at 52° when hydrated, 122° when anhydrous — $\text{NH}_4\text{A}'$ — NaA' , 3aq — $\text{Na}_2\text{C}_6\text{H}_3\text{NSO}_3$, 3aq — KA' — KA' , aq — KA' , 2aq — BaA'_2 , aq — BaA'_2 , 2aq red crystals, sl sol water

***p* Nitro-phenol sulphonic acid** $\text{C}_6\text{H}_4\text{NSO}_3$, *tc* $\text{C}_6\text{H}_3(\text{OH})(\text{NO}_2)(\text{SO}_3\text{H})$ [142] Formed from *p*-nitro phenol and fuming H_2SO_4 (Körner a Post, *B* 5, 852, 1055, 6, 395, 7, 163, *A* 205, 38) Formed also by nitrating phenol *o* sulphonic acid (Stuckenbergh, *A* 205, 45) Crystals (containing 3aq), beginning to decompose when heated at 110° . Give a brown pp with FeCl_3 — KA' monoclinic crystals, $a b c = 1.704 \ 1.1524$, $\beta = 117^\circ 59'$ — KA' , aq — NaA' , 2aq — $\text{Na}_2\text{A}'$, 2aq — CaA' , 3aq — CaA' , 2½aq — BaA' , aq — BaA' , 2aq — PhA' , 1½aq — CuA'

Nitro-phenol disulphonic acid $\text{C}_6\text{H}_3\text{NS}_2\text{O}_6$, *tc* $\text{C}_6\text{H}_2(\text{OH})(\text{NO}_2)(\text{SO}_3\text{H})_2$ Formed from di nitro benzene disulphonic acid by reduction to nitro amido benzene disulphonic acid and displacement of NH_2 by OH (Lamprecht, *B* 8, 289) Minute needles — BaA' , 2aq crystalline

Di-nitro-phenol sulphonic acid $\text{C}_6\text{H}_3\text{NSO}_3$, *tc* $\text{C}_6\text{H}_2(\text{OH})(\text{NO}_2)_2(\text{SO}_3\text{H})$ Formed by the action of nitrous acid on *s* di phenyl hydrazine disulphonic acid (Balentine, *A* 202, 358) Prisms (from alcohol), v sol water. Decomposes at 160° — KA' , ½aq — KA' , 2aq — BaA' , 3½aq (Bertram, *P Beibl* 6, 779)

Tri-nitro-phenol sulphonic acid $\text{C}_6\text{H}_2(\text{OH})(\text{NO}_2)_3(\text{SO}_3\text{H})$ [64213] Formed from phenol *m* sulphonic acid and HNO_3 (Beandsen, *A* 177, 92) — KA' , aq prisms, exploding when heated — BaA' , 3aq crystals, m sol water

***o* Nitro-diphenyl** $\text{C}_{12}\text{H}_9\text{NO}_2$, *tc* $\text{C}_6\text{H}_4\text{C}_6\text{H}_4\text{NO}_2$ [12] [37°] (c 320°) Formed, together with the *p* isomeride, by nitration of diphenyl (Luddens, *B* 8, 870, Hubner, *A* 209, 341, Schultz, *A* 207, 352) Thick plates (from dilute alcohol)

***p* Nitro-diphenyl** [113°] (340° 1 v) Formed as above (Schultz, *A* 174, 210, Hubner, Zimmermann, *B* 13, 1960) Long needles (from alcohol) Yields *p* nitro benzoic acid on oxidation

***oo* Di-nitro-diphenyl** $\text{C}_{12}\text{H}_8\text{N}_2\text{O}_4$, *tc* [21] $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{C}_6\text{H}_4\text{NO}_2$ [12] [124°] Formed from di nitro *p* amido diphenyl by elimination of amidogen (Tauber, *B* 24, 197) Straw-yellow needles, sl sol cold alcohol

***op* Di-nitro-diphenyl** $\text{C}_{12}\text{H}_8\text{N}_2\text{O}_4$, *tc* [21] $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{C}_6\text{H}_4(\text{NO}_2)$ [14] [935°] Formed, together with the *pp* isomeride, by heating diphenyl with HNO_3 and H_2SO_4 (Fittig, *A* 124, 275, Schultz, Schmidt a Strasser, *A* 207, 349). Golden monoclinic needles, $a b c = 1.08 \ 1.91$; $\beta = 87^\circ 30'$ More sol alcohol than the *pp* isomeride.

mm-Di-nitro diphenyl

[8 1] $C_6H_4(NO_2)_2$ $C_6H_4(NO_2)_2$ [1 8] [198°] Formed from di-nitro di *p* amido diphenyl by elimination of the NH_2 groups (Brunner & Witt, *B* 20, 1028) Small yellow needles Yields di-*m*-amido diphenyl on reduction

pp Di-nitro-diphenyl

[4 1] $C_6H_4(NO_2)_2$ $C_6H_4(NO_2)_2$ [1 4] [233°] (Schultz, *A* 174, 221) Formed as above Needles Yields benzidine on reduction

Tetra-nitro-diphenyl $C_6H_4(NO_2)_4$ [140°]

Formed from diphenyl, H_2SO_4 , and HNO_3 (Losanitsch, *B* 4, 404) Amorphous mass, sl sol alcohol

o NITRO-PHENYL-ACETIC ACID $C_6H_4NO_2$

o $C_6H_4(NO_2)CHCOH$ [138°] (*B*), [141°] (*S*) Formed, in small quantity, in the preparation of the *p* isomeride by nitration of phenyl-acetic acid (Radziszewski, *B* 3, 648, Bedson, *C J* 37, 93) Obtained also by saponifying its nitrile (Gabriel & Borgmann, *B* 16, 2066) Needles (from water) or monoclinic plates (from alcohol) Yields *o* nitro benzoic acid on oxidation with $KMnO_4$ Gives oxindole on reduction — BaA' , 2aq

Nitrile $C_6H_4(NO_2)CH_2CN$ *o* Nitro benzyl cyanide [83°] (*B*), [84°] (*S*) Formed in small quantity, together with the *m* and *p* isomerides, by nitration of benzyl cyanide (H Salkowski, *B* 17, 507) Formed also, together with a larger quantity of the compound $C_6H_4(NO_2)CH_2CH_2C_6H_4NO_2$ [111°] and small quantities of $C_6H_4N_2O_2$ [c 238°] and $C_6H_4N_2O_2$ [191°], by boiling *o* nitro benzyl chloride with alcoholic KCy (Bamberger, *B* 19, 2635) Tri metric prisms

m-Nitro-phenyl-acetic acid

[3 1] $C_6H_4(NO_2)CH_2CO_2H$ [117°] (*G* & *B*), [120°] (*S*) Formed from the nitrile which is obtained from *m* nitro benzyl chloride and KCy Needles — AgA' silky needles

Nitrile [61°] Monoclinic crystals

p Nitro-phenyl-acetic acid

[4 1] $C_6H_4(NO_2)CH_2CO_2H$ [152°] Formed as above (Radziszewski, *B* 2, 209, Maxwell, *B* 12, 1765, Gabriel, *B* 14, 2342, 15, 834, Bedson, *C J* 37, 92) Silky needles With *o* nitro-phenyl acetic acid it forms a molecular compound [114°] Yields *p* oxy benzoic acid on oxidation Sodium amalgam yields $N_2(C_6H_4CH_2CO_2H)_2$ [above 300°] (Wittenberg, *Bl* [2] 43, 111) — NaA' , 2aq — BaA'_2 — BaA'_2 , 7aq — ZnA'_2 , aq — AgA' needles

Methyl ether MeA' [55°] NeedlesEthyl ether EtA' [65°] Plates

Amide [192°] Long prisms

Nitrile [116°] Plates Alcohol KOH forms a crimson solution in which diazobenzene chloride ppts $C_6H_4N_2O_2$ [202°] (Czumpelik, *B* 3, 474, Perkin, *C J* 43, 111)

Di-nitro-phenyl-acetic acid $C_6H_4N_2O_2$ *o*

[4 2 1] $C_6H_4(NO_2)_2CH_2CO_2H$ [160°] Formed from phenylacetic acid, H_2SO_4 , and fuming HNO_3 (*R*, Gabriel & Meyer, *B* 14, 823) Formed also by boiling di nitro phenyl-acetoacetic ether with dilute H_2SO_4 (Heckmann, *A* 220, 129) Pale yellow needles, sol hot water Decomposed by heat into di-nitro toluene [71°] and CO_2

Methyl ether MeA' Forms with diazobenzene chloride $C_6H_4(NO_2)_2C(NNHPh).CO_2Me$

[183°] (*V* Meyer, *B* 22, 319) Diazotoluene forms the homologous tolyl hydrazide of methyl di nitro phenyl glyoxylate [168°] crystallising in red needles (Hausknecht, *B* 22, 325) The corresponding derivatives of diaoxylylene and di azonaphthalene melt at 159° and 94° respectively

Ethyl ether EtA' [55°] Needles When heated with alcoholic potash it yields $C_6H_4N_2O_2$ [151°], which forms the salt $K_2C_6H_4N_2O_2$, crystallising in golden plates

Tetra-nitro-di-phenyl-acetic ether

$\{C_6H_4(NO_2)_2\}_2CHCO_2Et$ [154°] Formed from sodium di nitro phenyl acetoacetic ether and biomo di nitro benzene (Von Richter, *B* 21, 2470) Crystalline — $C_{10}H_{10}N_4O_{10}$ [80°] very hygroscopic plates

p-NITRO-PHENYL-ACETIC ALDEHYDE

$C_6H_4(NO_2)CHCHO$ [86°] Formed by boiling the barium salt of $C_6H_4(NO_2)CHClCH(OH)CO_2H$ with water (Lipp, *B* 19, 2645, cf Foirer, *B* 17, 984) Needles, sl sol cold water

DI-NITRO-PHENYL-ACETOACETIC ETHER

[4 2 1] $C_6H_4(NO_2)_2CHAcCO_2Et$ [94°] Formed from $C_6H_4Br(NO_2)_2$ acetoacetic ether, and $NaOEt$ (Heckmann, *A* 220, 128) Plates

Tri-nitro-phenyl-acetoacetic ether

$C_6H_4(NO_2)_3CHAcCO_2Et$ [98°] Formed, together with $\{C_6H_4(NO_2)_2\}_2CHAcCO_2Et$ [205°], from picryl chloride $C_6H_2Cl(NO_2)_3$ and sodium acetoacetic ether (Dittrich, *B* 23, 2720) Crystals, v sol hot alcohol

p-NITRO PHENYL ACETURIC ACID

$C_6H_4(NO_2)CH_2CO_2NHCH_2CO_2H$ [173°] Got by nitrating phenylacetic acid (Hotter, *J p* [2] 38, 110) Needles, decomposed by boiling $HClAq$ into glycooll and *p* nitro phenyl acetic acid — ZnA'_2 , 2aq — AgA' needles, v sl sol cold water

o NITRO PHENYL ACETYLENE $C_6H_4NO_2$

o $C_6H_4(NO_2)CCH$ [82°] Formed by boiling *o* nitro phenyl propionic acid with water (Baeyer, *B* 13, 2259) Needles, sol hot water Gives pps with ammoniacal $AgNO_3$ and Cu_2Cl_2

p-Nitro phenyl acetylene [149°] (*M*), [152°] (*D*)

Formed by boiling *p* nitro phenyl propionic acid with water (Drewson, *A* 212, 158) Formed also from $C_6H_4(NO_2)CHBrCHBrCO_2Et$ and alcoholic potash (*C L* Muller, *A* 212, 133) Needles (from hot water) Gives a red pp with ammoniacal Cu_2Cl_2 and a greenish yellow pp with ammoniacal $AgNO_3$

Di *p* nitro di phenyl-acetylene $C_6H_4N_2O_2$ *o* $C_6H_4(NO_2)_2C \equiv C C_6H_4NO_2$ [288°] Formed from $C_6H_4(NO_2)CHBrCHBrC_6H_4NO_2$ by heating with soda lime at 180° (Elbs & Bauer, *J p* [2] 34, 346) Yellow needles (by sublimation)

o Nitro di phenyl di acetylene $C_6H_4NO_2$ *o* $C_6H_4(NO_2)_2C \equiv C C_6H_4NO_2$ [155°] Formed by the action of K_2FeCy_4 on a mixture of the cuprous salts of phenyl acetylene and *o* nitro phenyl-acetylene (Baeyer & Landsberg, *B* 15, 57). Yellow plates, sol alcohol

Di-*o*-nitro di phenyl diacetylene

$C_6H_4(NO_2)_2C \equiv C C \equiv C C_6H_4(NO_2)_2$ [212°] Formed by the action of an alkaline solution of K_2FeCy_4 on the cuprous salt of *o* nitro-phenyl acetylene (Baeyer, *B* 15, 51) Golden needles, sol chloroform Fuming H_2SO_4 converts it into the isomeric disatogen

NITRO-PHENYL-ACRYLIC ACID *o*. NITRO-CINNAMIC ACID

NITRO-DI-PHENYL-ACRYLIC ACID

Nitrile Theo.-m., and p., varieties, melting at 128°, 134°, and 118° respectively, are formed by the action of the corresponding nitro-benzoic aldehydes on phenyl-acetic nitrile (benzyl cyanide) in presence of alcoholic NaOEt (Frost, *A* 250, 180)

***o*-NITRO-PHENYL-ALLENYL-MALONIC ACID** $C_6H_4(NO_2)CH=CHCH(CO_2H)_2$ [213°] Formed by heating *o* nitro cinnamic aldehyde with malonic acid and HOAc at 100° (Einhorn, *A* 253, 374) Needles—CuA''—AgA'' yellowish plates

***p*-Nitro-phenyl-allenyl-malonic acid** [208°] Formed from *p* nitro-cinnamic aldehyde, malonic acid, and HOAc (Einhorn a Gehrenbeck, *B* 22, 45) Yellow needles (from HOAc) Br forms $C_6H_4(NO_2)CHBrCHBrCBrC(CO_2H)_2$ [206°] crystallising in plates—(NH₄)₂A''—CuA''—AgA'' flocculent pp

Ethyl ether EtA'' [105°] Needles

***o*-NITRO-PHENYL-AMIDO-ACETIC ACID** $C_6H_4(NO_2)NHCH_2CO_2H$ [193°] Formed from bromo-acetic acid and *o* nitro aniline at 125° (Plöchl, *B* 19, 6) Dark red prisms, sl sol ether Yields oxy-quinoxaline dihydride on reduction—NH₄A' flat orange prisms

***p*-NITRO-PHENYL- ω -AMIDO-ACETO-PHENONE** $C_6H_4COCH_2NHCH_2NO_2$ [167°] Formed by heating its nitrosamine with HCl Möhlau, *B* 15, 2474) Golden needles (from HOAc) Yields acetophenone and *p* phenylene-diamine on reduction

Nitrosamine $C_6H_4NH_2NO$, ω

$C_6H_4COCH_2N(NO)C_6H_4NO_2$ Formed from phenyl-amido-acetophenone, HOAc, and nitrous acid gas (M) Plates, decomposing at 135°–145°

Di-nitro-phenyl- ω -amido-acetophenone $C_6H_4COCH_2NHCH_2(NO_2)_2$ [172°] Formed by nitration of phenyl amido acetophenone (Möhlau, *B* 15, 2479) Golden prisms (from HOAc) Yields tri amido benzene on reduction

***s*-TRI-NITRO-TRI-PHENYL-TRI-AMIDO-BENZENE** $C_6(NHPh)(NO_2)_3$ [238°] Formed from $C_6Br_3(NO_2)_3$ and aniline (Jackson a Wing, *Am* 10, 283) Orange powder, insol water

***m*-NITRO-PHENYL-*p*-AMIDO-BENZOIC ACID** $C_6H_4(NO_2)(NHPh)CO_2H$ [3 4 1] [254°] Formed by heating (4,3,1) bromo nitro benzoic acid with aniline (Schöpf, *B* 22, 3281) Garnet red needles Yields an amido-acid [153°]—NaA'—NaA'aq—BaA', 3aq—AgA' orange plates

Ethyl ether EtA' [123°] Hexagonal

Anilide $C_6H_4(NO_2)(NHPh)(NHPh)CO$ [216°] Formed by heating aniline with bromo nitro-benzoyl chloride (Grohmann, *B* 23, 3448) Blood red leaflets from HOAc

Nitrile $C_6H_4(NH_2)(NHPh)CN$ [126°] Formed from bromo nitro benzonitrile and aniline (Schöpf, *B* 23, 3444)

***o*-Nitro-phenyl-*m*-amido-benzoic acid** $C_6H_4(NO_2)(NHPh)CO_2H$ [2 3 1] [248°] Formed from (3,2,1)-bromo-nitro-benzoic acid and aniline (Schöpf, *B* 23, 3440) Yellow needles—NaA' 2aq—BaA', 5aq

Ethyl ether EtA' [112°] Needles

***m*-Nitro-phenyl-*o*-amido-benzoic acid** *Nitrile* $C_6H_4(NO_2)(NHPh)CN$ [5 2 1] [170°] Formed from (2,5,1)-bromo-nitro-benzonitrile and aniline (S.) Lemon-yellow needles

Di-nitro phenyl-*o*-amido-benzoic acid

$C_6H_4N_2O_6$, ω [4 2 1] $C_6H_4(NO_2)_2NHCH_2CO_2H$ [264°] Formed by warming *o* amido benzoic acid with $C_6H_4Cl(NO_2)_2$ (Jourdan, *B* 18, 1448) Orange needles, almost insol. water—BaA', dark red crystalline powder

NITRO-PHENYL-AMIDO-NAPHTHOQUINONE *v* (a)-NAPHTHOQUINONE, *Reactions* 16 and 17

DI-NITRO-PHENYL-DI-AMIDO-DIPHENYL

$C_6H_4N_2O_6$, ω $C_6H_4(NH_2)C_6H_4NHCH_2C_6H_4(NO_2)_2$ [245°] Formed by boiling benzidine with alcohol and (1,2,4) chloro di nitro-benzene (Willgerodt, *B* 9, 981) Long needles (from HOAc)

Di *o* nitro-di-phenyl diamido diphenyl

$C_6H_4(NO_2)_2NHCH_2C_6H_4NHCH_2C_6H_4(NO_2)_2$ [240°] Formed by boiling benzidine with *o* chloro nitrobenzene and alcohol (Schöpf, *B* 22, 904) Needles (from HOAc)

Tetra-nitro di-phenyl-di-amido-diphenyl

$C_6H_4(NO_2)_2NHCH_2C_6H_4NHCH_2C_6H_4(NO_2)_2$ [above 330°] Formed from [1 2 4] $C_6H_4Cl(NO_2)_2$, alcohol, and benzidine at 120° (W) Yellow powder, sl sol alcohol

DI-NITRO-PHENYL-AMIDO-TOLYL AMINE

[4 2 1] $C_6H_4(NO_2)_2NHCH_2C_6H_4MeNH_2$ [147°] Formed from tolylene *o* diamine and *i* chloro di nitro benzene (Ernst, *B* 23, 3428) Brownish yellow needles Yields with HNO₃ the azimide

$C_6H_4(NO_2)_2N \llcorner \begin{smallmatrix} C_6H_5 \\ N \end{smallmatrix} \gg N$ [186°]

***o* NITRO DI PHENYL AMINE** $C_6H_4N_2O_6$, ω

[2 1] $C_6H_4(NO_2)NHC_6H_5$ [75°] Formed from aniline and *o* chloro nitro benzene or *o* bromo nitro benzene at 100° (Schöpf, *B* 22, 903, 23, 1839) Trimetric crystals (from alcohol), $a \cdot b \cdot c = 468 \cdot 1 \cdot 671$ Yields on reduction the amido compound [80°]

***p* Nitro-diphenylamine**

[4 1] $C_6H_4(NO_2)NHCH_2C_6H_5$ [133°] Formed from benzoyl diphenylamine by nitration and elimination of Bz (Hofmann, *A* 132, 167, Lellmann, *B* 15, 825) Formed also from its nitrosamine by treatment with aniline (Witt, *C* 33, 205) Pale-yellow scales (from dilute alcohol) Colours alcoholic potash scarlet Dyes silk yellow

Benzoyl derivative [129°] Prisms

Nitrosamine $C_6H_4(NO_2)N(NO)C_6H_5$

[134°] Formed by warming diphenylamine with HNO₃, isoamyl nitrite, and alcohol (W) Crystals, sol chloroform

Di-o-nitro diphenylamine $NH(C_6H_4NO_2)_2$

[220°] (L), [212°] (W) Obtained from its benzoyl derivative, and also, together with the *p*-isomeride, by the action of alcohol (50 c c), aniline (25 g) and aniline hydrochloride (30 g) at 100° on the mixed di nitro di phenyl nitrosamines prepared from diphenylamine (17 g), amyl nitrite (48 g), alcohol (50 c c), nitric acid (40 c c of SG 1.424), and HOAc (50 c c) (Witt, *C* J 33, 208) Red felted needles

Benzoyl derivative $NBz(C_6H_4NO_2)_2$

Formed, together with that of the *p* isomeride from benzoyl diphenylamine and fuming HNO₃ (Lellmann, *B* 15, 827)

Di *p*-nitro-diphenylamine $C_6H_4N_2O_6$, ω

$NH(C_6H_4NO_2)_2$ [216°] (L), [214°] (W) Got as above Yellow needles with blue reflex

Benzoyl derivative [224°] Monoclinic crystals, sl sol alcohol.

Di nitro diphenylamine $C_{12}H_8N_2O_4$, *s*.
 $C_6H_5NH C_6H_4(NO_2)_2$ [1 2 4]. [157°]. Formed from $C_6H_5Br(NO_2)$, or $C_6H_5Cl(NO_2)$, and aniline or *p*-phenyl thio urea (Clemm, *B* 3, 128, Willgerodt, *B* 9, 977, 11, 601, cf Hepp, *Bl* [2] 80, 4)

Tri-nitro diphenylamine $C_{12}H_5N_3O_6$, *s*.
 $C_6H_5NH C_6H_4(NO_2)_2$ [1 2 4 6]. [175°]. Formed from $C_6H_5Cl(NO_2)_2$ (picryl chloride) and aniline (Clemm, *B* 3, 126) Scarlet prisms

Tri nitro diphenylamine
 $[3] C_6H_5(NO_2) NH C_6H_4(NO_2)_2$ [1 2 4]. [194°] Formed from $C_6H_5Br(NO_2)$, or $C_6H_5Cl(NO_2)_2$, and *m* nitro aniline (Austen, *B* 7, 1250, Willgerodt, *B* 9, 1178) Short yellow needles (from HOAc)

Tri nitro diphenylamine
 $[4] C_6H_5(NO_2) NH C_6H_4(NO_2)_2$ [181°] Formed from *p* nitro aniline and bromo di nitro benzene (A) Yellow powder, *v* sol HOAc

Tri nitro diphenylamine [135°] Formed by boiling the acetyl derivative of diphenylamine with dilute nitric acid (S G 1029) (Norton & Allen, *B* 18, 1997) Yellow needles, *v* sol alcohol

Tetra nitro diphenylamine $C_{12}H_4N_4O_8$, *s*.
 $[3] C_6H_4(NO_2) NH C_6H_4(NO_2)_2$ [1 2 4 6]. [205°] Formed from *m* nitro aniline and picryl chloride (Austen, *B* 7, 1248) Orange crystals (from HOAc)

Tetra nitro diphenylamine
 $[4] C_6H_4(NO_2) NH C_6H_4(NO_2)_2$ [1 2 4 6]. [216°]. Formed in like manner from *p*-nitro aniline (A)

Tetra nitro diphenylamine $NH[C_6H_4(NO_2)_2]_2$. [180°] Got by heating $C_6H_5(NO_2)_2NH CO_2Et$ with alcoholic potash (Hager, *B* 17, 2629) Reddish brown plates (from alcohol)

Tetra nitro diphenylamine [192°] Formed by nitration of diphenylamine, diphenyl nitrosamine, and diphenyl methylamine $NMePh$. (Gnehm & Wyss, *B* 10, 1318) Yellow crystals (from alcohol) Forms a scarlet solution in $NaOH_{aq}$

Hexa nitro-diphenylamine $[C_6N_2(NO_2)_4]_2NH$ *Dipicrylamine* [238°] (A), [234°] (M) Formed by nitrating diphenylamine, diphenyl methylamine, or tetra nitro diphenylamine [216°] (Austen, *B* 7, 1250, Gnehm, *B* 7, 1399, 9, 1245, 1557, Mertens, *B* 11, 845) Yellow prisms (from acetic acid) Its ammonium salt $NH_4C_{12}H_4N_6O_{12}$ is used as a yellow dye ('aurantia') — $Ba(C_{12}H_4N_6O_{12})_2$ red rhombohedra

Hexa nitro diphenylamine [261°] Formed by nitrating tetra nitro diphenylamine [205°] (A) Small yellow crystals (from HOAc). Explodes when heated.

Nitro tri phenyl amine $(C_6H_5)_3N C_6H_4(NO_2)$ [140°] Formed from triphenylamine, HOAc, and HNO_3 (Herz, *B* 23, 2537) Golden plates

Di nitro-tri phenyl amine $C_6H_5N(C_6H_4NO_2)_2$. [207°] Formed from triphenylamine (2 g), HOAc (35 g) and HNO_3 (2 g) at 60° (Herz, *B* 23, 2538) Yellow needles, *v* sol benzene

Tri nitro-tri-phenylamine $N(C_6H_4NO_2)_3$. [280°] Formed from triphenylamine (2 g), HOAc (35 g), and HNO_3 (4 g) at 100° (Heydrich, *B* 18, 2156, Herz, *B* 23, 2559). Bronze-yellow needles, *v* sol HOAc

***m* Nitro-phenyl-angelic aldehyde** $C_6H_4(NO_2)CH CH_2CHO$ [46°] Formed from *m* nitro benzoic aldehyde, butyric acid, and dilute $NaOH_{aq}$ (Von Miller & Rohde, *B* 23,

1888) Plates, reduced by tin and HCl to amido-ethyl indonaphthene [89°]

Phenyl hydraside [185°] Red needles.

DI NITRO DI-*p*-PHENYL BENZENE

$C_{18}H_{12}(NO_2)_2$. [277°] Formed by nitration of diphenylbenzene (Schmidt & Schultz, *B* 11, 1755, A 203, 125) Yellow monoclinic needles (from nitro benzene)

Tri-nitro-di-*p*-phenyl-benzene $C_{18}H_{11}(NO_2)_3$. [195°] Formed from diphenylbenzene and fuming HNO_3 (S & S) Needles Yields on reduction a base [170°]

Tri-nitro diphenylbenzene [200°] Formed by nitration of isodiphenylbenzene (S & S). Needles Yields on reduction a base [288°]

Tetra-nitro-tri-phenyl-benzene $C_{18}H_9(NO_2)_4$. [above 370°] Formed, together with an isomeride [108°], by nitrating triphenylbenzene (Mel lin, *B* 23, 2535) Both bodies crystalline in needles

NITRO-PHENYL-BENZYLIDENE-AMINE

$C_{11}H_9N_2O_2$, *s*. $C_6H_5CH N C_6H_4NO_2$. [66°] (Lazorenko, *J* 1870, 760), [73°] (Lachovitch, *M* 9, 695) Formed from benzoic aldehyde (or hydrobenzamide) and *m*-nitro aniline Needles

***p* Nitro phenyl-benzylidene-amine** $C_6H_5N C_6H_4(NO_2)$ [1 4]. [115°] Formed from hydrobenzamide by warming with *p* nitro-aniline Yellow needles (Lachovitch)

Isomerides *v* Nitro BENZYLIDENE ANILINE

NITRO-PHENYL BENZYL OXIDE

$C_6H_4(NO_2)OCH_2Ph$ Formed from potassium nitro phenol, alcohol, and benzyl chloride (Kumft, A 224, 121) The *o*- compound melts at 29°, and the *p* compound at 106° Both are crystalline

Di nitro phenyl benzyl oxide $C_{11}H_9N_2O_3$, *s*. $C_6H_4(NO_2)_2OCH_2Ph$ Formed from silver di nitrophenol and benzyl iodide (K) The (4,2,1)-compound melts at 149°, and the (6,2,1) compound at 76° ($OH=1$) Both crystalline from HOAc

Tri nitro phenyl benzyl oxide $C_{11}H_7N_3O_3$, *s*. $[6.4.2.1] C_6H_3(NO_2)_3OCH_2Ph$ [147°] Formed from silver picrate and benzyl iodide (K). Yellowish prisms (from benzene)

TRI-NITRO-DI-PHENYL-BENZYL-PHOSPHINE OXIDE $PO(C_6H_4NO_2)_2(C_6H_5NO_2)$ [206°]. Formed from the oxide, fuming HNO_3 , and conc H_2SO_4 (Dörken, *B* 21, 1505) Crystals, *m* sol HOAc

DI-NITRO-PHENYL-BENZYL SULPHIDE $C_6H_5S C_6H_4(NO_2)_2$ [1 2 4]. [128°] Formed from (1,2,4) chloro di nitro-benzene, alcoholic K_2S , and benzyl chloride (Willgerodt, *B* 18, 331) Yellowish plates

NITRO-PHENYL-BROMO-PROPIONIC ACID

o. BROMO-NITRO PHENYL PROPIONIC ACID

***o*-NITRO-PHENYL-BUTINYL METHYL KETONE** $C_6H_4(NO_2)C_4H_7COCH_3$ [78.5°]. Formed, together with $(C_6H_4(NO_2)O.H_2)CO$ [208.5°], from *o* nitro cinnamic aldehyde, acetone, alcohol, and dilute (2 *p*.) $NaOH_{aq}$ (Diehl & Einhorn, *B* 18, 2327) Broad needles (from alcohol)

o-NITRO-PHENYL-BUTINYL PHENYL-BUTINYL KETONE

$C_6H_4(NO_2)C_4H_7CO C_6H_5C_4H_7$ [186.5°]. Formed from *o* nitro-cinnamic aldehyde, phenyl-butynyl methyl ketone, alcohol, and dilute $NaOH_{aq}$

(Drebl & Einhorn, *B* 18, 2829) Golden crystals (from acetone)

***p*-NITRO-PHENYL-ISOBUTYRIC ACID**

$C_6H_4(NO_2)CH_2CHMeCO_2H$ [121°] Formed from phenyl isobutyric acid and conc HNO_3 (Edeleanu, *C. J* 53, 559) Small prisms, sol alcohol

NITRO-PHENYL-CARBAMIC ETHER

$C_6H_4(NO_2)NHC(O)Et$ The *o* compound [58°] and the *p* compound [129°] are got from the corresponding nitro aniline and $ClCO_2Et$ (Rudolph, *B* 12, 1295; Hager, *B* 17, 2625) The *p* compound is also got by nitration of phenyl carbamic ether (Behrend, *A* 233, 9) Both are crystalline

Di nitro-phenyl carbamic ether $C_6H_4N_2O_5$ *re* [4 2 1] $C_6H_4(NO_2)_2NHCO_2Et$ [111°] Formed by nitration of either *o*- or *p*-nitro phenyl-carbamic ether (Hager, *B* 17, 2629) Needles (from alcohol) An isomeride [210°] is got by the action of HNO_3 on $C_6H_4NHCSOEt$ (Losanitsch, *B* 10, 691)

***Di* nitro *di* phenyl carbamic ether**

$(C_6H_4NO_2)_2NCO_2Et$ The only *o*- compound is formed together with the *p*-compound [134°] by nitration of *di* phenyl carbamic ether (Hager, *B* 18, 2574) The *p*-compound is the less sol. alcohol

***m*-NITRO-TRI-PHENYL-CARBINOL**

$C_6H_4(NO_2)CPh_2OH$ [75°] Formed from $C_6H_4(NO_2)CHPh_2$ by bromination in sunlight, followed by successive treatment with $KOAc$ and KOH (Tschacher, *B* 21, 190) Colourless crystals, sol ligroin

p Nitro-tri phenyl-carbinol [136°] Formed by oxidising *p* nitro tri phenyl methane with CrO_3 in $HOAc$ (Baeyer & Lohr, *B* 23, 1623) Crystals (from dilute $HOAc$)

Tri-*p*-nitro tri phenyl carbinol $C_6H_4(NO_2)_3$ *re* $C_6H_4(NO_2)_3COH$ [172°] Formed by oxidising tri nitro tri-phenyl methane (E & O Fischer, *B* 11, 1079) Colourless crystals (from $HOAc$)

TETRA-NITRO-DI-PHENYL CARBONATE

$(C_6H_4(NO_2)_2)_2CO$ [127°] Formed from *di* phenyl carbonate, HNO_3 , and H_2SO_4 (Kempf, *J pr* [2] 1, 407, Löwenberg, *C C* 1886, 390) Nodules, *v* sl sol ether

NITRO-DIPHENYL CARBOXYLIC ACID

$C_6H_4(NO_2)_2$ [222°] Formed by nitration of diphenyl *o* carboxylic acid (Schmidt, *A* 193, 115) Monoclinic crystals (from alcohol) — BaA' — CaA' nodules, *v* sol water

Nitro diphenyl carboxylic acid $C_6H_4NO_5$ *re* [2 1] $C_6H_4(CO_2H)C_6H_4(NO_2)CO_2H$ [1 4 2] [217°] Formed by oxidation of nitro phenanthraquinone [257°] (Strasburger, *B* 16, 2347) Light yellow needles (from water)

***Di* nitro-diphenyl carboxylic acid**

[4 1] $C_6H_4(NO_2)_2C_6H_4(NO_2)CO_2H$ [1 2 4] [252°] Formed by nitrating diphenyl *p* carboxylic acid (Strasser & Schultz, *A* 210, 192) Needles, *m* sol alcohol

Methyl ether MeA' [156°] Needles

(a) *Di* nitro diphenyl dicarboxylic acid

$C_6H_4(NO_2)_2(CO_2H)_2$ [249°] (*H*), [253°] (Schultz, *A* 196, 26) Formed by oxidation of *di* nitro phenanthraquinone (Struve, *B* 10, 75), and, together with the following acid, by nitration of diphenyl *di* *o* carboxylic acid (Hummel, *A* 193, 129) Pale yellow needles (containing aq) — BaA' , 6aq long prisms.

Methyl ether MeA' [178°] Prisms.

(*β*) *Di*-nitro-diphenyl dicarboxylic acid. [297°] Formed as above (Schultz, *A* 203, 105). Needles (from hot water) — BaA' , 4aq triqmic prisms

Methyl ether MeA' [132°] Tables

NITRO-PHENYL CHLORO-METHYL KETONE

***o* CHLORO NITRO ACETOPHENONE**

***o* NITRO-PHENYL CINNAMIC ACID**

$C_6H_4NO_2$ [196°] Formed from *o* nitro benzoic aldehyde, sodium phenyl acetate, and Ac_2O at 160° (Oghaloro & Rosini, *G* 20, 396) Needles — BaA' 5aq — BaA' 8aq

NITRO-PHENYLENE *o* DIAMINE

$C_6H_4(NO_2)(NH_2)_2$ [4 2 1] [198°] Formed by reducing (4,2,1) *di* nitro aniline with alcoholic ammonium sulphide (Gottlieb, *A* 85, 27; Heum, *B* 21, 2305) Dark red plates (from toluene). Ac_2O at 190° forms $C_6H_4(NO_2)_2NHCM_6$ [216°]. — $B'HCl$ aq — $B'H.PtCl_5$ — $B'HNO_3$ — $B'H_2SO_4$ — $B'H_2C_2O_4$ — $B'H_2PtCl_5$, 5aq

***Di* acetyl derivative [227°] Needles**

Nitro phenylene *m* diamine $C_6H_4N_2O_5$ *re* $C_6H_4(NO_2)(NH_2)_2$ [161°] Obtained from its diacetyl derivative, which is got by nitrating $C_6H_4(NHAc)_2$ (Barbaglia, *B* 7, 1259) Yellowish red prisms, sol water

Di acetyl derivative $C_6H_4(NO_2)(NHAc)_2$ [246°] Slender needles (from alcohol)

***Di* benzoyl derivative**

$C_6H_4(NO_2)(NHBz)_2$ [222°] Got by nitrating dibenzoyl phenylene *m* diamine (Ruhemann, *B* 14, 2652) Needles (from $HOAc$)

Nitro phenylene *p* diamine

$C_6H_4(NO_2)(NH_2)_2$ [2 4 1] [187°] Formed from its diacetyl or dibenzoyl derivatives, got by nitrating the corresponding derivatives of phenylene *p* diamine (Ladenburg, *B* 17, 149; Hinsberg, *A* 254, 255) Dark needles with green lustre

Di acetyl derivative $C_6H_4(NO_2)(NHAc)_2$ [186°] On warming with $NaOHAq$ it yields the mono acetyl derivative crystallising in red needles [195°]

Di* nitro phenylene diamine $C_6H_4N_2O_5$ *re

$C_6H_4(NO_2)_2(NH_2)_2$ [211°] Formed by reducing picramide $C_6H_4(NO_2)_2NH_2$ [6 4 2 1] with ammonium sulphide (Norton & Elliott, *B* 11, 327) Red needles, almost insol cold water

Di acetyl derivative $C_6H_4(NO_2)_2(NHAc)_2$ [246°] Yellow needles

***Di*-nitro-phenylene-*m* diamine**

$C_6H_4(NO_2)_2(NH_2)_2$ [4 2 3 1] [c 250°] Formed by heating *di* nitro resorcin with aqueous ammonia (Barr, *B* 21, 1545) Brownish needles (from $HOAc$), sl sol alcohol

***Di* nitro-phenylene-*m*-diamine**

$C_6H_4(NO_2)_2(NH_2)_2$ [c 300°] Obtained by saponification of its *di* acetyl derivative which is formed by nitration of *di* acetyl *m* phenylene-diamine (Nietzki & Hagenbach, *B* 20, 333). Orange yellow crystals

***Di* acetyl derivative [228°] Needles**

Di nitro-phenylene-*p* diamine *Di* acetyl derivative [258°] Formed by nitrating diacetyl phenylene *p* diamine (Nietzki & Hagenbach, *B* 20, 331) Yellow solid, sl sol alcohol

Tri-nitro-phenylene *m* diamine $C_6H_4N_3O_6$ *re*

$C_6H(NO_2)_3(NH_2)_2$ [6 4 2 3 1] [above 250°] Formed by boiling the *di* ethyl ether of tri-nitro resorcin with alcoholic ammonia (Nöling & Collin, *B* 17, 260; Barr, *B* 21, 1546).

Yellow granules Reduced by SnCl_4 and HCl to unstable penta amido benzene

NITRO-DIPHENYLENE-KETONE $\text{C}_{12}\text{H}_9\text{NO}$, [3 6] $\text{C}_6\text{H}_4(\text{NO}_2) < \frac{\text{O}}{\text{CO}} >$ [220°] Formed, as well as di nitro diphenylene ketone [290°], by nitration of *o* diphenylene ketone (Schultz, *A* 203, 103) The isomeric nitro derivative of iso diphenylene ketone [83°] melts at 220°–230° (Carnelley & Dunn, *B* 21, 2005)

Nitro-diphenylene-ketone carboxylic acid $\text{C}_{12}\text{H}_7(\text{NO}_2)_2\text{O}_4$ [246°] Got by warming di phenylene ketone carboxylic acid with HNO_3 (Fittig & Liepmann, *A* 200, 6) Golden needles (from alcohol) —BaA', 4aq yellow needles, sl sol water

(a) **DI NITRO DIPHENYLENE KETONE OXIDE** $\text{C}_6\text{H}_4(\text{NO}_2) < \frac{\text{O}}{\text{CO}} > \text{C}_6\text{H}_4(\text{NO}_2)$ [190°]

Formed, together with a (β) isomeride [260°], by warming diphenylene ketone oxide with HNO_3 (Wichelhaus & Salzmänn, *B* 10, 1401, *R* Richter, *J pr* [2] 23, 292, *A G* Perkin, *C J* 43, 189, Gracbe, *A* 274, 286) An isomeric body [224°] is formed, together with a di nitro-derivative [235°], by nitration of iso di phenylene ketone oxide [91°] (*R*)

NITRO-PHENYLENE-DI-METHYL-*o* DIAMINE $\text{C}_6\text{H}_3(\text{NO}_2)(\text{NMe}_2)(\text{NH})$ [4 1 2] [63°] Formed by reducing di nitro dimethylaniline by ammonium sulphide (Heim, *B* 21, 2308) Orange needles (from water)

Nitro-phenylene tri methyl diamine $\text{C}_6\text{H}_3(\text{NO}_2)(\text{NMe}_2)(\text{NHMe})$

Acetyl derivative [c 210°]
Nitrosamine $\text{C}_6\text{H}_3(\text{NO}_2)(\text{NMe}_2)(\text{NMeNO})$ [87°] Formed from $\text{C}_6\text{H}_3(\text{NMe}_2)_3$ and HNO in excess (Wurster & Schobig, *B* 12, 1811) Needles

Tri nitro phenylene di methyl diamine $\text{C}_6\text{H}_3\text{N}_3\text{O}_6$ *ie* $\text{C}_6\text{H}(\text{NO}_2)_3(\text{NHMe})_2$ [235°] Formed by heating its nitramine with phenol or aqueous methylamine (Romburgh, *R T C* 7, 6, 8, 279) Golden crystals (from HOAc)

Di nitramine $\text{C}_6\text{H}_3(\text{NO}_2)_2(\text{NMe NO})_2$ Formed by boiling $\text{C}_6\text{H}_3(\text{NMe}_2)_3$ with fuming HNO_3 (Romburgh, *R T C* 6, 252) Pale yellow crystals, decomposing at about 205° A nitramine $\text{C}_6\text{H}_3(\text{NO}_2)(\text{NHMe})(\text{NMeNO})_2$ is got by the action of methylamine on $\text{C}_6\text{H}_3(\text{NO}_2)_3\text{NMeNO}$. It separates from HOAc in golden crystals [192°]

NITRO-PHENYLENE (α) NAPHTHYL *o* DIAMINE $\text{C}_6\text{H}_3(\text{NO}_2)(\text{NH}_2)(\text{NHC}_6\text{H}_4)$ [147°] Formed from (4, 2, 1) di nitro phenyl (α) naphthylamine and ammonium sulphide (Heim, *B* 21, 2302) Needles (from HOAc), v e sol alcohol The isomeric compound from di nitro-phenyl (β) naphthylamine melts at 195°, and yields an acetyl derivative [200°], which is converted by Ac_2O into nitro phenylene (β) naphthyl acetanilide [162°]

DI-NITRO-PHENYLENE NAPHTHYLENE OXIDE $\text{C}_{12}\text{H}_7(\text{NO}_2)_2\text{O}$ [235°] Formed by nitrating (α) phenylene (α) naphthylene oxide (Arr, *A* 209, 141) V sol ether and HOAc

NITRO-PHENYLENE NAPHTHYL-ACET-AMIDINE $\text{C}_6\text{H}_3(\text{NO}_2) < \frac{\text{N}(\text{C}_6\text{H}_4)}{\text{NMe}} >$ [162°]

Formed from nitro amido phenyl (β) naphthylamine and Ac_2O (Heim, *B* 21, 589) Needles.

DI-NITRO-DIPHENYLENE OXIDE $\text{C}_{12}\text{H}_8(\text{NO}_2)_2\text{O}$ [200°] Formed from diphenyl-

one oxide and fuming HNO_3 (Hoffmeister, *A* 159, 211) Crystals (from alcohol)

NITRO PHENYLENE-UREA $\text{C}_6\text{H}_4\text{N}_2\text{O}$, *ie* $\text{C}_6\text{H}_4(\text{NO}_2) < \frac{\text{NH}}{\text{NH}} > \text{CO}$ Formed by heating nitro amido phenyl carbamic ether (Hager, *B* 17, 2630) Colourless needles, not melted at 300°.

NITRO-*o* DI-PHENYL ETHANE $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{CHPh CH}_3$ [80°] Formed, together with $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{CH CH}_3$ [149°], by nitration of *o* di phenyl ethane (Anschütz & Romig, *B* 18, 664) Long yellow needles

Di-*p* nitro-*s* di phenyl ethane [4 1] $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{CH}_2\text{CH}_2\text{C}_6\text{H}_4(\text{NO}_2)$ [1 4] [179°] Formed, together with an isomeride [75°], from dibenzyl and fuming HNO_3 (Stelling & Fittig, *A* 137, 260, Leppert, *B* 9, 15) Formed also from *p* nitro benzyl chloride, SnCl_4 , and NaOHAq (W Roser, *A* 238, 364) Needles, sl sol alcohol.

DI NITRO DI PHENYL ETHANE DICARB OXYLIC ACID $\text{C}_{12}\text{H}_{12}(\text{NO}_2)_4\text{O}_4$ Formed by nitrating *s* di phenyl ethane di *o* carboxylic acid (Dobref, *A* 239, 70) Minute crystals, melting above 300° —CaA''

Ethyl ether LiHA'' [60°]
Di nitro di phenyl ethane dicarboxylic acid [226°] Formed by nitration of *s* di phenyl ethane *aB* dicarboxylic acid (Reimer, *B* 14, 1802) Amorphous (containing aq) An isomeric acid [242°] is got by nitrating *s* di phenyl ethane *aa* dicarboxylic acid Both acids yield *p* nitro benzoic acid on oxidation

***o* NITRO PHENYL-ETHYL CARBONATE** $\text{C}_6\text{H}_3(\text{NO}_2)\text{OCO OEt}$ (275° 285°) Formed by the action of chloro formic ether upon the potassium salt of *o* nitro phenol (Bender, *B* 19, 2268) Heavy yellow oil

NITRO-PHENYL-ETHYLENE *v* Nitro-STERENE

Nitro *s* di phenyl ethylene $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{CPh CH}_3$ [36°] Formed from $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{CPh}(\text{OH})\text{CH}_3$ and AcCl (Anschutz & Romig, *B* 18, 664) Yellow crystals (from ether)

Di-*o* nitro di phenyl ethylene $(\text{C}_6\text{H}_4(\text{NO}_2))_2\text{CH}$ Formed in two modifications 'cis' [126°] and 'trans' [196°], by the action of alcoholic potash upon *o* nitro benzyl chloride (Bischoff, *B* 21, 2072, 23, 2072) Both crystallise in needles

Di *p* nitro di phenyl ethylene Formed in two modifications, [c 213°] and [c 282°], by the action of alcoholic potash on *p* nitro benzyl chloride (Walden, *B* 23, 1959, cf Strakosch, *B* 6, 328) Both are crystalline

DI-*m*-NITRO-DI-PHENYL-ETHYLENE-DIAMINE $(\text{C}_6\text{H}_4(\text{NO}_2)_2\text{NH})_2\text{C}_6\text{H}_4$ [206°] Obtained by heating *m* nitro aniline with ethylene bromide at 130° (Gattermann & Hager, *B* 17, 778) Reddish yellow crystals, insol alcohol

NITRO-*s*-DI-PHENYL-ETHYLENE CARB OXYLIC ACID *Nitrile*

$\text{C}_6\text{H}_4(\text{NO}_2)_2\text{CCy CHPh}$ [176°] Got from *p*-nitro-phenyl acetonitrile, benzoic aldehyde, and alcoholic NaOEt at 50° (Remse, *B* 23, 8134). Yellow needles By using *o* or *m* nitro benzoic aldehyde, the corresponding di nitro-compounds [4 1] $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{CCy CH C}_6\text{H}_4(\text{NO}_2)$ [2 1] [185°] and [4 1] $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{CCy CH C}_6\text{H}_3(\text{NO}_2)$ [3 1] [195°] may be made Both crystallise in needles.

***m*-NITRO-PHENYL-ETHYLENE-QUINOLINE** $\text{C}_6\text{NH}_2\text{CH CH C}_6\text{H}_4\text{NO}_2$ [136°] Ob-

tained by heating methyl quinoline (lepidine) with *m* nitro benzoic aldehyde and KHSO_4 at 160° (Heymann & Königs, *B* 21, 1424). Needles

NITRO-PHENYL ETHYL KETONE

$\text{C}_6\text{H}_4(\text{NO}_2)\text{CO.C}_2\text{H}_5$ [100°] Formed, together with a syrupy isomeride, by nitration of phenyl ethyl ketone (Barry, *B* 6, 1007) Prisms

NITRO-PHENYL-FURFURYL-ACRYLIC

ACID *Nitrile* $\text{C}_6\text{H}_4(\text{NO}_2)\text{CO.C}_4\text{H}_3\text{O}$ [173°] Formed from furfuraldehyde, *p* nitro phenyl acetone, and alcoholic NaOEt (Freund & Immerwahr, *B* 23, 2852) Needles

o-NITRO-PHENYL-GLYCIDIC ACID

$\text{C}_6\text{H}_3(\text{NO}_2)\text{CH(OH)CH(OH)CO}_2\text{H}$ *Nitro phenyl oxyacrylic acid* [108°] Formed from $\text{C}_6\text{H}_3(\text{NO}_2)\text{CH(OH)CHClCO}_2\text{H}$ and alcoholic potash (Baeyer, *B* 13, 2262; Morgan, *B* 17, 219; Lipp, *B* 19, 2649) Prisms (containing aq) Melts at 94° when hydrated, 108° when anhydrous Yields indigo and CO_2 on heating $-\text{NH}_4\text{A}'$ aq $-\text{AgA}'$ white crystalline pp

p-Nitro-phenyl-glycidic acid [188°]

Formed in the same way as the *o* isomeride (Lipp), and also by the action of HOCl on sodium *p* nitro cinnamate (Erlenmeyer, *B* 14, 1868) Plates (from hot water) Yields $\text{C}_6\text{H}_3(\text{NO}_2)\text{CH(OH)CH(OH)CO}_2\text{H}$ on boiling with dilute H_2SO_4

NITRO-PHENYL GLYCOCOLL v NITRO

PHENYL AMIDO ACETIC ACID

NITRO-PHENYL GLYCOLLIC ACID v GLYCOLLIC ACID

o-NITRO-PHENYL GLYOXYLIC ACID

$\text{C}_6\text{H}_3(\text{NO}_2)\text{CO.CO}_2\text{H}$ [49°] Formed from its amide, which is got by the action of cold conc HClAq on $\text{C}_6\text{H}_3(\text{NO}_2)\text{CH}_2\text{Cy}$ (Claisen & Shadwell, *B* 12, 352; Fehrlin, *B* 23, 1577) Needles *Amide* [189°] (*C* & *S*), [199°] (*F*) *Nitrile* [54°] Prisms (from ligroin)

Phenyl hydrazide [166°] Changed by dissolving in alcoholic KOH and adding HCl into an isomeride [190°] HNO_3 converts the first phenyl hydrazide into a body melting at $77^\circ-80^\circ$ and the second into one melting at $95^\circ-100^\circ$ Both yield isatin phenyl hydrazide on reduction The ethyl ether of the phenyl-hydrazide $\text{C}_{10}\text{H}_7\text{N}_2\text{O}_2$ crystallises in yellow prisms [128°] (Krause, *B* 23, 3617)

Phenyl-methyl hydrazide [142°]

Oxam of the ethyl ether

$\text{C}_6\text{H}_3(\text{NO}_2)\text{C(OH)CO}_2\text{Et}$ [163°] Needles (from boiling water) (Gabriel, *B* 16, 519)

m-Nitro-phenyl glyoxylic acid [78°] Formed by boiling its amide with alkalis (Claisen & Thompson, *B* 12, 1944, 14, 1187) Prisms — KA' flat prisms — BaA' aq — AgA' nodules

Amide $\text{C}_6\text{H}_3(\text{NO}_2)\text{CO CONH}_2$ [152°]

Formed from *m* nitro phenyl acetone, and also by nitration of phenyl-glyoxylic amide

Nitrile (231° at 145 mm) Oil

Phenyl hydrazide [176°] (*F*) Crystals Successive treatment with KOH and HClAq yields a green compound [285°]

Di-nitro-phenyl-glyoxylic acid

Phenyl-hydrazide of the methyl ether $\text{C}_6\text{H}_3(\text{NO}_2)_2\text{C(OH)CO}_2\text{Me}$ [183°] Formed from methyl-di-nitro-phenyl-acetate and diazobenzene chloride (V. Meyer, *B* 22, 819) Alcoholic potash forms a blue solution, changing to

yellow, and forming $\text{C}_6\text{H}_3(\text{NO}_2)_2\text{C(CO}_2\text{H)NPhN}$ [272°], which yields a methyl ether [132°]

m NITRO-DIPHENYL-GUANIDINE

$\text{NH C(NHPh) NHC}_6\text{H}_4\text{NO}_2$ [182°] Formed from *m* nitro-di-phenyl thio urea, PbO , and alcoholic NH_3 (Brückner, *B* 7, 1236) Cyanogen, followed by dilute HClAq , changes it to the oxalyl derivative [168°], whence hot conc HCl forms nitro di phenyl parabanic acid (Hirsch, *C* 1888, 624)

m-Nitro-tri-phenyl-guanidine [159°]

Formed from *m* nitro-di phenyl thio urea, PbO , and aniline (*B*, Losanitsch, *B* 16, 50) Yellow plates — $\text{B'H}_2\text{P}^+\text{Cl}_4$

m Di-nitro di phenyl-guanidine

$\text{NH C(NH C}_6\text{H}_4\text{NO}_2)_2$ [190°] Formed from *m* nitro aniline and cyanogen chloride (Hofmann, *A* 67, 156), or from di nitro di phenyl thio urea, PbO , and alcoholic NH_3 (*B*) Scales $\text{B'HCl} - \text{B'H}_2\text{P}^+\text{Cl}_4$

Tri *m* nitro tri phenyl guanidine

$\text{C}_6\text{H}_3(\text{NO}_2)_3\text{N C(NH C}_6\text{H}_4\text{NO}_2)_2$ [189°] Formed from di nitro di phenyl thio urea, iodine, and alcohol (*L*) Yellow plates, sol hot alcohol

DI-NITRO DI-PHENYL HEPTANE

$\text{C}_6\text{H}_4(\text{C}_6\text{H}_4\text{NO}_2)_2$ Oil (Auger, *Bl* [2] 47, 42)

o-NITRO-PHENYL-HYDRAZINE

$\text{C}_6\text{H}_3(\text{NO}_2)\text{NH.NH}_2$ [90°] Formed from *o*-nitro diazobenzene chloride, HCl , and SnCl_4 at 0° (Bischler, *B* 22, 240, 2801) Brick red needles from benzene, al sol cold alcohol With benzaldehyde it yields $\text{C}_6\text{H}_3\text{CH.NH C}_6\text{H}_4\text{NO}_2$ [187°] — B'HSnCl_4 prisms — B'HCl needles — $\text{B'H}_2\text{SO}_4$ flesh-coloured needles

Formyl derivative

$\text{C}_6\text{H}_3(\text{NO}_2)\text{NH.NHCHO}$ [177°] Formed from *o* nitro phenyl hydrazine hydrochloride, formic acid, and some Na_2CO_3 Needles, v e sol hot Aq

Acetyl derivative [141°] Needles

Di-acetyl derivative [58°] Prisms

Benzoyl derivative [166°] Needles

Oxalyl derivative

$\text{C}_6\text{O}_2(\text{NH.NH C}_6\text{H}_4\text{NO}_2)_2$ Formed from the hydrazide and oxalic ether Yellow needles, sol hot nitrobenzene.

m-Nitro phenyl-hydrazine

$\text{C}_6\text{H}_3(\text{NO}_2)\text{NH.NH}_2$ [93°] Prepared in the same way as the *o*-compound (Bischler & Brodsky, *B* 22, 2809) Canary yellow needles Reacts with ketonic compounds, yielding their *m* nitro phenyl hydrazides, with the following melting points from aldehyde [98°], from acetone [112°], from benzoic aldehyde [118°], from acetophenone [160°], from benzal [158°]; and from aceto acetic ether [117°]

Salts — $\text{B'HCl} - \text{B'H}_2\text{SO}_4$ yellow crystalline groups, v sol hot water

Acetyl derivative [146°] Plates

Di-acetyl derivative [150°] Tables

(a)-*Acetyl-(B)* benzoyl derivative

$\text{C}_6\text{H}_3(\text{NO}_2)\text{NBz.NHAc}$ [137°] Formed from the acetyl derivative and Bz_2O at 160° Yellowish aggregates of crystals

(a)-*Benzoyl-(B)*-acetyl derivative

$\text{C}_6\text{H}_3(\text{NO}_2)\text{NAc.NHBz}$ [147°] Formed from the benzoyl derivative, Ac_2O , and NaOAc . Needles (by sublimation).

Benzoyl derivative [151°] Needles

Di-benzoyl derivative. [158°]. Plates.

Di-nitro di-phenyl-hydrazine

$C_6H_5NHNH.C_6H_5(NO_2)_2$ [1 2 4] [120°] Formed from $C_6H_5Cl(NO_2)_2$ and phenyl hydrazine (Willgerodt, *J pr* [2] 87, 350, 40, 252, 42, 132) Red plates Converted by shaking with HgO into $C_6H_5.N_2.C_6H_5(NO_2)_2$ [117°] On boiling with alcohol it yields $C_6H_5.N_2.C_6H_5(NO_2)_2$ [178°], boiling $HOAc$ forms $C_6H_5.N_2.C_6H_5(NO_2)_2$ [175°]

Di m nitro s di phenyl hydrazine

$(C_6H_5(NO_2))_2N_2H_2$ [220°] Formed from di-nitro azobenzene and cold alcoholic ammonium sulphide (Lermontoff, *B* 5, 236) Yellow needles

Tri nitro di phenyl-hydrazine

$C_6H_5NH.NHC_6H_5(NO_2)_2$ [1 2 4 6] [185°] Formed from $C_6H_5Cl(NO_2)_2$ and phenyl hydrazine hydrochloride (Willgerodt, *J pr* [2] 87, 346, 40, 264, Fischer, *A* 190, 132, 253, 1) Red crystals, melting at 175°-180° when slowly heated, but 183°-185° when quickly heated By boiling with $MeOH$ it is converted into the compound $C_6H_5.N_2.C_6H_5(NO_2)_2$ [218°] On heating with $HOAc$ it yields $C_6H_5.N_2.C_6H_5(NO_2)_2(NO)$ [248°] (Freund, *B* 22, 1663), which yields a mono sulphonic acid crystallising from water in yellow needles, not melted at 360°

o NITRO PHENYL-HYDRAZINE SULPHONIC ACID $C_6H_5(NO_2)(SO_3H)NHNH_2$ Formed from o nitro diazobenzene sulphonic acid and a well cooled, strongly acid, solution of $SnCl_2$ (Nietzki & Lerch, *B* 21, 3220) — $HA.HCl$

m Nitro phenyl hydrazine sulphonic acid [3 6 1] $C_6H_5(NO_2)(SO_3H)NHNH_2$ Formed from nitro diazobenzene sulphonic acid and cold $SnCl_2$ (Lamprecht, *B* 18, 2194) Yellow needles (containing aq) — KA' 1/4aq — BaA' 1/4aq — PbA' 4aq

NITRO PHENYL HYDROXYLAMINE v HYDROXYLAMINE DERIVATIVES

DI NITRO DI PHENYL HYPOPHOSPHOROUS ACID $(C_6H_5(NO_2))_2PO.OH$ [268°] Formed from Ph_2PO_2H , nitric acid, and H_2SO_4 (Dörken, *B* 21, 1513) Yellow pp, v sol water — NH_4A' [260°] — KA' 2aq — BaA' 6aq — PbA' — AgA'

NITRO PHENYL INDIAZINE CARBOXYLIC ACID $C_6H_5(NO_2) < \begin{smallmatrix} N(C_6H_5) \\ C(CO_2H) \end{smallmatrix} > N$ [272°]

Formed by the action of alcoholic potash on the red needles [183°] formed from di-nitro-phenyl acetic ether and diazobenzene (V Meyer, *B* 22, 319, *A* 264, 149) Sulphur yellow needles, v sl sol alcohol Reduced by $SnCl_2$ to a dihydride [235°]

Methyl ether MeA' [192°] Needles Converted by HNO_3 into $C_6H_5.N_2O_2$ [281°], and by H_2SO_4 into a sulphonic acid (Strassmann, *B* 23, 714)

Ethyl ether EtA' [158°] Needles

NITRO-DI-PHENYL-KETONE v NITRO-BENZOPHENONE

DI-NITRO-PHENYL-MALONIC ETHER $C_6H_5(NO_2)_2CH(CO_2Et)_2$ [51°] Formed from sodium malonic ether and $C_6H_5Br(NO_2)_2$ (Von Richter, *B* 21, 2472) Pale-yellow prisms.

m-NITROPHENYL MERCAPTAN

$C_6H_5(NO_2).SH$ Formed by the action of alcoholic potash on the ether formed from potassium xanthate and m-diazobenzene (Leuckart, *J pr* [2] 41, 197). Yellow liquid with nasty smell

p-Nitro-phenyl mercaptan $C_6H_5(NO_2).SH$ [77°] Formed from $C_6H_5Cl(NO_2)$ and alcoholic KSH (Willgerodt, *B* 18, 881). Crystals

Di nitro-phenyl mercaptan $C_6H_5(NO_2)_2SH$ [4 2 1] [181°] Formed from $C_6H_5Cl(NO_2)_2$ and KSH (Willgerodt, *J* 1884, 974) Needles

Ethers (Willgerodt, *B* 18, 330) MeA' [126°] — EtA' [113°] — PrA' [94°] — $PrOH_2A'$ [72°] — $C_6H_5CH_2A'$ [128°] — BzA' [113°]

Di-nitro-phenyl-mercaptan [195°] Formed by heating $C_6H_5(NO_2).SCN$ with conc H_2SO_4 (Austen & Smith, *Am* 8, 90) Yellow powder

Tri-nitro phenyl mercaptan $C_6H_5(NO_2)_3SH$ [6 4 2 1] [114°] Formed from $C_6H_5Cl(NO_2)_3$ and alcoholic KSH (W) Small yellowish needles Explodes at 115° — KA' brown needles

o-NITRO PHENYL-METHACRYLIC ACID $C_6H_5(NO_2).CH.CMe.CO_2H$ [165°] Formed by hydrolysis of its ether, which is prepared from methyl phenyl methacrylate and HNO_3 Formed also from phenyl isobutyric acid and HNO_3 (Edeleanu, *B* 20, 621, *C J* 53, 559) Crystalline powder, yielding o nitro benzoic acid on oxidation

m Nitro phenyl-methacrylic acid [197°] Formed from m nitro benzoic aldehyde by heating with sodium propionate and propionic anhydride (Von Miller, *B* 23, 1900) White powder, v sol hot alcohol

p-Nitro phenyl methacrylic acid [208°] Formed in the same way as the o isomeride (E) Crystals — AgA' white needles

Methyl ether MeA' [115°] Plates

m NITRO-PHENYL METHACRYLIC ALDEHYDE $C_6H_5(NO_2).CH.CMe.CHO$ [83°] Formed from m nitro-benzoic aldehyde, propionic aldehyde, and dilute (10 p c) aqueous $NaOH$ (Miller & Kinkelin, *B* 19, 530) Thin prisms (from alcohol) Aniline yields only $C_6H_5(NO_2).CH.NPh$ and crystalline $C_6H_5(NO_2).CH(NHPh)_2$ [170°] Tin and HCl yield a base $C_6H_5.N$ [98°], whence AcO forms $C_6H_5.AcN$ [145°], and benzoic aldehyde produces $C_6H_5.N(CHPh)$ [73°]

Phenyl hydrazide $C_6H_5.N_2O_2$ [135°] **NITRO DI PHENYL METHANE** $C_6H_5(NO_2)_2$

o compound Formed from o nitro benzyl chloride, benzene, and $AlCl_3$ (Geigy & Koenigs, *B* 18, 2402) Oil

m compound [141°] Formed from m nitro-benzyl alcohol and conc H_2SO_4 (Becker, *B* 15, 2091) Oil, sol alcohol

p compound [31°] Formed by either of the above methods (Basler, *B* 16, 2716, Manns, *C C* 1888, 1363) Prisms, v sol alcohol

m-Nitro-tri-phenyl methane

$CHPh_2.C_6H_5.NO_2$ [90°] Formed from m-nitro benzoic aldehyde, benzene, and H_2SO_4 (Tscha cher, *B* 19, 2463, 21, 188) Crystals (from ligroin)

p-Nitro-tri-phenyl-methane [93°] Formed in like manner (Baeyer & Löhr, *B* 23, 1622)

Di-nitro-di-phenyl-methane $C_6H_5(NO_2)_2$ By nitrating diphenyl methane Doer (*B* 5, 795) obtained two compounds of this formula, melting at 183° and 172°, while Staedel (*A* 194, 863) obtained the (a)- compound [188°] and a (β) isomeride [118°] By nitrating m-nitro diphenyl-methane Becker (*B* 15, 2092) obtained a fourth isomeride [94°], while Basler (*B* 16, 2719) got a fifth isomeride [175°] by the nitration of p-nitro-di-phenyl-methane

Tri-nitro-tri-phenyl-methane $CH(C_6H_5.NO_2)_3$ [207°] Formed by nitrating tri phenyl-methane

(E a O Fischer, *A* 194, 254, cf Hemilian, *B*, 7, 1208) Scales (from benzene)

Tetra-nitro-di-phenyl-methane [172°] Formed from CH_2Ph_2 and fuming HNO_3 at 0° (Staedel, *A* 218, 359) Long pointed needles

DI-NITRO-DI-PHENYL-METHYL-AMINE $\text{C}_6\text{H}_4(\text{NO}_2)\text{NMeC}_6\text{H}_5$ [167°] Formed from $\text{C}_6\text{H}_4\text{Cl}(\text{NO}_2)_2$ and $\text{C}_6\text{H}_5\text{NMe}$, or $\text{C}_6\text{H}_5\text{NHMe}$ (Leymann, *B* 15, 1235) Reddish needles

NITRO DI PHENYL-METHYL CARBINOL $\text{C}_6\text{H}_4(\text{NO}_2)\text{CPh}(\text{OH})\text{CH}_3$ [107°] Formed from *u*-di phenyl ethane and HNO_3 (Anschtz a Romig, *B* 18, 664) White prisms, yielding an acetyl derivative [86°]

***o*-NITRO PHENYL TRIMETHYLENE GLYCOL** $\text{C}_6\text{H}_3(\text{NO}_2)\text{CH}(\text{OH})\text{CH}_2\text{CH}_2(\text{OH})$ [109°] Formed from *o* nitro benzoic aldehyde, acetic aldehyde, and an alkali (Baeyer & Drewson, *B* 15, 2861) Colourless needles

NITRO PHENYL TRIMETHYLENYL KE TONE CARBOXYLIC ACID

$\text{C}_6\text{H}_3(\text{NO}_2)\text{CO C}(\text{CO}_2\text{H})\text{CH}_2\text{CH}_2$ [176°] Obtained from its ether, which is produced by the action of ethylene bromide on sodium *p* nitro benzoyl acetic ether (Perkin a Bellinot, *B* 18, 958) Colourless needles—AgA' amorphous *Ethyl ether* EtA' [84°] Prisms

NITRO-PHENYL-METHYL KETONE v NITRO-ACETOPHENONE

***p*-NITRO-PHENYL METHYL-OXAZOLE** $\text{CH C}(\text{C}_6\text{H}_4\text{NO}_2)\text{N}=\text{C}(\text{CH}_3)\text{CH}_2\text{O}$ [157°] Formed by the action of conc HNO_3 on the base obtained from acetamide and bromo acetophenone (Lewy, *B* 21, 926) Yellow needles, v sol hot alcohol Yields an amido-derivative [115°]

***p*-NITRO PHENYL (*β*)-METHYL PIPERIDINE** $\text{C}_6\text{H}_4(\text{NO}_2)\text{NC}_4\text{H}_8\text{Me}$ [61°] Formed by heating (*β*) methyl piperidine with $\text{C}_6\text{H}_4\text{Cl}(\text{NO}_2)_2$ at 150° (Lellmann a Buttner, *B* 23, 1389) Golden plates (from alcohol)—B'HAuCl₂ 2aq

Di-nitro phenyl (*β*) methyl piperidine [67°] Formed in like manner, using the compound $\text{C}_6\text{H}_4\text{Cl}(\text{NO}_2)_2$ [1 2 4] Yellow needles

***o*-NITRO DI PHENYL-METHYL-PYRAZOLE**

$\text{C}_6\text{H}_3(\text{NO}_2)_2\text{C}(\text{CH}_3)\text{N}(\text{NPh})\text{CHMe}$ [95°] or [105°] (285° at 70 mm) Formed by heating its carboxylic acid [218°] (Knorr a Jödicke, *B* 18, 2261) Indescent plates [95°], slender needles, or thick prisms [105°]—B'H₂PtCl₆ [198°]

***p* Nitro di-phenyl-methyl-pyrazole** $\text{C}_6\text{H}_3(\text{NO}_2)_2\text{C}(\text{CH}_3)\text{N}(\text{NPh})\text{CHMe}$ Formed by heating its carboxylic acid [202°] Oil—B'H₂PtCl₆ slender needles

Tri-nitro di phenyl methyl pyrazole $\text{C}_6\text{H}_2(\text{NO}_2)_3\text{C}(\text{CH}_3)\text{N}(\text{N(C}_6\text{H}_4\text{NO}_2)_2)\text{CHMe}$ [178°] Formed by nitrating di-phenyl methyl pyrazole (Knorr a Laubmann, *B* 22, 174) V sl sol alcohol

NITRO-DI-PHENYL-METHYL PYRAZOLE CARBOXYLIC ACID

$\text{C}_6\text{H}_3(\text{NO}_2)_2\text{C}(\text{CH}_3)\text{N}(\text{N(C}_6\text{H}_4\text{NO}_2)_2)\text{CHMe}$. The ethers of the *o*-acid [218°] and of the *p*-acid [202°] are respectively formed by heating *o*- and *p*-nitro-benzoyl-acetoacetic ether with phenyl-hydrazine in HOAc (Knorr a Jödicke, *B* 18, 2267) The *o*-ether melts at 146° and the *p*-ether at 128° Both crystallise well

***m*-NITRO-PHENYL-DI-METHYL-PYRIDINE DICARBOXYLIC ETHER** $\text{C}_{10}\text{H}_8\text{N}_2\text{O}_4$ $\text{C}_6\text{H}_4(\text{NO}_2)\text{C}_2\text{NMe}_2(\text{CO}_2\text{Et})_2$ [65°] Formed from its dihydride and fuming HNO_3 (Lepetit, *G* 17, 461) Colourless crystals (from alcohol)—B'H₂PtCl₆ [202°] Orange yellow needles—B'HNO₃ [130°] Colourless needles

NITRO PHENYL-DI-METHYL PYRIDINE DIHYDRIDE DICARBOXYLIC ETHER $\text{C}_6\text{H}_4(\text{NO}_2)\text{C}_2\text{NHMe}(\text{CO}_2\text{Et})_2$ Formed from nitro benzoic aldehyde, acetoacetic ether, alcohol, and NH₃ (Lepetit, *G* 17, 460, *B* 20, 1841) *o* isomeride [120°] Yellow tables *m*-isomeride [161°] Tables *p* isomeride [118°–122°]

***m* NITRO-PHENYL-METHYL-QUINOLINE**

$\text{C}_6\text{H}_4\text{CH}(\text{CMe})\text{C}_8\text{H}_6\text{N}_2$ [145°] Formed by heating aniline with *m* nitro α methyl cinnamic aldehyde and conc HClAq (Miller a Kinkelin, *B* 19, 531) Small plates, v sol hot alcohol—B'HCl—B'H₂PtCl₆ long needles

DI NITRO PHENYL (*α*) NAPHTHYLAMINE $\text{C}_{10}\text{H}_7\text{N}_2\text{O}_4$ $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{NHC}_6\text{H}_5$ [190 5°] Formed from (*α*) naphthylamine and $\text{C}_6\text{H}_4\text{Br}(\text{NO}_2)_2$ [72°] (Heim, *B* 21, 2302) Orange red needles (from alcohol) Conc H₂SO₄ forms a dark blue solution

Isomeride [77°] Prepared by nitration of phenyl (*α*) naphthylamine (Streiff, *B* 13, 1853) **Di nitro phenyl (*β*) naphthylamine** [169°] (*H*), [179°] (*E*) Prepared by the action of $\text{C}_6\text{H}_4\text{Br}(\text{NO}_2)_2$ or $\text{C}_6\text{H}_4\text{Cl}(\text{NO}_2)_2$ on (*β*) naphthylamine (Heim, *B* 21, 589, Ernst, *B* 23, 4429) Prisms By nitration of phenyl (*β*) naphthylamine Streiff obtained $\text{C}_{10}\text{H}_7(\text{NO}_2)_2\text{N}$ [85°] and $\text{C}_{10}\text{H}_7(\text{NO}_2)_2\text{N}$ [192°–195°], both crystalline

Tetra nitro phenyl naphthylamine $\text{C}_{10}\text{H}_5(\text{NO}_2)_4\text{NHC}_6\text{H}_5$ The (*α*) compound [162 5°] and the (*β*) isomeride [253°] are formed from aniline and the corresponding bromo tetra nitro naphthalenes (Merz a Weith, *B* 15, 2712) Both crystallise from benzene in orange needles (containing benzene)

DI-NITRO-PHENYL-(*α*) NAPHTHYL HYDRAZINE $\text{C}_{10}\text{H}_7\text{N}_4\text{O}_4$ [181°] Formed from (*α*) chloro di nitro benzene and (*α*) naphthyl hydrazine (Willgerodt, *J pr* [2] 43, 184) Rec prisms (*β*)-Naphthylamine yields an isomeride [188°]

Tri-nitro-phenyl-(*α*) naphthyl hydrazine $\text{C}_{10}\text{H}_5\text{N}_5\text{O}_6$ [176°] Got from an alcoholic solution of picryl chloride and (*α*) naphthyl hydrazine (*W*) Occurs in a red stable modification and an unstable yellow one (*β*)-Naphthylamine forms an isomeride [175°] also occurring in two forms

DI-NITRO-PHENYL-(*β*)-NAPHTHYL OXIDE $\text{C}_{10}\text{H}_7\text{O}_2$ $\text{C}_6\text{H}_4(\text{NO}_2)_2$ [1 2 4] [95°] Formed from $\text{C}_6\text{H}_4\text{Cl}(\text{NO}_2)_2$ and (*β*) naphthol (Ernst, *B* 23, 3430) Yellow needles (from alcohol)

NITRO-PHENYL NITRO-BENZYL OXIDE $\text{C}_6\text{H}_4(\text{NO}_2)\text{OCH}_2\text{C}_6\text{H}_4(\text{NO}_2)$ The compound formed from *p* nitro benzyl chloride, *o* nitro phenol, and alcoholic potash melts at 129°, the *pp* isomeride at 183° (Kumpf, *B* 17, 1077, *A* 224, 107)

Di-nitro-phenyl nitro benzyl oxide. [4 2 1] $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{OCH}_2\text{C}_6\text{H}_4\text{NO}_2$ [1 4] [201°] an [6 2 1] $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{OCH}_2\text{C}_6\text{H}_4\text{NO}_2$ [1 4] [187°] have been prepared (Staedel, *B* 14, 899, Kumpf

They yield di nitro aniline and *p* nitro benzyl alcohol [91°] on heating with alcoholic ammonia

Tri nitro phenyl nitro benzyl oxide
[6 4 2 1] $C_6H_2(NO_2)_3 \cdot O \cdot CH_2 \cdot C_6H_4 \cdot NO_2$ [1 4] [108°]. Long thin needles (K)

DI NITRO-DI-PHENYL OXIDE
 $C_6H_4(NO_2)_2$ [185°] Formed by nitrating di-phenyl oxide (Hoffmeister, *A* 159, 191) Needles

Di nitro di phenyl oxide $C_6H_4(NO_2)_2 \cdot OC_6H_5$ [71°] Formed from $C_6H_5 \cdot Cl(NO_2)_2$ and $PhOK$ (Willgerodt) Needles

Tri nitro-di phenyl oxide
[4 2 1] $C_6H_4(NO_2)_3 \cdot O \cdot C_6H_4 \cdot NO_2$ [1 x] Formed from $C_6H_5 \cdot Cl(NO_2)_2$ and $C_6H_5 \cdot (NO_2)_2(OK)$ The *o* cern compound ($x=2$) melts at 119°, the *p* isomeride ($x=4$) at 114° (Willgerodt & Häetlin, *B* 17, 1764) Both are v sol benzene

Tetra nitro di-phenyl oxide
[6 4 2 1] $C_6H_2(NO_2)_4 \cdot O \cdot C_6H_4 \cdot (NO_2)_2$ [1 x] Formed from $C_6H_5 \cdot Cl(NO_2)_2$ and $C_6H_5 \cdot (NO_2)_2(OK)$ The *o* compound ($x=2$) melts at 173° and the *p*-isomeride at 153° (W & H) Both are crystalline

Tetra nitro di-phenyl oxide $\{C_6H_4(NO_2)_2\}_2 \cdot O$ [195°] Formed by the action of $C_6H_5 \cdot Cl(NO_2)_2$ on $C_6H_5 \cdot (OK)(NO_2)_2$ (Willgerodt, *B* 13, 887) Thick crystals, almost insol alcohol

NITRO-PHENYL-OXY-ACETIC ACID v NITRO MANDELIC ACID

p NITRO-PHENYL OXY BUTYL KETONE
ANHYDRIDE CARBOXYLIC ACID, $H_{11}(NO_2)_2 \cdot O$.

i.e. $O \leftarrow \begin{matrix} C(C_6H_4NO_2) \\ CH, CH, CH \end{matrix} \rightarrow CO \cdot OH$ Formed from trimethylene bromide and sodium *p* nitro benzyl acetic ether (Peikin, *jun*, *B* 18, 954, *C* *J* 51, 735) Melts at 172° when crystallised from benzene, 183° when crystallised from water — *AgA'* light yellow needles

Ethyl ether EtA' [63°] Lustrous yellow monoclinic crystals, $a \ b \ c = 2 \ 353 \ 1 \ 1 \ 553$, $\beta = 80^\circ 42'$

m-NITRO PHENYL PARACONIC ACID

$C_{11}H_9NO_4$ *i.e.* $C_6H_4(NO_2) \cdot CH \leftarrow \begin{matrix} CH(CO_2H) \\ CO \end{matrix} \rightarrow CH$.

[171°] Formed by heating *m* nitro benzoic aldehyde with Ac_2O and $NaOAc$ at 125° (Salo monson, *B* 18, 2154, *R* *T* *C* 6, 1) Crystals Yields with baryta the salt $C_{11}H_8NO_4 \cdot Ba$ The corresponding *p*-isomeride melts at 163° (*S*, cf Erdmann, *B* 18, 2742)

p NITRO-PHENYL PENTINOIC ACID

$C_9H_7(NO_2) \cdot CH \cdot CH \cdot CH \cdot CO \cdot H$ [271°] Formed from *p* nitro cinnamic aldehyde, Ac_2O , and $NaOAc$ (Einhorn & Gehrenbeck, *B* 22, 45, *A* 253, 357) Formed also by oxidising the ketone $C_9H_7(NO_2) \cdot CH \cdot CH \cdot CH \cdot CO \cdot Me$ with $NaOCl$ Yellowish needles (from alcohol) Forms a tetrabromide [254°] — *AgA'* flocculent pp

Ethyl ether EtA' [118°] Plates

o Nitro-di-phenyl pentinoic acid *Nitrolic* $C_6H_4 \cdot CH \cdot CH \cdot CH \cdot C(C_6H_4 \cdot NO_2) \cdot CN$ [206°] Formed from *p* nitro benzyl cyanide, cinnamic aldehyde, and $NaOEt$ (Rames, *B* 23, 3185) Needles

p NITRO-PHENYL PHENYL-(β)-AMIDO-PROPIONIC ACID

$C_9H_7(NO_2) \cdot CH(NHPh) \cdot CH_2 \cdot CO_2H$ [122°] Formed from aniline and $C_6H_4(NO_2) \cdot CHBr \cdot CH_2 \cdot CO_2H$ (Basler, *B* 17, 1500) Yellow crystals

Ethyl ether EtA' [78°] Crystals

DI-NITRO-PHENYL-PHENYLENE-DI-AMINE $C_6H_4(NO_2)_2 \cdot NH \cdot C_6H_4 \cdot NH_2$ [172°].

VOL. III.

Formed from $C_6H_5 \cdot Cl(NO_2)_2$ [1 2 4] and phenylene-diamine (Leymann, *B* 15, 1237)

NITRO-PHENYL PHOSPHATES The following compounds have been prepared by Rapp (*A* 224, 158), the NO_2 being in the *p*-position: $C_6H_4(NO_2) \cdot O \cdot PO(OH)_2$ [112°], $(C_6H_4(NO_2)_2)_2 \cdot PO \cdot OH$ [133°], $(C_6H_4(NO_2)_2)_2 \cdot PO \cdot OEt$ [135°], and $(C_6H_4(NO_2)_2)_2 \cdot PO$ [155°] Tri *o* nitro tri phenyl phosphate melts at 126° (Engelhardt & Lat schinoff, *Z* 1870, 230)

TRI-NITRO TRI-PHENYL PHOSPHINE OXIDE $OP(C_6H_4NO_2)_3$ [243°] Got by nitrating tri phenyl phosphine hydrate (Michaelis & Soden, *B* 17, 921, *A* 229, 324) It is accompanied by an isomeride [68°]

m NITRO PHENYL PHTHALIMIDE

$C_6H_4 \left\langle \begin{matrix} CO \\ C(C_6H_4NO_2) \end{matrix} \right\rangle$ [243°] Prepared by heating phthalic anhydride with *m* nitro aniline (Gabriel, *B* 11, 2261) Needles, v sol $EtOH$

NITRO PHENYL PIPERIDINE The following compounds are formed by the action of piperidine upon the corresponding halogen derivatives of nitro- and di nitro benzene respectively (Lellmann, *B* 20 680, 21, 2281) [1 4] $C_6H_4(NO_2)_2 \cdot NC_4H_9$ [81°] red prisms, yielding the salts $BHCl$ and $B \cdot H_2PtCl_6$ [1 2] $C_6H_4(NO_2)_2 \cdot NC_4H_9$ [105 5°] yellow plates, yielding the salts $BHCl$ and $B \cdot H_2PtCl_6$ [4 2 1] $C_6H_4(NO_2)_3 \cdot NC_4H_9$ [92°] orange needles

o NITRO PHENYL-PROPIOLIC ACID

$C_6H_4 \cdot NO_2$ *i.e.* $C_6H_4(NO_2) \cdot C \equiv C \cdot CO_2H$ Formed from $C_6H_4(NO_2) \cdot CHBr \cdot CHBr \cdot CO \cdot H$ (or its ether) and aqueous $NaOH$ (Baeyer, *B* 13, 2258, Muller, *A* 212, 127) Needles (from hot water), decomposing at 156° On boiling with water it gives *o* nitro phenyl acetylene Boiling alkalis yield *o*-nitro Reduction with glucose and alkalis produces indigo $FeSO_4$ also reduces it, in alkaline solution, to indigo white Its Na salt boiled with aqueous KCN and glucose yields indigo, even in presence of much HCN (Michael, *J* *pr* [2] 35, 254)

Ethyl ether EtA' [61°] Tables Converted by conc H_2SO_4 into isatogenic ether (*g* v)

p-Nitro-phenyl propiolic acid [181°] (*M*), [198°] (*D*) From $C_6H_4(NO_2) \cdot CHBr \cdot CHBr \cdot CO_2Et$ and alcoholic potash (*C* Muller, *A* 212, 127, Drewson, *A* 212, 154, Perkin, *C* *J* 49, 442). Yields *p* nitro phenyl acetylene and CO_2 on distilling with steam — *AgA'* amorphous powder

Ethyl ether EtA' [126°] Needles

o NITRO β PHENYL PROPIONIC ACID

$C_6H_4(NO_2) \cdot CH \cdot CH \cdot CO_2H$ [112°] Formed from (2, 4, 1) nitro amido phenyl propionic acid by elimination of NH_2 (Gabriel & Zimmermann, *B* 12, 600, 13, 1680) Yellow crystals — *AgA'*

m-Nitro-phenyl propionic acid [118°]

Formed in like manner from the (3, 4, 1)-nitro-amido-phenyl propionic acid (Gabriel, *B* 15, 845) Yellow needles, sl sol water

p Nitro- β -phenyl-propionic acid [164°]

Formed, together with the *o* acid, by nitration of (β) phenyl propionic acid (Glaser & Buchanan, *Z* 1869, 193, Beilstein & Kuhlberg, *A* 163, 132) — $CaA', 2aq$ — $BaA', 2aq$ small needles.

Ethyl ether EtA'

o-Nitro α phenyl-propionic acid

$C_6H_4(NO_2) \cdot CHMe \cdot CO_2H$ [110°] Formed, together with the *p*-isomeride [88°], by nitration

R R

of *o*-phenyl propionic acid (Trinius, *A* 227, 262) The *o* acid forms the salt $\text{CaA}', 2\text{aq}$, the *p*-acid gives $\text{CaA}', 2\text{aq}$ and $\text{BaA}', 2\text{aq}$

Di-nitro-phenyl propionic acid

$\text{C}_6\text{H}_3(\text{NO}_2)_2\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$ [127°] Formed by nitration of β phenyl-propionic acid (G & Z)

Ethyl ether EtA' [32°] Needles

α -NITRO PHENYL PROPYLENE

$\text{C}_6\text{H}_4\text{CH}(\text{NO}_2)\text{CH}_3$ [64°] Formed from benzoic aldehyde, nitro ethane, and ZnCl_2 at 140° (Priests, *A* 225, 354), yellow needles

Di nitro phenyl propylene

$\text{C}_6\text{H}_3(\text{NO}_2)_2\text{CH}(\text{NO}_2)\text{CH}_3$ The *o* compound [77°] is formed, together with the *p* isomeride [116°], by nitrating α nitro phenyl propylene (T)

Di-nitro phenyl-propylene

$\text{C}_6\text{H}_3(\text{NO}_2)_2\text{CH}(\text{CHMe})$ [118°] Formed from $\text{C}_6\text{H}_5\text{CH}(\text{Me})\text{CO}_2\text{H}$ and HNO_3 (Edeleanu, *B* 20, 622) Yellowish needles

m-NITRO-PHENYL PYRIDYL-ETHYLENE

$\text{C}_6\text{H}_3(\text{NO}_2)\text{CH}(\text{CH}_2\text{C}_5\text{H}_4\text{N})$ [120°] Formed from *m* nitro benzoic aldehyde and methyl pyridine (Schuffan, *B* 23, 2716) Plates— $\text{B}'\text{H}_2\text{PtCl}_6$ [240°]—Mercury double salt $\text{B}'\text{HClHgCl}_2$ [211°]—Picrate yellow plates

TETRA-NITRO TETRA-PHENYL PYRROLE

$\text{NH}(\text{C}_6\text{H}_4\text{NO}_2)_4$ Formed from tetra phenyl pyrrole and HNO_3 (Fehrlin, *B* 22, 554) Yellow needles (from HOAc), decomposing at 123°

(α) NITRO (Py 1) PHENYL QUINOLINE

$\text{C}_6\text{H}_4\text{N}_2\text{O}_2$ [187°] Formed together with a smaller quantity of a (β) isomeride [118°] and a little of a (γ) isomeride [135°] by nitration of

(Py 1)-phenyl-quinoline $\text{C}_6\text{H}_4\text{N} \begin{smallmatrix} \text{CPh CH} \\ \text{N=CH} \end{smallmatrix}$ (Königs *a*. Net, *B* 20, 624) They are all crystalline

m-Nitro-(Py 3)-phenyl-quinoline

$\text{C}_6\text{H}_4\text{N} \begin{smallmatrix} \text{CH}_2\text{CH} \\ \text{N} \end{smallmatrix} \text{CO}_2\text{H}$ [124°] Obtained by heating *m* nitro-cinnamic aldehyde with aniline and HClAg at 140° (Miller & Kinkelin, *B* 18, 1900) White needles— $\text{B}'\text{HCl}$ — $\text{B}'\text{H}_2\text{PtCl}_6$

Tetrahydride $\text{C}_6\text{H}_4\text{N} \begin{smallmatrix} \text{CH}_2\text{CH} \\ \text{NH CH} \end{smallmatrix} \text{C}_6\text{H}_4\text{NO}_2$

[101°] Tables Yields a nitrosamine [71°]— $\text{B}'\text{HCl}$ silky needles

Nitro (B 2) phenyl-quinoline $\text{C}_{11}\text{H}_{10}\text{N}_2\text{O}_2$

[173°] Formed, as well as a di nitro derivative [208°], by the nitration of (B 2) phenyl-quinoline $\text{CPh CH} \begin{smallmatrix} \text{CH} \\ \text{CH} \end{smallmatrix} \text{C}_6\text{H}_4\text{N}$ (La Coste & Sorger, *A* 230, 28)

— $\text{B}'\text{H}_2\text{PtCl}_6$ yellow needles

DI-NITRO-DI-PHENYL-SUCCINIC ACID

$\text{C}_{12}\text{H}_8\text{O}_4(\text{NO}_2)_4$ The (α)- compound [226°] and its (β)-isomeride are formed by nitrating (α)- and (β)-di-phenyl succinic acid respectively (Reimer, *B* 14, 1804) Both give *p*-nitro benzoic acid on oxidation

DI-NITRO-DI-PHENYL-SULPHAZIDES

$\text{C}_{12}\text{H}_8(\text{NO}_2)_2\text{N}_2\text{SO}_2$ Compounds formed by the action of SO_2 , nitrous acid, and alcohol on the nitro-anilines (Limprioth, *B* 20, 1241). The *o*-, *m*-, and *p*-compounds melt at 150°, 182°, and 160° respectively They yield nitrogen, nitro benzene, and nitro benzene sulphonic acid on boiling with baryta

DI-NITRO-DI-PHENYL DISULPHIDE

$(\text{C}_6\text{H}_4\text{NO}_2)_2\text{S}_2$ [181°] (W), [170°] (L) Formed by oxidation of *p* nitro phenyl mercaptan (Willgerodt, *B* 16, 888), or by boiling with alcoholic

potash the product of the combination of potassium xanthate with *p* nitro diazobenzene (Leuckart, *J pr* [2] 41, 199) Prisms (from H_2OAc)

Tetra nitro-di-phenyl-sulphide

$\text{S}(\text{C}_6\text{H}_4(\text{NO}_2)_2)_2$ [193°] Obtained from [1° & $\text{C}_6\text{H}_4\text{Cl}(\text{NO}_2)_2$ and alcoholic KSH (Beilstein & Kurbatoff, *B* 11, 2056, Willgerodt, *B* 12, 768) Yellow needles An isomeric body [245°] is formed by the action of H_2SO_4 and fuming HNO_3 on $\text{C}_6\text{H}_3(\text{NO}_2)_3\text{SCN}$ (Austen & Smith, *Am* 8, 91)

Tetra nitro-di phenyl disulphide

$\text{S}_2(\text{C}_6\text{H}_4(\text{NO}_2)_2)_2$ Obtained by oxidising [4 2 1] $\text{C}_6\text{H}_3(\text{NO}_2)_3\text{SH}$ (Willgerodt *Bn* 2 527) Yellow needles, exploding at about 280°

Penta-nitro di-phenyl-sulphide

$\text{C}_6\text{H}_3(\text{NO}_2)_5$, S , $\text{C}_6\text{H}_4(\text{NO}_2)_4$ [217°] Formed from $\text{C}_6\text{H}_4\text{Cl}(\text{NO}_2)_2$, K S, and $\text{C}_6\text{H}_4\text{Cl}(\text{NO}_2)_2$ (W) Thick crystals (from HOAc)

Hexa nitro-di-phenyl sulphide

$\text{S}(\text{C}_6\text{H}_3(\text{NO}_2)_5)_2$ [226°] Formed from picrylchloride and K S (W) Golden plates (from HOAc)

DI NITRO-PHENYL SULPHOCYANIDE

$\text{C}_6\text{H}_3(\text{NO}_2)_2\text{SCN}$ [139°] Formed by heating [1 2 4] $\text{C}_6\text{H}_3\text{Br}(\text{NO}_2)_2$ with potassium sulphocyanide in MeOH (Austen & Smith, *Am* 8, 89) Buff yellow crystals (from chloroform)

NITRO DI PHENYL SULPHONE

$\text{C}_6\text{H}_5\text{SO}_2\text{C}_6\text{H}_4\text{NO}$ [92°] Formed by heating di phenyl sulphone with fuming HNO_3 (Gerike, *A* 100, 208) Minute crystals

Di nitro di phenyl sulphone

$(\text{C}_6\text{H}_4(\text{NO}_2)_2)_2\text{SO}$ [164°] (G), [197°] (S a. N) Formed by nitrating di phenyl sulphone (G) and by the action of SO_2 on nitro benzene (Schmid & Nötting, *B* 9, 79) Small tables

Tetra nitro di phenyl sulphone

$(\text{C}_6\text{H}_3(\text{NO}_2)_4)_2\text{SO}$ [241°] Prepared by oxidising the corresponding sulphide [193°] (Beilstein & Kurbatoff, *A* 197, 78) Yellowish prisms

p NITRO DIPHENYL *p* SULPHONIC ACID

$\text{C}_6\text{H}_4(\text{NO}_2)\text{C}_6\text{H}_4\text{SO}_3\text{H}$ Prepared by sulphonation of *p*-nitro diphenyl or by nitration of diphenyl *p* sulphonic chloride (Gabriel & Damberger, *B* 13, 1408)— NaA' — $\text{CuA}'_2, 4\text{aq}$ — $\text{BaA}'_2, 4\text{aq}$ small needles

Chloride $\text{C}_6\text{H}_4(\text{NO}_2)\text{SO}_2\text{Cl}$ [178°]

Amide $\text{C}_6\text{H}_4(\text{NO}_2)\text{SO}_2\text{NH}_2$ [228°]

Ethyl ether EtA' [169°]

Nitro diphenyl disulphonic acid

The chloride $\text{C}_{12}\text{H}_8(\text{NO}_2)_2(\text{SO}_2\text{Cl})_2$ [130°] is formed, together with $\text{C}_{12}\text{H}_8(\text{NO}_2)_2(\text{SO}_2\text{Cl})_2$ [166°], by nitration of diphenyl disulphonic chloride (G & D).

DI NITRO DI-PHENYL SULPHOXIDE

$(\text{C}_6\text{H}_4(\text{NO}_2)_2)_2\text{SO}$ [116°] Formed from di phenyl sulphoxide, NaNO_2 , and H_2SO_4 (Colby & McLoughlin, *Am* 9, 70, *B* 20, 198) Minute yellow crystals, v sol alcohol

NITRO PHENYL THIO CARBAMIC ACID

$\text{C}_6\text{H}_4(\text{NO}_2)\text{CS OH}$

Methyl ether MeA' The *m* compound [120°] is formed by boiling *m* nitro phenyl thio carbamide with MeOH (Steudemann, *B* 16, 551) Colourless needles

Ethyl ether EtA' The *m* compound [115°] and its *p*-isomeride [176°] are formed by boiling the corresponding nitro anilines with CS_2 , alcohol, and potash (Losantech, *B* 15, 470, 16, 49) Both are crystalline

m NITRO DI-PHENYL THIO-SEMICARBAZIDE

$\text{C}_6\text{H}_4(\text{NO}_2)\text{NH NH CS NHPh}$ [147°] Formed from phenyl thio carbamide and *m*-

nitro-phenyl hydrazine (Bischler & Brodsky, *B* 22, 2815) Dark yellow globular aggregates

m-NITRO-PHENYL THIO CARBIMIDE $C_6H_4(NO_2)NCS$ [61°] (*c* 277°) Formed by heating *m* nitro phenyl thio urea with As_2O_3 (Staudemann, *B* 16, 549, 2331) White needles

DI NITRO PHENYL THIOPHENE $C_6H_4(NO_2)_2C_2SH_2(NO_2)$ [178°] Formed from phenyl thiophene and fuming HNO_3 (Renard, *C R* 109, 699) Amorphous yellow powder

m NITRO PHENYL THIO UREA $C_6H_4N_2SO_2$ \cdot $\frac{1}{2}$ $C_6H_4(NO_2)NHCSNH_2$ [158°] Formed from *m* nitro phenyl thiocarbimide (Staudemann, *B* 16, 550) Lemon yellow crystals

m Nitro di phenyl thio urea $C_6H_4(NO_2)NHCSNHPh$ [156°] Formed from *m* nitro aniline and phenyl thiocarbimide (Bruckner, *B* 7, 1235, Losanitsch, *B* 14, 2365, Gebhardt, *B* 17, 3045) Small needles, sl sol cold alcohol

Di *m* nitro phenyl thio urea $CS(NH C_6H_4NO_2)_2$ [160°] Formed from *m* nitro aniline and *m* nitro phenyl thiocarbimide (Bruckner, *B* 6, 1103, *S*) Yellow crystals

o NITRO PHENYL *p* TOLUIDINE $C_6H_4(NO_2)NH C_6H_4$ [68°] Formed from *p*-toluidine and *o* bromo nitro benzene (Schöpf, *B* 23, 1842) Orange plates

Di nitro phenyl toluidine $[4 \frac{1}{2}] C_6H_4(NO_2)_2NHC_6H_4Me [1 \frac{1}{2}]$ Formed from toluidine and $C_6H_4Cl(NO_2)_2$ (Willgerodt, *B* 9, 980, Leymann, *B* 15, 1236) The *o* compound ($x=2$) melts at 102°, the *p* compound ($x=4$) at 137° The isomeric $PhNH C_6H_4(NO_2)_2Me$ formed from tri nitro toluene and aniline, melts at 142° (Hepp, *A* 215, 369)

DI NITRO PHENYL TOLYLENE DIAMINE $C_6H_4(NO_2)_2NH C_6H_4Me NH_2$ [184°] Formed from tolylene *m* diamine and $[1 \frac{1}{2}] C_6H_4Cl(NO_2)_2$ (Leymann, *B* 15, 1237) Red tables

Formyl derivative [157°]

Acetyl derivative [164°]

NITRO PHENYL TOLYL KETONE $C_6H_4(NO_2)O$ [127°] Formed by the action of HNO_3 on phenyl tolyl ketone and on phenyl *p* tolyl methane (Plascuda & Zinke, *B* 7, 983, Milne, *B* 5, 685) Flat plates (from alcohol)

Di nitro phenyl *m* tolyl ketone $C_6H_4(NO_2)_2O$ [145°] Formed from di nitro phenyl *m* tolyl methane [141°], $HOAc$, and CrO_3 (Senff, *A* 220, 236) Pointed needles (from alcohol) or short prisms (from $HOAc$)

Di nitro phenyl *p* tolyl ketone $C_6H_4(NO_2)_2CO C_6H_4(NO_2)$ [127°] Formed, as well as the tri nitro derivative [165°], by nitration of phenyl *p*-tolyl ketone (*Z* & *P*) Needles

m NITRO-PHENYL DI TOLYL METHANE $(C_6H_4)_2CH C_6H_4NO_2$ [85°] Formed from *m* nitro benzoic aldehyde, toluene, and H_2SO_4 (Tschacher, *B* 19, 2464, 21, 188) Crystals

Di nitro phenyl-tolyl methane $C_6H_4(NO_2)_2$ The three compounds of this composition got by nitrating phenyl *o*-, *m*-, and *p*-tolyl methane melt at 100°, 141°, and 137° respectively (Zinke, *B* 7, 986, Senff, *A* 220, 235) Tetra nitro-phenyl *p* tolyl methane melts at 161°

NITRO-PHENYL-*p*-TOLYL-THIO-UREA $C_6H_4N_2SO_2 \cdot \frac{1}{2}$ $C_6H_4NHCSNH C_6H_4NO_2$ [148°] Formed from (2,4,1) nitro toluidine and phenyl thiocarbimide (Staudemann, *B* 16, 2336) Crystals Melts, after one fusion, at 167°

m-Nitro phenyl-*p* tolyl thio-urea $C_6H_4(NO_2)NHCSNH C_6H_4$ [173°] Formed from *m* nitro phenyl thiocarbimide and *p* toluidine (*S*) Needles, sl sol ether

Di nitro phenyl *p* tolyl thio urea $C_6H_4(NO_2)_2NHCSNH C_6H_4NO_2$ [188°] Formed from *m* nitro phenyl thiocarbimide and (2,4,1)-nitro toluidine (*S*) Crystals, sl sol alcohol

m NITRO PHENYL UREA $C_6H_4N_2O_2 \cdot \frac{1}{2}$ $C_6H_4(NO_2)NHCO NH_2$ Formed from *m* nitro aniline and cyanogen chloride (Hofmann, *A* 67, 156, 70, 137) Yellow needles (from water)

m Nitro di phenyl urea $C_6H_4NHCO NHC_6H_4NO_2$ [197°] (*G*), [187°] (*B*) Formed from *m* nitro di phenyl thio-urea and PbO (Brückner, *B* 7, 1236) Formed also by boiling with benzene the compound $PhNHCO N(C_6H_4NO_2)N NPh$ [104°] obtained by the action of phenyl cyanate on $(C_6H_4NO_2)NH N NPh$ (Goldschmidt, *B* 21, 2578) Yellow needles

p Nitro di phenyl urea [202°] Formed by the action of phenyl cyanate on a solution of *p*-nitro diazoamidobenzene in benzene (*G*) Yellow crystals (from alcohol)

m Nitro tri phenyl-urea $NPh.CO NHC_6H_4NO_2$ [155°] Formed from *m* nitro aniline and $NPh.COCl$ (Lellmann & Bonhöffer, *B* 20, 2121) Yellow needles The isomeride prepared from *p* nitro aniline melts at 176°, and crystallises in bluish green tables

Di *m* nitro di phenyl urea $CO(NH C_6H_4NO_2)_2$ [233°] Formed from the thio urea and PbO (*B*) Yellow needles (Losanitsch, *B* 16, 50)

Tetra nitro di phenyl urea $CO(NH C_6H_4NO_2)_2$ Formed by nitration of di phenyl urea (Losanitsch, *B* 10, 690, 11, 1539) Yellow needles, melting above 200° (*L*) or at 189° (Hentschel, *J pr* [2] 34, 426) The green *K* salt $C_6H_4K_2N_4O_6$ explodes on heating

p NITRO PHENYL VALERIC ACID $C_6H_4(NO_2)CH_2CH_2CH_2CO_2H$ Formed by heating *p* nitro benzyl ethyl malonic ether with aqueous KOH (Lellmann & Schleich, *B* 20, 438) Sparingly soluble powder, carbonising above 300°

p NITRO PHENYL VINYL MALONIC ACID $C_6H_4(NO_2)CH=CHCH(CO_2H)_2$ [208°] Formed from *p* nitro cinnamic aldehyde, malonic acid, and $HOAc$ (Einhorn & Gehrenbeck, *B* 22, 45)

NITRO PHLOROGLUCIN $C_6H_4(NO_2)(OH)$ Formed from phloroglucin and dilute HNO_3 (Hlaswetz & Pfaunder, *A* 119, 199) Reddish yellow scales, sl sol water

Tri nitro phloroglucin $C_6(NO_2)_3(OH)$ [158°] Formed from tri nitroso phloroglucin, HNO_3 , and H_2SO_4 (Benedikt, *B* 11, 1376) Hexagonal crystals (containing aq) Its salts are explosive and dye yellow With KOy it gives the isopurpuric acid reaction $-KHA'' aq - KHA'' - K_2A'''$

NITRO PHTHALIC ACID $C_6H_4(NO_2)(CO_2H)$ [32 1] Mol w 211 [220°] *S* ($HOAc$) 75 at 26° (Aguar, *B* 5, 899)

Formation—1 By boiling naphthalene with HNO_3 (Mangnac, *A* 38, 7, Laurent, *A* 41, 110)—2 By nitration of phthalic acid (Hugo Muller, *Z* 1868, 257, Faust, *A* 160, 57, Milner, *A* 208, 224)—3 By oxidation of nitro-naphthalene or (a) di nitro naphthalene (Beilstein & Kurbatoff, *B* 12, 688, *C O* 1881, 859, *A* 202, 217, Guareschi, *B* 10, 294)

Properties.—Yellow crystals, v sol hot

water. Splits up below its melting point into water and anhydride when slowly heated

Salts — K_2A' aq — KHA'' aq — $(NH_4)_2A''$ — $(NH_4)HA'$ 2aq — BaA'' 2aq — ZnA'' 1½aq — PbA'' 1½aq — Ag_2A'' white powder

Mono ethyl ether EtA'' [111°]

Di-ethyl ether Et_2A'' [45°]

Anhydride $C_6H_4(NO_2)(CO_2H)_2$ [164°] (Graeff, *B* 15, 1127)

Nitro-phthalic acid $C_6H_4(NO_2)(CO_2H)_2$ [4 2 1] [161°]

Formation — 1 Together with the preceding isomeride, by nitration of phthalic acid (O Miller, *A* 208, 224) — 2 By the oxidation of di-nitro-(β)-naphthol (Graebe & Drews, *B* 17, 1171)

Properties — Small pale yellow needles (containing aq) Resolved at 165° into water and its anhydride

Salts — K_2A'' — BaA'' 2aq — Ba_2H_2A'' — Zn_2H_2A'' 2aq — Ag_2A'' long colourless needles

Mono ethyl ether EtHA'' [128°]

Di-ethyl ether Et_2A'' [33°]

Anhydride $C_6H_4(NO_2)_2$ [114°]

Di-nitro phthalic acid $C_6H_4(NO_2)_2(CO_2H)_2$ [5 3 2 1] [226°] Formed by the oxidation of

β - di-nitro naphthalene or tetra nitro (α)-naphthol with dilute HNO_3 (Beilstein & Kurbatoff, *B* 13, 354, *A* 202, 225, Merz & Weith, *B* 15, 2728) Prisms — CaA'' — BaA''

Mono-ethyl ether EtHA'' [187°]

Di-nitro phthalic acid $C_6H_4(NO_2)_2(CO_2H)_2$ [6 3 2 1] [200°] Formed by heating β - bromo

tetra nitro naphthalene with dilute HNO_3 (Meiz & Weith, *B* 15, 2728) Needles — BaA''

Di-nitro phthalic acid $C_6H_4(NO_2)_2(CO_2H)_2$ Formed from nitro anisic acid, HNO_3 , and H_2SO_4 (Engelhardt & Latschnoff, *Z* [2] 7, 262) Tables [from water] — BaA'' nearly insol water

Nitro isophthalic acid $C_6H_4(NO_2)(CO_2H)_2$ [5 3 1] [249°] *S* 146 at 15°, 171 at 16°, 81.1 at 99° Prepared, together with an isomeride [260°] by heating isophthalic acid (100 g)

with fuming HNO_3 (1 kilo) for 24 hours (Beyer, *J pr* [2] 22, 35, 25, 473, cf Storrs & Fittig, *A* 158, 285) Plates (containing 1½ aq)

Salts — K_2A'' 1½aq *S* (80 p.c. alcohol) 744 at 15° — Na_2A'' aq *S* (80 p.c. alcohol)

32 at 15° Explodes above 160° — $(NH_4)HA''$ — MgA'' 5aq *S* 2 16 at 15° — CaA'' 3½aq *S* 72 at 15°

Turned violet by light — SrA'' 4½aq *S* 47 at 15° — BaA'' 2½aq *S* 85 at 15° — ZnA'' aq *S* 55 — CdA'' 2aq *S* 75 at 15° — Pb_2OA'' — Cu_2OA'' — MnA'' 5aq *S* 2 44 at 15°

— Fe_2O_4A'' — CoA'' 4½aq *S* 2 16 at 15° — NaA'' 4½aq *S* 2 74 at 15° — Ag_2A'' Explodes above 100°

Methyl ether Me_2A'' [122°]

Ethyl ether Et_2A'' [84°]

Nitro-isophthalic acid $C_6H_4(NO_2)(CO_2H)_2$ [4 3 1] [246°] (*G*), [259°]. Formed by oxidation of nitro-xylene (Claus, *J pr* [2] 38, 318, cf Wroblewsky, *Bl* [2] 34, 332, Noyes, *Am* 10, 472) White needles (containing 3aq), m sol

cold water — BaA'' 4aq (*G*). — BaA'' 1½aq (*N*) — CaA'' ½aq — MgA'' 6aq — PbA'' 3aq (*W*) — Ag_2A'' 7½aq pearly plates

Di-nitro-isophthalic acid $C_6H_4(NO_2)_2(CO_2H)_2$ [215°] Formed from isophthalic acid and fuming HNO_3 at 180° (Claus) Needles (containing 5aq) — Na_2A'' 2aq — K_2A'' 2aq — BaA'' 7aq — CaA'' 4aq — MgA'' 4aq; needles, v sol water.

NITRO-PHTHALIDE

$[4 \frac{1}{2}] C_6H_4(NO_2) < \begin{smallmatrix} CO \\ CO \end{smallmatrix} > O$ [141°] Formed

by nitration of phthalide (Hoening, *B* 18, 3447) Long needles Aqueous KOH yields $C_6H_4(NO_2)(CH_2OH)(CO_2K)$ CrO_3 in $HOAc$ oxidises it to nitrophthalic acid [161°] The acid of which it is the anhydride melts at 129° An isomeric nitro-phthalide [136°] is formed by oxidising (α) nitro naphthalene

NITRO-DIPHTHALYL $C_{12}H_8NO_4$ 1c

$C_6H_4C_6H_4O_2C_6H_4NO_2$ [270°] Formed by heating nitro phthalide with phthalic anhydride and $NaOAc$ (Graebe & Guye, *A* 233, 244) Yellow needles (from $HOAc$)

NITRO-PIPERIDINE $C_6H_8N(NO_2)$ (245°)

Formed by treating piperyl urea with HNO_3 (*S G* 1 5) at — 10°, pouring upon sodium carbonate and extracting with ether (Franchmont & Klobbie, *R T C* 8, 302) Colourless liquid, solidifying below — 10° Volatile with steam

NITROPODOCARPIC ACID v *PODOCARPIC ACID*

NITRO-PROPANE $C_3H_7NO_2$ 1c *PrNO_2*

(127°) (*M* & *R*), (131°) (*P*) *S G* 1 10108, 2 10023 *MM* 3 819 (Perkin, *C J* 55, 689)

Formed, together with propyl nitrite, by the action of silver nitrite on propyl iodide (V Meyer & Rilliet, *B* 5, 1029, *A* 171, 36, Prubram & Handl, *M* 2, 653, Cahours, *C R* 77, 749) Oil — $NaC_3H_6NO_2$ white powder

Iso nitro propane $PrNO_2$ (c 117°) Formed,

together with an isomeride (44°), by the action of silver nitrite on isopropyl iodide (V Meyer & Locher, *B* 7, 670, *A* 171, 39, Kiesel, *J R* 16, 135, *Bl* [2] 40, 72, *Bn* 1, 225) Oil, decomposed by $HClAq$ at 100°

Di nitro propane $CH_3CH_2CH_2(NO_2)_2$ (189° cor) *S G* 2 1258 Formed from bromo-

nitro propane and KNO_3 (Ter Meer, *A* 181, 19), and by the oxidation of di propyl ketone (Chan cel, *C R* 96, 1466, Kurtz, *A* 161, 208) Oil — KA'' — AgA'' explosive laminae

Iso-di nitro propane $(CH_3)_2C(NO_2)_2$ [58°]

(187° uncor) Formed by oxidation of propyl-

pseudonitrole $(CH_3)_2C(NO_2)(NO_2)$ (Meyer & Locher, *B* 7, 1613) Formed also by the action

of nitric acid on isobutyric and isovaleric acids (Bredt, *B* 15, 2822) White crystals, volatile with steam

NITRO PROPENYL BENZOIC ACID

$C_6H_4(NO_2)(CH_2)CO_2H$ [3 4 1] [155°] Formed

by boiling nitro oxypropyl benzoic acid with aqueous HCl (*S G* 1 10) for a long time (Wid man, *B* 15, 2551, 16, 2569) Short needles — NH_4A'' — CaA'' 2aq *S* 555 at 16° — BaA'' 3½aq

S 425 at 18° — CuA'' aq — AgA'' slender needles

β NITRO-PROPIONIC ACID $C_3H_5NO_4$ 1c

$CH_3(NO_2)CH_2CO_2H$ [67°] Formed from β

iodo propionic acid and $AgNO_3$ (Lewkovitch, *J pr* [2] 20, 165) Scales (from chloroform)

Ethyl ether EtA'' (c 168°) *V D* 4 85 (calc 5 69)

DI-NITRO-PROPYL-ANILINE $C_6H_4N_2O_4$ 1c

$C_6H_4(NO_2)_2NHCH_2CH_2CH_2$ [4 2 1] [95°] Formed from propylamine and $C_6H_5Br(NO_2)$, or by oxidising

the following body (Van Romburgh, *R T C* 4, 191, 8, 252) Yellow needles

Di nitro di propyl aniline

$C_6H_4(NO_2)_2N(C_2H_5)_2$ [4 2 1]. [40°] (Romburgh, *R. T. C.* 6, 252).

Tri-nitro-propyl-aniline $C_6H_4(NO_2)_3.NH.C_3H_7$, [59°] Formed from $NH_4C_3H_7$ and $C_6H_5Cl(NO_2)_3$. Yields with HNO_3 the nitramine $C_6H_4(NO_2)_3.N(NO_2)C_3H_7$, [97°]

NITRO-ISOPROPYL BENZENE v **NITRO-CUMENE**

Di nitro p di propyl-benzene $C_6H_4Pr_2(NO_2)_2$, [65°] Formed from di propyl benzene and fuming HNO_3 (Korner, *B* 11, 1865, *A* 216, 226) Plates, volatile with steam

Tri nitro m di-isopropyl benzene $C_6H_3Pr_3(NO_2)_3$, [111°] Yellow needles (Uhlhorn, *B* 23, 3142)

NITRO-PROPYL-BENZOIC ACID v **NITRO-n CUMINIC ACID**

NITRO ISOPROPYL CINNAMIC ACID [4 2 1] $C_6H_4Pr(NO_2).CH.CH.CO.H$ 'Nitro cumenyl acrylic' acid [157°] Formed by nitration of propyl cinnamic acid (Einhorn *A* Hess, *B* 17, 2016, Widman, *B* 19, 258) Needles, v sol alcohol Yields o nitro cuminic aldehyde on oxidation by $KMnO_4$.

Nitro isopropyl cinnamic acid

[4 3 1] $C_6H_4Pr(NO_2).C_3H_7.CO.H$ [141°] Formed by heating m nitro cuminic aldehyde (4 pts) with Ac_2O (5 pts) and $NaOAc$ (3 pts) at 175° for 4 hours (Widman, *B* 19, 413) Tables Forms a dibromide [184°] — KA' (dried at 100°) — NaA' 3aq — BaA' 54aq — CaA' 3aq *Ethyl ether* EtA' [59°] Tables.

Nitro-n propyl-cinnamic acid

[4 2 1] $C_6H_4Pr(NO_2).C_3H_7.CO.H$ [123°] Formed, in small quantity, in the nitration of isopropyl cinnamic acid (Widman, *B* 19, 273) On oxidation by alkaline $KMnO_4$, it yields nitro n cuminic acid and nitro cuminic acid Bromine forms a di bromide [171°]

DI NITRO PROPYL-THIOPHENE

$C_6HPr_2(NO_2)_2$ S Formed by nitration (Ruff, *B* 20, 1712) Oil

NITRO PROTocatechuic ACID $C_6H_5NO_3$.

Methyl derivative

$C_6H_4(NO_2)(OMe)(OH).CO.H$ [x 3 4 1] Formed by boiling its acetyl derivative [182°] which is produced by the nitration of acetyl vanillic acid $C_6H_3(OMe)(OAc)CO.H$ (Tiemann *A* Matsumoto, *B* 9, 945, 11, 132) Needles (from alcohol)

The isomeric $C_6H_4(NO_2)(OMe)(OH).CO.H$ [5 3 4 1] [202°] is formed by oxidation of acetyl nitro eugenol (Weselsky *A* Benedikt, *M* 3, 392), and crystallises in yellow needles

Methyl derivative

$C_6H_4(NO_2)(OMe)(OH).CO.H$ [6 4 3 1] [173°] Formed from its acetyl derivative [169°], which is got by nitrating acetyl isovanillic acid (T *A* M) Needles

Di methyl derivative $C_6H_4NO_3$ v $C_6H_4(NO_2)(OMe).CO_2H$ Formed by nitration of veratric acid $C_6H_3(OMe)_2.CO_2H$ (T *A* M, Merck, *A* 108, 59) Yellow needles (containing 3aq) Yields the ethers MeA' [144°] and EtA' [100°]

Iso-nitro-protocatechuic acid *Di-methyl ether* $C_6H_4(NO_2)(OMe)_2.CO_2H$ [202°] Formed by methylation of nitro-vanillic acid (T *A* M) Needles Yields MeA' [126°] crystallising in needles

Nitro protocatechuic acid *Methyl-propyl ether* $C_6H_4H_2(NO_2)(OMe)(OPr).CO_2H$ Formed by nitration (Cahours, *Bl* [2] 29, 270)

Nitro-protocatechuic acid *Methylene ether* $CH_2O.C_6H_4(NO_2)CO_2H$. [172°] Formed

from piperonylo acid $CH_2 \begin{smallmatrix} \diagup O \diagdown \end{smallmatrix} C_6H_4.CO_2H$ by nitration (Jobst *A* Hesse, *B* 11, 1031, *A* 199, 70) Needles — KA' 3aq — PbA' 4aq — CuA' 4aq. — AgA' needles or plates

NITROPYRUSSIDES v vol II p 340

NITROPYROCATECHIN $C_6H_4NO_3$ v $C_6H_4(NO_2)(OH)$, [4 2 1] [170°] Formed by the action of nitrous acid on pyrocatechin (Benedikt, *B* 11, 362, *J pr* [2] 18, 455) Formed also by boiling the carbonyl derivative of (5,2,1) nitro amido phenol with potash (Von Chelmecki, *J pr* [2] 42, 442) Small yellow needles (from ether) Its aqueous solution is turned purple by alkalis Dyes stuff mordanted with alumina orange (Kostanecki, *B* 22, 1347) — BaA' 3aq dark red plates, with metallic lustre

An isomeric nitropyrocatechin [86°] is formed, together with the preceding, by nitration of pyrocatechin (Weselsky *A* Benedikt, *M* 3, 386) *A di methyl derivative* of nitro pyrocatechin $C_6H_4(NO_2)(OMe)_2$ [96°] is formed by nitrating veratrole (Merck, *A* 108, 60, The mann *A* Matsumoto, *B* 9, 939, 11, 131)

The *methylene derivative*

$C_6H_4(NO_2) \begin{smallmatrix} \diagup O \diagdown \end{smallmatrix} CH$ [148°] is a product of the action of nitric acid on piperonylo acid (Hesse, *A* 199, 73, 341) It crystallises in needles

Di nitro pyrocatechin $C_6H_4(NO_2)_2(OH)_2$ *Methyl derivative* $C_6H_4(NO_2)_2(OMe)(OH)$ *Di nitro guaiacol* [123°] Made by the action of nitrous acid gas upon an ethereal solution of guaiacol at 0° (Herzig, *M* 3, 825) Plates The *di methyl derivative* $C_6H_4(NO_2)_2(OMe)_2$, formed by nitration of veratrol, melts above 100° (M) The *methylene derivative* $C_6H_4(NO_2)_2O.CH_2$, [101°] is formed in the nitration of piperonylo acid (H)

Tri nitro-pyrocatechin *Di methyl-derivative* $C_6H_4(NO_2)_3(OMe)_2$, [145°] Got by nitrating $C_6H_4(NO_2)(OMe)_2$ (T *A* M) Prisms

DI NITRO-PYROCOLL $C_6H_4(NO_2)_2N_2O_2$ Got by nitrating pyrocoll (Ciamian *A* Danesi, *G* 12, 39) Yellow crystals, decomposing before fusion

NITRO-PYROGALLOL $C_6H_2(NO_2)(OH)_3$, [205°] Got by passing nitrous fumes into an ethereal solution of pyrogallol (Barth, *M* 1, 882) Trichmic olive brown prisms (containing aq), $a b c = 2.842.1.493$ $C_6H(NO_2)(OEt)_2(OH)$ [123°] and $C_6H(NO_2)(OEt)(OH)$, [139°] are formed in the same way (Weselsky *A* Benedikt, *M* 2, 214) The compounds $C_6H(NO_2)(OEt)$, [73°] and $C_6(NO_2)_2(OEt)$, [93°] are formed by nitration

NITROPYROMECONIC ACID $C_6H_4(NO_2)O$, Formed by nitrating pyromeconic acid (Ost, *J pr* [2] 19, 192) Crystals (from alcohol) — NaA' — AgA'

DI NITRO PYROMELLITIC ACID

$C_6(NO_2)_4(CO_2H)_2$, [5 2 6 4 3 1] Formed by oxidation of di nitro ψ cuminic acid $C_6Me_2(NO_2)_2.CO_2H$ [205°] (Nef, *C J* 53, 428, *A* 258, 317) Long silky needles — $Ag.A'$ amorphous pp

Methyl ether $Me.A'$ [180 6°]

Ethyl ether $Et.A'$ [180°]

NITRO-PYROMUCIC ACID $C_6H_4NO_3$ v $C_6H_4(NO_2)O.CO.H$ [184°] Formed from dehydromucic acid (1 pt), HNO_3 (10 pts), and conc H_2SO_4 (1 pt) (Klinkhardt, *J pr* [2] 25, 51) Got also from $C_6H_4(NO_2)O.CH_2.CH(NO_2)$ by

oxidation with CrO_3 (Priests, *B* 18, 1862) Yellow plates (from water) Yields succinic acid (and not an amido-acid) on reduction with tin and HCl aq— CaA'_2 — PbA'_2 — AgA'

Ethyl ether EtA'_2 [101°]

DI-NITRO-PYRROLE $\text{C}_4\text{H}_4(\text{NO}_2)_2\text{NH}$ [152°]

Formed by the action of fuming HNO_3 on pyrrol methyl ketone Formed also, together with an isomeride [178°], by the action of fuming HNO_3 on pyrrole carboxylic acid at 0° (Ciamcian a Silber, *B* 18, 1462, 19, 1081, *G* 16, 347) Colourless plates BaA'_2 , yellow needles

NITRO PYRROLE CARBOXYLIC ACID

$\text{C}_4\text{H}_3(\text{NO}_2)\text{NH}(\text{CO}_2\text{H})$ [217°] Formed by saponifying its methyl ether, which is got by nitrating $\text{C}_4\text{H}_4\text{NH}(\text{CO}_2\text{Me})$ (Anderlini, *B* 22, 2505, *Rend Accad Linc* [5] 1, 40) Yellow needles (containing aq), sl sol cold water

Methyl ether MeA' [197°]

An isomeride acid [161°] may be obtained from its methyl ether [179°] which accompanies the preceding ether $\text{C}_4\text{H}_4(\text{NO}_2)_2\text{NH}(\text{CO}_2\text{Me})$ [115°] is also formed in the nitration

Nitro-pyrrole carboxylic acid [146°] Formed by boiling di nitro pyrrole with potash solution (Ciamcian a Danesi, *G* 12, 40) Minute needles (containing aq)— $\text{NH}_4\text{A}'$ prisms or scales

NITRO PYRROLE-DI-METHYL DIKE

$\text{C}_4\text{H}_2(\text{NO}_2)_4$ *see* $\text{C}_4\text{H}_2(\text{NO}_2)_2\text{N}(\text{CO}_2\text{CH}_3)_2$ [149°] Formed by nitrating pyrrole di methyl di ketone (Ciamcian a Silber, *G* 16, 347, *B* 18, 1467, 19, 1078) Needles (from water)

NITRO PYRROLE METHYL KETONE By

nitrating $\text{NH}-\begin{array}{c} \text{CH CH} \\ \text{C=C} \end{array}$ two compounds are formed [197°] and [156°] Both yield pps of $\text{C}_4\text{H}_2\text{N}_2\text{O}_4\text{Ag}$ (Ciamcian a Silber, *B* 18, 1413, 1457) A compound $\text{C}_4\text{H}_2(\text{NO}_2)_2\text{N CO CH}_3$ [114°] crystallising in yellow needles (containing aq) may also be obtained

(*B* 1) **NITRO QUINOLINE** $\text{C}_8\text{H}_6\text{N}_2\text{O}_2$ *see* $\text{CH C}(\text{NO}_2)\text{C CH CH}$ [72°] Formed, together with the (*B* 4) isomeride, by the nitration of quinoline, especially in presence of fuming H_2SO_4 , in the cold (Claus a Kramer, *B* 18, 1243, Noeltling a Trautmann, *B* 23, 8654) Colourless needles (containing aq)

(*B* 2) **Nitro-quinoline** $\text{NO}_2\text{C}-\begin{array}{c} \text{CH C} \\ \text{CH C} \end{array}\text{CH CH}$ [150°] (La Coste, *B* 16, 669), [164°] (*C* a *K*) Formed by boiling *p* nitro aniline (25 pts), glycerin (60 pts), nitro benzene (15 pts), and H_2SO_4 (50 pts) for 4 hours Needles (containing aq)— $\text{B}'\text{H}_2\text{PtCl}_6$, small yellow needles

Methyl iodide $\text{B}'\text{MeI}$ Needles

(*B* 3) **Nitro-quinoline** $\text{CH CH C}(\text{NO}_2)\text{C CH CH}$ [181 5°] Formed from *m* nitro aniline, picric acid, glycerin, and H_2SO_4 (Claus a Stiebel, *B* 20, 3095) Needles— $\text{B}'\text{HCl}$ [225°]— $\text{B}'\text{HNO}_3$,— $\text{B}'\text{H}_2\text{PtCl}_6$, prisms

(*B* 4) **Nitro-quinoline** $\text{CH CH}-\begin{array}{c} \text{CH C} \\ \text{CH C} \end{array}\text{CH CH}$ [89°] Formed by nitrating quinoline, and also by boiling *o* nitro-aniline with glycerin, nitrobenzene, and H_2SO_4 (Kömgas, *B* 12, 449, La Coste, *B* 16, 678, Claus, *B* 18, 1243, Noeltling, *B* 23, 8654) Formed also by heating quinoline (*B* 4)-sulphonic acid with HNO_3 (Claus a

Küttner, *B* 19, 2886), and by warming $\text{C}_8\text{H}_6(\text{NO}_2)(\text{OMe})\text{CH CH CHO}$ with alcoholic ammonia (Miller a Kinkelin, *B* 22, 1716) Prisms— $\text{B}'\text{H}_2\text{PtCl}_6$, orange needles

(*B* 2, 4) **Di-nitro quinoline**

$\text{C}(\text{NO}_2)_2\text{CH C CH CH}$ [150°] Formed by $\text{CH C}(\text{NO}_2)\text{C N CH}$ heating (4, 2, 1) di nitro aniline with glycerin, nitro benzene, and H_2SO_4 (La Coste, *B* 15, 562) Long slender needles

By the nitration of quinoline two isomeric di nitro-quinolines [183°] and [134°] may be got (Claus a Kramer, *B* 18, 1243) Their platino chlorides $\text{B}'\text{H}_2\text{PtCl}_6$ form yellow crystals

NITRO-QUINOLINE-(Py 3) CARBOXYLIC ACID $\text{C}_8\text{H}_5(\text{NO}_2)(\text{CO}_2\text{H})\text{N}$ [220°] Formed by boiling (*Py* 3) methyl quinoline (quinaldine) with nitric acid (*S* *G* 1 4) (Doebner a Miller, *B* 15, 3076) Crystals, sl sol cold water— AgA'

NITRO RESORCIN $\text{C}_6\text{H}_3(\text{NO}_2)(\text{OH})_2$ [4 3 1]

[115°] Formed together with a volatile (2, 3, 1) isomeride [85°], in the preparation of diazoresorcin by the action of nitrous acid on an ethereal solution of resorcin (Weselsky, *A* 164, 1, *M* 1, 887) Lemon yellow needles. When heated with concentrated sulphuric acid it yields $\text{O}(\text{C}_6\text{H}_4(\text{NO}_2)\text{OH})_2$ (Hazura, *M* 4, 610, 5, 188) which forms $\text{Ba}(\text{C}_6\text{H}_4\text{N}_2\text{O}_4)_2$ 2aq and $\text{BaC}_6\text{H}_4\text{N}_2\text{O}_4 \cdot 5\frac{1}{2}\text{aq}$ The isomeride [85°] is converted by the action of nitrous acid into $\text{C}_6\text{H}_4(\text{OH})\text{O}(\text{NOH})(\text{NO}_2)$ [1 3 4 2] (De la Harpe a Reverdin, *Bl* [2] 49, 760)— $\text{BaH}_2\text{A}'_2 \cdot 5\text{aq}$ — $\text{BaH}_2\text{A}'_2 \cdot \text{aq}$ — $\text{BaH}_2\text{A}'_2 \cdot 2\text{aq}$ golden needles

Methyl ethers

$\text{C}_6\text{H}_3(\text{NO}_2)(\text{OH})(\text{OMe})$ [4 3 1] [95°] Volatile with steam— $\text{C}_6\text{H}_3(\text{NO})_2(\text{OMe})(\text{OH})$ [4 3 1]

[144°] Not volatile with steam
Ethyl ethers $\text{C}_6\text{H}_3(\text{NO}_2)(\text{OEt})(\text{OH})$ [79°]

Volatile with steam [131°] Non volatile
Di acetyl derivative $\text{C}_6\text{H}_3(\text{NO})_2(\text{OAc})_2$

[91°] Tables (from alcohol) (Errera, *G* 15, 273)
Di benzoyl derivative
 $\text{C}_6\text{H}_3(\text{NO}_2)(\text{OBz})_2$ [111°] Got by nitration (Schiaparelli a Abelli, *G* 13, 257, Errera, *G*, 15, 271)

Di m nitro-di benzoyl derivative [123°]

Di nitro resorcin $\text{C}_6\text{H}_2(\text{NO}_2)_4(\text{OH})$ [4 2 3 1] [142°] Formed by the action of nitrous fumes, or of cold HNO_3 , upon di nitroso resorcin (Benedikt a Hubl, *M* 2, 323, Barr, *B* 21, 1514, Von Kostanecki, *B* 21, 3122) Formed also by boiling di nitro *m* amido phenol with dilute KOH aq (Lippmann a Fleissner, *M* 6, 814, 7, 98) Golden leaflets— $\text{K}_2\text{A}'_2 \cdot \frac{1}{2}\text{aq}$ — BaA'_2 — $\text{Ag}_2\text{A}'_2$ red pp

Methyl ether $\text{C}_6\text{H}_3(\text{NO}_2)_2(\text{OMe})(\text{OH})$

[75°] Needles (Aronheim, *B* 12, 30)
Di nitro resorcin $\text{C}_6\text{H}_2(\text{NO}_2)_4(\text{OH})_2$ [213°] Formed by nitration of the di acetyl derivative of resorcin (Typke, *B* 16, 552) Yellow prisms or needles— $(\text{NH}_4)_2\text{A}'_2$ — $\text{BaH}_2\text{A}'_2$ — BaA'_2 red scales with violet lustre, v sl sol water

Ethers $\text{C}_6\text{H}_3(\text{NO}_2)_2(\text{OMe})_2$ [67°],

$\text{C}_6\text{H}_3(\text{NO}_2)_2(\text{OEt})_2$ [75°] Obtained by nitration of the ethers of resorcin (Homig, *B* 11, 1039, Aronheim, *B* 12, 82)

Tri nitro resorcin

$\text{C}_6\text{H}(\text{NO}_2)_3(\text{OH})_2$ [6 4 2 3 1] *Styphnic acid*
Oxyphnic acid *Mol w* 245 [175°]. *S.* 64 at 14° (Stenhouse, *Pr.* 19, 410).

Formation—1 By the action of boiling nitric acid on extract of Brazil wood, or sapan wood, euxanthone, gum ammoniac, asafetida, galbanum, pucedanin, ostruthin, saganenium, or the aqueous extract of fustic or sandal wood (Chevreul, *A Ch* 66, 116, 73, 43, Erdmann, *J pr* 37, 409, 38, 355, Botiger a Will, *A* 58, 273; Rothe, *J pr* 46, 376, Gorup Besanex, *A* 183, 336, Stenhouse, *C J* 19, 236) Graebe, *B* 22, 1405) —2 By the action of nitric acid on *m*-nitro phenol, on γ , δ , or ϵ di nitro phenols, and on β or γ tri nitrophenol (Bantlin, *B* 10, 524, 11, 210), Henriques, *A* 215, 340) —3 By the nitration of resorcin or of either di nitroresorcin (Merr a Zetter, *B* 12, 681, Benedikt a Hubl, *M* 2, 326, Von Kostanecki, *B* 21, 3122) —4 By boiling tri nitro phenylene di methyl diamine with potash (Romburg, *R T C* 7, 6) —5 Together with three di nitro benzoic acids, by adding *o* nitro benzoic acid to a mixture of fuming HNO_3 and H_2SO_4 (Griess, *B* 7, 1224, Salkowski, *B* 8, 637)

Properties—Yellow laminae Ppd from its aqueous solution by HCl V sol alcohol and ether

Salts— $(\text{NH}_4)\text{HA}'$ — $(\text{NH}_4)_2\text{A}''$ monoclinic needles, a b c = 1.166 2 09, β = 76° 52' — $\text{Na.A}'$ 2aq — KHA' aq — $\text{K.A}''$ — BaA' 3aq — BaA'' aq — SrA' 2aq — CaA'' 3aq — $\text{Pb}(\text{OH})\text{A}''$ — $\text{MnH.A}'$ 12aq — CoA'' 3aq — $\text{CaK.A}'$ 4aq — $\text{NiK.A}'$ 3aq — CuA'' 4aq — $\text{Cu}(\text{NH}_4)_2\text{A}''$ 7aq — $\text{Cuk.A}'$ 4aq — $\text{Ag.A}''$ aq slender needles

Methyl ether Me A' [124°] Formed by nitrating $\text{C}_6\text{H}_5(\text{OMe})_2$ (Hong, *B* 11, 1039)

Di ethyl ether Et A' [121°] Yields tri nitro *m* phenylene diamine on heating with ammonia (Nolting a Collin, *B* 17, 239)

NITRO RESORCIN SULPHONIC ACID

$\text{C}_6\text{H}_3(\text{NO})_2(\text{OH})_2(\text{SO}_3\text{H})$ [124°] Formed by sulphonating nitro resorcin [115°] (Huzara, *M* 4, 610) Minute crystals (containing 1' aq) — BaA''' 4aq yellow needles — BaA''' 2aq yellow scales — $\text{Ba.A}'''$ 10aq blood red needles

A nitro resorcin disulphonic acid is formed by oxidising the corresponding nitroso compound with H_2O (Ulzer, *M* 9, 1130)

NITRO SALICYLIC ACID v Nitro-oxy BENZOIC ACID

NITROSAMINES Compounds containing nitrosyl (NO) united to nitrogen They are described under the amines from which they are derived by displacement of hydrogen by nitrosyl Nitrosamines are formed by the action of nitrous acid upon secondary bases They are neutral substances and may be reconverted into the parent base by boiling with tin and HCl aq, with zinc and H_2SO_4 , with aniline, or with alcoholic potash (Geuther, *A* 128, 151, Griess, *B* 7, 218, Witt, *C J* 33, 203) Many aromatic nitrosamines are converted into *p* nitroso compounds by alcoholic HCl , the nitrosyl entering the benzene nucleus (Fischer a Hepp, *B* 20, 1247, 2471)

NITROSATES This name is given by Wallach (*A* 241, 288) to compounds formed by the union of nitrogen peroxide with unsaturated hydrocarbons Thus Guthrie's 'amylene nitrite' (vol 1 p 210) would be called amylene nitrosate and may be represented as nitroso-amyl nitrate of formula $\text{C}_5\text{H}_9(\text{NO})(\text{O NO}_2)$ or $\text{C}_5\text{H}_9(\text{NOH})(\text{ONO}_2)$ This body reacts with aromatic

bases forming $\text{C}_5\text{H}_9(\text{NOH})\text{NPh}$ [141°], $\text{C}_5\text{H}_9(\text{NOH})\text{NHCH}_3$ [141°], and the isomeric $\text{C}_5\text{H}_9(\text{NOH})\text{NHCH}_2\text{H}_5$ [115°], which yield nitrosamines melting at 128°, 148°, and 150° respectively Amylene 'nitrosate' reacts in like manner with *o* anisidine, piperidine, and diethylamine, forming bases melting at 139°, 98°, and 72° respectively These bases are termed 'nitrol amines' by Wallach

The term nitrosite is given by Wallach to compounds resulting from the union of N_2O with unsaturated hydrocarbons Thus terpinene nitrosite $\text{C}_{10}\text{H}_{16}\text{N}_2\text{O}$ may be viewed as a nitroso nitrite with formula $\text{C}_{10}\text{H}_{16}(\text{NO})(\text{ONO})$ or $\text{C}_{10}\text{H}_{16}(\text{NOH})(\text{ONO})$ They readily exchange ONO for NHR' or $\text{NR}'\text{R}''$ when acted upon by bases, forming nitrolamines Thus terpinene nitrosite acted upon by ethylamine yields 'terpinene nitrol-ethylamine' $\text{C}_{10}\text{H}_{18}(\text{NOH})\text{NHET}$ [131°]

NITROSO ACETIC ETHER v OXIMIDO ACETIC ETHER

NITROSO ACETOACETIC ETHER $\text{C}_5\text{H}_7\text{NO}$, $\text{CH}_3\text{COCH}(\text{NOH})\text{COEt}$ [54°] Formed by the action of nitrous acid on aceto acetic ether, and on acetyl malonic ether (V Meyer a Zublin, *B* 11, 320, Wiegand, *B* 15, 1050, Ceresole, *B* 15, 1326, Lang, *B* 20, 1327) Prisms, sl sol water, sol alkalis Forms $\text{CH}_3\text{C}(\text{NOH})\text{C}(\text{NOH})\text{COEt}$

Anilide $\text{C}_6\text{H}_5\text{N}_2\text{O}$ [100°] Formed by the action of nitrous acid on the anilide of acetoacetic acid (Knorr, *A* 236, 80) Prisms

NITROSO TRIACETONAMINE v ACETRONAMINE

NITROSO ACETONE $\text{C}_4\text{H}_7\text{NO}$, $\text{CH}_3\text{COCH}(\text{NOH})\text{CH}_3$ or $\text{CH}_3\text{COCH}_2\text{NO}$ *Oxim of pyruvic aldehyde Oxim of methyl glyoxal* [65°] Formed by the action of nitrous acid on acetoacetic ether (V Meyer a Zublin, *B* 11, 695, Ceresole, *L* 15, 1326), and by warming acetone with amyl nitrite and HCl (Claisen, *B* 20, 252) Silvery leaflets or prisms, boiling with decomposition at about 200° V sol water and alcohol, volatile with steam May be sublimed

Reactions—1 Dilute HCl aq at 140° forms acetic and formic acids and ammonia (Treadwell and Steiger, *B* 15, 1059) —2 Tin and HCl give di methyl pyrazine.—3

Hydroxylamines hydrochloride forms methyl glyoxim or acetoximic acid (vol 1 p 38) and a compound, $\text{C}_4\text{H}_9\text{N}_2\text{O}_2$, which detonates at 238°–247°, and forms an explosive hydrochloride $\text{C}_4\text{H}_9\text{N}_2\text{O}_2\text{HCl}$ [113°] (Scholl, *B* 23, 3578) —4 **Phenyl hydrazine** yields $\text{CH}_3\text{C}(\text{NHPH})\text{CH}(\text{NOH})$ [134°] (Pechmann, *B* 21, 2994) —5 **Phenyl methyl-hydrazine** yields $\text{CH}_3\text{C}(\text{NMPH})\text{CH}(\text{NOH})$ [118°]

Methyl ether $\text{C}_4\text{H}_9\text{O}(\text{NOME})$ (115° uncor) Formed by heating nitroso acetone with NaOME (Meyer a Ceresole, *B* 15, 8067, 16, 833) Colourless oil

Ethyl ether $\text{C}_4\text{H}_9\text{O}(\text{NOET})$ (130°).

Benzyl ether $\text{C}_4\text{H}_9\text{O}(\text{NOCH}_2\text{C}_6\text{H}_5)$ [46°].

Di-nitroso-acetone $\text{CH}(\text{NOH})\text{COCH}(\text{NOH})$ [144°] Formed by the action of nitrous acid on acetone dicarboxylic acid (Pechmann a Wehsarg, *B* 19, 2465, 21, 2992) Prisms, sl. sol cold water, decomposed by boiling water into HCy , CO_2 , and water Explodes when heated

Phenyl hydrazide $\text{NHPH OCH}(\text{NOH})$ [145°] Needles. Yields a mono-acetyl derivative [133°].

Phenyl-methyl-hydrazide [187°]**Crystals**

Oxim $\text{CH}(\text{NOH})\text{C}(\text{NOH})\text{CH}(\text{NOH})$ *Tri nitroso propane* [171°] Crystalline powder

NITROSO-ACETOPHENONE $\text{C}_6\text{H}_5\text{NO}_2$ *re* $\text{C}_6\text{H}_5\text{COCHNOH}$ *Oxim of phenyl glyoxylaldehyde* [128°] Prepared by the action of amyl nitrite and NaOEt on acetophenone (Claisen a Manasse, *B* 20, 2194, Braun, *B* 22, 556) Thin, monoclinic plates, $a, b, c = 2.762, 1.2146, b = 66^\circ 54'$ Sol cold water, soluble in aqueous Na_2CO_3 On heating with AcO it yields $\text{C}_6\text{H}_5\text{COCN}$ SnCl_4 in HCl aq, reduces it to ω amido acetophenone and di phenyl pyrazine When its compound with NaHSO_3 is boiled with H_2SO_4 it yields $\text{C}_6\text{H}_5\text{COCHO}$ Hy droxylamine hydrochloride yields $\text{C}_6\text{H}_5\text{N}_2\text{O}_2$ [207°-211°] (Scholl, *B* 23, 3580)

Oxim v Oxim of PHENYL GLYOXAL

NITROSO-ANILINE $\text{C}_6\text{H}_5(\text{NO})(\text{NH})$ [14°] [174°] Formed by heating nitroso phenol with NH_4Cl , ammonium acetate, and ammonium carbonate (Fischer a Hepp, *B* 20, 2175, 21, 684) Steel blue needles (from benzene) Decomposed by NaOHAq into NH_3 and nitroso phenol Tin and HCl reduce it to phenylene *p* diamine Phenyl hydrazine hydrochloride forms $\text{C}_6\text{H}_5\text{N}_2\text{O}$ [125°] Phenyl methyl hydrazine yields $\text{C}_6\text{H}_5\text{N}_2\text{O}$ [151°] — $\text{C}_6\text{H}_5\text{NaN}_2\text{O}$ 2aq yellow crystals

NITROSO-ANTHRONE v ANTHRACENF

NITROSO-BENZENE $\text{C}_6\text{H}_5\text{NO}$ On distilling with steam, the product of the action of nitrosyl chloride on HgPh_2 , there is obtained a pungent green liquid, which yields aniline on reduction (Baeyer, *B* 7, 1638) By oxidising the di-oxim of quinone with alkaline K_2FeCy_6 , there is obtained a golden yellow pp, probably di nitroso benzene $\text{C}_6\text{H}_4(\text{NO})_2$ [14°] It yields *p* phenylene diamine on reduction, and *p* di nitro benzene on warming with HNO_3 Hydroxylamine hydrochloride converts it into quinone dioxim

NITROSO-BENZYL ALLYL-THIO UREA $\text{PhC}(\text{NOH})\text{NHCSNHC}_6\text{H}_5$ Formed by melting together allyl thiocarbimide and benzamidoxim (Koch, *B* 24, 899) Fine needles

ISO-NITROSO-BENZYL-AMINE v BENZ ENYL AMIDOXIM*p* **NITROSO-DI-BENZYL-ANILINE**

$\text{C}_6\text{H}_5(\text{NO})\text{N}(\text{CH}_2\text{C}_6\text{H}_5)_2$ [92°] Formed by adding amyl nitrite to a solution of di benzyl aniline in alcoholic HCl Thin steel blue plates, or small green crystals V sol ether and CS_2 , m. sol. alcohol On reduction it gives *u* di benzyl-*p*-phenylene diamine (Matzudaira, *B* 20, 1616)

NITROSO-BENZYL-MALONIC ACID

$\text{C}_6\text{H}_5\text{C}(\text{NO})(\text{CO}_2\text{H})_2$ [120°] Obtained from its ether, which is got from nitroso malonic ether, NaOEt , and benzyl chloride (Conrad a Bischoff, *A* 204, 121, 209, 215) Plates On fusion, or on boiling with water, it gives benzyl alcohol, CO_2 , and $\text{HCy} - \text{K}_2\text{A}'$ aq (dried at 100°)

NITROSO-BENZYL TOLYL-THIO UREA

$\text{PhC}(\text{NOH})\text{NHCSNH}_2\text{C}_6\text{H}_4\text{Me}$ [67°] Formed by melting *p* tolyl thio carbimide with benzamidoxim (Koch, *B* 24, 897)

NITROSO-BETORCIN $\text{C}_6\text{H}_5\text{NO}_2$ *re*

$\text{C}_6\text{H}(\text{NO})\text{Me}_2(\text{OH})_{1.435}$ [143°] Obtained by the action of nitrosyl sulphate $\text{SO}_3\text{H}(\text{NO})$ on a solu-

tion of betorein (Stenhouse a Groves, *O J* 87, 404, Von Kostanecki, *B* 19, 2823) Red prisms (from HOAc)

p **NITROSO-ISOBUTYL-ANILINE**

$\text{C}_6\text{H}_5(\text{NO})\text{NHCH}_2\text{Pr}$ [94°] Formed from iso butyl aniline, NaNO_2 , and HCl (Wacker, *A* 243, 297) Steel blue crystals, v sol alcohol Yields $\text{C}_6\text{H}_5(\text{NH}_2)\text{NHCH}_2\text{Pr}$ on reduction Boiling alkalis split it up into *p* nitroso phenol and iso butylamine Further treatment with NaNO_2 and HCl yields $\text{C}_6\text{H}_5(\text{NO})\text{N}(\text{NO})\text{CH}_2\text{Pr}$

a **NITROSO-n BUTYRIC ACID** $\text{C}_4\text{H}_7\text{NO}_2$ *re*

$\text{C}_4\text{H}_7\text{C}(\text{NOH})\text{CO}_2\text{H}$ [151°] Formed by the action of nitrous acid and NaOH upon ethyl acetoacetic ether (Wienig, *B* 15, 1057) Flat prisms — AgA' insoluble powder

B Nitroso butyric acid

$\text{CH}_3\text{C}(\text{NOH})\text{CH}_2\text{CO}_2\text{H}$ [140°] Obtained from its ether, which is got by the action of hydroxylamine on acetoacetic ether (Westenberger, *B* 16, 2996) — AgA' white pp

(aB) Di isonitroso butyric acid $\text{C}_4\text{H}_7\text{N}_2\text{O}_4$ *re* $\text{CH}_3\text{C}(\text{NOH})\text{C}(\text{NOH})\text{CO}_2\text{H}$ Obtained from its ethyl ether [140°] which is formed, together with the anhydride $\text{C}_4\text{H}_7\text{N}_2\text{O}_4$ [133°], by the action of hydroxylamine on nitroso acetoacetic ether (Ceresole a Kockert, *B* 17, 821) The acid is crystalline and gives the salts BaA' , $2\frac{1}{2}\text{aq}$ and AgA' The anhydride gives BaA' , $2\frac{1}{2}\text{aq}$ and $\text{Ag}_2\text{A}''$

NITROSO CARVACROL

$\text{C}_6\text{H}_4(\text{NO})(\text{CH}_3)(\text{CH}_2)(\text{OH})$ [153°] Yellow prisms (Paterno a Canzoneri, *B* 12, 388) Reduced by SnCl_2 to amido carvacrol [304°]

NITROSO-CARVENE v CARVONIM

NITROSO COMPOUNDS Compounds containing nitrosyl NO They are usually obtained by the action of nitrous acid They may be divided into nitrosamines (*g v*) in which nitrosyl is attached to nitrogen, and nitroso compounds proper in which nitrosyl is attached to carbon Compounds in which nitrosyl is attached to oxygen are called nitrites Compounds containing the divalent radicle oximodogen NOH are often called isonitroso compounds, the group CNOH being isomeric, and often interchangeable, with the group CHNO The isonitroso compounds may be obtained by the action of hydroxylamine on aldehydes, ketones, and ketonic compounds, and may thus be termed oximides, oximes, or oxims of these ketonic bodies Nitrous acid acting upon the group COCH_2 frequently converts it into $\text{COC}(\text{NOH})$ the new body may be termed either a nitroso derivative of the original ketone, or a monooxim of the diketone COCO , the latter terminology is that usually employed in this dictionary Nitrous acid acting upon a secondary amine forms a nitrosamine, with tertiary aromatic amines and with phenols it yields nitroso compounds, the nitrosyl taking up the *para* position When the *p* position is occupied the nitrosyl can in some cases still enter the benzene nucleus in the *o* position The nitroso phenols $\text{HO C} \begin{smallmatrix} \text{CH CH} \\ \text{CH CH} \end{smallmatrix} \text{CNO}$ and the oxims of the

mono quinones $\text{CO} \begin{smallmatrix} \text{CH CH} \\ \text{CH CH} \end{smallmatrix} \text{CNOH}$ are identical, and will be described under the quinones Some aromatic nitrosamines are converted into

the isomeric *p* nitroso compounds by the action of alcoholic HCl

NITROSO-CREATININE *v* CREATININE

NITROSO-CRESOL *v* Oxim of TOLUQUINONE

DI-NITROSO CRESOREICIN $C_6H_4Me(NO)_2(OH)_2$ or $C_6H_4Me(NO)_2O$ [1 3 5 2 4] Formed from cresorein and HNO_2 (Von Kostanecki, *B* 20, 3135) Pale green plates (containing aq) Explodes above 160° Sl sol water With HNO_3 it yields di nitro cresorein [90°]

DI-NITROSO-CYMENE $C_{10}H_{12}N_2O_2$ [72°] Formed by oxidising the di oxim of thymoquinone with alkaline K_2FeC_4 (Kehrmann a Messinger, *B* 23, 3560) Greenish yellow pp, smelling like iodine After one fusion it melts at 130°

NITROSO-ETHYL-ACETONE is the (β) oxim of METHYL ETHYL DIKETONE (*q v*)

NITROSO-ETHYL-ANILINE $C_8H_9N_2O$ *see* [4 1] $C_8H_9(NO)(NH_2Et)$ [78°] Obtained by adding alcoholic HCl to an ethereal solution of the nitrosamine of ethyl aniline (Fischer a Hepp, *B* 19, 2993) Green plates, v sol alcohol Yields $C_8H_9(NH_2)(NH_2Et)$ (270°) on reduction On heating with aqueous NaOH it is split up into nitroso phenol and ethylamine — $B'HCl$ needles, v sol water

Nitroso di ethyl aniline [1 4] $C_8H_9(NO)NEt_2$ [84°] Formed from di ethyl aniline and nitrous acid (Kopp, *B* 8, 621) Green prisms (from ether) Decomposed by boiling dilute NaOH into nitroso phenol and diethylamine Salts — $B'H_2P_2Cl_4$ — $B'I_3$ [118 5°] (Dafert, *M* 4, 506) — $B'I_3$ [127°] — $B'H_2SO_4$ — $B'2C_2H_5(NO)_2(OH)$ — $B'HCy$ [171°] (Lippmann, *M* 6, 544) Orange crystals (from alcohol)

NITROSO DI ETHYL KETONE *v* (a) Oxim of METHYL ETHYL DIKETONE

a NITROSO ETHYL-PHENYL AMINE

$C_8H_9(NH_2)CH(NO)CH_3$ Formed by heating $C_8H_9(NH_2)CHNO$ with KOH, methyl alcohol, and MeI at 100° (Gabriel a Meyer, *B* 14, 2339) Yellowish oil — $B'HCl$ prisms

Acetyl derivative

$C_8H_9(NHAc)CH(NO)CH_3$ [109°]

NITROSO ETHYL o TOLUIDINE C_8H_9NO *see* $C_8H_9Me(NO)NH_2Et$ [140°] Green plates (Fischer, *B* 19, 2994)

NITROSO ETHYL-o-XYLIDINE $C_{10}H_{11}NO$ *see* $C_8H_9(NO)Me(NH_2Et)$ [1 2 3 4] [124°] Green crystals (Menton, *A* 263, 327) — $B'HCl$ needles

NITROSO FORMANILIDE *v* FORMIC ACID

a NITROSO GLUTARIC ACID

$CO_2H C(NO)CH_2CH_2CO_2H$ [152°] Produced by boiling furazyl propionic acid

$O < N C CH_2CH_2CO_2H$ [86°] with potash, the semi nitrile $CN C(NO)CH_2CH_2CO_2H$ [87°] being formed at the same time (Wolff, *A* 260, 112) Prisms Yields amido-glutaric acid on reduction — $BaA''1\frac{1}{2}aq$ needles, v sl sol water

Amidoxim

$CO_2H CH_2CH_2C(NO)C(NO)NH_2$ [158°] Formed by the action of hydroxylamine on the semi nitrile [87°] Needles, sl sol water

NITROSO GUANIDINE *v* GUANIDINE

NITROSO HEXOIC ETHER

$CH_3C(NO)CH_2CH_2CO_2Et$ Formed from ethyl-acetoacetic ether and hydroxylamine (Westenberger, *B* 16, 2997) Oil.

Nitroso hexoic acid $CH_3C(NO)CMe_2CO_2H$ [97°] By the action of amyl nitrite and nitric acid on tri methyl ethylene there is formed a compound $CMe_2(ONO)C(NO)CH_3$ which when heated with alcoholic KCy yields the nitrile $CH_3C(NO)CMe_2CN$ [100°] (230°) which forms on saponification the corresponding amide [164°] and acid [97°] (Wallach, *A* 248, 166) The acid is split up by heat into CO_2 and the oxim of methyl isopropyl ketone

NITROSO-INDOXYL *v* ψ -ISATIN OXIM

NITROSO MALONIC ACID $CH(NO)(CO_2H)_2$ or $C(NO)(CO_2H)_2$ Oxim of mesoxalic acid

Formation — 1 By treating barbituric acid with nitrous acid and warming the resulting violonic acid with potash (Baeyer, *A* 131, 292) 2 From its ether, which is got by passing nitrous fumes into sodium malonic ether (Conrad a Bischoff, *B* 13, 599, *A* 209, 211) — 3 By the action of hydroxylamine on mesoxalic acid (Meyer a Muller, *B* 16, 608)

Properties — Needles Decomposes at 126° with violence At 40° its aqueous solution gives off CO_2 and HCy Sodium amalgam reduces it to amido malonic acid

Salts — $KA''\frac{1}{2}aq$ — $PbA''aq$ — $AgA''\frac{1}{2}aq$

Ethyl ether Et_2A'' SG $\frac{1}{2}$ 1 149 Oil

NITROSO MESITYL OXIDE

$CMe_2CHCOCHNOH$ [102°] Prisms (Claisen a Manasse, *B* 22, 526)

NITROSO METHYL ACETONE *v* Oxim of DI METHYL DIKETONE

NITROSO DI METHYL p AMIDO BENZOIC ACID $C_8H_9(NH_2)(NMe_2)CO_2H$ [224°] Formed by the action of nitrous acid on $C_8H_9(NMe_2)CO_2H$ (Bischoff, *B* 22, 342) Plates (from alcohol) Yields $C_8H_9(NMe_2)CO_2H$ on reduction with $SnCl_2$ and HCl Salts — $B'H_2C_2O_4$ [178°-181°] — $B'C_2H_5(NO)_2OH$ [168°] — $B'HCl$ slender needles

Methyl ether $MeA''6\frac{1}{2}aq$ [101°] — $B'HCl$ — $B'C_2H_5(NO)_2OH$ Golden yellow needles

NITROSO DI METHYL-AMIDO BENZO PHENONE $C_8H_9CO C_6H_4(NH_2)NMe_2$ Oil (Bischoff, *B* 22, 340)

Nitroso-tetra-methyl-diamido-benzophenone *v p* 263

p NITROSO-METHYL ANILINE $C_8H_9N_2O$ *see* $C_8H_9(NO)NMe_2H$ [118°] Formed by adding alcoholic HCl to an ethereal solution of the nitrosamine $C_8H_9NMe_2(NO)$ (Fischer a Hepp, *B* 19, 2991) Steel blue prisms (from water) Decomposed by $NaOHAq$ into *p* nitroso phenol and methylamine Yields $C_8H_9(NH_2)(NMe_2H)$ on reduction Nitrous acid forms the nitrosamine $C_8H_9(NO)NMe_2NO$ [101°] Nitric acid (SG 1 13) yields the nitro-compound $C_8H_9(NO_2)NMe_2NO$ [104°]

Nitroso-di-methyl aniline $C_8H_9(NO)NMe_2$ or $C_8H_9 < NMe_2 > O$ Mol w 160 [85°] Formed by the action of nitrous acid on di-methyl aniline hydrochloride (Baeyer a Caro, *B* 7, 963, Schraube, *B* 8, 616, Wunster, *B* 12, 523, 1825, Meldola, *C J* 39, 37) Green plates (from ether)

Reactions — 1 Reduced by *tin* and $HClAq$ to $C_8H_9(NH_2)(NMe_2)$ — 2 Resolved by boiling alkali into nitroso phenol and dimethylamine — 3 K_2FeC_4 oxidises it to $C_8H_9(NO_2)(NMe_2)$ — 4 Alcoholic potash forms $NO(C_8H_9NMe_2)$ — 5 $HClAq$ at 105° yields $C_8H_9(NH_2)(NMe_2)$.

$C_6H_4Cl_2(NH_2)(NMe_2)$ and $C_6H_4Cl_2(NH_2)_2$ (Möhlan, *B* 19, 2010) — 6 *Phenyl hydrazine acetate* yields $C_{12}H_{11}N_3O$ [108°] This base is also formed by the action of diazobenzene on nitroso dimethylaniline (O Fischer, *B*, 21, 2610, 22, 623) Phenyl methyl hydrazine yields the compound $C_{12}H_{15}N_3O$ [141°]

Salts — $B'HCl$ yellow needles — $B'H_2SO_4$ — $B'H_2C_2O_4$ 2aq — $B'H_2C_2O_4$ — $B'_2H_2FeCy_2$ aq — $B'_2H_2FeCy_2$ 2aq — B'_2AgNO_3 — B'_2H_2Cy [222°] (Lippmann a Fleissner, *M* 6, 537)

Combinations — B'_2I_2 [116°] (Dafert, *M* 4, 506) — B'_2I_2 [124°] — B'_2PhNH_2 steel blue crystals — $B'_2NH_2C_6H_4Me$ [14] — B'_2PhOH — $B'_2C_6H_5$ dark green crystals — $B'_2HCyC_6H_5$ — $B'_2HCyC_6H_4NO_2$ — $B'_2HCyC_6H_5$ — $(B'HCy)(PhN_2)_2$

NITROSO-METHYL OXINDOLE v. Oxim of

METHYL-ISATIN

NITROSO-METHYL-o-TOLUIDINE

$C_8H_9Me(NO)(NHMe)$ [152] [151°] Formed by the action of HCl on the isomeric nitrosamine $C_8H_9Me(NMeNO)$ (Kock, *A* 243, 308) Green plates Split up by boiling $NaOHAq$ into nitroso-*o* cresol and methylamine $KMnO_4$ oxidises it to nitro methyl *o* toluidine — $B'H_2Cl_2$ aq [110°] Yellow cubes

Nitroso di-methyl *m*-toluidine

$C_8H_9Me(NO)NMe_2$ [125] [92°] Formed by the action of nitrous acid on di methyl *m* toluidine (Wurster a Riedel, *B* 12, 1796, 13, 126) Light green needles Decomposed by boiling $NaOHAq$ into NMe_2H and the oxim of *m* tolouquinone — $B'HCl$ — $B'_2H_2FeCy_2$ aq — $B'_2H_2FeCy_2$ 2aq yellow needles

NITROSO-METHYL-o-XYLIDINE

$C_8H_9Me(NO)(NHMe)$ [1263] [161°] Green needles, sl sol water (Menton, *A* 263, 323) — $B'HCl$ crystalline meal

NITROSO-NAPHTHALENE $C_{10}H_7(NO)$ [89°]

Formed from $Hg(C_{10}H_7)_2$ and $NOBr$ in CS_2 (Bayer, *B* 7, 1639, 8, 615) Yellow crystals

Di-nitroso-naphthalene $C_{10}H_6(NO)_2$ [14]

Formed by the action of alkaline K_2FeCy_4 on the dioxim of (α)-naphthoquinone (Nietzki a Guitermann, *B* 21, 433). Pale yellow powder, exploding at 120° Insol water and alcohol

Di-nitroso naphthalene $C_{10}H_6(NO)_2$ [12]

[126°] Formed from (β) naphthoquinone dioxim and K_2FeCy_4 (Leuckart, *B* 19, 174) Needles, m sol alcohol

NITROSO-NAPHTHOL v Oxim of NAPHTHOQUINONE

NITROSO (β) NAPHTHOLSULPHONICACID

$C_{10}H_6(NO)(OH)SO_3H$ or $C_{10}H_6(NO)(OH)O(SO_3H)$ [123] or [132] Formed from ammonium (β) naphthol sulphate, $NaNO_2$, and HCl (Meldola, *C* J 39, 41) Very soluble orange crystals Its solution gives with phenol in $HOAc$ a blue colour, becoming red on dilution, and with diphenyl amine a blue colour, remaining blue on dilution Tin and HCl reduce it to the amido acid — BaA' aq orange needles — $BaC_2H_3NSO_3$ 2aq green needles — $Ag(NH_4)A'$ — $(NH_4)A'$ aq green — MgA'' 3aq orange — ZnA'' 3aq — PbA'' aq

An isomeric acid, obtained by reducing benzene azo (β) naphthol sulphonic acid with aqueous ammonium sulphide, crystallises in sparingly soluble grey needles (Griess, *B* 14, 2042)

NITROSO-DI-(α) NAPHTHYL-AMINE

$C_{10}H_7(NO)NHO_2H$. [169°] Formed from

$(C_{10}H_7)NNO$ and alcoholic HCl (Fischer a Hepp, *B* 20, 1248, Wacker, *A* 243, 301) Dark red needles With boiling dilute H_2SO_4 it yields the mono oxim of (α) naphthoquinone and (α) naphthylamine — $B'HCl$ green needles -

Nitroso (β) naphthylamine

$C_{10}H_7(NO)NH_2$ [12] [162°] Formed by heating the (α) oxim of (β) naphthoquinone with NH_4Cl and NH_4OAc (Ilinski, *B* 17, 391, Harden, *A* 255, 150) Dark green needles (from dilute alcohol Yields naphthylene *o* diamine on reduction and the di oxim of (β) naphthoquinone on treatment with hydroxylamine — $B'HCl$ — $B'_2H_2PtCl_6$ — $B'_2H_2SO_4$ aq

(α) NITROSO - (β) - NAPHTHYL-ETHYL-

AMINE $C_{11}H_9(NO)NHEt$ [121°] Formed by the action of alcoholic HCl at 6° on the nitrosamine $C_{11}H_9N(Et)(NO)$, and also by the action of ethyl amine on the (α) oxim of (β) naphthoquinone (Fischer a Hepp, *B* 20, 2471, 21, 686) Green crystals Yields a crystalline nitrosamine $C_{12}H_{11}N_2O_2$, decomposing at 105°

(α) Nitroso-(α) naphthyl ethyl amine

$C_{11}H_9N_2O$ v $C_{10}H_7(NO)NHEt$ [14] [133°] Formed in like manner (Kock, *A* 243, 310) Brown pp Reduced by stannous chloride to $C_{10}H_7(NH)(NHEt)$ Yields ethylamine and $C_{10}H_7(NO)H$ *o* when boiled with $NaOHAq$ — $B'HCl$ — Picrate $C_{18}H_{15}N_3O_8$ [174°] — $C_{12}H_{13}N_2O_2Na$ white spangles, v sol water

Tetrahydride $C_8H_7 < C(NHEt)CH$

[119°] Formed from the isomeric nitrosamine and alcoholic HCl (Bamberger a Helwig *B* 22, 1814) Needles — $B'HCl$ golden crystals Nitroso naphthyl di ethyl amine $C_{10}H_7(NO)NEt_2$ [165°] Formed by adding $NaNO_2$ to a well cooled solution of the base (B E Smith, *C* J 41, 182) Reddish golden scales Gives a blue colour with H_2SO_4

NITROSO-NITRATES v NITROSATES

NITROSO-NITRO ANTHRONE $C_{14}H_9N_2O_4$

[263°] Formed by the action of alkalis on 'hydro anthracene nitrite (Liebermann, *B* 14, 467, cf vol 1 p 277)

NITROSO-NITRO-BUTANE $C_4H_9N_2O_4$ v

$CH_3C(NO)(NO_2)C_2H_5$ *Pseudobutylnitrole* [58] Formed by the action of KOH , KNO_3 , and dilute H_2SO_4 on β nitro butane (Meyer a Locher, *A* 180, 186) and of NO on $CH_3C(NO)C_2H_5$ (Scholl, *B* 21, 508) White prisms (from chloroform), yields a blue liquid on fusion Insol water and alkalis

The isomeric $PrCH(NO)(NO_2)$ and $PrCH(NO)(NO_2)$ are oils (Demole, *B* 7, 790, Züblin, *B* 10, 2084)

NITROSO NITRO PENTANE $Et_2C(NO)(NO_2)$

[68°] Formed from Et_2CNOH and N_2O_4 (Scholl, *B* 21, 509)

NITROSO-NITRO-PROPANE $C_3H_7N_2O_4$ v

$CH_3C(NO)(NO_2)CH_3$ [76°] Formed from acetoxim and N_2O_4 (Scholl, *B* 21, 508) The isomeric compound $CH_3CH_2CH(NO)NO_2$ or $CH_3CH_2C(NO)NO_2$ melts at 60° (Meyer, *A* 175, 114)

NITROSO-NITRO RESORCIN $C_6H_4N_2O_4$ v

$C_6H_4(OH)(NO_2)O(NOH)$ [1234] Formed from nitro resorcin [85°] and nitrous acid (De la Harpe a Reverdin, *B* 21, 1405) Brown needles, not melted at 200°, explodes at a higher temperature.

NITROSO ORCIN $C_8H_7Me(NO)(OH)$. Formed from orcin, NaOHAq, and amyl nitrite (Kramer, B 17, 1888). Dark red prisms. When heated with orcin and H_2SO_4 , it gives the dyestuff $C_{11}H_{11}NO_3$.

Di nitroso orcin $C_8H_7Me(NO)_2(OH)_2$ [1 2 4 3 5]. Formed by adding H_2SO_4 , containing N_2O , to a solution of orcin (Stenhouse a Groves, C J 31, 544). Yellow prisms. Blackens about 140° without melting. Alcoholic hydroxylamine hydrochloride at 100° yields $C_8H_7Me(NO)_2$, whence AcO forms $C_8H_7Me(N_2O)_2$ [47°] (Goldschmidt, B 20, 1607). The compound $C_8H_7Me(NO)_2$ yields, on oxidation by potassium ferriocyanide, the product $C_8H_7Me(NO)_2$ [103°], crystallising in pale-yellow needles.

NITROSO OXANTHRANOL $C_{11}H_9NO$. Formed by boiling 'hydro anthracene nitrite' with alkalis (Liebemann, B 14, 471). Orange flakes, sol alkalis.

NITROSO OXINDOLE v **ISATIN OXIM**

NITROSO OXY METHYL QUINOLINES

C_8H_7N $C_8H_7Me(NO)(OH)$. The following crystalline compounds have been obtained by the action of nitrous acid on the oxy methyl quinolines (Noelting a Trautmann, B 23, 3665) — (B 3) nitroso (B 4) oxy (B 1) methyl quinoline, (L 1) nitroso (B 4) oxy (B 2) methyl quinoline, (B 4) nitroso (B 1) oxy (B 2) methyl quinoline, (B 1) nitroso (B 4) oxy (L 3) methyl quinoline, and (B 2) nitroso (B 1) oxy (B 4) methyl quinoline. Friedlander and Muller (Py 20, 2011) have obtained in like manner (Py 1,3) nitroso-oxy (Py 4) methyl quinoline crystallising in red needles.

NITROSO OXY DI PHENYL AMINE

$C_6H_5(NO)(OH)NPh$ [4 3 1]. Formed from $C_6H_5(OH)NPh(NO)$ and alcoholic HCl (Kohler, B 21, 909). Red needles, m sol alcohol.

NITROSO (B 4) OXY QUINOLINE

$C_8H_7(NO)(OH)N$. Formed from o oxy quinoline and nitrous acid (Luppmann a Fleisner, M 10, 794). Yellow needles. The isomeric nitroso (B 2) oxy quinoline crystallises from $HOAc$ in golden needles (Mathews, B 21, 1886).

(Py 2) Nitroso (Py 1,3) di oxy quinoline

$C_6H_5 \begin{smallmatrix} CO C(NO)H \\ N C(OH) \end{smallmatrix}$ [208°]. Formed by the action of nitrous acid on (Py 1,3) di oxy quinoline (oxycarbostyryl (Baeyer a Homolka, B 16, 2216). Orange prisms. Decomposed by cone $HClAq$ into isatin and hydroxylamine. $SnCl_4$ yields tri oxy quinoline.

NITROSO PHENOL v **MONO-OXIM OF QUINONE**

NITROSO PHENYL ACETIC ACID v **Oxim**

of **PHENYL GLYOXYLIC ACID**

p NITROSO DI PHENYL-AMINE

$C_6H_5(NO)NPhH$ [143°]. Formed from diphenyl nitrosamine and alcoholic HCl (O Fischer a Hepp, B 19, 2991, 21, 677, 2614). Green plates (from benzene). With phenyl hydrazine hydrochloride it yields a compound $C_{18}H_{16}N_2O$ [112°]. Free phenyl hydrazine in ether yields amido diphenylamine [75°] and $C_6H_5N_2O$ [173°] v Bromo aniline yields $C_6H_5Br.N$ [243°]. Tin and HCl reduce it to $C_6H_5(NH_2)NPhH$ [65°] (Ikuta, A 243, 274). Aqueous NaOH yields aniline and quinone oxim. — $B'HCl$ bronze tablets or needles.

Acetyl derivative [97°]. Red prisms.

Nitrosamine $C_6H_5(NO)NPh(NO)$ [98°].

NITROSO-PHENYL BENZYL-THIO-UREA

$PhC(NO)NHCSNPh$ [172°]. Crystals (from alcohol) (Koch, B 24, 394).

NITROSO-PHENYL (a)-NAPHTHYL AMINE

$C_{10}H_7(NO)NPh$ [150°]. Formed from phenyl-naphthyl nitrosamine and alcoholic HCl (Fischer a Hepp, B 20, 1247). Brownish yellow crystals. Yields $C_{10}H_7(NH_2)NPh$ on reduction. Boiling dilute H_2SO_4 splits it up into aniline and quinone oxim — $B'HCl$ green plates.

TRI NITROSO PHLOBOGLUCIN

$C_6(NO)_3(OH)$. Prepared by the action of KNO_3 and $HOAc$ on phloroglucin (Benedikt, B 11, 1374). Needles, sol water and alcohol — K_4A''' needles, exploding above 130° .

TRI-NITROSO-PROPANE v. *Oxim* of Di-

NITROSO ACETONE

NITROSO PROPIONIC ACID v. *Oxim* of **Pyruvic acid**

NITROSO PROPYL-ANILINE $C_8H_7N_2O$ v $C_8H_7(NO)NPrH$ [59°]. Formed from the isomeric $C_8H_7NPr(NO)$ and alcoholic HCl (Wacker, A 243, 291). Steel blue needles, v sol alcohol. Yields $C_8H_7(NH_2)NPrH$ on reduction, and quinone oxim and $NPrH_2$ on boiling with alkalis. $NaNO_2$ and HCl yield $C_8H_7(NO)NPr(NO)$ [69°].

Nitroso di propyl-aniline $C_8H_7(NO)NPr_2$ [42°]. Formed from di propyl aniline (241°) and HNO_2 (Mandl, M 7, 99). Green trimetric crystals, $a b c = 576 \cdot 1 \cdot 277$. Yields quinone oxim and dipropylamine on warming with potash. HCl forms $C_8H_7N_2O$ [140°].

NITROSO PROPYL CRESOL $C_8H_7NO_2$ v $C_8H_7MePr(NO)(OH)$. *Cymoquinone oxim* [140°] is formed from propyl cresol, KNO_3 , and $HOAc$ (Mazzara, G 12, 167). The isomeric $C_8H_7MePr(NO)(OH)$ melts at 167° .

NITROSO RESORCIN $C_6H_4(NO)(OH)_2$ [4 3 1]. *Oxy quinone oxim*. Formed from $C_6H_4(OH)_2(ONa)$ and amyl nitrite (Fèvre, Bl [2] 39, 585, C R 96, 790). Golden crystals (containing aq), turning brown at 112° . Its solution is turned deep green by a ferrous salt. $SnCl_4$ reduces it to amido resorcin. H_2O yields nitroresorcin (Ulzer, M 9, 1128) — NH_4A 2aq — $KA'Aq$ — $NaA'Aq$ — AgA' brown needles.

Methyl ether MeA' (Aronheim, B 12, 80).

Ethyl ether EtA' . Yellow flakes.

Di nitroso resorcin $C_6H_4(NO)_2(OH)_2$ [4 2 3 1].

Formed by the action of nitrous acid on resorcin (Fitz, B 8, 631, Kostanecki, B 22, 1345). Yellowish plates (containing aq). Explodes at 115° . Forms coloured lakes. Yields di amido-resorcin on reduction — NH_4A' — NaA' dark-green powder.

NITROSO RESORCIN DISULPHONIC ACID

The salt $C_6H_4(NO)(OH)(OK)SO_3K$ is formed by the action of KNO_2 and $HOAc$ on potassium resorcin disulphonic acid (Ulzer, M 9, 1127). It forms violet crystals.

NITROSO SUCCINIC ACID $C_4H_5NO_4$ v $CO_2HCH_2C(NO)CO_2H$. Obtained from its mono ether, which is got by allowing di nitroso succino succinic ether to stand with water (Ebert, A 229, 65). Crystals, decomposing below 126° — CaA'' 4aq.

Mono-ethyl ether $EtHA''$ [111°] — NH_4EtA'' — $CaEtA''$ 2aq — $CaC_4H_5NO_4$ 2aq — $BaC_4H_5NO_4$ aq — $Zn(EtA'')_2$ — $AgEtA''$.

An isomeric ether $EtHA''$ [54 7°] is obtained by the action of $NaOEt$ on the oxim of oxalacetic

ether (Prutti, *C O* 1888, 1460, 1890, 938, Hantzsch, *B* 23, 11)

Di-ethyl ether Et.A'. Oil Identical with the oxim of oxalacetic ether

Di nitroso succinic acid
 $\text{CO}_2\text{H C}(\text{NOH})\text{C}(\text{NOH})\text{CO}_2\text{H}$ [130°] Formed from carboxy tartaric acid and hydroxylamine (Muller, *B* 16, 2985) Prisms— $\text{Ag}_2\text{A}'$ explosive pp

NITROSOSULPHATES and **NITROSO SULPHURIC ACIDS** *v* **SULPHATES** and **SULPHURIC ACID** in vol iv

NITROSO THIOGLYCOLLIC ACID
 $\text{HS C}(\text{NOH})\text{CO}_2\text{H}$ Formed by boiling nitrosothiohydantoin with baryta water (Maly a. Andreasch, *M* 1, 168, *B* 13, 601) Crystals, *v* sol ether Gives a blue colour with FeCl_3 Decomposed by boiling water or alcohol into CO_2 , hydrogen sulphocyanide, and H_2O — BaA' aq

NITROSO-THIOHYDANTOIN $\text{C}_2\text{H}_3\text{N}_2\text{OS}$ Formed from thiohydantoin and HNO_2 (Maly, *B* 12, 967) Crystalline powder, *sl* sol water

NITROSO-THYMOL *v* *Oxim* of **THYMOQUINONE**

DI NITROSO-TOLUENE $\text{C}_6\text{H}_4\text{Me}(\text{NO})_2$ [6 3 2or1] [α 144°] Formed by oxidising toluquinone dioxim with K_2FeCy_4 (Nietzki, *B* 21, 492, Mehne, *B* 21, 734) Amorphous insoluble powder, volatile with steam Gasified on fusion Reconverted by hydroxylamine into toluquinone dioxim

NITROSO o-TOLUIDINE $\text{C}_6\text{H}_4\text{NO}$ *z* $\text{C}_6\text{H}_3\text{Me}(\text{NO})(\text{NH}_2)$ [1 5 2] [116°] Formed by heating toluquinone mono oxim (nitroso *o* cresol, with acetate and chloride of ammonium (Mehne, *B* 21, 731) Small green needles with blue reflex Yields NH_3 , and nitroso *o* cresol on heating with aqueous NaOH Hydroxylamine yields toluquinone dioxim

Nitroso-m-toluidine
 $\text{C}_6\text{H}_3\text{Me}(\text{NO})(\text{NH}_2)$ [1 2 5] [178°] Formed in like manner from nitroso *m* cresol Resembles its isomeride and yields the same dioxim on treatment with hydroxylamine

o-NITROSO-VALERIC ACID is the *Oxim* of **PROPYL GLYOXYLIC ACID**

γ-Nitroso-valeric acid
 $\text{CH}_3\text{C}(\text{NOH})\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$ *Oxim* of *acetylpropionic acid* [96°] Formed from *β* acetylpropionic acid (levulic acid) and hydroxylamine (Muller, *B* 16, 1617) Prisms Yields levulic acid on treatment with tin and HCl H_2SO_4 at 100° forms methyl succinimide (Bredt, *A* 251, 816, cf Rischbicht, *B* 20, 2671)— $\text{BaA}_2\cdot 2\text{aq}$ — AgA' white pp

Ethyl ether Et.A' Oil
γ-Di nitroso valeric acid
 $\text{CH}(\text{NOH})\text{C}(\text{NOH})\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$ [136°] Formed from glyoxyl propionic acid and hydroxylamine (Wolf, *A* 260, 93) Prisms Converted by conc H_2SO_4 at 70° into furazyl propionic acid $\text{O} \begin{smallmatrix} \text{N} \\ \text{C} \end{smallmatrix} \text{CH}_2\text{CH}_2\text{CO}_2\text{H}$ [86°]. — $\text{BaA}'\cdot 3\text{aq}$ thin needles

NITROSO-XYLENOL *v* *Oxim* of **XILOQUINONE**

180-NITRO STEARIC ACID $\text{C}_{18}\text{H}_{33}(\text{NO})\text{O}_2$ Formed by boiling stearic acid (100 g) with HOAc (1500 cc) and HNO_3 (250 g of SG 1.48) for four days (Claus, *J pr* [2] 43, 161) Yellowish

buttery mass, *v* sol ether and alcohol, *insol* water and ligroin Yields stearic acid on reduction It is therefore not a true nitro compound. — $\text{K}_2\text{A}'$ — $\text{K}_2\text{A}'\cdot\text{KHCO}_3$ — $\text{Na}_2\text{A}'$ granular mass, *insol* ether— SrA' — CaA' — CuA' light green

NITRO-STYCHNINE *v* **STYCHNINE**

NITRO-STYRENE The *o*, *m*, and *p*-isomerides $\text{C}_6\text{H}_4(\text{NO})\text{CH CH}_3$, melting at 14°, −5°, and 29° respectively, are formed by boiling the acids $\text{C}_6\text{H}_4(\text{NO})\text{CHBrCH CO H}$ with aqueous Na CO_3 (Einhorn, *B* 16, 2213, Prausnitz, *B* 17, 597, Basler, *B* 16, 3005) The corresponding dibromides $\text{C}_6\text{H}_4(\text{NO})_2\text{CHBrCHBr}$ melt at 52°, 79°, and 73° respectively

ω-Nitro styrene $\text{C}_6\text{H}_5\text{CH CH NO}_2$ [58°] (250° 260°) Formed by heating benzoic aldehyde with nitro methane and ZnCl_2 for 8 hours at 160° (Priests, *A* 225, 319) Formed also by boiling styrene with HNO_3 (Simon, *A* 31, 269, Blyth a. Hofmann, *A* 53, 297) Yellow crystals, yielding benzoic acid on oxidation When freshly prepared it is soluble in NaOHAq , but the solution slowly decomposes, yielding benzoic aldehyde and resin Diluted H_2SO_4 yields benzoic aldehyde, hydroxylamine, and CO Conc HClAq yields hydroxylamine and PhCHCl CO H [78°]

ω-Di-nitro-styrene $\text{C}_6\text{H}_3(\text{NO})_2\text{CH CH}(\text{NO})_2$ [107°] Formed, together with the *ω* isomeride, by nitration of *ω* nitro styrene (Priests) Yellow needles (from alcohol)

ωp Di-nitro styrene [199°] Formed as above, and also by the action of HNO_3 and H SO_4 on *p* nitro cinnamic acid at 0° (Friedlander a. Mahly, *A* 229, 221, *B* 16, 851) Yellow crystals, *sol* KOHAq Dilute H_2SO_4 decomposes it into *p* nitro benzoic aldehyde, hydroxylamine, and CO

ωm-Di-nitro-styrene [122°] Formed from *m* nitro cinnamic acid, HNO_3 , and H SO_4 at 0° (Friedlander a. Lazarus, *A* 229, 233) Yellowish plates (from water) Conc H_2SO_4 at 100° gives CO and *m* nitro benzaldoxim

o-NITRO STYRYL-ACROLEIN $\text{C}_6\text{H}_4\text{NO}_2$ *z* $\text{C}_6\text{H}_3(\text{NO}_2)_2\text{CH CH CO CH O}$ [153°] Formed from *o* nitro cinnamic aldehyde, aldehyde, and very dilute NaOH (Einhorn, *B* 17, 2026) Pale yellow crystals (from dilute alcohol)

o-NITRO-STYRYL ACRYLIC ACID
 $\text{C}_6\text{H}_4(\text{NO}_2)\text{CH CH CH CO}_2\text{H}$ [218°] Formed from *o* nitro cinnamic aldehyde, Ac_2O , and sodium acetate, and obtained also by oxidising $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{CH}_2\text{CO CH}_3$ with aqueous NaOCl (Diehl a. Einhorn, *B* 18, 2331) Slender felted needles, *v* sol hot alcohol

o-NITRO STYRYL GLYOXYLIC ACID
 $\text{C}_6\text{H}_4(\text{NO}_2)\text{CH CH CO CO}_2\text{H}$ [136°] Formed from *o* nitro benzoic aldehyde, pyruvic acid, and HClAq (Baeyer a. Drewson, *B* 15, 2862) Crystals Converted by alkalis into indigo

DI-m-NITRO-DI STYRYL KETONE [232°] Sparingly soluble flakes (Von Miller a. Rohde, *B* 22, 1839)

o NITRO STYRYL METHYL KETONE
 $\text{C}_6\text{H}_4(\text{NO}_2)\text{CH CH CO CH}_3$ [60°] Formed, together with the *p* isomeride [110°], by nitration of styryl methyl ketone (Baeyer a. Drewson, *B* 15, 2858, 16, 1958) Formed also by boiling $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{CH}_2\text{CO CH}_3$ with Ac_2O , or $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{CH}_2\text{CH CO CH}_3\cdot\text{CO}_2\text{CH}_3$ with dilute

H_2SO_4 (Fischer & Kuzel, *B* 16, 35) Long needles, sol alcohol

***m* NITRO STYRYL-QUINOLINE** $\text{C}_{11}\text{H}_{12}\text{N}_2\text{O}_2$
 $\text{C}_6\text{H}_5\text{C}_6\text{H}_4\text{NCHCHC}_6\text{H}_4\text{NO}_2$ [132°]
 Formed by heating methyl quinoline (lepidine) with *m* nitro benzoic aldehyde and KHSO_4 at 160° (Heymann & Königs, *B* 21, 1429) Needles (from alcohol)

An isomeride [139°] is formed from (*Py* 3)-methyl quinoline and *m* nitro benzoic aldehyde (Wallach, *B* 16, 2009, Wartman, *B* 23, 3646). It gives the crystalline salts B'HCl — B'HN_2 — $\text{B'C}_6\text{H}_5(\text{NO}_2)_2\text{OEt}$ — B'H.PtCl_4 1½ aq

***p* Nitro styryl quinoline** [165°] Formed from (*Py* 3) methyl quinoline and *p* nitro-benzoic aldehyde (Bulach, *B* 20, 2047, 22, 285) Needles Yields a dibromide $\text{C}_{11}\text{H}_{12}\text{N}_2\text{O}_2\text{Br}_2$ [276°] which turns brown at 230°

NITRO DI-STYRYL DI-VINYL KETONE *v*
 NITRO PHENYL BUTYL PHENYL BUTYL KETONE

NITRO α SULPHO-BENZOIC ACID $\text{C}_6\text{H}_4\text{NSO}_3$
 $\text{C}_6\text{H}_4(\text{NO}_2)(\text{SO}_3\text{H})(\text{COH})$ [4 2 1] [110°]
 Formed by oxidising nitro toluene sulphonic acid (Hart, *Am* 1, 350, Hedrick, *Am* 9, 411, Kastle, *Am* 11, 177) White needles (from hot water) — KHA 1 aq long needles — KA — BaA

Chloride $\text{C}_6\text{H}_4(\text{NO}_2)(\text{SO}_2\text{Cl})(\text{COCl})$ [60°]
Amide $\text{C}_6\text{H}_4(\text{NO}_2)(\text{SO}_2\text{NH}_2)(\text{CO}_2\text{H})$ [172°]

Formed by oxidising *p* nitro toluene sulphonic amide with K_2FeO_4 or alkaline KMnO_4 (Nojes, *Am* 8, 171, 11, 161) Small granules (from hot water), melting at 177° when slowly heated, but at 172° when quickly heated Changes slowly when kept at 180° into the anhydride

$\text{C}_6\text{H}_4(\text{NO}_2) \left\langle \begin{smallmatrix} \text{SO} \\ \text{CO} \end{smallmatrix} \right\rangle \text{NH}$ [209°] which yields the salts $\text{KC}_6\text{H}_4\text{N}_2\text{SO}_3$, S 96 at 48.5° , $\text{Ba}(\text{C}_6\text{H}_4\text{N}_2\text{SO}_3)_2$ 3 aq, and $\text{AgC}_6\text{H}_4\text{N}_2\text{SO}_3$. The free amic acid yields the salts $\text{Ba}(\text{C}_6\text{H}_4\text{N}_2\text{SO}_3)_2$ aq, $\text{AgC}_6\text{H}_4\text{N}_2\text{SO}_3$ 1 aq, and $\text{Ag}_2\text{C}_6\text{H}_4\text{N}_2\text{SO}_3$ aq

Nitro *m* sulphobenzoic acid
 $\text{C}_6\text{H}_4(\text{NO}_2)(\text{SO}_3\text{H})(\text{COH})$ [τ 3 1] Formed by nitrating *m* nitrobenzoic acid (Lumprecht & Usler, *A* 106, 27) Crystalline — BaA 3 aq — BaA 1½ aq — BaH_2A 2 aq radiating prisms

Nitro *p* sulphobenzoic acid
 $\text{C}_6\text{H}_4(\text{NO}_2)(\text{SO}_3\text{H})(\text{CO}_2\text{H})$ [2 4 1] Formed by oxidising (2, 1, 1) nitro toluene sulphonic acid (Hart *Am* 1, 352) — KHA — BaA 2 aq granules

Nitro *p* sulphobenzoic acid
 $\text{C}_6\text{H}_4(\text{NO}_2)(\text{SO}_3\text{H})(\text{CO}_2\text{H})$ [3 4 1] [181°] Formed by nitrating *p* sulphobenzoic acid (Hart, *Am* 1, 342, Remsen, *A* 178, 288) Prisms — KHA 1½ aq — BaA 4 aq — BaH_2A 5 aq — CaA 5 aq — CuA 5 aq bluish green crystals

NITRO SULPHO TOLUIC ACID $\text{C}_6\text{H}_4\text{NSO}_3$
 $\text{C}_6\text{H}_4\text{Me}(\text{NO}_2)(\text{SO}_3\text{H})(\text{CO}_2\text{H})$ [1 6 4 3] Formed by oxidation of nitro *m* xylene sulphonic acid $\text{C}_6\text{H}_4\text{Me}(\text{NO}_2)(\text{SO}_3\text{H})$ [1 3 6 4] with KMnO_4 (Lumprecht, *B* 18, 2191) — AK 1 aq fine white silky needles

NITRO SULPHYDRO CINNAMIC ACID
 $\text{C}_6\text{H}_4(\text{NO}_2)\text{CHC}(\text{SH})\text{CO}_2\text{H}$ [240°] Formed from $\text{C}_6\text{H}_4(\text{NO}_2)\text{CHC}(\text{SH})\text{CO}_2\text{SH}$, nitric acid and H_2SO_4 (Bondzynski, *M* 8, 355) Crystals (from alcohol) — BaA long needles

NITRO α -SULPHYDRO CINNAMOYL SULPHOCYANIDE $\text{C}_6\text{H}_4(\text{NO}_2)\text{CHC}(\text{SH})\text{COSCN}$
 The α -compound [189°] is formed, together with the *p*-derivative [251°] by nitrating sulphydro cinnamoyl sulphocyanide These bodies may

also be got from thioglycoyl sulphocyanide and the corresponding nitro- benzoic aldehyde (Bondzynski, *M* 8, 355) Both are crystalline

NITRO-SULPHYDRO METHYL IMIDAZOLE
Methyl derivative $\text{C}_6\text{H}_4\text{Me}(\text{NO}_2)\text{SMe}$ [85°]

Formed from $\text{NM} \left\langle \begin{smallmatrix} \text{CH} \\ \text{C(SMe)N} \end{smallmatrix} \right\rangle \text{CH}$ and dilute

HNO_3 (Wohl & Marekwald, *B* 22, 1358) Yellow needles, sl sol cold water — B'H.PtCl_4 [197°]

NITRO SULPHYDRO PHENYL IMIDAZOLE
Methyl derivative $\text{C}_6\text{H}_5\text{Ph}(\text{NO}_2)\text{SMe}$

[116°] Formed from $\text{NPh} \left\langle \begin{smallmatrix} \text{CH} \\ \text{C(SMe)N} \end{smallmatrix} \right\rangle \text{CH}$ and dilute HNO_3 (Wohl & Marekwald, *B* 22, 1357)

NITROSYL BROMIDE, CHLORIDE, and SULPHATE *v* Nitrogen oxybromides and oxychlorides, *p* 569, and Nitro sulphamic acid, vol iv, *p* 601

NITRO TEREPHTHALIC ACID $\text{C}_6\text{H}_4\text{NO}_2$
 $\text{C}_6\text{H}_4(\text{NO}_2)(\text{CO}_2\text{H})_2$ [2 4 1] [270°] Formed by nitrating terephthalic acid (De la Rue & Muller, *A* 121, 90, Burkhardt, *B* 10, 145) Crystalline — A , A' powder (Skraup, *M* 7, 148)

Methyl ether MeA [70°] Prisms (Ahrens, *B* 19, 1636)

Amide $\text{C}_6\text{H}_4(\text{NO}_2)(\text{CONH}_2)_2$ Prisms

NITRO TEREPHTHALIC ALDEHYDE
 $\text{C}_6\text{H}_4(\text{NO}_2)(\text{CHO})_2$ [86°] Formed from terephthalic aldehyde, KNO_3 , and H_2SO_4 at 110° (Löw, *A* 231, 364) Large needles (by sublimation) With acetone and NaOH at 60° it gives the indigo reaction

NITRO THIENOL $\text{C}_6\text{H}_3\text{S}(\text{NO}_2)(\text{OH})$ [116°]
 Formed by treating a dilute H_2SO_4 solution of amido thiophene with nitrous acid and boiling for some time Colourless needles Sol water and ether Dissolves in alkalis with a yellow colour (Stadler, *B* 18, 2319)

NITRO-(α)-THIENYL-GLYOXYLIC ACID
 $\text{C}_6\text{H}_4(\text{NO}_2)\text{S CO CO}_2\text{H}$ [92°] Formed by oxidation of nitro thienyl methyl ketone [123°] (Peter, *B* 18, 541) Crystals

NITRO (a) THIENYL METHYL KETONE
 $\text{C}_6\text{H}_4(\text{NO}_2)\text{S CO CH}_3$ Two isomerides [86°] and [123°] are formed by nitrating (a) thienyl methyl ketone with fuming HNO_3 at -8° (Peter, *B* 17, 2646, 18, 541) They both yield the same di nitro thienyl methyl ketone [167°]

***m* NITRO THIOBENZOIC ALDEHYDE**
 $(\text{C}_6\text{H}_4(\text{NO}_2)\text{CHS})_2$ A grey powder formed by passing H_2S into an alcoholic solution of *m* nitro benzoic aldehyde (Bertagnini, *A* 79, 269) Insol. ordinary solvents

NITRO THIONYL ANILINE
 $\text{O}_2\text{H}_4(\text{NO})\text{N}(\text{SO})$ Formed from nitro-aniline and thionyl chloride (Michaelis & Humme, *B* 24 755) The *m* compound melts at 63.5° , the *p* isomeride at 70° Decomposed by hot water

NITRO THIOPHENE $\text{C}_6\text{H}_4(\text{NO}_2)\text{S}$ [44°] (225° cor) Prepared by passing air charged with thiophene vapour through fuming HNO_3 (Meyer & Stadler, *B* 17, 2648, 18, 533) Pale-yellow monoclinic prisms

Di nitro thiophene $\text{C}_6\text{H}_2(\text{NO}_2)_2\text{S}$ [52°] (290°) Formed, together with the isomeride [78°], by further nitration of nitro thiophene (Meyer & Stadler, *B* 17, 2648, 2779, 18, 530, 1778) Yellow monoclinic plates, *m* sol water Converted by repeated steam distillation into the isomeride [78°] A drop of KOH aq added to the alcoholic solution gives a splendid red colour, destroyed by excess of KOH . Forms the

double compounds $C_6H_4(NO_2)_2SC_6H_5$ [50°] and $C_6H_4(NO_2)_2SC_6H_4$ [162°]

Di-nitro-thiophene [78°] Formed as above
Yellow needles, volatile with steam

NITRO THIOPHENE SULPHONIC ACID
 $C_6H_4(NO_2)(SO_3H)_2$ Formed from nitro thiophene and fuming H_2SO_4 (Stadler, B 18, 534)
White hygroscopic crystals—AgA'

Chloride Oil

Amide $C_6H_4(NO_2)_2S(SO_2NH_2)$ [178°]

NITRO (a) THIOPHENIC ACID $C_6H_4NSO_3$, α $C_6H_4(NO_2)(CO_2H)$ [146°] Formed from (a) thiophenic acid and conc HNO_3 at 50° (Römer, B 20, 116) Needles, slowly changed by water into a variety melting at about 125° A little NaOH colours its alcoholic solution magenta CuA' —AgA' needles

Ethyl ether EtA' [71°]

NITRO THYMOL $C_6H_4Me(C_6H_4)(NO_2)(OH)$ [140°] Formed by oxidation of nitroso thymol (R Schiff, B 8, 1501, Liebermann, B 10, 612)

Di nitro-thymol [55°] Formed by nitration of thymol or its sulphonic acid (Lallemand, A Ch [3] 49, 152) Crystalline—KA'—BaA', 3aq—CaA', 6aq—AgA' lemon yellow pp

Ethyl ether EtA [53°] Tables (from alcohol) (Ladenburg & Engelbrecht, B 10, 1218)

Tri-nitro-thymol [111°] Got by nitrating di nitro thymol Yields a methyl ether [92°] (Atochley, Z 1871, 415)

NITRO-TOLUAMIDOXIM $C_6H_4N_2O_2$, α $C_6H_4Me(NO_2)C(NO_2)(NH_2)$ [4 2 1] [161°]

Formed by heating nitro toluic nitrile with alcoholic hydroxylamine (Weise, B 22, 2430)
Needles—B'HCl white crystalline mass

o-NITRO-TOLUENE $C_6H_4Me(NO_2)$ [1 2] Mol w 137 (218°) SG 1.168 (Streng, B 24, 1987) SV 1423 (Lossen, A 254, 73) Formed, together with the *p* isomeride, by nitration of toluene (Glénard & Boudault, C R 19, 505, Hofmann & Muspratt, A 53, 221, Kekulé, Z [2] 3, 225, Rosenstiehl, A Ch [4] 27, 433) Formed also by elimination of NH_3 from (2, 1, 4) nitro *p* toluidine (Beilstein & Kuhlberg, A 155, 1, 158, 348) Liquid, solidifies at -10.5° After administration to dogs it appears in the urine as *o*-nitro benzoic acid and crystalline $C_6H_4N_2O_6 \cdot 2\frac{1}{2}aq$ (Jaffé, Russ Zeit Pharm 1878, 513, Noyes, Am 5, 99) Long boiling with alkaline K_2FeO_4 yields *o*-nitro benzoic acid Zinc dust and alcoholic NaOH reduce it to *o*-azoxy toluene [59°] (Gutermann, B 20, 2016) Its product of sulphonation differs from that of *p*-nitro toluene in giving no red colour when boiled with alkalis (Reverdin & Harpe, BI [2] 50, 44)

m-Nitro-toluene $C_6H_4Me(NO_2)$ [1 3] [16°] (230°) SG 2.1168 SV 1440 Occurs in small quantity in crude nitro toluene (Monnet, Reverdin, A Nöling, B 12, 445, 18, 1337) Prepared from *o*- or *p*-toluidine by successive acetylation, nitration, saponification, diazotisation, and boiling with alcohol (Beilstein & Kuhlberg, A 155, 24, 158, 346, Buchka, B 22, 829) Yields *m*-nitro-benzoic acid on oxidation $SnCl_4$ in $HClAq$ reduces it to pure *m* toluidine, while zinc dust and $HClAq$ yield chloro *m*-toluidine also Boiling with KOH in MeOH forms $(C_6H_4Me)_2N_2O$ [39°]

p-Nitro-toluene $C_6H_4Me(NO_2)$ [1 4] [54°] (234°) (Streng, S.V.S. 121-7 (Schiff, A 223, 261).

Formed, together with the *o*-isomeride, by nitration of toluene Trimetric crystals Much less volatile with steam than *o*-nitro-toluene Oxidised by boiling alkaline K_2FeO_4 to *p* nitro-benzoic acid (Noyes, B 16, 52) Reduced by iron and $HClAq$ to pure *p*-toluidine, while zinc and $HClAq$ yield chlorinated toluidine Zinc dust and NaOH reduce it to $(C_6H_4Me)_2N_2$ [144°], two azoxy compounds $(C_6H_4Me)_2N_2O$ [75°] and [70°] and $(C_6H_4Me)_2N_2H_2$ [126°] (Janovsky & Reimann, B 22, 40) CrO_3Cl_2 followed by water yields nitro toluquinone (Etdard, C R 87, 989) NaOMe yields a brownish red product reduced by $SnCl_4$ to $C_6H_4(C_6H_4NH_2)_2$ (Bender & Schultz, B 19, 3237)

ω-Nitro-toluene $C_6H_4CH_3(NO_2)$ *Phenyl-nitro-methane* Formed by the action of acids upon the di sodio-derivative of nitro benzyldiene

phthalide $C_6H_4 \begin{matrix} \diagup C(ONa) \\ \diagdown C(Na)NO_2 \end{matrix} \begin{matrix} \diagup \\ \diagdown \end{matrix} C_6H_4$ (Ga-

briel & Koppe, B 18, 1254, 19, 1145) Liquid, boiling with decomposition at 226° Reduced by tin and HCl to benzylamine By heating with fuming HCl at 150° it yields benzoic acid and hydroxylamine Gives a white crystalline sodium derivative

Di-nitro-toluene $C_6H_4Me(NO_2)_2$ [1 2 4] Mol w 182 [70°] (300°) SVS 1375 (Schiff) S (CS₂) 219 at 17° Obtained by nitration of toluene (Deville, A 44, 307, Cahours, C R 24, 555, Nöling & Witt, B 18, 1336) and *o* or *p* nitro toluene Obtained also by eliminating NH_3 from di-nitro toluidine [195°] (Staedel, A 239, 220) Monoclinic needles, al sol cold alcohol Yields tolylene *m* diamine on reduction (Baeyer, B 7, 1638) By partial reduction with ammonium sulphide the *p*-nitro-group is reduced, giving $C_6H_4Me(NO_2)(NH_2)$ [1 2 4] of melting point [78°] On the other hand, by alcoholic $SnCl_4$ (3 mols) the *o* nitro-group is first reduced, giving $C_6H_4Me(NH_2)(NO_2)$ [1 2 4] of melting point [107°] (Anschütz & Heusler, B 19, 2161)

s-Di-nitro-toluene $C_6H_4Me(NO_2)_2$ [1 3 5] [93°] Formed by eliminating NH_3 from di nitro-*o* toluidine [208°] or di nitro *p* toluidine [166°] (Staedel, B 14, 901, A 217, 189, Neville & Winther, C J 41, 416, Hubner, A 222, 75) Yellow needles (from HOAc mixed with benzene), v sol benzene and alcohol Volatile with steam Yields di nitro benzoic acid [204°] on oxidation

Di-nitro-toluene $C_6H_4Me(NO_2)_2$ [1 2 3] [63°] Formed by heating (2, 3, 1, 4) di nitro toluic acid with dilute $HClAq$ (Rozanski, B 22, 2681)
Hair-like needles (from dilute HOAc)

Di-nitro-toluene $C_6H_4Me(NO_2)_2$ [1 2 5] [48°] (N & L), [52°5] (R) Formed by heating (1, 4, 3, 6)-di nitro toluic acid with dilute $HClAq$ at 250° (Rozanski, B 22, 2879) Formed also from toluquinone dioxim and HNO_3 (Nietzki & Gutermann, B 21, 428) Yellow crystals (from ligroin) Appears also to occur among the products of the nitration of toluene (Lumprecht, B 18, 1402)

Di-nitro-toluene $C_6H_4Me(NO_2)_2$ [1 2 6] [61°] Formed by eliminating NH_3 from di nitro *p* toluidine [168°] (Staedel, A 217, 206, 225, 884) Formed also by nitration of toluene Needles (from alcohol).

Di-nitro toluene $C_6H_4Me(NO_2)_2$ [1 3 4]? [60°]
S (CS₂) 2 188 at 17° A product of nitration of *m*-nitro toluene (Beilstein a Kuhlberg) Long needles (from CS₂)

(a) **Tri-nitro-toluene** $C_6H_3Me(NO_2)_3$ [1 2 4 6]
 Mol w 227 [82°] **S** (CS₂) 386 at 17° Formed by nitration of toluene (Wilbrand, A 128, 178) Flat needles, v sol hot alcohol Forms with aniline a compound $C_6H_4Me(NO_2)_2 \cdot PhNH_2$ [84°] (Hepp, A 215, 365)

(β) **Tri nitro toluene** $C_6H_3Me(NO_2)_3$ [112°]
 Formed, together with the (γ) isomeride, by nitration of *m* nitro toluene (Hepp) Triclinic prisms (from acetone)

(γ) **Tri nitro toluene** $C_6H_3Me(NO_2)_3$ [104°]
 Formed as above (Hepp) Trimetric plates, $a b c = 937.1 \ 672 \ V$ sol cold alcohol

NITRO-TOLUENE ω PHOSPHONIC ACID

$C_6H_4(NO_2)_2CH_2PO(OH)_2$ Formed by dissolving toluene ω phosphonic acid in fuming HNO₃ (Lutthauer, B 22, 2144) Yellow needles, decomposing at 217° without melting The acid $(C_6H_4(NO_2)_2CH_2)PO(OH)_2$ melts at 212°

NITRO-TOLUENE SULPHONIC ACID

$C_6H_4Me(NO_2)_2SO_3H$ Formed by reduction of $C_6H_4Me(NO_2)_2SO_3Cl$ by sodium amalgam (Otto a Gruber, A 145, 24) Crystalline —NaA' $\frac{1}{2}$ aq

Di nitro toluene sulphonic acid

$C_6H_3(CH_3)(NO_2)_2SO_3H$ Formed by reduction of di nitro toluene sulphonic chloride with zinc dust (Perl, B 18, 71) V sol water and alcohol

Salts —A'K.—A'Ba.—A'Pb 3aq minute prisms

o NITRO-TOLUENE SULPHONIC ACID

$C_6H_4Me(NO_2)(SO_3H)$ [125] Formed from $C_6H_4Me(NO_2)(NH_2)(SO_3H)$ [1 2 4 5] by heating its diazo derivative with alcohol at 100° (Foth, A 230, 305)

Chloride $C_6H_4Me(NO_2)(SO_3Cl)$ [50°].

Amide [133 5°] Long needles

o Nitro toluene sulphonic acid

$C_6H_4Me(NO_2)(SO_3H)$ [1 2 4] Formed by sulphonating *o* nitro toluene or by nitrating toluene *p* sulphonic acid (Beilstein a Kuhlberg, A 155, 18, Engelhardt a Bek, Z [2] 5, 209, Kornatzki, A 221, 180)

Salts —BaA', 2aq **S** (of BaA') 58 at 19 5° —PbA', 2aq **S** (of PbA') 77 at 18°

Chloride Oil (Otto a Gruber, A 145, 23)

Amide [128°] (O a G), [139°] (K), [144°] (Neale, A 203, 73) Yields a benzoyl derivative $C_6H_4Me(NO_2)_2SO_2NHBz$ [180°] whence the salts $C_6H_4Me(NO_2)_2SO_2NKBz$, $Ca(C_6H_4N_2SO_3)_2$ 2aq and $Ba(C_6H_4N_2SO_3)_2$ may be prepared, and whence PCl₅ produces $C_6H_4Me(NO_2)_2SO_2NCClPh$ [125°] from which ammonium carbonate forms $C_6H_4N_2SO_3$ [128°] (Anna Wolkoff, Z 1871, 422, B 5, 141)

p Toluide [181°] Crystals

o-Nitro-toluene sulphonic acid

$C_6H_4Me(NO_2)(SO_3H)$ [1 2 3, 5 or 6] Formed from (2, 1, 4) nitro toluidine by sulphonating and eliminating NH₂ (Foth) Its salts are v e sol water

Chloride [50°] Thick prisms

Amide [135°] Needles

o-Nitro toluene sulphonic acid

$C_6H_4Me(NO_2)(SO_3H)$ [1 2 or 6 8] Formed from *p*-toluidine sulphonic acid by nitration and elimination of NH₂ (Peschmann, A 178, 314, Foth,

A 280, 308) —BaA', 2aq plates, al sol cold water

Chloride $C_6H_4Me(NO_2)SO_3Cl$ [58 5°].

Amide $C_6H_4Me(NO_2)SO_3NH_2$ [163 5°]

m Nitro-toluene sulphonic acid Formed by sulphonating *m* nitro toluene (B a K) —BaA', 2aq **S** (of BaA') 1 145 at 17 5° —PbA', 2 $\frac{1}{2}$ aq **S** (of PbA') 3 62 at 18°

p-Nitro toluene sulphonic acid
 $C_6H_4Me(NO_2)(SO_3H)$ [1 4 2] [134°] **S** 210 at 23°, 250 at 28° Formed by sulphonating *p* nitro toluene (Javorsky, Z 1865, 222, B a K, Jenssen, A 172, 230, Hart a Remsen, B 10, 1046, Am 1, 349, Schwanert, A 186, 351, Noyes, Am 8, 168, Hauser, Bl [3] 3, 797) Trimetric crystals (containing 2 $\frac{1}{2}$ aq) NaOH aq yields an azoxy compound reduced by zinc dust to di amido stilbene disulphonic acid

Salts —NH₄' long prisms, not decomposed by H₂SO₄ at 100° —NaA' 2aq —KA' **S** 2 62 at 16° —BaA', 3aq **S** 3 34 at 18 5° —CaA', 4aq —CaA', aq —CaA', 6aq —PbA', 3aq **S** (of PbA') 15 3 at 19° —PbA', 2aq

Chloride [44°] Tablets (from ether)

Amide [187°] Needles

Nitro-toluene exo-sulphonic acid

[1 4] $C_6H_4(NO_2)CH_2SO_3H$ Formed by nitration of $C_6H_5CH_2SO_3H$ (Mohr, A 221, 217)

Chloride Oil When gently distilled it gives SO₃ and $C_6H_4(NO_2)CH_2Cl$ [1 4] [71 5°]

Amide [204°] Prisms Accompanied by an isomeride [140°–160°]

Nitro-toluene disulphonic acid

$C_6H_4Me(NO_2)(SO_3H)_2$ Formed by boiling *p* bromo toluene disulphonic acid with fuming HNO₃ (Kornatzki, A 221, 198) —K₂A' The same, or an isomeric acid, is obtained by displacing Br by H and nitrating the product, it gives the salts K₂A' and BaA' 3aq

Di-nitro-toluene exo-sulphonic acid

$C_6H_3(NO_2)_2CH_2SO_3H$ Formed from the acid $C_6H_4(NO_2)CH_2SO_3H$ and a mixture of H₂SO₄ (2 pts) and fuming HNO₃ (1 pt) (Mohr, A 221, 225) —KA' —BaA', 4aq —PbA', 4aq

Di-nitro-toluene sulphonic acid

$C_6H_4Me(NO_2)_2SO_3H$ [1 2 6 4] [165°] Formed by nitrating toluene *p* sulphonic acid (Schwanert, B 10, 28, A 186, 342) Trimetric prisms (containing 2aq) —KA' **S** 52 at 14 5° **S** (94 p o alcohol) 09 at 22° —NH₄' **S** 4 2 at 18° —BaA', 4aq **S** 3 at 17° —CaA' 2aq —PbA', 2aq —PbA' 3aq **S** (of PbA') 2 64 at 14 5° (B a K, Z [2] 6, 796)

Chloride [125°] Crystals (from ether)

Amide [203°] Laminæ

(a) NITRO-*o*-TOLUIC ACID $C_6H_4NO_2$ etc

$C_6H_4Me(NO_2)(CO_2H)$ [2 5 1] [179°] Formed, together with the (β) acid, by nitration of *o* toluic acid, and, together with the (γ) acid by oxidation of nitro-*o*-xylene with dilute HNO₃ (Jacob sen, B 16, 1957, 17, 162) Small crystals, v. al sol water Yields amido toluic acid [195°] and oxy toluic acid [179°] —KA' aq —CaA', 2aq —BaA', 2aq slender needles

(β) Nitro-*o*-toluic acid

$C_6H_4Me(NO_2)CO_2H$ [2 5 1] [145°] Formed as above. Long needles Yields oxy toluic acid [183°] —BaA', 2aq —CaA', 2aq

(γ)-Nitro-*o*-toluic acid

$C_6H_4Me(NO_2)CO_2H$ [2 4 1]. [152°]. Formed as

above Long needles Yields oxy toluic acid [179°] —BaA', 5aq easily soluble prisms

(a) Nitro-*m*-toluic acid

$C_6H_4Me(NO_2)CO_2H$ [3 6 1] [219°] Formed, together with a small quantity of its (3, 2, 1)-isomeride [182°], by nitration of *m* toluic acid (Jacobsen, *B* 14, 2353, Ahrens, *Z* 1869, 183, Krausler, *Z* 1866, 370, Panatovic, *J pr* [2] 33, 64) Monoclinic prisms —BaA', 2aq —CaA', 4aq m sol water

(β) Nitro-*m*-toluic acid $C_6H_4Me(NO_2)CO_2H$ [3 2 1] [182°] Formed as above (Jacobsen)

s Nitro-*m*-toluic acid

$C_6H_4Me(NO_2)CO_2H$ [3 5 1] [167°] Formed by oxidation of *s*-nitro *m*-xylene with $KMnO_4$ and acetic acid (Thöl, *B* 18, 360) Silky needles, v sol water —BaA', 4aq *S* 308 at 15° Needles

Nitro *m* toluic acid

$C_6H_4Me(NO_2)CO_2H$ [3 4 1] [214°] Formed by oxidation of crude nitro-xylene (Beilstein a Kreusler, *A* 144, 168, Remsen a Kuhara, *Am* 3, 426) and of nitro isocymene (Kelbe, *A* 221, 161) —NH₄A' 2aq —MgA' 7aq —CaA', 2aq —BaA', 4aq very soluble needles

Ethyl ether EtA' [55°] (B a K)

Amide [151°] (B a K)

Nitrile $C_6H_4Me(NO_2)CN$ [80°].

Nitro-*p*-toluic acid

$C_6H_4Me(NO_2)(CO_2H)$ [4 3 1] [190°] Formed by boiling cymene or *p*-toluic acid with fuming HNO_3 (Noad, *A* 63, 297, Fittica, *A* 172, 309, Fittig, *A* 168, 251, Ahrens, *Z* [2] 5, 102) Monoclinic prisms, sl sol cold water —BaA', 4aq —CaA', 3aq —CuA', 4aq —Cu₂A', (OH) —Cu₂A', (OH) aq (Noyes, *Am* 10, 472) —Pb(OH)A' —AgA' The ethers MeA' and EtA' are crystalline

Nitro-*p*-toluic acid

$C_6H_4Me(NO_2)(CO_2H)$ [4 2 1] [161°] Obtained by heating its nitrile with HCl aq at 195° Long needles —BaA', 4aq —BaA', 5aq (Noyes, *Am* 10, 472) —CaA', 2aq —CuA', aq —AgA' needles

Amide [153°] Slender needles

Nitrile $C_6H_4Me(NO_2)CN$ [99°] (G, W),

[101°] (N) Formed from (3, 1, 4) nitro-*p*-toluidine by Sandmeyer's reaction (Glock, *B* 21, 2662, Weiss, *B* 22, 2429, Von Niementowski, *J pr* [2] 40, 4, 21, 1535, 1992) Needles (from alcohol) Yields on reduction with tin and HCl the compounds (C_6H_4MeCy)₂N₂O [182°] and $C_6H_4Me(NH_2)CN$ [94°] Does not form an imido-ether when treated with alcoholic HCl (Pinner, *B* 23, 2919)

A nitro toluic acid [218°] was obtained by Ahrens together with the acids [219°] and [190°] by the action of HNO_3 on crude xylene

Di-nitro-*o* toluic acid

$C_6H_4Me(NO_2)_2CO_2H$ [2 5 3 1] [206°] Formed by nitrating *o* toluic acid (Jacobsen a Wierss, *B* 16, 1957, Racine, *A* 239, 77) Needles Yields di nitro-phthalic acid [226°] on oxidation —BaA', 2aq v e sol water

Methyl ether MeA' [74°] Needles

Di-nitro-*p* toluic acid

$C_6H_4Me(NO_2)_2CO_2H$ [4 3 5 1] [158°] Formed by nitrating *p* toluic acid (Brückner, *B* 8, 1678) Plates (from hot water) —KA' 2aq —CaA', 2aq —BaA', 2aq —AgA'

Di-nitro *p* toluic acid

$C_6H_4Me(NO_2)_2CO_2H$ [4 2 5 1] [188°] Formed, together with the isomeride [249°], by nitrating

(2, 4, 1)-nitro toluic acid (Bozansky, *B* 22, 2676) Radiating needles Yields (1, 4, 3) di-nitro toluene on heating with dilute HCl at 250° —NaA' 3aq —BaA', 2aq —CaA', 2aq

Di nitro-*p*-toluic acid

$C_6H_4Me(NO_2)_2CO_2H$ [4 2 3 1] [249°] Formed as above (R) Trimeric prisms —CaA', aq —BaA', 4aq long needles

NITRO-*m*-TOLUIC ALDEHYDE $C_6H_4Me(NO_2)CHO$ An oil, formed as well as di nitro *m* toluic aldehyde [112°], by nitrating *m* toluic aldehyde (Bornemann, *B* 17, 1473)

NITRO-*o*-TOLUIDINE

$C_6H_4Me(NH_2)(NO_2)$ [1 2 8] [97°] Obtained from acetyl-*o*-toluidine by nitration and saponification (Lellmann a Wurthner, *A* 228, 240), and also by heating its sulphonic acid with dilute H_2SO_4 at 180° (Nietzki a Polln, *B* 28, 138) Prisms (from dilute alcohol)

Acetyl derivative [158°] Plates

Nitro-*o*-toluidine $C_6H_4Me(NH_2)(NO_2)$ [1 2 4] [107°] Obtained by nitrating *o* toluidine (1 pt) dissolved in H_2SO_4 (10 pts) (Nölting a Collin, *B* 17, 268) and by reduction of (4, 2, 1) di nitro toluene [70 5°] (Graeff, *A* 229, 343, Lumprecht, *B* 18, 1400, Anschütz, *B* 19, 2161) Orange monoclinic prisms Sweet taste —B', H_2SO_4 , plates, decomposed by water

Acetyl derivative [151°] Needles

Nitro-*o* toluidine $C_6H_4Me(NH_2)(NO_2)$ [1 2 5] [128°] Obtained from its acetyl derivative which is got by nitrating acetyl-*o* toluidine (Beilstein a Kuhlberg, *A* 158, 345) Small lemon yellow needles (from water)

Acetyl derivative [197°] Needles

Nitro *o* toluidine $C_6H_4Me(NH_2)(NO_2)$ [1 2 6] [92°] Formed by reduction of (6, 2, 1) di nitro toluene (Cunrath, *A* 172, 223, Ullmann, *B* 17, 1957) Formed also, together with the (1, 2, 4) isomeride, by nitrating *o* toluidine in presence of a large excess of H_2SO_4 (Green a Lawson, *priv com*) Bright yellow slender needles —B'HCl

Acetyl derivative [158°] Needles

Benzoyl derivative [167°]

Nitro *m* toluidine $C_6H_4Me(NH_2)(NO_2)$ [1 3 6] [184°] Formed from its acetyl derivative, which is got by nitrating acetyl *m* toluidine (Beilstein a Kuhlberg, *A* 158, 348) Obtained also by heating the ethyl ether [54°] of nitro cresol [129°] with NH_3 aq at 150° (Staedel, *A* 209, 214) Needles, v sol alcohol Yields tolylene *p* diamine [64°] on reduction (Fileti a Crosa, *G* 18, 298)

Acetyl derivative [102°] Cubes

Nitro *m*-toluidine $C_6H_4Me(NH_2)(NO_2)$ [1 3 4] [109°] Formed by heating the ethyl ether [51°] of nitro-cresol [56°] with NH_3 aq for 8 hours at 150° (Staedel, *A* 259, 225) Golden plates, m sol alcohol

s Nitro *m* toluidine

$C_6H_4Me(NH_2)(NO_2)$ [1 3 5] [98°] Formed from *s* di nitro toluene (Becker, *B* 15, 1138, Neville a Winther, *C J* 41, 416, Staedel, *A* 217, 199) Needles —B'HCl [56°] Prisms

Benzoyl derivative [177°]

Nitro *m* toluidine $C_6H_4Me(NH_2)(NO_2)$ [1 3 2] [58°] Formed by reducing (2, 3, 1) di nitro-toluene (Lumprecht, *B* 18, 1401) —B'HCl —B', H_2SO_4 , tables, v sol hot water

Acetyl derivative [186°] Needles

Nitro-*p*-toluidine $C_6H_4Me(NH_2)(NO_2)$ [1 4 3].

[116°] Formed from acetyl-*p* toluidine by nitration and hydrolysis (Beilstein, A Kuhlberg, A 155, 23, Lorenz, A 172, 177, Hubner, A 208, 813, Cosack, B 13, 1088, Ehrlich, B 15, 2009, Gattermann, B 18, 1483, Lellmann, A 221, 7, Nöling, B 17, 263) Formed also by heating nitro-*p* cresol with NH_4Aq at 180° (Barr, B 21, 1543) Red monoclinic prisms, $a b c = 1.358 : 1.755$, $\beta = 54^\circ 51'$ (Panebianco, G 9, 358) — B'HCl — B'HNO_3 crystals, decomposed by water

Acetyl derivative [95°] Needles Reduced by means of ammonium sulphide at 0° to $\text{C}_6\text{H}_4\text{Me}(\text{NHAq})_2 \cdot \text{N}_2\text{O}$ [196°] and the compound $\text{C}_6\text{H}_4\text{Me} \begin{smallmatrix} \text{N} \\ \text{NH CMe} \end{smallmatrix} \text{O}$ [234°], whence B'HCl , B'H PtCl_4 , and B'HNO_3 (Bankievitch, B 22, 1396)

Trichloroacetyl derivative [55°].

Valeryl derivative [88°] Yields on reduction $\text{C}_6\text{H}_4\text{Me} \begin{smallmatrix} \text{N} \\ \text{NH} \end{smallmatrix} \text{C}_6\text{H}_5$ [145°]

Benzoyl derivative [143°] Needles

Nitro *p* toluidine $\text{C}_6\text{H}_4\text{Me}(\text{NH}_2)(\text{NO}_2)$ [1 4 2] [77 5°] Formed by reduction of (4, 2, 1) di-nitro toluene (B a K) and, together with a small quantity of the preceding isomeride, by the action of nitric acid on a solution of *p* toluidine in H_2SO_4 (Hubner, B 10, 1716, Nolting a Collin, B 17, 263, Foth, A 230, 299) Monoclinic needles — B'HCl [220°] — B'HNO_3 — B'H SO_4 2aq stellate needles — B'AgNO_3 [132°] Greenish yellow crystals (Mixer, Am 1, 241)

Acetyl derivative [144 5°] Needles (Wallach, A 234, 353)

Benzoyl derivative [172°] Pale yellow prisms (Bell, C N 30, 202)

Di-nitro-*o* toluidine

$\text{C}_6\text{H}_4\text{Me}(\text{NH}_2)(\text{NO}_2)_2$ [1 2 3 5] [208°] Formed from di nitro *o* cresol and its ethers by the action of NH_3 (Staedel, B 14, 900, A 217, 185, 203, Van Romburgh, R T C 3, 398, Barr, B 21, 1543) Yellow prisms (from xylene)

Di-nitro-*m* toluidine

$\text{C}_6\text{H}_4\text{Me}(\text{NH}_2)(\text{NO}_2)_2$ [1 3 4 6] [193°] Formed from the ethyl ether of di nitro *m* cresol and NH_4Aq at 100° (Staedel, A 259, 220), and from $\text{C}_6\text{H}_4\text{MeBr}(\text{NO}_2)_2$ and NH_3 (Jackson, B 22, 1232) Formed also by reducing (γ) tri nitro toluene (Hepp, A 215, 368) Yellow crystals, yielding di nitro toluene [71°] on elimination of NH_3 .

Di-nitro-*p* - toluidine $\text{C}_6\text{H}_4\text{Me}(\text{NH}_2)(\text{NO}_2)_2$ [1 4 3 5] [168°] S (CS₂) 32 at 18° Formed by nitration of acetyl or benzoyl *p* toluidine and hydrolysis of the product (Beilstein, B 13, 242, Hubner, A 222, 73) Formed also by the action of ammonia on the ethers of di nitro *p* cresol (Staedel, A 217, 183) Needles, sl sol alcohol Yields chrysamic acid on oxidation

Acetyl derivative [195°] Needles Yields on reduction an azoxy-compound [236°], an azo-compound [244°], and $\text{C}_6\text{H}_4\text{N}_2\text{O}_3$ [256°] The compounds $\text{C}_6\text{H}_4\text{Me}(\text{NO}_2) \begin{smallmatrix} \text{N} \\ \text{NH} \end{smallmatrix} \text{CMe}$ [246°] and

$\text{C}_6\text{H}_4\text{Me}(\text{NH}_2) \begin{smallmatrix} \text{NH CMe} \\ \text{N} \end{smallmatrix} \text{O}$ [266°] may also be got by reduction (Bankievitch, B 21, 2404)

Trichloroacetyl derivative [142°]. Prisms or needles (Friederici, B 11, 1975)

Benzoyl derivative [186°] Needles
Vol III

An isomeric body [203°] is got by nitrating benzoyl-(2,1,4) nitro toluidine (Cunert, A 172, 229).

Di-nitro-*p* - toluidine $\text{C}_6\text{H}_4\text{Me}(\text{NH}_2)(\text{NO}_2)_2$ [1 4 2 6] [168°] Formed from tri nitro-toluene [82°] and ammonium sulphide (Tiemann, B 3, 218, Beilstein, B 13, 242, Staedel, A 226, 854). Needles, v sol alcohol

Di-nitro-*p* - toluidine $\text{C}_6\text{H}_4\text{Me}(\text{NH}_2)(\text{NO}_2)_2$ [94°] Formed by heating (β) tri nitro toluene with alcoholic NH_3 at 100° (Hepp) Golden needles (from HOAc)

Tri-nitro-*m* - toluidine $\text{C}_6\text{H}_4\text{Me}(\text{NH}_2)(\text{NO}_2)_3$ [1 3 2 4 6] [136°] Formed by the action of NH_3 on the ethyl ether of tri nitro *m* cresol (Nolting a Salis, B 15, 1864, A Ch [6] 4, 128, Staedel, A 259, 222) Small cubes, sol alkalis, forming a red solution

NITRO-*p*-TOLUIDINE SULPHONIC ACID $\text{C}_6\text{H}_4\text{Me}(\text{NH}_2)(\text{NO}_2)(\text{SO}_3\text{H})$ [1 4 2 5] S 1603 at 15° Formed by sulphonating nitro-*p* toluidine (Limpicht, B 18, 2183, Foth, A 230, 298) — KA' aq — BaA' 4aq — PbA' 3 1/2 aq

DI-NITRO TOLYL-ACETIC ACID

$\text{C}_6\text{H}_4\text{Me}(\text{NO}_2)_2 \text{CH}_2 \text{CO}_2\text{H}$ [173°] Formed by nitration (Senkowsky, M 9, 856) Yields the ethers MeA' [41°] and EtA' [68°] crystallising in needles

NITRO *p*-TOLYL-AMIDO-ACETIC ACID

$[\text{1 3 4}] \text{C}_6\text{H}_4\text{Me}(\text{NO}_2) \text{NH CH CO}_2\text{H}$ [190°] Formed from nitro *p* toluidine and bromo acetic acid (Plochl, B 19, 9, Leuckhart B 20, 24) Prisms — $\text{NH}_4\text{A'}$ — BaA' 1 aq — PbA' 2 purple red needles

Ethyl ether EtA' [65°] Needles

NITRO *o* TOLYLAMIDO BENZOIC ACID

$[\text{3 4 1}] \text{C}_6\text{H}_3(\text{NO}_2)(\text{NHCH}_2\text{CO}_2\text{H}) \text{CO}_2\text{H}$ [211°] Formed by heating *o* toluidine with bromo nitrobenzoic acid (Heidensleben, B 23, 3451) Brown needles — NaA' 2 aq red needles

Ethyl ether EtA' [106°] Leaflets

***m* Nitro *p* tolyl amido benzoic acid**

$\text{C}_6\text{H}_4\text{Me NH C}_6\text{H}_4(\text{NO}_2) \text{CO}_2\text{H}$ [257°] Formed from *p* toluidine and bromo nitro benzoic acid (Schöpf, B 22, 3288, H) — NaA' dark red needles

Ethyl ether EtA' [115°] Leaflets

NITRO DI *p* TOLYL AMINE

$\text{NH}(\text{C}_6\text{H}_4)(\text{C}_6\text{H}_4\text{NO}_2)_2$ [85°] The *benzoyl derivative* [167°] is formed, together with that of di nitro di tolyl amine [191°], by nitrating benzoyl di *p* tolyl amine (Lellmann, B 15, 831)

Hexa nitro di *p* tolyl amine

$\text{NH}(\text{C}_6\text{H}_4\text{Me}(\text{NO}_2)_3)_2$ [258°] Formed from di-tolyl-nitrosamine and fuming HNO_3 (Lehne, B 13, 1545) Trimetric crystals

NITRO TOLYL-ISOBUTYRIC ACID

$[\text{1 3 6}] \text{C}_6\text{H}_4\text{Me}(\text{NO}_2) \text{CH}_2 \text{CHMe CO}_2\text{H}$ [139°] Formed from iso tolyl nitro toluene and dilute HNO_3 (S G 1 12) at 200° (Effront, B 17, 2326) — AgA' colourless plates

NITRO TOLYLENE DIAMINE $\text{C}_6\text{H}_4\text{N}_2 \text{O}_2$ *ie* $\text{C}_6\text{H}_4\text{Me}(\text{NO}_2)(\text{NH}_2)_2$ [1 2 2 6] [154°] Obtained from its *acetyl derivative* [253°], which is got by nitrating di acetyl tolylene diamine (Tiemann, B 3, 9, Ladenburg, B 8, 1211) Needles, with violet reflex Yields a *di-benzoyl derivative* [245°] (Ruhemann, B 14, 2656)

Nitro-tolylene diamine *Benzoyl derivative* $\text{C}_6\text{H}_4\text{Me}(\text{NO}_2)(\text{NH}_2)(\text{NHBz})$ [1 2 5 4] [139°]. S S

Formed by reducing benzoyl-di-nitro-toluidine (Hübner, *A* 208, 317) Red needles (from water).

Nitro tolylene diamine $C_6H_4Me(NO_2)(NH_2)_2$ [1 6 4 2] ? [132°] Formed by reducing (6,4,2,1)-tri-nitro-toluene (Tiemann, *B* 3, 218) Red prisms (from water)

Tri-nitro-tolylene-diamine

$C_6Me(NO_2)_3(NH_2)_2$ [1 2 4 6 3 5] [222°] Formed from $C_6Me(NO_2)_3Br$, and alcoholic NH_3 (Palmer, *B* 21, 3501) Small yellow prisms

NITRO-TOLYLENE-TETRA-METHYL-DIAMINE $C_6H_4Me(NO_2)(NMe)_2$ [63°] Formed by nitration (Niementowski, *B* 20, 1888) Prisms

DI-NITRO-DI-TOLYL-ETHYLENE-DIAMINE

$C_6H_4(NH C_6H_4Me NO_2)_2$ [195°] Formed from (8,1,4) nitro toluidine and ethylene bromide (Gattermann & Hager, *B* 17, 779) Red plates

NITRO-TOLYL-HYDRAZINE SULPHONIC ACID

$C_6H_4Me(NO_2)(N_2H_4)(SO_3H)$ [1 2 4 5] Formed from nitro-*p*-diazo-toluene sulphonic acid and a cooled solution of $SnCl_2$ (Lamprecht, *B* 18, 2194) Tables— BaA' , 4sq yellow prisms

NITRO-TOLYL-METHYLENE PHTHALIDE

$C_6H_4 \begin{array}{c} \diagup O=C(NO_2) C_6H_4 \\ \diagdown CO \end{array}$ [144°] Formed from tolyl-methylene-phthalide by the action of nitrous acid, the resulting $C_6H_4 \begin{array}{c} \diagup C(NO_2) CH(NO_2) C_6H_4 \\ \diagdown CO \end{array}$

[138°] being boiled with dilute alcohol (Heilmann, *B* 23, 3163) Needles

NITRO TOLYL METHYLENE-PHTHALIMIDINE

$C_6H_4 \begin{array}{c} \diagup C=C(NO_2) C_6H_4 \\ \diagdown CO NH \end{array}$ [159°] Formed from tolyl-methylene-phthalimidine and nitrous acid (Heilmann, *B* 23, 3161) Needles (from alcohol)

NITRO *m*-TOLYL-PROPIONIC ACID

$C_6H_4Me(NO_2)C_6H_4CO_2H$ [130°-136°] Formed from (2,5,1) iodo isobutyl toluene and HNO_3 (S G 1 25) at 200° Efront, *B* 17, 2327) Needles (from water)

DI NITRO DI-TOLYL-PROPIONIC ACID

$(C_6H_4MeNO_2)_2CMe CO_2H$ [129°] Formed, together with the tetra-nitro-acid [225°] by nitrating di-tolyl propionic acid (Haiss, *B* 15, 1476) Yellowish crystals

DI NITRO-DI-*o*-TOLYL-SULPHAZIDE

$C_6H_4N_2O_2S$ [2 4 1] $C_6H_4Me(NO_2) NH NH SO_2 C_6H_4(NO_2)Me$ [1 4 2] ? [142°] Obtained by the action of alcoholic SO_2 upon nitro-*o*-diazo toluene (Lamprecht, *B* 20, 1241) Small yellow prisms

NITRO-TOLYL-THIOCARBAMIC ETHER

[1 2 4] $C_6H_4Me(NO_2) NH CS OEt$ [96°] Formed by boiling with alcohol nitro-tolyl-thiocarbamide, which is produced by the action of Ac_2O on phenyl-nitro tolyl-thio-urea (Steuemann, *B* 16, 2337) Needles, v sol alcohol

NITRO-TOLYL-THIO-UREAS

The following compounds have been prepared by Steuemann (*B* 16, 2337) from $C_6H_4Me(NO_2)(NH_2)$ [1 2 4]

$NH_2CS NH C_6H_4Me(NO_2)$ [176°]

[4 1] $C_6H_4Me NH CS NH C_6H_4Me(NO_2)$ [169°]

$CS(NH C_6H_4Me(NO_2))_2$ [207°]

DI-NITRO-DI-*p*-TOLYL-UREA

$CO(NH C_6H_4NO_2)_2$ [c. 233°] Formed from di-*p* tolyl-guanidine, alcohol, and HNO_3 (S G

1 4) (A G Perkin, *C* 7, 87, 698) Needles (from xylene)

NITRO-URACIL v Nitro-DI OXY PY IMIDINE

NITRO-URAMIDO-BENZOIC ACIDS

The three following acids are obtained by boiling the three di-nitro-uramido-benzoic acids with aqueous NH_3 (Griess, *B* 5, 193) —
 $C_6H_4(NO_2)(NH CO NH_2) CO_2H$ [6 3 1] Crystals.
 $C_6H_4(NO_2)(NH CO NH_2) CO_2H$ [4 3 1] Needles.
 $C_6H_4(NO_2)(NH CO NH_2) CO_2H$ [2 3 1] Plates
 The isomeric $C_6H_4(NO_2)(NH CO NH_2) CO_2H$ [5 3 1] is formed, together with nitro di-uramido benzoic acid, by the action of potassium cyanate on nitro amido benzoic acid (Griess, *B* 17, 2184) It yields the salt BaA' , 5sq

Nitro-diuramido-benzoic acid

$(NH_2 CO)_2N C_6H_4(NO_2) CO_2H$ forms crystals (containing 2aq), and yields the salt BaA' , 7½aq
 Three crystalline di-nitro-*m*-uramido benzoic acids are got by nitrating *m* uramido benzoic acid A di nitro-*p*-uramido benzoic acid is formed by nitrating *p*-uramido-benzoic acid

NITROUS ACID v Nitrogen, p 567.

NITROUS ETHER v ETHYL NITRITE

NITRO-UVITIC ACID

$C_6H_4Me(NO_2)(CO_2H)_2$ [1 x 3 5] [227°] Formed, together with an isomeride $C_6H_4NO_2$, ½aq [250°] by nitrating uvitic acid (Böttinger, *B* 9, 804, *A* 189, 171) Prisms (containing 2aq) — K_2A'' aq — BaA'' aq — CaA'' 8aq needles, m sol hot water

NITRO VALERIC ACID $C_6H_4(NO_2) CO_2H$

Formed by the action of nitric acid on isovaleric acid and on di isomyl ketone (Dessaignes, *A* 79, 374, Bredt, *B* 15, 2319, Brazier, a Gossleth, *A* 75, 262, Schmidt, *B* 6, 602) Monoclinic tables AgA' prisms (from hot water)

DI NITRO VINYL FURFURANE

$C_6H_4(NO_2)O CH CH NO_2$ [144°] Formed by nitrating vinyl furfuran (Priebe, *B* 18, 1362) Yellow needles Yields a dibromide [111°]

NITRO VINYL PHENOL *Methyl derivative* $C_6H_4(NO_2)(CH CH NO_2)OMe$ [3 1 4]

[163°] Formed from the methyl derivative of *p* coumaric acid and HNO_3 (Einhorn a Grabfield, *A* 243, 369) Yellow needles (from alcohol)

o **NITRO-*o* XYLENE** $C_6H_4Me(NO_2)$ [1 2 4]

Mol w 151 [29°] (258°) S G ¾ 1 139 Formed by nitration of *o* xylene (Jacobsen, *B* 17, 160) Long yellow prisms

o-Nitro-*o*-xylene $C_6H_4Me(NO_2)$ [1 2 3] (250°

1 V at 739 mm) S G ½ 1 147 Formed, together with the preceding isomeride, by the action of H_2SO_4 and HNO_3 on *o* xylene (Nöling a Forel, *B* 18, 2669) Liquid

c Nitro-*m*-xylene $C_6H_4Me_2(NO_2)$ [1 3 2],

(225°) at 745 mm S G ½ 1 112 Formed from nitro xylidine [78°] by eliminating NH_3 (Grevink, *B* 17, 2430), and, together with the (1,3,4) isomeride, by nitration of *m* xylene with HNO_3 and H_2SO_4 at 0° (N a F) Liquid

p-Nitro-*m*-xylene $C_6H_4Me_2(NO_2)$ [1 3 4] (244° cor) S V 164 5 Formed by nitrating *m*-xylene (Harmsen, *B* 13, 1558) or its dihydride (Wallach, *A* 258, 380), and by eliminating NH_3 from nitro-xylidine [128°] (G) Liquid

s-Nitro-*m*-xylene $C_6H_4Me_2(NO_2)$ [1 3 5], [75°], (263° 1 V) at 739 mm. Formed by eliminating NH_3 from nitro-xylidine [70°] (Wroblewsky, *A* 207, 94, *BI* [2] 84, 332, Thol,

B. 18, 360, Nörling & Forel, B 18, 2678)
Needles, volatile with steam

Nitro *p*-xylene $C_6H_4Me_2(NO_2)$ [1 4 2] (239°
1 V) at 739 mm SG 1⁶ 1132. Formed by
nitration of *p*-xylene (Jannasch, A. 176, 55,
N a F) Liquid.

***m*-Nitro *m*-xylene** $C_6H_4Me_2(CH_3, NO_2)$. Formed
by the action of alkalis followed by HCl₂ on

3164) Oil, with irritating odour

Di-nitro *m* xylene $C_6H_4Me_2(NO_2)_2$ [1 3 4 2]
Mol w 196 [82°] Formed, together with the
isomeride [93°], by nitrating *m* xylene with HNO₃
and H₂SO₄ at 5° (Grevingk, B 17, 2422) Plates,
v sol alcohol

Di nitro *m*-xylene $C_6H_4Me_2(NO_2)_2$ [1 3 4 6]
[93°] Formed by nitrating *m* xylene or its di-
hydride (Luhmann, A 144, 274, Fittig, A 148,
5, Wallach, A 258, 332) Crystals (from alcohol)

Di-nitro-*p*-xylene $C_6H_4Me_2(NO_2)_2$ [1 4 2 3]
[93°] Formed, together with the isomeride
[124°], by nitrating *p*-xylene (Rammer, B [2]
9, 434, Fittig, A 136, 307, 147, 17, Jannasch,
A 171, 79, Nörling, B 19, 144, Lellmann, A
228, 252) Monoclinic crystals Yields xylene-
diamine [75°]

Di nitro *p*-xylene $C_6H_4Me_2(NO_2)_2$ [1 4 2 6]
[124°] Needles

Di-nitro *p*-xylene $C_6H_4Me_2(NO_2)_2$ [1 4 2 5].
Formed in small quantity by nitrating *p* xylene
(L) Long yellow needles (from alcohol)

Tri nitro-*m* xylene $C_6H_3Me_3(NO_2)_3$ [1 3 2 4 6].
Mol w 241 [c 182°] Formed by nitration of
m xylene or its dihydride (Luhmann, Grevingk,
Tilden, C J 45, 416, Wallach, A 258, 333)
Crystals, insol hot alcohol

Tri nitro *p* xylene $C_6H_3Me_3(NO_2)_3$ [1 4 2 3 5]
[140°] Formed by nitration of *p* xylene (Fittig,
Nörling, B 19, 145). Crystals (from benzene)

NITRO *m*-XYLENE PHOSPHONIC ACID

$C_6H_4Me_2(NO_2)PO(OH)_2$. Two acids of this formula,
[100°] and [182°], are formed by nitrating
m-xylene (α)-phosphonic acid (Weller, B 20,
1722, 21, 1492) From *m* xylene (β) phosphonic
acid an isomeric acid [107°] is obtained, and
another isomeride [224°] may be obtained from
p xylene phosphonic acid

NITRO *m*-XYLENE SULPHONIC ACID

$C_6H_4Me_2(NO_2)(SO_3H)$ [1 3 6 4] [132°] Formed
by sulphonating nitro *m* xylene and by nitrating
m-xylene (α) sulphonic acid (Harmsen, B 13,
1558, Lumprecht, B 18, 2191, Claus & Schmidt,
B 19, 1418) Crystals NaA' aq—NaA' 2aq—

Amide [179°] (L); [187°] (O a S)

Chloride [98°] (L)

Nitro-*m*-xylene sulphonic acid

$C_6H_4Me_2(NO_2)(SO_3H)$ [1 3 5 4] [100°] Formed,
with the preceding and succeeding acid, by
nitrating (1,3,4) xylene sulphonic acid (O a S)
Plates—KA'—NaA' aq—BaA', 1½aq—CaA', 6aq
—PbA', 4aq—CuA', 6aq—AgA' aq. needles, v.
sol. water

Amide [108°] Needles.

Chloride [97°]

Nitro-*m*-xylene sulphonic acid

$C_6H_4Me_2(NO_2)SO_3H$ [1 3 2 4] [144°] Formed
as above (O a S) Plates (containing aq)—
KA' ½aq—NaA' aq—BaA',—CaA',—PbA',—
CuA', 2aq—AgA' ½aq

Chloride [96°] Needles.

Amide [172°] Needles

Di-nitro-xylene sulphonic acid

$C_6H_4Me_2(NO_2)_2SO_3H$ [1 3 6 5 4] [70°] Formed,
as well as the following isomeride, by nitrating
m-xylene sulphonic acid (Claus & Schmidt, B.
19, 1425) Plates.—KA'—NaA' aq—BaA', ½aq.
—BaA', 2½aq—CaA', 5aq—PbA', 4½aq—
CuA', 4aq pale green plates

Chloride [118°] Crystals.

Amide [158°] Needles

Di-nitro-xylene sulphonic acid

$C_6H_4Me_2(NO_2)_2SO_3H$ [1 3 6 2 4] Needles (con-
taining 2aq) (Lumprecht, B 18, 2192, O. a. S).
—NaA' aq—KA'—BaA', 3aq—CaA', 8½aq—
CuA', 2½aq—PbA', 3½aq prisms.

Chloride [123°] Prisms

Amide [193°] Prisms

NITRO-*m*-XYLENOL $C_6H_4NO_2$ s.s.

$C_6H_4Me_2(NO_2)(OH)$ [1 3 x 4] [68 5°] Formed
by nitrating *m*-xynolol (Lako, A 182, 32)
Needles—KA' 3aq dark red plates

Nitro *m* xynolol $C_6H_4Me_2(NO_2)(OH)$ [95°]
Formed by the action of nitrous acid on the
nitro xylidine obtained by partial reduction of
di nitro *m* xylene (Pfaff, B 16, 616, 1136)
Needles—KA' 2aq red crystals

Methyl ether MeA' [57°] Needles

(α) Nitro *p*-xynolol

$C_6H_4Me_2(NO_2)(OH)$ [1 4 6 3] [115°] (O), [122°]
(G a S) Formed by oxidising nitroso-*p*-xylene-
ol (the oxum of phlorone) with alkaline K₂FeCy₄.
(Olver, G 12, 162, Goldschmidt & Schmid, B.
18, 569) Needles, sol. hot water

(β)-Nitro *p*-xynolol $C_6H_4Me_2(NO_2)(OH)$.
[236°] Formed by nitrating *p* xynolol (O).
Oil—BaA', purple scales

(γ)-Nitro *p*-xynolol [89°] Formed by heat-
ing *p* xynolol sulphonic acid with fuming HNO₃.
(O) Light-yellow scales—KA' aq—BaA', aq.
light yellow scales

Nitro-*p*-xynolol $C_6H_4Me_2(NO_2)(OH)$ [1 4 3 5].
[91°] Formed by the action of nitrous acid on
the corresponding nitro xylidine (Von Kosta-
necki, B 19, 2320) Buff-coloured plates;
perhaps identical with the preceding isomeride.

Nitro-*p*-xynolol *Ethyl ether*

$C_6H_4Me_2(NO_2)(OEt)$ [85°] Formed from *p*-
xylidine by nitration and treatment with nitrous
acid (Nörling, Witt, a. Forel, B 18, 2667)

Di-nitro-*o*-xynolol

$C_6H_4Me_2(NO_2)_2(OH)$ [1 2 3 5 4] [128°] Formed
as a by-product by nitrating *o*-xylene (Nörling
& Pick, B 21, 3158) Obtained also from (1, 2, 4)-
xylidine. Needles, al. sol. cold water

Di-nitro-*o*-xynolol

$C_6H_4Me_2(NO_2)_2(OH)$ [1 2 3 4 6] [82°] Obtained
by nitrating and diazotising (1, 2, 3)-xylidine (N.
a. P.) Orange yellow needles, m. sol water

Di-nitro-*p*-xynolol [121°] Formed from *p*-
xynolol, H₂SO₄, and HNO₃ (Kostanecki, B 19,
2321) Yellow plates (from water)

NITRO-*m*-XYLENOL SULPHONIC ACID

$C_6H_4Me_2(NO_2)(OH)(SO_3H)$ [1 3 x 6 4] Formed
from nitro-xylidine sulphonic acid by the diazo
reaction (Lumprecht & Sartig, B. 18, 2190, A.

130, 340) —BaA', 3aq —PbA', 3aq The *ethyl derivative* forms $C_6HMe_2(NO_2)(OEt)(SO_3K)$ aq, crystallising in plates

NITRO-*m*-XYLIDINE $C_6H_4N_2O_2$ *ie* $C_6H_2Me_2(NO_2)(NH_2)$ [1 3 5 4] [76°] Formed from acetyl *m*-xylidine by nitration and saponification (Wroblewski, A 207, 91, Nörling a Forel, B 18, 2677) Orange needles

Acetyl derivative [178°] Needles

Nitro-*m*-xylidine

$C_6H_4Me_2(NO_2)(NH_2)$ [1 3 6 4] [123°] Formed by reduction of di nitro *m* xylene (Fitting, A 147, 18, Wallach, A 258, 332) and by nitration of 1,3,4) *m* xylidine (1 pt) dissolved in H_2SO_4 (10 pts) (Nörling a Collin, B 17, 265) Orange needles —B'HCl —B'H₂SO₄ —B'H₂C₂O₄

Acetyl derivative [160°]

Diacetyl derivative [116°].

Nitro-*s*-xylidine

$C_6H_4Me_2(NO_2)(NH_2)$ [1 3 4 5] [54°] Formed by nitration of *s*-*m*-xylidine dissolved in 10 pts of conc H_2SO_4 (Nörling a Forel, B 18, 2679) Yellow needles Volatile with steam

Nitro-*m* xylidine

$C_6H_4(CH_3)_2(NO_2)(NH_2)$ [1 3 2 4] or [1 3 4 2] [78°] Formed by reduction of di-nitro *m* xylene [82°] with alcoholic ammonium sulphide (Grevink, B 17, 2425) Yellow needles, sol hot water

Acetyl derivative [149°] White needles

Nitro-*p*-xylidine $C_6H_4Me_2(NO_2)(NH_2)$ [1 4 5 2] [142°] Formed by nitration of acetyl *p* xylidine and saponification, or by nitration of *p* xylidine dissolved in conc H_2SO_4 (Nörling, Witt, a Forel, B 18, 2666) Formed also by reducing di nitro *p*-xylene (Kostanecki, B 19, 2318) Brownish yellow crystals On reduction it gives the *para* diamine [147°]

Acetyl derivative [166°] Needles

Nitro-*p* xylidine $C_6H_4Me_2(NO_2)(NH_2)$ [1 4 3 5] [96°] Formed by reduction of di nitro *p* xylene [123°] (Fitting, A 147, 22, Kostanecki, B 19, 2320) Needles (from alcohol)

Acetyl derivative [180°] Needles

Di-nitro-*p* xylidine

$C_6H_4Me_2(NO_2)_2(NH_2)$ [1 4 3 5 2] [203°] Formed from tri nitro-*p* xylene and alcoholic NH_3 (Nörling, B 19, 145) Needles (from HOAc)

Di nitro-xylidine [192°] Formed by reduction of tri nitro-xylene (Bussenius a Eisenstuck, A 118, 165, Beilstein, A 133, 45) Yellow needles

NITRO XYLIDINE SULPHONIC ACID

$C_6H_4Me_2(NO_2)(NH_2)SO_3H$ [1 3 x 6 4] S 0818 at 8° Formed by nitrating xylidine sulphonic acid (Lumprecht a Sartig, B 18, 2189, A 230, 338) Needles —KA' 1½aq —BaA' 1½aq —PbA' aq yellow silky needles

NITRO-XYLYLENE DIAMINE $C_6H_4N_2O_2$ *ie* $C_6H_4(NO_2)(NH_2)_2$ [215°] Formed by reducing tri-nitro-*m* xylene (Bussenius a Eisenstuck, A 118, 159, Fitting, A 148, 6, Wallach, A 258, 338) Red prisms With EtI at 105° it yields crystalline $C_6H_4Me_2(NO_2)(NH_2)(NH_2Et)$ —B'HCl —B'H₂Cl₂ —B'H₂PtCl₂ 3aq —B'H₂SO₄ 2aq —B''(H₂SO₄)₂ 2aq —B''H₂SO₄

NITEYL CHLORIDE *v* Nitrogen oxychlorides, under Nitrogen, p 570

NOBLE METALS The elements Gold, Ruthenium, Rhodium, Palladium, Iridium, Osmium, and Platinum are sometimes classed

together as the *noble metals*. The application of the term *noble* to metals is a survival of the alchemical notion of a close connexion between physical and moral properties. Gold was regarded by the alchemists as the purest metal, as that which most nearly approached their ideal element. As gold did not change when heated in air, and did not dissolve in any single acid, these two properties came to be looked on as characteristic, and when these properties were found to belong also to certain other metals these other metals were placed in the same class as gold. Silver dissolves in nitric acid, but it does not change by heating in air, hence Ag was often classed with Au as a noble metal. The term *noble* is applied in this article to the seven metals named above, as a convenient form of expressing the fact that these metals have many properties in common. The seven metals are all found uncombined in nature, they are all very lustrous, heavy, generally ductile and malleable, hard (except Au), some are not oxidised by heating in air, others combine with O at high temperatures.

Au has been known from prehistoric times. Pt was discovered about 1750, and the other Pt metals from 1803 to 1845. The name platinum is said to be derived from *platina del Pinto* (*platina*=diminutive of *plata*=silver), a name by which the natural alloy of the metal was known in New Granada, from whence it was first obtained. The names palladium and rhodium were given by Wollaston who separated these metals from Pt ore, in 1803, the first suggested by the planet Pallas discovered about that time, and the second from *ῥόδον*=a rose, in allusion to the colour of solutions of the salts of the metal. Tennant discovered two other metals in Pt ore, in 1803, he called one iridium, because of its many coloured salts (*iris*=the rainbow), and the other osmium, because of the peculiar smell of its volatile oxide (*οσμή*=a smell). In 1845, Claus separated a sixth metal from Pt ore from the Ural, and called it ruthenium, in allusion to Russia.

Ru, Rh, Pd, and Ir, Os, Pt, form the second and third sections or families of Group VIII in the periodic classification of the elements, the first family of this group is composed of Fe, Ni, and Co. Au belongs to Group I, it is a member of the family Cu, Ag, Au. As Cu follows immediately after Fe, Ni, Co in the *long period* beginning with K and ending with Br, and as Ag follows Ru, Rh, Pd, in the *long period* Rb to I, so Au is placed in immediate succession to Os, Ir, Pt in the *long period* which, when it is complete, will begin with an alkali metal resembling Os and end with a halogen more or less like I. Looking at the position of Au in the periodic scheme of classification (*v* Table, p 204, vol II) one may say that the relations of this element to Os, Ir, and Pt will be found very similar to the relations of Ag to Ru, Rh, and Pd, and also to the relations of Cu to Fe, Ni, and Co.

The table on page 629 presents some of the important properties of the metals Ru, Rh, and Pd.

These three metals form *oxides* MO and MO₂. Ru and Rh also form M₂O₃. Ru forms a volatile oxide RuO₄, Rh forms RhO₄, and Pd₂O is known. The oxides MO are basic, forming salts

	RUTHENIUM	RHODIUM	PALLADIUM

Atomic weight / spec gravity	8.5	8.6	9.8
Melting points (approx)	above 2000°	2000°	1500°-1600°
Spec heats	0.61	0.58	0.6
Occurrence and preparation	The metals Rh, Ru, and Pd, occur in small quantities in many Pt ores, they are usually separated in the form $2\text{NH}_4\text{Cl}$ MCl_2 , on strongly heating these double chlorides, the metals remain.		
Physical properties	White, lustrous, hard, brittle, crystalline, less ductile and malleable than Pd, fuses in O H flame.	Greyish white, very hard, malleable, not very ductile, may be fused in O H flame, and is thus obtained in crystals.	White, hard, lustrous, ductile and malleable, most fusible of the Pt metals. Crystallises in octahedral and also in hexagonal forms.
Chemical properties	Oxidised by heating powdered metal in air, also by heating with KOH or K_2CO_3 , forming K_2RuO_4 , which is sol water. Combines with Cl at red heat, dissolves very slowly in <i>aqua regia</i> .	Oxidised at red heat, when in powder, combines with Cl at red heat, unacted on by any acid, but when alloyed with Pb, Cu, &c, dissolves in <i>aqua regia</i> . Fused with KHSO_4 , forms a soluble Rh K sulphate. Absorbs H rapidly. When in very fine powder, decomposes H_2CO_3 to H and CO_2 , and $\text{C}_2\text{H}_6\text{O}$ to H and $\text{C}_2\text{H}_4\text{O}$.	Oxidises superficially at moderate temp, at higher temps the oxide is reduced. Absorbs H rapidly, probably forming a definite compound. Dissolves in hot conc HClAq or H_2SO_4 , also sol HNO_3 and <i>aqua regia</i> .

$\text{MX}(\text{X} = \text{SO}_4, \text{etc})$ Ru_2O_3 and Rh_2O_3 are also basic, the corresponding salts are M_3X . A few salts corresponding with RuO_4 have been isolated, but none derivable from Rh_2O_3 or PdO_2 has been prepared. RhO_2 has not yet been proved to be basic. RuO_4 is not known, but a few salts (*ruthenates*) have been isolated in which RuO_4 forms the negative radicle, e.g. K_2RuO_4 . An acid HRuO_4 is known, the K salt (KRuO_4) is said to be isomorphous with KClO_4 and KMnO_4 . RuO_4 is a solid melting at c 26°, it is very volatile, easily reduced to lower oxides, explodes at c 108° giving RuO_2 and O, with KOHAq it forms K_2RuO_4 . The chlorides generally correspond with the oxides MO , M_2O_3 , and MO_2 , the chlorides form double chlorides with more positive chlorides, the salts MCl , 2XCl are best regarded as salts of the acids H_2MCl_2 (e.g. K_2PdCl_4 and $(\text{NH}_4)_2\text{RuCl}_6$). The cyanides MCy_2 form double salts, an acid H_2RuCy_2 is known. The sulphides generally correspond with the oxides MO , M_2O_3 , and MO_2 , PdS forms thio-salts, Na_2PdS_2 , &c; Rh_2S_3 dissolves in alkali sulphides the sulphides M_2S_3 and MS_2 are therefore more or less acidic. The three metals form many ammoniacal compounds, which are best regarded as salts of various radicles obtained by replacing H in two or more NH_3 molecules by Ru, Rh, or Pd.

In the table on page 680 are presented some of the more important properties of the metals Os, Ir, Pt, and Au.

Au differs considerably in its chemical properties from Os, Ir, and Pt. The oxides of Os, Ir, and Pt are MO and MO_2 , M_2O_3 , represented by Os_2O_3 and Ir_2O_3 , OsO_4 . Very few salts of Os have been prepared as yet, OsO and Os_2O_3 are probably basic. OsO_2 is not known, but osmates, e.g. K_2OsO_4 , have been isolated. OsO_4 is solid, with low melting and boiling points, it is slowly soluble in water, seems to form very unstable salts with alkalis, but does not decompose carbonates. Os forms a peculiar acid $\text{H}_2\text{N}_2\text{OsO}_4$, perhaps HO OsO_4 , $\text{N N OsO}_4\text{OH}$, it also forms ammoniacal bases, in which OsO seems to replace H_2 in N_2H_4 , and OsO_2 to replace H_2 in N_2H_6 . The acid H_2OsCy_2 is known. Very few salts of Ir are known, Ir_2O_3 is basic. The chloride IrCl_3 , corresponding to IrO_2 , is known, and also such salts as IrO SO_4 , in which an acid radicle seems to replace O in IrO_2 . Some uridates have been obtained, e.g. $\text{K}_2\text{O } 2\text{IrO}_4$. The acid H_2IrCy_2 , and salts of this acid, exist. Some ammoniacal bases are known, in which Ir seems to replace H_2 of N_2H_4 . A few salts corresponding with PtO are known, but they have been but little studied. PtO forms salts such as $\text{Pt}(\text{SO}_4)_2$. PtO_2 also combines with some positive oxides to form salts $x\text{PtO}_2 \cdot y\text{RO}$, e.g. $3\text{PtO}_2 \cdot \text{Na}_2\text{O}$. PtO_2 also combines with acidic and basic oxides to form complex salts, e.g. $\text{PtO}_2 \cdot 10\text{MoO}_3$ (or 10WO_3) $\cdot 4\text{Na}_2\text{O} \cdot x\text{H}_2\text{O}$. A very large number of salts of complex ammoniacal

<i>Spec. heats</i>	0.311	0.326	0.324	0.324
<i>Occurrence and preparation</i>	The three metals Os, Ir, and Pt, occur in small quantities, associated (? alloyed) with each other, and frequently with Ru, Rh, and Pd. They are usually separated as 2NH ₄ Cl MOCl ₄ , and are obtained by strongly heating these compounds			Occurs native, generally alloyed with Ag. Prepared by removing earthy impurities, or by crushing auriferous quartz, forming an amalgam of Au and Hg, and removing Hg by heat, sometimes by smelting, or by treatment with Cl &c
<i>Physical properties</i>	White, with tinge of blue, very hard, crystalline, brittle, also a black, amorphous, powder. Os does not melt at the highest temp of the O-H flame, it is the heaviest substance known.	White, lustrous, hard, crystalline, brittle, but fairly malleable at red heat, also a hard black powder. Melts in O-H flame.	Silver white, very lustrous, fairly hard, very malleable and ductile, expands by heat less than any other metal. Melts in O-H flame.	Very lustrous, yellow metal, crystallises in octahedra, good conductor of heat and electricity, most malleable of all metals, very ductile. Also obtained as a lustreless, brown yellow, powder.
<i>Chemical properties</i>	Oxidised readily, to OsO ₄ , by heating finely powdered metal in air, also oxidised by HNO ₃ , when in fine powder. Oxidised by fusion with KOH or KNO ₃ . Combines directly with Cl.	When finely divided, oxidises slowly when heated in air, and dissolves in <i>aqua regia</i> , in compact form is insol in all acids. Oxidised by fusion with KOH and KNO ₃ . Combines directly with Cl.	Not oxidised by heating in air or O, but by fusion with KOH. Dissolves in <i>aqua regia</i> . Combines directly with Cl. Absorbs H rapidly, and gives it off again at red heat.	Not oxidised by heating in air. Dissolves in <i>aqua regia</i> . Combines directly with Cl, Br, and I. Compounds are easily decomposed, yielding Au.

bases, containing Pt, are known. Pt is rather remarkable for the number of compounds which it forms with H and acidic radicals, these compounds are acids, and corresponding with each is a series of salts; the acids in question are H₂PtCl₆, H₂PtCl₅, H₂PtBr₆, H₂PtI₆, H₂Pt(NO₃)₆Cl₂, H₂Pt(NO₃)₅Cl₃, H₂PtO(NO₃)₄, H₂PtCy₄, H₂PtCy₃Cl₃, H₂Pt(SCN)₄, H₂Pt₂S₄ (salts of H₂Pt₂S₄ exist).

Au forms three oxides, Au₂O, AuO, and Au₂O₃. Au₂O is slightly sol. cold water, a few salts corresponding with Au₂O₃ are known, e.g. Au(NO₃)₃, AuSO₄, corresponds with AuO. Au₂O₃ forms aurates, e.g. KAuO₄, by reacting with alkalis. The sulphides, Au₂S and AuS, form thio-salts with the alkali sulphides, e.g. NaAuS₂,

but these thio salts have been examined very slightly. The chlorides are AuCl and AuCl₃, the acids HAuCl₄, HAuBr₄, and HAuCy₄, and salts of the form M'AuCl₄, are known. The compounds of Au are easily decomposed with separation of Au.

The Pt metals fall into two families. (1) Ru, Rh, Pd, and (2) Os, Ir, Pt. The elements, as a group, possess the physical characters of metals very distinctly marked, but the existence of acidic oxides and sulphides points to the non-metallic nature of these elements. Au is physically more metallic, and chemically more non-metallic, than any of the other noble metals. For the relations of Au to Cu and Ag, and

the relations of this family to the members of Group VIII (Fe, Ni, Co, Ru, Rh, Pd, Os, Ir, Pt), and also to the other members of Group I (Li, Na, K, Rb, Cs), *v* COPPER GROUP OF ELEMENTS, vol. ii p 250, *v* ALSO IRON GROUP OF ELEMENTS, this vol p 65. For details about the individual noble metals, *v* GOLD, vol ii p 647, Iridium, this vol p 46, Osmium, Palladium, in this vol, PLATINUM, RHODIUM, and RUTHENIUM in vol 17.

M M P M

NOMENCLATURE The nomenclature of chemistry is based on the system introduced by Lavoisier, De Morveau, Berthollet, and De Fourcroy in 1787. The leading principles laid down by the French chemists were (1) that every substance is to be regarded as an element until it is proved to be otherwise, (2) that the name of a compound is to exhibit the elements, and as far as possible the relative proportions of the elements, of which it is composed. The names given to elements are not based on any uniform principle, some are known by the names given them for centuries, more recently discovered elements are named, sometimes from the names of compounds of them well known before the elements were discovered, sometimes from the localities where the material was found from which the element was prepared for the first time, sometimes from a characteristic property of the element, sometimes from fanciful considerations, and sometimes to express the pride of the discoverer in his own nationality. To all more recently discovered metals have been given names ending in *um*. Binary compounds are designated by names ending in *ide*, this termination being applied to the name of the more negative element, thus all binary compounds of O are called oxides. As Cl is more negative than S, it is better to call S_2Cl_2 sulphur chloride than chlorine sulphide. When two oxides, chlorides, &c., of an element exist, they are generally distinguished by throwing the name of the more positive element into adjectival form, and using the termination *ic* to indicate more of the negative element, and *ous* to denote less of the negative element, relatively to a fixed quantity of the more positive element, thus the compounds $FeCl_2$ and $FeCl_3$ are known as ferrous chloride and ferric chloride respectively. When more than two oxides, chlorides, &c., of an element are known, it is customary either to use prefixes *di-* (or *bi*), *tri-* (or *ter*), &c., or to indicate the relative proportions of the elements by such prefixes as *hypo* and *per*. It is also customary to give names to certain oxides for the purpose of indicating their acidic character. Thus the five oxides of N have been named as follows at different times

N_2O Nitrous oxide, nitrogen monoxide (might also be called hyponitrous anhydride)

NO Nitric oxide, nitrogen dioxide

N_2O_3 Nitrogen trioxide, nitrogen sesquioxide, nitrous anhydride

N_2O_4 Nitrogen dioxide, nitrogen tetroxide, nitroso-nitric anhydride, nitrogen peroxide

N_2O_5 Nitrogen pentoxide, nitric anhydride, nitrogen peroxide

The same name—nitrogen dioxide—has been given to two different compounds, NO and NO_2 ;

and the name peroxide has been used for NO_2 and N_2O_5 . This illustrates a difficulty. The prefixes *mono*, *di*-, &c. are sometimes employed to designate the first, second, third, &c. members of a series of oxides, chlorides, &c. of the same element, without implying anything as to the number of O, Cl, &c. atoms in the molecules of the various compounds, but the same prefixes are employed sometimes to imply one, two, &c. atoms of O, Cl, &c. On both systems of naming N_2O is called monoxide, on the first system NO is called dioxide, but on the second system it must be called monoxide, hence the second system of naming gives the same name to two different compounds. To get over this difficulty N_2O may be called dinitrogen monoxide, and NO mononitrogen monoxide, but such names are cumbersome. The prefix *per-* is generally employed to designate the highest compound of a series, & the one with relatively most negative element, but a higher compound may be discovered, in such a case the prefix, if used at all, must be moved from the older to the more recently discovered substance. Salts are named from the acids of which they are metallic derivatives. If there are two acids containing the same elements, to that with relatively more of the negative radicle is given a name ending in *-ic*, and its salts are called *-ates*, to the other acid is given a name ending in *-ous*, and its salts are called *-ites*. By the use of prefixes *per*, *hypo*, &c., four or five acids and their salts may be named, e.g.

$HClO$ Hypochlorous acid.

$HClO_2$ Chlorous acid

$HClO_3$ Chloric acid

$HClO_4$ Perchloric acid

Compounds which probably contain the OH group are generally called hydroxides, and those containing the SH group are called hydro sulphides or sulphhydrates. These names more or less imply a special view of the structure of the compounds, as the same view is not always held by all chemists, it seems preferable to call a commonly occurring compound, such as KOH, potash, rather than potassium hydroxide. The nomenclature of organic chemistry must be based on certain conceptions regarding the structure of carbon compounds. These compounds are so numerous, and many of them show such small differences in empirical composition, while not a few are identical in composition, that it would be impossible to frame a systematic nomenclature without the help of the conceptions of molecular structure which lie at the root of organic chemistry. In other words names cannot be found for the vast variety of carbon compounds without considering the properties and functions of these compounds as well as their composition, but the only way we have of expressing, at present, the chemical properties of carbon compounds is in terms of the molecular and atomic theory. For complicated examples *v* AZO-COMPOUNDS, vol i p 369, to some simpler cases *v* HYDROCARBONS, vol. ii p 715.

No attempt is made in this article to trace the historical development of chemical nomenclature, nor to discuss fully the present system of naming used in the science. Chemical nomenclature is a subject the details of which must be

learned gradually by studying chemical substances and their reactions. The article NOMENCLATURE in the first edition of this Dictionary contains references to the more important older memoirs on the subject. In addition to these should be added a report on chemical nomenclature by a committee of the British Association (*B A* 1884 89). Reference should also be made to the suggestions of the Council of the Chemical Society (*C J* 35, 277). M M P M

NONADECANE *v* ENNDECANE

NONANE *v* ENNANE

NONAPHTHENE $C_{14}H_{10}$ (136° cor.) SG $\frac{20}{20}$ 763 H C γ 1,380,900 H C β 1,383,400 Occurs in Russian petroleum (Markownikoff, *J R* 15, 331, Ossipoff, *J R* 20, 645). It is ψ cumene hexahydride as it yields ψ cumene sulphonic acid on treatment with H_2SO_4 (Konovaloff, *C C* 1887, 1133, *J R* 22, 4, 118). Br and AlBr₃ yield tri bromo ψ cumene. Nitric acid (SG 14) yields $C_8H_7NO_2$ (219°), which on reduction yields $C_8H_7NH_2$ (172°–177°), SG $\frac{2}{2}$ 873, smelling like conine. Chlorine yields C_8H_7Cl (186°), whence C_8H_7I (110° at 200 mm), C_8H_7OAc (209°), and C_8H_7OH (191°), SG $\frac{20}{20}$ 8972 may be successively derived. Nonaphthyl iodide is converted by Ag_2O into $(C_8H_7)_2O$ (801°), SG $\frac{20}{20}$ 866. Nonaphthylene C_8H_8 (136°), SG $\frac{2}{2}$ 807 may be obtained from nonaphthyl chloride.

Isononaphthene $C_{14}H_{18}$ (151°) H C γ 1,381,700 H C β 1,384,200 Occurs also in Russian petroleum.

NONIC ACID $C_{10}H_{18}O_2$ [187°] Formed by the action of bromine and alcoholic potash on isopropyl isovaleric acid (Wohlbruck, *B* 20, 2336). Plates.

NONOIC ACID *v* ENNOIC ACID

NONYL The radicle C_9H_{19} , called ENNYL in this Dictionary.

Di-nonyl is OCTODECANE

NONYL ALCOHOL *v* ENNYL ALCOHOL

NONYLENE *v* ENNYLENE

NONYLENIC ACID *v* ENNENOIC ACID

NONYLIC ACID *v* ENNOIC ACID

NORMETHYLEMIPIC ACID *v* Methyl derivative of DI OXY-PHTHALIC ACID

NORMETHYLNITROHEMIPIC ACID *v* Methyl derivative of NITRO DI OXY PHTHALIC ACID

NORNARCOTINE *v* NARCOTINE

NOROPIANIC ACID *v* OPIANIC ACID

NORWEGIUM Ng (?) At w c 219 This name was given by Dahll to a substance separated by him from *nickel glance* from the Norwegian island of Osterö and ranked by him among the elements (*B* 12, 1731, 13, 250). According to Prochazka (*A C J* 2, 213) the element exists in some specimens of unrefined Pb (along with Bi, Cu, and Ni). The claim of Ng to rank as an element cannot be regarded as yet satisfactorily established. Ng is said to show great resemblances to Bi, to melt at c 254°, to form a fusible oxide resembling Bi_2O_3 . The hydroxide is soluble in KOHAq, also in a large excess of NH_3 or Na carbonate solution. If the oxide is Ng_2O_3 , the at w is approximately 219, if the oxide is NgO , the at w is approximately 146. M M P M

NOTATION The expression of the composition, and, as far as possible, the properties, of compounds by the use of symbols and formulæ. The subject is discussed sufficiently in the articles EQUATIONS, CHEMICAL (*q v* vol II p 433), FORMULÆ (*q v* vol II p 572), and ISOMERISM (*q v* this vol p 79). M M P M

NUCIN *v* JUGLONE

NUCITANNIN Occurs in walnuts (Phipson, *C N* 20, 116). Decomposed by dilute acid into sugar and red amorphous rufic acid $C_{14}H_{12}O_4$, which yields the salts $CaC_8H_4O_4$, and $PbC_8H_4O_4$.

NUCLEIN *v* PROTEIDS, Appendix C

NUCLEO ALBUMIN *v* PROTEIDS, Appendix C

NUCLEO PROTEIDS *v* PROTIDS, Appendix C

NUMBERS, LAW OF EVEN Laurent (*A Ch* [3] 18, 266) said that the sum of the mono valent, trivalent, and pentavalent elements contained in any well defined and stable compound is always an even number. This *law of even numbers* was long an article of belief among orthodox chemists. If by an *n* valent element is meant one the atom of which combines directly with *n* other atoms to form a molecule, then there are several exceptions to the so called law, e.g. themolecules $InCl_2$, $InCl_3$, and probably $InCl$ exist as gases, so do the molecules $FeCl_2$ and $FeCl_3$, the molecules WCl_2 and WCl_6 , &c. M M P M

NUPHARIN $C_{14}H_{12}N_2O_2$. An amorphous substance in the rhizome of *Nuphar luteum* (Gruning, *J* 1882, 1156).

NUX VOMICA *v* STRYCHNINE

O

n-OCTADECANE $C_{18}H_{38}$ [28°] (317°). SG $\frac{2}{2}$ 775, $\frac{2}{2}$ 768 Occurs in paraffin from brown coal. Formed by reduction of stearic acid with HI and P and by the action of Na on ennyl iodide (Krafft, *B* 15, 1703, 16, 1723, 19, 2221, 21, 2261). Hexagonal tables.

OCTADECINENE $C_{18}H_{34}$ [30°] (164° at 15 mm) SG $\frac{2}{2}$ 8016 Formed by heating $C_{18}H_{34}Br_2$ with alcoholic potash (Krafft, *B* 17, 1874). Plates.

OCTADECIC ACID $(C_{17}H_{33})_2CH CO_2H$ [39°] (above 300°) Prepared by heating di octylmalonic acid (Conrad & Bischoff, *B* 13, 597). White crystals.

OCTADECYL ALCOHOL $C_{18}H_{37}OH$ [59°] (210° at 15 mm) SG $\frac{2}{2}$ 8048, $\frac{2}{2}$ 7849 Occurs in crude cetyl alcohol, and is prepared by reducing stearic aldehyde with zinc dust and acetic acid (Krafft, *B* 16, 1722, 17, 1627).

Acetyl derivative [α 31°] (223° at 15 mm)

OCTADECYL-BENZENE $C_{18}H_{38}$, C_8H_8 [86°] (249° at 15 mm) Formed from octadecyl iodide, iodobenzene, and sodium (Krafft, *B* 19, 2984) Yields a solid sulphonic acid

OCTADECYLENE $C_{18}H_{34}$ [18°] (179° at 15 mm) $SG \frac{1}{2}$ 7910, $\frac{2}{3}$ 7881 Formed by distilling octadecyl palmitate (Krafft, *B* 16, 8024)

Octadecylene $C_{18}H_{34}$ *Anthemene* [64°] $SG \frac{1}{2}$ 942 VD 127 ($H=1$) Obtained from *Anthemus nobilis* by extracting the blossoms with ligroin (Naudin, *Bl* [2] 41, 488) Minute needles

OCTADECYLENE BROMIDE *v* **DI-BROMO-OCTADECANE**

OCTADECYL IODIDE $C_{18}H_{37}I$ [33 5°] (K), [43°] (S) From the alcohol, I , and P (Krafft, *B* 19, 2984, Schweizer, *Ar Ph* [3] 22, 753)

OCTADECYL-PHENOL $C_{18}H_{37}O$, C_8H_8 , OH [84°] (277° at 15 mm) Formed by fusing octadecylbenzene sulphonic acid with potash (Krafft, *B* 19, 2985) Plates (from alcohol)
